Treatment of melanoma, resistant chronic myelocytic leukemia, recurrent, metastatic, inoperable ovarian carcinoma. Used in combination with radiation therapy for local control of primary squamous cell carcinoma of head/neck, excluding lip. Treatment of sickle cell anemia with at least 3 painful crises in previous 12 mos. **OFF-LABEL:** Treatment of hematologic conditions (e.g., polycythemia vera), cervical cancer, essential thrombocythemia, hyperleukocytosis due to AML, treatment of meningiomas.
**Precautions**

**Contraindications:** Hypersensitivity to hydroxyurea. **Cautions:** WBC count less than 2,500 cells/mm³ or platelet count less than 100,000 cells/mm³, severe anemia. Previous irradiation therapy, concurrent use with other cytotoxic drugs, renal/hepatic impairment, elderly; pts with sickle cell anemia if neutrophils less than 2,000 cells/mm³, platelets less than 80,000 cells/mm³, Hgb less than 4.5 g/dL, or reticulocytes less than 80,000 cells/mm³ when Hgb less than 9 g/dL.

**Action**

Inhibits DNA synthesis without interfering with RNA synthesis or protein. In sickle cell anemia, increases RBC, Hgb levels, thereby decreasing concentration of sickled cells; alters adhesion of RBCs to endothelium. **Therapeutic Effect:** Interferes with normal repair process of cancer cells damaged by irradiation.

**Pharmacokinetics**

Well absorbed from GI tract. Protein binding: 75%–80%. Metabolized in liver. Excreted in urine as urea and unchanged drug. **Half-life:** 3–4 hrs.

** неделю considerations**

**Pregnancy/Lactation:** Crosses placenta; distributed in breast milk. May cause fetal harm. **Children:** Safety and efficacy not established. **Elderly:** More sensitive to hydroxyurea effects; may require lower dosage.

**Interactions**

**DRUG:** Bone marrow depressants (e.g., alemtuzumab, methotrexate) may increase myelosuppression. **Live virus vaccines** may potentiate virus replication, increase vaccine side effects, decrease the pt’s antibody response to vaccine. **HERBAL:** Echinacea may decrease effect. **FOOD:** None known. **LAB VALUES:** May increase serum BUN, creatinine, uric acid.

**Availability (Rx)**

**Capsules:** 200 mg (Droxia), 300 mg (Droxia), 400 mg (Droxia), 500 mg
(Hydrea).

Administration/handling
Do not open capsules.

Indications/routes/dosage

**Alert** Antineoplastic therapy interrupted when platelet count less than 100,000 cells/mm³ or WBC count less than 2,500 cells/mm³. Resume when counts return to normal.

Sickle cell anemia therapy interrupted when neutrophils less than 2,000 cells/mm³, platelets less than 80,000 cells/mm³, Hgb less than 4.5 g/dL, or reticulocytes less than 80,000 cells/mm³ with Hgb less than 9 g/dL. Reduce dose by 2.5 mg/kg/day following recovery.

CML, Head and Neck Cancer

**PO:** ADULTS, ELDERLY: 15 mg/kg/day. Adjust dose based on tumor type, disease state, response, pt risk factors. May give alone or in combination with other agents.

Sickle Cell Anemia

**PO:** ADULTS, ELDERLY: Initially, 15 mg/kg once daily. May increase by 5 mg/kg/day every 12 wks. **Maximum:** 35 mg/kg/day. **CHILDREN 6 MOS AND OLDER:** 20 mg/kg/dose once daily; increase by 5 mg/kg/day q8wk until mild myelosuppression is achieved. **Maximum:** 35 mg/kg/day.

Dosage in Renal Impairment

Reduce dose to 7.5 mg/kg/day for CrCl 60 mL/min or less.

Dosage in Hepatic Impairment

No dose adjustment.

Side effects

**Frequent:** Nausea, vomiting, anorexia, constipation or diarrhea. **Occasional:**
Mild, reversible rash; facial flushing, pruritus, fever, chills, malaise. **Rare:** Alopecia, headache, drowsiness, dizziness, disorientation.

**Adverse effects/toxic reactions**

Myelosuppression manifested as hematologic toxicity (leukopenia and, to a lesser extent, thrombocytopenia, anemia).

**Nursing considerations**

**Baseline assessment**

Obtain bone marrow studies, renal function, LFT before therapy begins, periodically thereafter. Obtain Hgb, WBC, platelet count, serum uric acid at baseline and wkly during therapy. Pts with marked renal impairment may develop visual or auditory hallucinations, marked hematologic toxicity.

**Intervention/evaluation**

**Patient/family teaching**

• Promptly report fever, sore throat, signs of local infection, unusual bleeding/bruising at any site.

**CLASSIFICATION**

hydrOXYzine
hye-drox-ee-zeen
Apo-HydrOXYzine
Atarax
Novo-Hydroxyzin
Vistaril
◆CLASSIFICATION
PHARMACOTHERAPEUTIC: Histamine H₁ antagonist.

CLINICAL: Antihistamine, antianxiety, antispasmodic, antiemetic, antipruritic.

Do not confuse hydrOXYzine with hydrALAZINE or hydroxyurea, or Vistaril with Restoril, Versed, or Zestril.

Uses

Antiemetic, treatment of anxiety/agitation, antipruritic.

Precautions

Contraindications: Hypersensitivity to hydrOXYzine. Early pregnancy; subcutaneous, intravenous administration; pts with prolonged QT interval. Cautions: Narrow-angle glaucoma, prostatic hypertrophy, bladder neck obstruction, asthma, COPD, elderly.

Action

Competes with histamine for receptor sites in GI tract, blood vessels, respiratory tract. Therapeutic Effect: Produces anxiolytic, anticholinergic, antihistaminic, analgesic effects; relaxes skeletal muscle; controls nausea, vomiting.

Pharmacokinetics

*Lifespan considerations*

Pregnancy/Lactation: Unknown if drug crosses placenta or is distributed in breast milk. Children: Not recommended in newborns or premature infants (increased risk of anticholinergic effects). Paradoxical excitement may occur. Elderly: Increased risk of dizziness, sedation, confusion. Hypotension,
hyperexcitability may occur.

**Interactions**

**DRUG:** Alcohol, other CNS depressants (e.g., diphenhydrAMINE, gabapentin, LOrazepam, morphine) may increase CNS depressant effects. QT interval–prolonging medications (e.g., amiodarone, azithromycin, certinib, haloperidol, moxifloxacin) may increase risk of QT interval prolongation, torsades de pointes. **HERBAL:** Gotu kola, kava kava, St. John’s wort, valerian may increase CNS depression. **FOOD:** None known. **LAB VALUES:** May cause false-positive urine 17-hydroxycorticosteroid determinations.

**Availability (Rx)**

**Oral Solution:** 10 mg/5 mL. **Syrup:** 10 mg/5 mL. **Tablets:** 10 mg, 25 mg, 50 mg. **Capsules:** 25 mg, 50 mg, 100 mg.

**Administration/handling**

**PO**

- May give without regard to food.
- Shake oral suspension well.
- Scored tablets may be crushed; do not break, crush, or open capsule.

**Indications/routes/dosage**

**Anxiety**

**Note:** Initiate elderly dose at the lower end of recommended dosage.

**PO:** **ADULTS, ELDERLY:** 50–100 mg 4 times/day or 37.5–75 mg/day in divided doses.

**Pruritus**

**PO:** **ADULTS, ELDERLY:** 25 mg 3–4 times/day. **CHILDREN 6 YRS AND**
OLDER: 50–100 mg/day in divided doses. CHILDREN YOUNGER THAN 6 YRS: 50 mg/day in divided doses.

Dosage in Renal/Hepatic Impairment
No dose adjustment. Change dosing interval to q24h in pts with primary biliary cirrhosis.

Side effects
Side effects are generally mild, transient. Frequent: Drowsiness, dry mouth, marked discomfort with IM injection. Occasional: Dizziness, ataxia, asthenia, slurred speech, headache, agitation, increased anxiety. Rare: Paradoxical reactions (hyperactivity, anxiety in children; excitement, restlessness in elderly or debilitated pts) generally noted during first 2 wks of therapy, particularly in presence of uncontrolled pain.

Adverse effects/toxic reactions
Hypersensitivity reaction (wheezing, dyspnea, chest tightness) may occur. QT interval prolongation, torsades de pointes have been reported. Acute generalized exanthematous pustulosis (AGEP) may occur.

Nursing considerations

Baseline assessment
Anxiety: Offer emotional support. Assess motor responses (agitation, trembling, tension), autonomic responses (cold/clammy hands, diaphoresis). Antiemetic: Assess for dehydration (poor skin turgor, dry mucous membranes, longitudinal furrows in tongue).

Intervention/evaluation
For pts on long-term therapy, CBC, BMP, LFT should be performed periodically. Monitor lung sounds for signs of hypersensitivity reaction. Monitor serum electrolytes in pts with severe vomiting. Assess for paradoxical reaction, particularly during early therapy. Assist with ambulation if drowsiness, light-headedness occur. Obtain EKG if palpitations occur or cardiac arrhythmia is
suspected. Assess skin for rash, pustules.

**Patient/family teaching**

- Marked discomfort may occur with IM injection.
- Sugarless gum, sips of water may relieve dry mouth.
- Drowsiness usually diminishes with continued therapy.
- Avoid tasks that require alertness, motor skills until response to drug is established.
- Treatment may cause life-threatening heart arrhythmias; report chest pain, difficulty breathing, palpitations, passing out. Do not take newly prescribed medications unless approved by prescriber who originally started treatment.
I

**ibandronate**
eye-*ban*-droe-*nate
Boniva

**CLASSIFICATION**
P**HARMACOTHERAPEUTIC**: Bisphosphonate.
**CLINICAL**: Calcium regulator.

**Uses**
Treatment/prevention of osteoporosis in postmenopausal women. **OFF-LABEL**: Hypercalcemia of malignancy; reduces bone pain and skeletal complications from metastatic bone disease due to breast cancer.

**Precautions**
**Contraindications**: Hypersensitivity to ibandronate, other bisphosphonates; oral tablets in pts unable to stand or sit upright for at least 60 min; pts with abnormalities of the esophagus that would delay emptying (e.g., stricture, achalasia), hypocalcemia. **Cautions**: GI diseases (duodenitis, dysphagia, esophagitis, gastritis, ulcers [drug may exacerbate these conditions]), renal impairment with CrCl less than 30 mL/min.

**Action**
Inhibits bone resorption via activity on osteoclasts. **Therapeutic Effect**: Reduces rate of bone resorption, resulting in increased bone mineral density.

**Pharmacokinetics**

**Lifespan considerations**

**Pregnancy/Lactation:** May cause fetal harm/malformations. Unknown if distributed in breast milk. Breastfeeding not recommended. **Children:** Safety and efficacy not established. **Elderly:** No age-related precautions noted.

**Interactions**

**DRUG:** Vitamin D, antacids containing aluminum, calcium, magnesium decrease absorption. Aspirin, NSAIDs (e.g., ibuprofen, ketorolac, naproxen) may increase GI irritation. **HERBAL:** None significant. **FOOD:** Beverages (other than plain water), dietary supplements, dairy products, food interfere with absorption. **LAB VALUES:** May decrease serum alkaline phosphatase. May increase serum cholesterol.

**Availability (Rx)**

**Injection Solution:** 3 mg/3 mL syringe. **Tablets:** 150 mg.

**Administration/handling**

**PO**
- Give 60 min before first food or beverage of the day, on an empty stomach with 6–8 oz plain water (not mineral water) while pt is standing or sitting in upright position.
- Pt cannot lie down for 60 min following administration.
- Instruct pt to swallow whole; do not break, crush, dissolve, or divide tablet (potential for oropharyngeal ulceration).

**IV**
- Give over 15–30 sec.
- Give over 1 hr for metastatic bone disease; over 1–2 hrs for hypercalcemia of malignancy.
Indications/routes/dosage

Note: May consider discontinuing after 3–5 yrs in pts at low risk for fracture.

Osteoporosis

PO (Prevention/Treatment): ADULTS, ELDERLY: 150 mg once monthly.
IV (Treatment): ADULTS, ELDERLY: 3 mg q3mos.

Dosage in Renal Impairment
Not recommended for pts with CrCl less than 30 mL/min.

Dosage in Hepatic Impairment
No dose adjustment.

Side effects

Frequent (13%–6%): Back pain, dyspepsia, peripheral discomfort, diarrhea, headache, myalgia. IV: Abdominal pain, dyspepsia, constipation, nausea, diarrhea. Occasional (4%–3%): Dizziness, arthralgia, asthenia. Rare (2% or less): Vomiting, hypersensitivity reaction.

Adverse effects/toxic reactions

Upper respiratory infection occurs occasionally. Overdose results in hypocalcemia, hypophosphatemia, significant GI disturbances.

Nursing considerations

Baseline assessment
Hypocalcemia, vitamin D deficiency must be corrected before beginning therapy. Obtain laboratory baselines, esp. serum chemistries, renal function. Obtain results of bone density study.

Intervention/evaluation
Monitor electrolytes, esp. serum calcium, phosphate. Monitor renal function tests.
**Patient/family teaching**

- Expected benefits occur only when medication is taken with full glass (6–8 oz) of plain water, first thing in the morning and at least 60 min before first food, beverage, medication of the day. Any other beverage (mineral water, orange juice, coffee) significantly reduces absorption of medication.
- Do not chew, crush, dissolve, or divide tablets; swallow whole.
- Do not lie down for at least 60 min after taking medication (potentiates delivery to stomach, reduces risk of esophageal irritation).
- Report swallowing difficulties, pain when swallowing, chest pain, new/worsening heartburn.
- Consider weight-bearing exercises; modify behavioral factors (e.g., cigarette smoking, alcohol consumption).
- Calcium and vitamin D supplements should be taken if dietary intake inadequate.

---

### ibrutinib

**Eye-broo-ti-nib**

**Imbruvica**

**CLASSIFICATION**

**PHARMACOTHERAPEUTIC:** Kinase inhibitor.

**CLINICAL:** Antineoplastic.

Do not confuse ibrutinib with axitinib, dasatinib, erlotinib, gefitinib, imatinib, nilotinib, PONATinib, SORAfenib, SUNItinib, or vandetanib.

---

### Uses

Treatment of pts with mantle cell lymphoma (MCL) who have received at least one prior therapy, chronic lymphocytic leukemia (CLL) with at least one prior therapy or with 17p deletion, first-line treatment of CLL. Waldenstrom’s macroglobulinemia (WM). Marginal zone lymphoma (MZL) requiring systemic therapy and having received at least one prior anti-CD-20 based therapy. Chronic graft versus host disease (CGVHD) after failure of at least one line of systemic therapy.

### Precautions
Contraindications: Hypersensitivity to ibrutinib. Cautions: Hepatic/renal impairment, elderly, pregnancy, history of GI disease (e.g., bleeding, ulcers).

Action

Inhibits enzymatic activity of Bruton’s tyrosine kinase (BTK), a signaling molecule that promotes malignant B-cell proliferation and survival. **Therapeutic Effect:** Inhibits tumor cell growth and metastasis.

Pharmacokinetics

Readily absorbed following PO. Metabolized in liver. Peak plasma concentration: 1–2 hrs. Protein binding: 97%. Excreted in feces (80%), urine (10%). **Half-life:** 4–6 hrs.

Lifespan considerations

**Pregnancy/Lactation:** May cause fetal harm. Avoid pregnancy. Unknown if distributed in breast milk. Must either discontinue drug or discontinue breastfeeding. **Children:** Safety and efficacy not established. **Elderly:** Increased risk of cardiac events (atrial fibrillation, hypertension), infections (pneumonia, cellulitis), GI events (diarrhea, dehydration, bleeding).

Interactions

**DRUG:** Strong CYP3A4 inhibitors (e.g., ketoconazole, clarithromycin) may increase plasma concentration/effect; avoid use. Strong CYP3A4 inducers (e.g., rifAMPin, phenytoin) may decrease plasma concentration/effect; avoid use. Anticoagulants (e.g., warfarin), antiplatelets (e.g., aspirin, clopidogrel), NSAIDs may increase risk of bleeding. **HERBAL:** St. John’s wort may decrease concentration/effect. **FOOD:** Grapefruit products, Seville oranges may increase concentration/effect. **All foods** may increase absorption/concentration. **LAB VALUES:** May decrease Hgb, Hct, neutrophils, platelets.

Availability (Rx)

**Capsules:** 140 mg.
Administration/handling

PO
- Give with water.
- Do not break, crush, or open capsule.

Indications/routes/dosage

MCL, MZL
PO: ADULTS/ELDERLY: 560 mg (4 × 140-mg capsules) once daily. Continue until disease progression or unacceptable toxicity.

CLL, WM, CGVHD
PO: ADULTS, ELDERLY: 420 mg (3 × 140 mg) once daily. Continue until disease progression or unacceptable toxicity.

Dose Modification
Based on Common Terminology Criteria for Adverse Events (CTCAE).

Any Grade 3 or Greater Nonhematologic Event, Grade 3 or Greater Neutropenia with Infection or Fever, or Any Grade 4 Hematologic Toxicities
Interrupt treatment until resolution to grade 1 or baseline, then restart at initial dose. If toxicity reoccurs, interrupt treatment until resolution to grade 1 or baseline, then reduce dose to 420 mg daily (one capsule less). If toxicity reoccurs, interrupt treatment until resolution to grade 1 or baseline, then reduce dose to 280 mg once daily (one capsule less). If toxicity still occurs at 280 mg dose, discontinue treatment.

Concomitant Use of Moderate CYP3A4 Inhibitors (e.g., Fluconazole, DiltiaZEM, Verapamil)
Start at reduced dose of 140 mg daily. If toxicity occurs, either discontinue treatment or find alternate agent with less CYP3A inhibition.
Concomitant Short-Term Use of Strong CYP3A4 Inhibitors (7 days or less) (e.g., Antifungals, Antibiotics)
Interrupt treatment until strong CYP3A medications no longer needed.

Concomitant Chronic Use of Strong CYP3A4 Inhibitors or Inducers
Treatment not recommended.

Dosage in Renal Impairment
No dose adjustment.

Dosage in Hepatic Impairment
Mild impairment: Decrease dose to 140 mg. Moderate to severe impairment: Avoid use.

Side effects
Frequent (51%–23%): Diarrhea, fatigue, musculoskeletal pain, peripheral edema, nausea, bruising, dyspnea, constipation, rash, abdominal pain, vomiting. Occasional (21%–11%): Decreased appetite, cough, pyrexia, stomatitis, asthenia, dizziness, muscle spasms, dehydration, headache, dyspepsia, petechiae, arthralgia.

Adverse effects/toxic reactions
Anemia, lymphopenia, neutropenia, thrombocytopenia is expected response to therapy. Treatment-emergent myelosuppression (grade 3–4 CTCAE) reported in 41% of pts: neutropenia (29%), thrombocytopenia (17%), anemia (9%). Infections including upper respiratory tract infection, UTI, pneumonia, skin infection, sinusitis were reported. Hemorrhagic events including epistaxis, GI bleeding, hematuria, intracranial hemorrhage, subdural hematoma reported in 5% of pts. Serious and fatal cases of renal toxicity reported: increased serum creatinine 1.5 times upper limit of normal (ULN) (67% of pts), increased serum creatinine 1.53 times ULN (9% of pts). Second primary malignancies including skin cancer (4%), other carcinomas (1%) occurred.
Nursing considerations

Baseline assessment

Intervention/evaluation

Patient/family teaching
• Blood levels will be monitored routinely.
• Difficulty breathing, fever, cough, burning with urination, body aches, chills may indicate acute infection.
• Avoid pregnancy.
• Report any black/tarry stools, bruising, nausea, RUQ abdominal pain, yellowing of skin or eyes, palpitations, nose bleeds, blood in urine or stool, decreased urine output.
• Avoid alcohol.
• Do not take herbal products.
• Do not ingest grapefruit products.
• Severe diarrhea may lead to dehydration.
• Contact physician before any planned surgical/dental procedures.
• Immediately report neurological changes: confusion, one-sided paralysis, difficulty speaking, partial blindness.
• Do not receive live vaccines.
• Do not break, crush, or open capsule.

**ibuprofen**

*eye-bue-pro-fen*

*Advil*

*Apo-Ibuprofen* 🌟

*Caldolor*

*Motrin*

*NeoProfen*

*Novo-Profen* 🌟

**Fixed-Combination(s)**

**Children’s Advil Cold:** ibuprofen/pseudoephedrine (a nasal decongestant): 100 mg/15 mg per 5 mL. **Combunox:** ibuprofen/oxyCODONE (a narcotic analgesic): 400 mg/5 mg. **Duexis:** ibuprofen/famotidine (an H₂ antagonist): 800 mg/26.6 mg. **Reprexain CIII:** ibuprofen/HYDROcodone (a narcotic analgesic): 200 mg/5 mg. **Vicoprofen:** ibuprofen/HYDROcodone (a narcotic analgesic): 200 mg/7.5 mg.

**CLASSIFICATION**

**PHARMACOTHERAPEUTIC:** NSAID.

**CLINICAL:** Antirheumatic, analgesic, antipyretic, antidysmenorrheal, vascular headache suppressant.

■ **BLACK BOX ALERT** ■ Increased risk of serious cardiovascular thrombotic events, including myocardial infarction, CVA. Increased risk of severe GI reactions, including ulceration, bleeding, perforation.

**Do not confuse Motrin with Neurontin, or Advil with Aleve.**

**Uses**

**Oral:** Treatment of fever, rheumatoid disorders, osteoarthritis, mild to moderate
pain, primary dysmenorrhea. **Caldolor:** Mild to moderate pain; severe pain in combination with an opioid analgesic; fever. **NeoProfen:** Induces closure in clinically significant patent ductus arteriosus (PDA) in premature infants weighing between 500 and 1,500 g who are no more than 32 wks gestational age when usual medical management is ineffective. **OFF-LABEL:** Treatment of cystic fibrosis, pericarditis. Juvenile idiopathic arthritis.

### Precautions

**Contraindications:** History of hypersensitivity to ibuprofen, aspirin, other NSAIDs. Treatment of perioperative pain in coronary artery bypass graft (CABG) surgery. Aspirin triad (bronchial asthma, aspirin intolerance, rhinitis). **NeoProfen:** Infants with proven or suspected untreated infection, elevated total bilirubin, congenital heart disease in whom patency of the patent ductus arteriosus is necessary for satisfactory pulmonary or systemic blood flow (e.g., pulmonary atresia), bleeding, thrombocytopenia, coagulation defects, suspected necrotizing enterocolitis, significant renal impairment. **Cautions:** Pts with fluid retention, HF, dehydration, coagulation disorders, concurrent use with aspirin, anticoagulants, steroids; history of GI disease (e.g., bleeding, ulcers), smoking, use of alcohol, elderly, debilitated pts, hepatic/renal impairment, asthma.

### Action

Reversibly inhibits COX-1 and COX-2 enzymes, resulting in decreased formation of prostaglandin precursors. **Therapeutic Effect:** Produces analgesic, anti-inflammatory effects; decreases fever.

### Pharmacokinetics

Rapidly absorbed from GI tract. Protein binding: 90%–99%. Metabolized in liver. Primarily excreted in urine. Not removed by hemodialysis. **Half-life:** 2–4 hrs.

**Lifespan considerations**
**Pregnancy/Lactation**: Unknown if drug crosses placenta or is distributed in breast milk. Avoid use during third trimester (may adversely affect fetal cardiovascular system: premature closure of ductus arteriosus). **Children**: Safety and efficacy not established in pts younger than 6 mos. **Elderly**: GI bleeding, ulceration more likely to cause serious adverse effects. Age-related renal impairment may increase risk of hepatic/renal toxicity; reduced dosage recommended.

**Interactions**

**DRUG**: May decrease effects of antihypertensives (e.g., amLODIPine, lisinopril, valsartan), diuretics (e.g., furosemide). Aspirin, other salicylates may increase risk of GI side effects, bleeding. May increase effects of oral anticoagulants (e.g., warfarin). May increase concentration, risk of toxicity of lithium, methotrexate. **HERBAL**: Cat’s claw, dong quai, evening primrose, feverfew, garlic, ginkgo, ginseng, horse chestnut, red clover may increase antiplatelet activity. **FOOD**: None known. **LAB VALUES**: May prolong bleeding time. May alter serum glucose level. May increase serum BUN, creatinine, potassium, ALT, AST. May decrease serum calcium, glucose; Hgb, Hct, platelets.

**Availability (Rx)**

**Capsules**: 200 mg. **Injection, Solution (NeoProfen)**: 10 mg/mL. **(Caldolor)**: 100 mg/mL. **Suspension, Oral**: 100 mg/5 mL. **Suspension, Oral Drops**: 40 mg/mL. **Tablets**: 200 mg, 400 mg, 600 mg, 800 mg. **Tablets, Chewable**: 100 mg.

**Administration/handling**

**IV (Caldolor)**

**Reconstitution**

- Dilute with D₅W or 0.9% NaCl to final concentration of 4 mg/mL or less.

**Rate of Administration**

- Infuse over at least 30 min.

**Storage**
• Store at room temperature.
• Stable for 24 hrs after dilution.

IV (Neoprofen)

Reconstitution
• Dilute to appropriate volume with D5W or 0.9% NaCl.
• Discard any remaining medication after first withdrawal from vial.

Rate of Administration
• Administer via IV port nearest the insertion site.
• Infuse continuously over 15 min.

Storage
• Store at room temperature.
• Stable for 30 min after dilution.

PO
• Give with food, milk, antacids if GI distress occurs.

Indications/routes/dosage

Fever
PO: ADULTS, ELDERLY: 200–400 mg q4–6h prn. CHILDREN 6 MOS AND OLDER: 5–10 mg/kg q6–8h. Maximum: 400 mg/dose; 1,200 mg/day.
IV: ADULTS, ELDERLY: 400 mg q4–6h or 100–200 mg q4h prn. Maximum: 3.2 g/day.
CHILDREN 12–17 YRS: 400 mg q4–6h prn. Maximum: 2,400 mg/day.
CHILDREN 6 MOS–11 YRS: 10 mg/kg q4–6h prn. Maximum/dose: 400 mg.
Maximum: 40 mg/kg up to 2,400 mg/day.

Osteoarthritis, Rheumatoid Disorders
PO: ADULTS, ELDERLY: 400–800 mg 3–4 times/day. Maximum: 3.2 g/day.

Pain
PO: ADULTS, ELDERLY, CHILDREN 12 YRS AND OLDER: 200–400 mg q4–6h prn. CHILDREN 6 MOS–11 YRS: 4–10 mg/kg q6–8h prn. Maximum:
40 mg/kg/day (400 mg/dose).
**IV:** **ADULTS, ELDERLY:** 400–800 mg q6h prn. **Maximum:** 3.2 g/day.

**Primary Dysmenorrhea**
**PO:** **ADULTS:** 200–800 mg q4–6h prn. **Maximum:** 1,200 mg/day.

**Patent Ductus Arteriosus (PDA)**
**IV:** **INFANTS:** Initially, 10 mg/kg then 2 doses of 5 mg/kg, after 24 hrs and 48 hrs. All doses based on birth weight.

**Dosage in Renal Impairment**
Hold if anuria or oliguria evident. Avoid use in severe impairment.

**Dosage in Hepatic Impairment**
Avoid use in severe impairment.

**Side effects**
**Occasional (9%–3%):** Nausea, vomiting, dyspepsia, dizziness, rash. **Rare (less than 3%):** Diarrhea or constipation, flatulence, abdominal cramps or pain, pruritus, increased B/P.

**Adverse effects/toxic reactions**
Overdose may result in metabolic acidosis. Rare reactions with long-term use include peptic ulcer, GI bleeding, gastritis, severe hepatic reaction (cholestasis, jaundice), nephrotoxicity (dysuria, hematuria, proteinuria, nephrotic syndrome), severe hypersensitivity reaction (particularly in pts with systemic lupus erythematosus or other collagen diseases). **NeoProfen:** Hypoglycemia, hypocalcemia, respiratory failure, UTI, edema, atelectasis may occur. **Caldolor:** Abdominal pain, anemia, cough, dizziness, dyspnea, edema, hypertension, nausea, vomiting have been reported.

**Nursing considerations**
**Baseline assessment**

Assess onset, type, location, duration of pain, inflammation. Inspect appearance of affected joints for immobility, deformities, skin condition. Assess temperature. Question medical history as listed in Precautions.

**Intervention/evaluation**

**Patient/family teaching**

- Avoid aspirin, alcohol during therapy (increases risk of GI bleeding).
- If GI upset occurs, take with food, milk, antacids.
- May cause dizziness.
- Report ringing in ears, persistent stomach pain, respiratory difficulty, unusual bruising/bleeding, swelling of extremities, chest pain/palpitations.

**idelalisib**

eye-del-a-lis-ib

**Zydelig**

◆ CLASSIFICATION

PHARMACOTHERAPEUTIC: Kinase inhibitor.

CLINICAL: Antineoplastic.

■ **BLACK BOX ALERT** ■ Fatal and/or serious hepatotoxicity may occur. Monitor LFT prior to and during treatment. Fatal and/or serious and severe diarrhea or colitis may occur. Monitor for GI symptoms. Fatal and serious pneumonitis may occur. Monitor for pulmonary symptoms and bilateral interstitial infiltrates. Interrupt, then reduce or discontinue treatment if hepatotoxicity, severe diarrhea, or pneumonitis occurs. Fatal and serious intestinal perforation may occur. Discontinue if perforation suspected.

**Uses**
Treatment of relapsed chronic lymphocytic leukemia (CLL), in combination with riTUXimab, in pts for whom riTUXimab alone would not be considered appropriate therapy due to other co-morbidities. Treatment of relapsed follicular B-cell non-Hodgkin’s lymphoma (FL) or relapsed small lymphocytic lymphoma (SLL) in pts who have received at least two prior systemic therapies.

**Precautions**

**Contraindications:** History of serious allergic reactions to idelalisib (e.g., anaphylaxis, toxic epidermal necrolysis). **Cautions:** Baseline anemia, leukopenia, neutropenia, thrombocytopenia; GI bleeding, hepatic impairment. Pts with active infection, high tumor burden. Avoid concomitant use of hepatotoxic or promotility medications.

**Action**

Inhibits several cell signaling pathways including B-cell receptor signaling and CXCR4 and CXCR5 signaling, which are involved in trafficking B cells to lymph nodes and bone marrow. **Therapeutic Effect:** Inhibits tumor cell growth and metastasis.

**Pharmacokinetics**

Well absorbed following PO administration. Metabolized in liver. Protein binding: 84%. Peak plasma concentration: 1.5 hrs. Excreted in feces (78%), urine (14%). **Half-life:** 8.3 hrs.

**Lifespan considerations**

**Pregnancy/Lactation:** May cause fetal harm; avoid pregnancy. Use effective contraception during treatment and for at least 1 mo after discontinuation. Unknown if distributed in breast milk. Must either discontinue drug or discontinue breastfeeding. **Children:** Safety and efficacy not established in pts younger than 18 yrs. **Elderly:** May have increased risk of side effects/adverse reactions.

**Interactions**
DRUG: Strong CYP3A4 inducers (e.g., rifAMPin, phenytoin) may decrease concentration/effect. Strong CYP3A4 inhibitors (ketoconazole, ritonavir) may increase concentration/effect. HERBAL: St. John’s wort may decrease concentration/effect. FOOD: None known. LAB VALUES: May increase serum ALT, AST, bilirubin, GGT; triglycerides. May decrease Hgb, neutrophils, platelets, serum sodium. May increase or decrease lymphocytes, serum glucose.

Availability (Rx)

Tablets: 100 mg, 150 mg.

Administration/handling

PO

• Give without regard to meals.
• Swallow tablets whole.

Indications/routes/dosage

Chronic Lymphocytic Leukemia (in Combination with RiTUXimab), Follicular B-cell Non-Hodgkin’s Lymphoma, Small Lymphocytic Lymphoma

PO: ADULTS/ELDERLY: 150 mg twice daily. Continue until disease progression or unacceptable toxicity.

Dose Modification

Hepatotoxicity

* Elevated Serum ALT, AST
3–5 Times Upper Limit of Normal (ULN): Maintain dose. 5–20 Times ULN: Monitor serum ALT, AST wkly. Withhold until ALT, AST less than 1 times ULN, then resume at 100 mg twice daily. Greater Than 20 Times ULN: Permanently discontinue.

* Elevated Serum Bilirubin
1.5–3 Times ULN: Monitor serum bilirubin wkly. Maintain dose.
3–10 Times ULN: Monitor serum bilirubin wkly. Withhold until bilirubin less than 1 times ULN, then resume at 100-mg dose.

**Greater Than 10 Times ULN:** Permanently discontinue.

**Diarrhea**

**Moderate Diarrhea:** Maintain dose.

**Severe Diarrhea or Hospitalization:** Withhold until resolved, then resume at 100-mg dose. **Life-Threatening Diarrhea:** Permanently discontinue.

**Neutropenia**

ANC 1,000–1,500 cells/mm$^3$: Maintain dose. ANC 500–1,000 cells/mm$^3$: Monitor ANC wkly and maintain dose. ANC Less Than 500 cells/mm$^3$: Permanently discontinue.

**Thrombocytopenia**

Platelets 50,000–75,000 cells/mm$^3$: Maintain dose. Platelets 25,000–50,000 cells/mm$^3$: Monitor platelet count wkly and maintain dose. Platelets Less Than 25,000 cells/mm$^3$: Monitor platelet count wkly. Withhold until platelets greater than 25,000 cells/mm$^3$, then resume at 100-mg dose.

**Pneumonitis**

Any Symptoms: Permanently discontinue.

**Dosage in Renal Impairment**

No dose adjustment.

**Dosage in Hepatic Impairment**

Use caution. See dose modification.

**Side effects**

**CLL**

**Frequent (35%–21%):** Pyrexia, nausea, diarrhea, chills. **Occasional (10%–5%):** Headache, vomiting, generalized pain, arthralgia, stomatitis, gastric reflux, nasal congestion.

**Non-Hodgkin’s Lymphoma**

**Frequent (47%–21%):** Diarrhea, fatigue, nausea, cough, pyrexia, abdominal pain, rash. **Occasional (17%–10%):** Dyspnea, decreased appetite, vomiting,
asthenia, night sweats, insomnia, headache, peripheral edema.

**Adverse effects/toxic reactions**

Thrombocytopenia, neutropenia, leukopenia, lymphopenia are expected responses to therapy, but more severe reactions, including bone marrow failure, febrile neutropenia, may occur. Fatal and/or serious events including hepatotoxicity (14% of pts), severe diarrhea or colitis (14% of pts), hypersensitivity reactions (including anaphylaxis), pneumonitis, intestinal perforation were reported. Neutropenia occurred in 31% of pts, which may greatly increase risk of infection. Severe skin reactions including toxic epidermal necrolysis, generalized rash, exfoliative rash were reported. Other infections may include bronchitis, *C. difficile* colitis, pneumonia, sepsis, UTI. Fatal and/or serious intestinal perforation may occur.

**Nursing considerations**

**Baseline assessment**

Obtain ANC, CBC, BMP, LFT, PT/INR, vital signs, urine pregnancy. Receive full medication history including herbal products. Question possibility of pregnancy, current breastfeeding status, use of contraceptive measures in female pts of reproductive potential. Question history of hypersensitivity reaction or acute skin reactions to drug class. Perform full dermatologic exam with routine assessment. Offer emotional support.

**Intervention/evaluation**

Diligently monitor blood counts (esp. ANC, CBC, platelet count) frequently. Any interruption of therapy or dosage change may require wkly lab monitoring until symptoms resolve. Obtain *C. difficile* toxin PCR if severe diarrhea occurs. Screen for acute cutaneous reactions, allergic reactions, other acute infections (sepsis, UTI), hepatic impairment, pulmonary events (dyspnea, pneumonitis, pneumonia), or tumor lysis syndrome (electrolyte imbalance, uric acid nephropathy, acute renal failure). Monitor strict I&O, hydration status, stool frequency and consistency.

**Patient/family teaching**
• Blood levels will be routinely monitored. Any change in dose or interruption of therapy may require blood draws every week.
• Avoid pregnancy; do not breastfeed.
• Report abdominal pain, amber or bloody urine, bruising, black/tarry stools, persistent diarrhea, yellowing of skin or eyes.
• Fever, cough, burning with urination, body aches, chills may indicate acute infection.
• Avoid alcohol.
• Immediately report difficult breathing, severe coughing, chest tightness.
• Therapy may cause severe allergic reactions, intestinal tearing, or skin rashes or severe diarrhea related to an infected colon.
• Do not take any over-the-counter medications including herbal products unless approved by your doctor.

**ifosfamide**

*eye-fos-fa-mide*

**Ifex**

**CLASSIFICATION**

PHARMACOTHERAPEUTIC: Alkylating agent.

CLINICAL: Antineoplastic.

■ **BLACK BOX ALERT** ■ Hemorrhagic cystitis may occur. Severe myelosuppressant. May cause CNS toxicity, including confusion, coma. Must be administered by personnel trained in administration/handling of chemotherapeutic agents. May cause severe nephrotoxicity, resulting in renal failure.

Do not confuse ifosfamide with cyclophosphamide.

**Uses**

Treatment of germ cell testicular carcinoma (used in combination with other chemotherapy agents and with concurrent mesna for prophylaxis of hemorrhagic cystitis). **OFF-LABEL:** Small-cell lung, non–small-cell lung, ovarian, cervical, bladder cancer; soft tissue sarcomas, Hodgkin’s, non-Hodgkin’s lymphomas; osteosarcoma; head and neck, Ewing’s sarcoma.
Precautions

Contraindications: Hypersensitivity to ifosfamide. Urinary outflow obstruction. 
Cautions: Renal/hepatic impairment, compromised bone marrow reserve, active urinary tract infection, preexisting cardiac disease, prior radiation therapy. Avoid use in pts with WBCs less than 2,000 cells/mm$^3$ and platelets less than 50,000 cells/mm$^3$.

Action

Pharmacokinetics

Lifespan considerations

Pregnancy/Lactation: If possible, avoid use during pregnancy, esp. first trimester. Males must use effective contraception and not conceive a child during treatment and for at least 6 months after discontinuation. May cause fetal harm. Distributed in breast milk. Breastfeeding not recommended. Children: Not intended for this pt population. Elderly: Age-related renal impairment may require dosage adjustment.

Interactions

DRUG: Bone marrow depressants (e.g., alemtuzumab, methotrexate) may increase myelosuppression. Live virus vaccines may potentiate virus replication, increase vaccine side effects, decrease pt’s antibody response to vaccine. HERBAL: St. John’s wort may decrease concentration. FOOD: None known. LAB VALUES: May increase serum BUN, bilirubin, creatinine, uric acid, ALT, AST.
Availability (Rx)

Injection, Powder for Reconstitution (Ifex): 1 g, 3 g. Injection, Solution: 50 mg/mL.

Administration/handling

**Alert** Hemorrhagic cystitis occurs if mesna is not given concurrently. Mesna should always be given with ifosfamide.

**IV**

Reconstitution

- Reconstitute vial with Sterile Water for Injection or Bacteriostatic Water for Injection to provide concentration of 50 mg/mL. Shake to dissolve.
- Further dilute with 50–1,000 mL D₅W or 0.9% NaCl to provide concentration of 0.6–20 mg/mL.

Rate of Administration

- Infuse over minimum of 30 min.
- Give with at least 2,000 mL PO or IV fluid (prevents bladder toxicity).
- Give with protectant against hemorrhagic cystitis (i.e., mesna).

Storage

- Store vials of powder at room temperature.
- Refrigerate vials of solution.
- After reconstitution with Bacteriostatic Water for Injection, vials and diluted solutions stable for 24 hrs if refrigerated.

**IV incompatibilities**

Cefepime (Maxipime), methotrexate.

**IV Compatibilities**

Granisetron (Kytril), ondansetron (Zofran).

Indications/routes/dosage

**Alert** Dosage individualized based on clinical response, tolerance to adverse effects. When used in combination therapy, consult specific protocols for
optimum dosage, sequence of drug administration.

**Germ Cell Testicular Carcinoma**

**IV: ADULTS:** 1,200 mg/m²/day for 5 consecutive days. Repeat q3wks or after recovery from hematologic toxicity. Administer with mesna (to prevent bladder toxicity).

**Dosage in Renal/Hepatic Impairment**
Use caution.

**Side effects**

**Frequent (83%–58%):** Alopecia, nausea, vomiting. **Occasional (15%–5%):** Confusion, drowsiness, hallucinations, infection. **Rare (less than 5%):** Dizziness, seizures, disorientation, fever, malaise, stomatitis (mucosal irritation, glossitis, gingivitis).

**Adverse effects/toxic reactions**

Hemorrhagic cystitis with hematuria, dysuria occurs frequently if protective agent (mesna) is not used. Myelosuppression (leukopenia, thrombocytopenia) occurs frequently. Pulmonary toxicity, hepatotoxicity, nephrotoxicity, cardiotoxicity, CNS toxicity (confusion, hallucinations, drowsiness, coma) may require discontinuation of therapy.

**Nursing considerations**

**Baseline assessment**
Obtain urinalysis before each dose. If hematuria occurs (greater than 10 RBCs per field), therapy should be withheld until resolution occurs. Obtain WBC, platelet count, Hgb before each dose. Offer emotional support.

**Intervention/evaluation**
Monitor hematologic studies, urinalysis, renal function, LFT. Assess for fever, sore throat, signs of local infection, unusual bruising/bleeding from any site, symptoms of anemia (excessive fatigue, weakness). Monitor for toxicities.
Patient/family teaching

- Alopecia is reversible, but new hair growth may have a different color or texture.
- Drink plenty of fluids (protects against cystitis).
- Do not have immunizations without physician’s approval (drug lowers resistance).
- Avoid contact with those who have recently received live virus vaccine.
- Avoid crowds, those with infections.
- Report unusual bleeding/bruising, fever, chills, sore throat, joint pain, sores in mouth or on lips, yellowing skin or eyes.

◆ CLASSIFICATION
PHARMACOTHERAPEUTIC: Second-generation (atypical) antipsychotic.
CLINICAL: Antipsychotic.

■ BLACK BOX ALERT ■ Elderly pts with dementia-related psychosis are at increased risk for mortality due to cerebrovascular events.

Do not confuse iloperidone with amiodarone or dronedarone.

Uses

Acute treatment of schizophrenia in adults.

Precautions

Contraindications: Hypersensitivity to iloperidone. Cautions: Cardiovascular disease (HF, history of MI, ischemia, cardiac conduction abnormalities), cerebrovascular disease (increases risk of CVA in pts with dementia, seizure disorders). Pts at risk for orthostatic hypotension. Pts with bradycardia, hypokalemia, hypomagnesemia may be at greater risk for torsades de pointes. History of seizures, conditions lowering seizure threshold, high risk of suicide,
risk of aspiration pneumonia, congenital QT syndrome, concurrent use of medications that prolong QT interval, decreased GI motility, urinary retention, BPH, xerostomia, visual problems, hepatic impairment, narrow-angle glaucoma, diabetes, elderly.

### Action

Exact mechanism mediated through combination of DOPamine type 2 (D_2) and serotonin type 2 (5-HT_2) antagonisms. **Therapeutic Effect:** Diminishes symptoms of schizophrenia and reduces incidence of extrapyramidal side effects.

### Pharmacokinetics

Steady-state concentration occurs in 3–4 days. Well absorbed from GI tract (unaffected by food). Protein binding: 95%. Metabolized in liver. Primarily excreted in urine, with a lesser amount excreted in feces. **Half-life:** 18–33 hrs.

#### Lifespan considerations

**Pregnancy/Lactation:** Unknown if drug crosses placenta or is excreted in breast milk. Breastfeeding not recommended. **Children:** Safety and efficacy not established. **Elderly:** More susceptible to postural hypotension. Increased risk of cerebrovascular events, mortality, including stroke in elderly pts with psychosis.

### Interactions

**DRUG:** Alcohol, CNS depressants (e.g., diphenhydramINE, LORazepam, morphine) may increase CNS depression. **Strong CYP3A4 inhibitors** (e.g., clarithromycin, ketoconazole) or **strong CYP2D6 inhibitors** (e.g., FLUoxetine, PARoxetine) may increase concentration. **Medications causing prolongation of QT interval** (e.g., amiodarone, dofetilide, sotalol) may increase effects on cardiac conduction, leading to malignant arrhythmias (torsades de pointes). **HERBAL:** Gotu kola, kava kava, St. John’s wort, valerian may increase CNS depression. **St. John’s wort** may decrease concentration. **FOOD:** None known. **LAB VALUES:** May increase serum prolactin levels.
Availability (Rx)

Tablets: 1 mg, 2 mg, 4 mg, 6 mg, 8 mg, 10 mg, 12 mg.

Administration/handling

PO

• Give without regard to food.
• Tablets may be crushed.

Indications/routes/dosage

Note: Titrate to the proper dose range with dosage adjustments not to exceed 2 mg twice daily (4 mg/day).

Schizophrenia

PO: ADULTS: To avoid orthostatic hypotension, begin with 1 mg twice daily, then adjust dosage to 2 mg twice daily, 4 mg twice daily, 6 mg twice daily, 8 mg twice daily, 10 mg twice daily, and 12 mg twice daily on days 2, 3, 4, 5, 6, and 7, respectively, to reach target daily dose of 12–24 mg/day in 2 divided doses. Note: Reduce dose by 50% when receiving strong CYP2D6 or CYP3A4 inhibitors or poor metabolizers of CYP2D6 (see Interactions).

Dosage in Renal Impairment

No dose adjustment.

Dosage in Hepatic Impairment

Side effects

Frequent (20%–12%): Dizziness, drowsiness, tachycardia. Occasional (10%–4%): Nausea, dry mouth, nasal congestion, weight increase, diarrhea, fatigue, orthostatic hypotension. Rare (3%–1%): Arthralgia, musculoskeletal stiffness, abdominal discomfort, nasopharyngitis, tremor, hypotension, rash, ejaculatory
failure, dyspnea, blurred vision, lethargy.

**Adverse effects/toxic reactions**

Extrapyramidal disorders, including tardive dyskinesia (protrusion of tongue, puffing of cheeks, chewing/puckering of the mouth), occur in 4% of pts. Upper respiratory infection occurs in 3% of pts. QT interval prolongation may produce torsades de pointes, a form of ventricular tachycardia. Neuroleptic malignant syndrome (e.g., hyperpyrexia, muscle rigidity, altered mental status, irregular pulse or B/P) has been noted.

**Nursing considerations**

**Baseline assessment**

Assess pt’s behavior, appearance, emotional status, response to environment, speech pattern, thought content. EKG should be obtained to assess for QT prolongation before instituting medication. Question medical history as listed in Precautions.

**Intervention/evaluation**

Monitor for orthostatic hypotension; assist with ambulation. Monitor for fine tongue movement (may be first sign of tardive dyskinesia, possibly irreversible). Monitor serum potassium, magnesium in pts at risk for electrolyte disturbances. Assess for therapeutic response (greater interest in surroundings, improved self-care, increased ability to concentrate, relaxed facial expression).

**Patient/family teaching**

- Avoid tasks that require alertness, motor skills until response to drug is established.
- Be alert to symptoms of orthostatic hypotension; slowly go from lying to standing.
- Report if feeling faint, if experiencing heart palpitations, or if fever or muscle rigidity occurs.
- Report extrapyramidal symptoms (e.g., involuntary muscle movements, tics) immediately.
imatinib
im-at-in-ib

Gleevec

CLASSIFICATION
PHARMACOTHERAPEUTIC: Protein tyrosine kinase inhibitor.
CLINICAL: Antineoplastic.
Do not confuse imatinib with dasatinib, erlotinib, lapatinib, nilotinib, SORAfenib, or SUNItinib.

Uses

Newly diagnosed chronic-phase Philadelphia chromosome positive chronic myeloid leukemia (Ph+ CML) in children and adults. Pts in blast crisis, accelerated phase, or chronic phase Ph+ CML who have already failed interferon therapy. Adults with relapsed or refractory Ph+ acute lymphoblastic leukemia (ALL). Treatment in children with Ph+ ALL. Adults with myelodysplastic/myeloproliferative disease (MDS/MPD) associated with platelet-derived growth factor receptor (PDGFR) gene rearrangements. Adults with aggressive systemic mastocytosis (ASM) without mutation of the D816V c-Kit or unknown mutation status of the c-Kit. Adults with hypereosinophilic syndrome (HES) and/or chronic eosinophilic leukemia (CEL) with positive, negative, or unknown FIP1L1-PDGFR fusion kinase. Adults with dermatofibrosarcoma protuberans (DFSP) that is unresectable, recurrent, and/or metastatic. Pts with malignant gastrointestinal stromal tumors (GIST) that are unresectable and/or metastatic. Prevention of cancer recurrence in pts following surgical removal of GIST. **OFF-LABEL:** Treatment of desmoid tumors (soft tissue sarcoma). Post–stem cell transplant (allogeneic), follow-up treatment in recurrent CML. Treatment of advanced or metastatic melanoma.

Precautions

Contraindications: Hypersensitivity to imatinib. Cautions: Hepatic/renal impairment, thyroidectomy pts, hypothyroidism, gastric surgery pts. Pts in whom fluid accumulation is poorly tolerated (e.g., HF, hypertension, pulmonary disease).
**Action**

Inhibits Bcr-Abl tyrosine kinase, an enzyme created by Philadelphia chromosome abnormality found in pts with chronic myeloid leukemia. **Therapeutic Effect:** Suppresses tumor growth during the three stages of CML: blast crisis, accelerated phase, chronic phase. Induces apoptosis.

**Pharmacokinetics**

Well absorbed after PO administration. Protein binding: 95%. Metabolized in liver. Eliminated in feces (68%), urine (13%). **Half-life:** 18 hrs; metabolite, 40 hrs.

**Lifespan considerations**

**Pregnancy/Lactation:** May cause fetal harm. Breastfeeding not recommended. **Children:** Safety and efficacy not established. **Elderly:** Increased frequency of fluid retention.

**Interactions**

**DRUG:** CYP3A4 inducers (e.g., carBAMazepine, phenytoin, rifAMPin) may decrease concentration. **CYP3A4 inhibitors** (e.g., clarithromycin, erythromycin, ketoconazole) may increase concentration. **Bone marrow depressants** (e.g., alemtuzumab, methotrexate) may increase myelosuppression. **Live virus vaccines** may potentiate virus replication, increase vaccine side effects, decrease pt’s antibody response to vaccine. May reduce effect of **warfarin.** **HERBAL:** St. John’s wort decreases concentration. **FOOD:** Grapefruit products may increase concentration. **LAB VALUES:** May increase serum bilirubin, ALT, AST, creatinine. May decrease platelet count, RBC, WBC count; serum potassium, albumin, calcium.

**Availability (Rx)**

**Tablets:** 100 mg, 400 mg.

**Administration/handling**
PO

- Give with a meal and large glass of water.
- Tablets may be dispersed in water or apple juice (stir until dissolved; give immediately). Do not crush or chew tablets.

**Indications/routes/dosage**

**Ph+ Chronic Myeloid Leukemia (CML) (Chronic Phase)**

**PO:** ADULTS, ELDERLY: 400 mg once daily; may increase to 600 mg/day. **Maximum:** 800 mg. **CHILDREN:** 340 mg/m$^2$/day. **Maximum:** 600 mg.

**Ph+ CML (Accelerated Phase)**

**PO:** ADULTS, ELDERLY: 600 mg once daily. May increase to 800 mg/day in 2 divided doses (400 mg twice daily). **CHILDREN:** 340 mg/m$^2$/day. **Maximum:** 600 mg.

**Ph+ Acute Lymphoblastic Leukemia (ALL)**

**PO:** ADULTS, ELDERLY: 600 mg once daily.

**Gastrointestinal Stromal Tumors (GIST) (Following Complete Resection)**

**PO:** ADULTS, ELDERLY: 400 mg once daily for 3 yrs.

**GIST (Unresectable)**

**PO:** ADULTS, ELDERLY: 400 mg once daily. May increase up to 400 mg twice daily.

**Aggressive Systemic Mastocytosis (ASM) with Eosinophilia**

**PO:** ADULTS, ELDERLY: Initially, 100 mg/day. May increase up to 400 mg/day.

**ASM without Mutation of the D816V C-Kit or Unknown Mutation Status of C-Kit**

**PO:** ADULTS, ELDERLY: 400 mg once daily.
Dermatofibrosarcoma Protuberans (DFSP)
PO: ADULTS, ELDERLY: 400 mg twice daily.

Hypereosinophilic Syndrome (HES)/Chronic Eosinophilic Leukemia (CEL)
PO: ADULTS, ELDERLY: 400 mg once daily.

HES/CEL with Positive or Unknown FIP1L1-PDGFR Fusion Kinase
PO: ADULTS, ELDERLY: Initially, 100 mg/day. May increase up to 400 mg/day.

Myelodysplastic/Myeloproliferative Disease (MDS/MPD)
PO: ADULTS, ELDERLY: 400 mg once daily.

Usual Dosage for Children (2 Yrs and Older)

Ph+ CML (Chronic Phase, Recurrent or Resistant)
PO: 340 mg/m²/day. Maximum: 600 mg/day.

Ph+ CML (Chronic Phase, Newly Diagnosed, Ph+ ALL)
PO: 340 mg/m²/day. Maximum: 600 mg/day.

Dosage with Strong CYP3A4 Inducers
Increase dose by 50% with careful monitoring.

Dosage in Renal Impairment

<tr>
<td>Less than 20 mL/min</td>
<td>100 mg</td>
</tr>
</tbody>
</table>

Dosage in Hepatic Impairment
Mild to moderate impairment: No adjustment. Severe impairment: Reduce dosage by 25%.

Side effects

**Frequent (68%–24%):** Nausea, diarrhea, vomiting, headache, fluid retention, rash, musculoskeletal pain, muscle cramps, arthralgia. **Occasional (23%–10%):** Abdominal pain, cough, myalgia, fatigue, fever, anorexia, dyspepsia, constipation, night sweats, pruritus, dizziness, blurred vision, somnolence. **Rare (less than 10%):** Nasopharyngitis, petechiae, asthenia, epistaxis.

Adverse effects/toxic reactions

Severe fluid retention (pleural effusion, pericardial effusion, pulmonary edema, ascites), hepatotoxicity occur rarely. Neutropenia, thrombocytopenia are expected responses to the therapy. Respiratory toxicity is manifested as dyspnea, pneumonia. Heart damage (left ventricular dysfunction, HF) may occur.

Nursing considerations

**Baseline assessment**

Obtain baseline CBC, serum chemistries, renal function test. Monitor LFT before beginning treatment, monthly thereafter. Offer emotional support.

**Intervention/evaluation**

Assess periorbital area, lower extremities for early evidence of fluid retention. Monitor for unexpected, rapid weight gain. Offer antiemetics to control nausea, vomiting. Monitor daily pattern of bowel activity, stool consistency. Monitor CBC wkly for first mo, biweekly for second mo, periodically thereafter for evidence of neutropenia, thrombocytopenia; assess hepatic function tests for hepatotoxicity. Monitor renal function, serum electrolytes. Duration of neutropenia or thrombocytopenia ranges from 2–4 wks.

**Patient/family teaching**

- Avoid crowds, those with known infection.
- Avoid contact with anyone who recently received live virus vaccine; do not
receive vaccinations.
• Take with food and a full glass of water.
• Avoid grapefruit products.
• Report chest pain, swelling of extremities, weight gain greater than 5 lb, easy bruising/bleeding.
• Avoid tasks that require alertness, motor skills until response to drug is established.

<table>
<thead>
<tr>
<th><strong>imipenem/cilastatin</strong></th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>im-i-pen-em/sye-la-stat-in</strong></td>
</tr>
<tr>
<td><strong>Primaxin</strong></td>
</tr>
</tbody>
</table>

CLASSIFICATION
PHARMACOTHERAPEUTIC: Fixed-combination carbapenem.
CLINICAL: Antibiotic.
Do not confuse imipenem with doripenem, ertapenem, or meropenem, or Primaxin with Premarin or Primacor.

**Uses**

Treatment of susceptible infections due to gram-negative (ESBL E. coli and Klebsiella, Enterobacter spp. PsAs), gram-positive (MSSA, Streptococcus spp.), anaerobic organisms including respiratory tract, skin/skin structure, gynecologic, bone, joint, intra-abdominal, complicated or uncomplicated UTIs; endocarditis (caused by S. aureus); polymicrobial infections; septicemia; serious nosocomial infections. OFF-LABEL: Hepatic abscess, neutropenic fever, melioidosis.

**Precautions**

Contraindications: Hypersensitivity to imipenem/cilastatin. Cautions: CNS disorders (e.g., brain lesions and history of seizures), sensitivity to beta-lactams (e.g., penicillins, cephalosporins), renal impairment, elderly.

**Action**

**Imipenem:** Penetrates bacterial cell membrane, inhibiting cell wall synthesis.
**Cilastatin:** Competitively inhibits the enzyme dehydropeptidase, preventing
renal metabolism of imipenem. **Therapeutic Effect:** Produces bacterial cell death.

### Pharmacokinetics

Readily absorbed after IM administration. Protein binding: **Imipenem:** 20%; **Cilastatin:** 40%. Widely distributed. Metabolized in kidneys. Primarily excreted in urine. Removed by hemodialysis. **Half-life:** 1 hr (increased in renal impairment).

#### Lifespan considerations

**Pregnancy/Lactation:** Crosses placenta. Distributed in cord blood, amniotic fluid, breast milk. **Children:** No precautions noted. **Elderly:** Age-related renal impairment may require dosage adjustment.

### Interactions

**DRUG:** May decrease concentration of valproic acid. Ganciclovir, probenecid may increase concentration. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** May increase serum alkaline phosphatase, BUN, bilirubin, creatinine, LDH, ALT, AST. May decrease Hgb, Hct.

### Availability (Rx)

**Injection, Powder for Reconstitution (Primaxin):** 250 mg, 500 mg.

### Administration/handling

#### IV

**Reconstitution**
- Dilute each 250- or 500-mg vial with 100–250 mL D₅W or 0.9% NaCl. Final concentration not to exceed 5 mg/mL.

**Rate of Administration**
- Give by intermittent IV infusion (piggyback).
- Do not give IV push.
- Infuse over 20–30 min (doses greater than 500 mg over 40–60 min).
- Observe pt during initial 30 min of first-time infusion for possible
hypersensitivity reaction.

Storage
• Solution appears colorless to yellow; discard if solution turns brown.
• IV infusion (piggyback) is stable for 4 hrs at room temperature, 24 hrs if refrigerated.
• Discard if precipitate forms.

- IV incompatibilities
Allopurinol (Aloprim), amphotericin B complex (Abelcet, AmBisome, Amphotec), fluconazole (Diflucan).

- IV Compatibilities
DiltiaZEM (Cardizem), insulin, propofol (Diprivan).

Indications/routes/dosage

Usual Dosage Ranges

**IV: ADULTS, ELDERLY, WEIGHING 70 KG OR MORE:** 250–500 mg q6–8h. **Maximum:** 4 g/day. **60–69 KG:** 250 mg q8h up to 1 g q8h. **50–59 KG:** 125 mg q6h up to 750 mg q8h. **40–49 KG:** 125 mg q6h up to 500 mg q6h. **30–39 KG:** 125 mg q8h up to 500 mg q8h. **CHILDREN OLDER THAN 3 MOS–12 YRS:** 15–25 mg/kg q6h. **Maximum:** 4 g/day. **CHILDREN 1–3 MOS:** 15–25 mg/kg q6h. **CHILDREN 1–4 WKS:** 20–25 mg/kg q8h. **CHILDREN YOUNGER THAN 1 WK:** 20–25 mg/kg q12h.

Dosage in Renal Impairment
Dosage and frequency are modified based on creatinine clearance and severity of infection. (See table.)

Dosage in Hepatic Impairment
Consider reducing dose frequency.

**Side effects**

**Occasional (3%):** Diarrhea, nausea, vomiting. **Rare (1%):** Rash.

**Adverse effects/toxic reactions**

Antibiotic-associated colitis, other superinfections (abdominal cramps, severe watery diarrhea, fever) may result from altered bacterial balance in GI tract. Anaphylactic reactions have been reported.

**Nursing considerations**

**Baseline assessment**

Question for history of allergies, particularly to beta-lactams, penicillins, cephalosporins. Inquire about history of seizures.

**Intervention/evaluation**

**immune globulin IV (IGIV)**

**im-mune glob-u-lin**

Bivigam

Carimune NF

Flebogamma DIF

Gammagard Liquid
Gammagard S/D  
Gammaplex  
Gamunex-C  
Hizentra  
Octagam 5%  
Privigen

CLASSIFICATION
PHARMACOTHERAPEUTIC: Immune globulin, blood product.  
CLINICAL: Immunizing agent.

BLACK BOX ALERT Acute renal impairment characterized by increased serum creatinine, oliguria, acute renal failure, osmotic nephrosis, particularly pts with any degree of renal insufficiency, diabetes mellitus, volume depletion, sepsis, and those older than age 65 yrs. Thrombosis may occur.

Uses

Precautions
Contraindications: Hypersensitivity to immune globulin. Selective IgA deficiency, hyperprolinemia (Hizentra, Privigen), severe thrombocytopenia,
coagulation disorders where IM injections contraindicated. Hypersensitivity to corn (Octagam); infants/neonates for whom sucrose or fructose tolerance has not been established (Gammaplex). **Cautions:** Cardiovascular disease, history of thrombosis, renal impairment.

**Action**

Replacement therapy for primary/secondary immunodeficiencies and IgG antibodies against bacteria, viral antigens; interferes with receptors on cells of reticuloendothelial system for autoimmune cytopenias/idiopathic thrombocytopenia purpura (ITP); increases antibody titer and antigen-antibody reaction potential. **Therapeutic Effect:** Provides passive immunity replacement for immunodeficiencies, increases antibody titer.

**Pharmacokinetics**

Evenly distributed between intravascular and extravascular space. **Half-life:** 21–23 days.

**Lifespan considerations**

- **Pregnancy/Lactation:** Unknown if drug crosses placenta or is distributed in breast milk. **Children/Elderly:** No age-related precautions noted.

**Interactions**

**DRUG:** Live virus vaccines may increase vaccine side effects, potentiate virus replication, decrease pt’s antibody response to vaccine. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** None significant.

**Availability (Rx)**

Injection, Powder for Reconstitution (Carimune NF): 3 g, 6 g, 12 g. (Gammagard S/D): 5 g, 10 g. **Injection, Solution** (Bivigam 10%, Flebogamma DIF 5%, 10%, Gammagard Liquid 10%, Gammaplex 5%, Gamunex-C 10%, Octagam 5%, Privigen 10%).

**Administration/handling**
Monitor vital signs, B/P diligently during and immediately after IV administration (precipitous fall in B/P may indicate anaphylactic reaction). Stop infusion immediately. EPINEPHrine should be readily available.

**Reconstitution**
- Reconstitute only with diluent provided by manufacturer.
- Discard partially used or turbid preparations.

**Rate of Administration**
- Give by infusion only.
- After reconstitution, administer via separate tubing.
- Rate of infusion varies with product used.

**Storage**
- Refer to individual IV preparations for storage requirements, stability after reconstitution.

**IV incompatibilities**
Do not mix with any other medications.

**Indications/routes/dosage**

**Primary Immunodeficiency Syndrome**
**IV: ADULTS, ELDERLY, CHILDREN:** *(Privigen):* 200–800 mg/kg q3–4wks. *(Carimune NF):* 400–800 mg/kg q3–4 wks. *(Flebagamma DIF, Gammagard, Gamunex-C, Octagam):* 300–600 mg/kg/q3–4wks. *(Bivigam, Gammaplex):* 300–800 mg/kg q3–4wks.

**Idiopathic Thrombocytopenic Purpura (ITP)**
**IV: ADULTS, ELDERLY, CHILDREN:** *(Carimune NF):* 400 mg/kg/day for 2–5 days. **Maintenance:** 400–1,000 mg/kg/dose to maintain platelet count or control bleeding. *(Gammagard):* 1,000 mg/kg; up to 3 additional doses may be given on alternate days.

**Kawasaki Disease**
**Note:** Must be used with aspirin.
IV: ADULTS, ELDERLY, CHILDREN: *(Gammagard)*: 1,000 mg/kg as single dose or 400 mg/kg/day for 4 consecutive days. Begin within 7 days of onset of fever. **American Heart Association Guidelines:** 2,000 mg/kg as a single dose given over 10–12 hrs within 10 days of disease onset.

**Chronic Lymphocytic Leukemia (CLL)**

IV: ADULTS, ELDERLY, CHILDREN: *(Gammagard)*: 400 mg/kg/dose q3–4wks.

**Chronic Inflammatory Demyelinating Polyneuropathy**

IV: ADULTS, ELDERLY, CHILDREN: *(Gamunex-C)*: **Loading Dose:** 2 g/kg divided over 2–4 days (consecutive). **Maintenance:** 1g/kg/day q3wks or 500 mg/kg for 2 consecutive days q3wks. **Privigen:** **Loading Dose:** 2 g/kg in divided doses over 2-5 consecutive days. **Maintenance:** 1 g/kg q3wks or 500 mg/kg for 2 consecutive days q3wks.

**Dosage in Renal Impairment**

Caution when giving IV.

**Dosage in Hepatic Impairment**

No dose adjustment.

**Side effects**

**Frequent:** Tachycardia, backache, headache, arthralgia, myalgia. **Occasional:** Fatigue, wheezing, injection site rash/pain, leg cramps, urticaria, bluish color of lips/nailbeds, light-headedness.

**Adverse effects/toxic reactions**

Anaphylactic reactions occur rarely, but incidence increases with repeated injections. EPINEPHrine should be readily available. Overdose may produce chest tightness, chills, diaphoresis, dizziness, facial flushing, nausea, vomiting, fever, hypotension. Hypersensitivity reaction (anxiety, arthralgia, dizziness, flushing, myalgia, palpitations, pruritus) occurs rarely.
Nursing considerations

Baseline assessment
Inquire about exposure history to disease for pt/family as appropriate. Have EPINEPHrine readily available. Pt should be well hydrated prior to administration.

Intervention/evaluation
Control rate of IV infusion carefully; too-rapid infusion increases risk of precipitous fall in B/P, signs of anaphylaxis (facial flushing, chest tightness, chills, fever, nausea, vomiting, diaphoresis). Assess pt closely during infusion, esp. first hr; monitor vital signs continuously. Stop infusion if aforementioned signs noted. For treatment of idiopathic thrombocytopenic purpura (ITP), monitor platelet count.

Patient/family teaching
• Explain rationale for therapy.
• Report sudden weight gain, fluid retention, edema, decreased urine output, shortness of breath.

**indacaterol**
**in-da-ka-ter-ol**
Arcapta Neohaler
Onbrez Breezhaler

FIXED COMBINATION(S)

**Utibron Neohaler:** indacaterol/glycopyrrolate (an anticholinergic): 27.5 mcg/15.6 mcg.
**CLASSIFICATION**
**PHARMACOTHERAPEUTIC:** Long-acting beta$_2$-adrenergic agonist.
**CLINICAL:** Bronchodilator.

■ **BLACK BOX ALERT** ■ Long-acting beta$_2$-adrenergic agonists (LABAs) have an increased risk of asthma-related deaths. Not indicated for
Uses
Long-term maintenance treatment of airflow obstruction in pts with chronic obstructive pulmonary disease (COPD), including chronic bronchitis and emphysema.

Precautions
Not indicated for the treatment of asthma, acute exacerbations of COPD. **Contraindications:** Hypersensitivity to indacaterol. Monotherapy in treatment of asthma. **Cautions:** Cardiovascular disease (coronary insufficiency, arrhythmias, hypertension, history of hypersensitivity to sympathomimetics), seizure disorders, hyperthyroidism, hypokalemia, diabetes. May cause paradoxical bronchospasm, severe asthma.

Action
Stimulates beta\(_2\)-adrenergic receptors in lungs, resulting in relaxation of bronchial smooth muscle. **Therapeutic Effect:** Relieves bronchospasm, reduces airway resistance, improves bronchodilation.

Pharmacokinetics

**Lifespan considerations**
**Pregnancy/Lactation:** Unknown if drug crosses placenta or is distributed in breast milk. **Children:** Safety and efficacy not established. **Elderly:** May be more sensitive to tremor, tachycardia due to age-related increased sympathetic sensitivity.
Interactions

**DRUG:** May decrease effectiveness of beta blockers (e.g., carvedilol, metoprolol). Diuretics (e.g., furosemide, HCTZ), corticosteroids (e.g., dexamethasone, prednisone), xanthine derivatives may increase risk of hypokalemia. Drugs that can prolong QT interval (e.g., erythromycin, quinidine, thioridazine), antiarrhythmics (e.g., amiodarone), MAOIs, tricyclic antidepressants (e.g., amitriptyline, doxepin) may potentiate cardiovascular effects (increased risk of ventricular arrhythmias). Erythromycin, ketoconazole, ritonavir, verapamil may increase serum concentration. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** May decrease serum potassium. May increase serum glucose.

Availability (Rx)

**Powder for Inhalation:** 75 mcg (in blister packs).

Administration/handling

**Inhalation**

- Do not shake or prime.
- Open cap of Neohaler by pulling upward, then open mouthpiece.
- Remove capsule from blister package and place in center of chamber. Firmly close until click is heard.
- Hold inhaler upright and pierce capsule by pressing side buttons once only.
- Instruct pt to exhale completely. Place mouthpiece into mouth, close lips, and inhale quickly and deeply through mouth (this causes capsule to spin, dispensing the drug). A slight whirring noise should occur. If not, this may indicate capsule is stuck. Gently tap inhaler to loosen and reattempt.
- Pt should hold breath as long as possible before exhaling.
- Check capsule to ensure that all the powder is gone. Instruct pt to reinhale if powder remains.

**Storage**

- Store at room temperature.
- Maintain capsules within individual blister pack until time of use.
- Do not store capsules in Neohaler device.
Indications/routes/dosage

Maintenance Therapy and Prevention of COPD
Inhalation: ADULTS, ELDERLY: 75 mcg (1 capsule) once daily via Neohaler inhalation device.

Dosage in Renal/Hepatic Impairment
No dose adjustment.

Side effects
Occasional (7%–5%): Cough, nasopharyngitis, headache. Rare (2%): Oropharyngeal pain, nausea.

Adverse effects/toxic reactions
Peripheral edema, diabetes mellitus, hyperglycemia, sinusitis, URI reported in greater than 2% of pts. Excessive sympathomimetic stimulation, hypokalemia may produce palpitations, arrhythmias, angina pectoris, tachycardia, muscle cramps, weakness. Hyperglycemia symptoms present with increased thirst, polyuria, dry mouth, drowsiness/confusion, blurred vision. Severe shortness of breath may indicate paradoxical bronchospasm, deteriorating COPD. Serious asthma-related events, including death, reported.

Nursing considerations

Baseline assessment

Intervention/evaluation

**Patient/family teaching**

- Follow manufacturer guidelines for proper use of inhaler.
- Increase fluid intake (decreases lung secretion viscosity).
- Rinse mouth with water after inhalation to decrease mouth/throat irritation.
- Avoid excessive use of caffeine derivatives (chocolate, coffee, tea, cola).
- An immediate cough lasting 15 sec may occur after inhaler use.
- Report any fever, productive cough, body aches, difficulty breathing.

<table>
<thead>
<tr>
<th>indapamide</th>
</tr>
</thead>
<tbody>
<tr>
<td>in-dap-a-mide</td>
</tr>
<tr>
<td>Apo-Indapamide</td>
</tr>
<tr>
<td>Lozide</td>
</tr>
</tbody>
</table>

**CLASSIFICATION**

**PHARMACOTHERAPEUTIC:** Thiazide.

**CLINICAL:** Diuretic, antihypertensive.

**Do not confuse indapamide with iopidine.**

**Uses**

Management of mild to moderate hypertension. Treatment of edema associated with HF. **OFF-LABEL:** Calcium nephrolithiasis.

**Precautions**

**Contraindications:** Hypersensitivity to indapamide. Anuria, sulfonamide-derived drugs. **Caution:** History of hypersensitivity to sulfonamides or thiazide diuretics. Severe renal disease, hepatic impairment, history of gout, prediabetes, diabetes, elderly, severe hyponatremia, elevated serum cholesterol.
**Action**

**Diuretic:** Blocks reabsorption of water, sodium, potassium at cortical diluting segment of distal renal tubule. **Antihypertensive:** Reduces plasma, extracellular fluid volume, and peripheral vascular resistance by direct effect on blood vessels. **Therapeutic Effect:** Promotes diuresis, reduces B/P.

**Pharmacokinetics**

Almost completely absorbed following PO administration. Protein binding: 71%–79%. Metabolized in liver. Excreted in urine. **Half-life:** 14–18 hrs.

**Lifespan considerations**

**Pregnancy/Lactation:** Unknown if drug crosses placenta or is distributed in breast milk. **Children:** Safety and efficacy not established. **Elderly:** May be more sensitive to hypotensive, electrolyte effects.

**Interactions**

**DRUG:** May increase risk of lithium toxicity. **HERBAL:** Ephedra, ginseng, licorice, yohimbe may worsen hypertension. **Black cohosh** may increase antihypertensive effect. **FOOD:** None known. **LAB VALUES:** May increase uric acid, plasma renin activity. May decrease protein-bound iodine; serum calcium, potassium, sodium.

**Availability (Rx)**

**Tablets:** 1.25 mg, 2.5 mg.

**Administration/handling**

**PO**

- Give with food, milk if GI upset occurs, preferably with breakfast (may prevent nocturia).

**Indications/routes/dosage**
Edema

**PO: ADULTS:** Initially, 2.5 mg/day, may increase to 5 mg/day after 1 wk.

Hypertension

**PO: ADULTS, ELDERLY:** Initially, 1.25 mg. May increase to 2.5 mg/day after 4 wks or 5 mg/day after additional 4 wks. Usual dose: 1.25–2.5 mg/day.

Dosage in Renal/Hepatic Impairment
Use caution.

Side effects

**Frequent (5% and greater):** Fatigue, paresthesia of extremities, tension, irritability, agitation, headache, dizziness, light-headedness, insomnia, muscle cramps. **Occasional (less than 5%):** Urinary frequency, urticaria, rhinorrhea, flushing, weight loss, orthostatic hypotension, depression, blurred vision, nausea, vomiting, diarrhea, constipation, dry mouth, impotence, rash, pruritus.

Adverse effects/toxic reactions

Vigorous diuresis may lead to profound water and electrolyte depletion, resulting in hypokalemia, hyponatremia, dehydration. Acute hypotensive episodes may occur. Hyperglycemia may be noted during prolonged therapy. Pancreatitis, blood dyscrasias, pulmonary edema, allergic pneumonitis, dermatologic reactions occur rarely. Overdose can lead to lethargy, coma without changes in electrolytes or hydration.

Nursing considerations

**Baseline assessment**

Obtain vital signs, esp. B/P for hypotension, before administration. Assess baseline electrolytes, particularly hypokalemia. Observe for edema; assess skin turgor, mucous membranes for hydration status. Assess muscle strength, mental status. Note skin temperature, moisture. Obtain baseline weight.
**Intervention/evaluation**

Continue to monitor B/P, vital signs, electrolytes, I&O, weight. Note extent of diuresis. Watch for electrolyte disturbances (hypokalemia may result in weakness, tremor, muscle cramps, nausea, vomiting, altered mental status, tachycardia; hyponatremia may result in confusion, thirst, cold/clammy skin).

**Patient/family teaching**

- Expect increased frequency, volume of urination (diminishes with long-term use).
- To reduce hypotensive effect, go slowly from lying to standing.
- Eat foods high in potassium such as whole grains (cereals), legumes, meat, bananas, apricots, orange juice, potatoes (white, sweet), raisins.
- Take early in the day to avoid nocturia.

---

**indomethacin**

in-doe-*meth*-a-sin

Indocin

Novo-Methacin

Tivorbex

CLASSIFICATION

PHARMACOTHERAPEUTIC: NSAID.

CLINICAL: Anti-inflammatory, analgesic.

BLACK BOX ALERT: Increased risk of serious cardiovascular thrombotic events, including myocardial infarction, CVA. Increased risk of severe GI reactions, including ulceration, bleeding, perforation.

Do not confuse Indocin with Imodium, Minocin, or Vicodin.

---

**Uses**

(Indocin): Treatment of active stages of rheumatoid arthritis, osteoarthritis, ankylosing spondylitis, acute gouty arthritis. Relieves acute bursitis, tendonitis.

(Tivorbex): Treatment of mild to moderate acute pain in adults. (IV Form): For closure of hemodynamically significant patent ductus arteriosus of premature
infants. **OFF-LABEL:** Management of preterm labor.

**Precautions**

**Contraindications:** Hypersensitivity to aspirin, indomethacin, other NSAIDs. Perioperative pain in setting of CABG surgery. History of asthma, urticaria, allergic reactions after taking aspirin, other NSAIDs. **Suppositories:** History of proctitis, recent rectal bleeding. **Injection:** In preterm infants with untreated/systemic infection or congenital heart disease where patency of PDA necessary for pulmonary or systemic blood flow; bleeding, thrombocytopenia, coagulation defects, necrotizing enterocolitis, significant renal dysfunction. **Cautions:** Cardiac dysfunction, fluid retention, HF, hypertension, renal/hepatic impairment, epilepsy; concurrent aspirin, steroids, anticoagulant therapy. Treatment of juvenile rheumatoid arthritis in children. History of GI disease (bleeding or ulcers), elderly, debilitated, asthma, depression, Parkinson’s disease.

**Action**

Produces antipyretic, analgesic, anti-inflammatory effects by inhibiting prostaglandin synthesis. **Therapeutic Effect:** Reduces inflammatory response, fever, intensity of pain. Closure of patent ductus arteriosus.

**Pharmacokinetics**

<table>

</table>

Well absorbed from GI tract. Protein binding: 99%. Metabolized in liver. Excreted in urine. **Half-life:** 4.5 hrs.

**Lifespan considerations**

**Pregnancy/Lactation:** Crosses placenta; distributed in breast milk. Avoid use during third trimester. **Children:** Safety and efficacy not established in those younger than 14 yrs. **Elderly:** Increased risk of serious adverse effects; GI bleeding, ulceration.

**Interactions**
DRUG: May decrease effects of antihypertensives (e.g., amLODIPine, lisinopril, valsartan), diuretics (e.g., furosemide). Aspirin, other salicylates may increase risk of GI side effects, bleeding. Bone marrow depressants (e.g., alemtuzumab, methotrexate) may increase risk of hematologic reactions. May increase risk of bleeding with heparin, anticoagulants (e.g., rivaroxaban, warfarin), thrombolytics (e.g., alteplase). May increase concentration, risk of toxicity of lithium. May increase risk of cycloSPORINE, methotrexate toxicity. HERBAL: Cat’s claw, dong quai, evening primrose, feverfew, garlic, ginkgo, ginseng, horse chestnut, red clover may increase antiplatelet activity. FOOD: None known. LAB VALUES: May prolong bleeding time. May alter serum glucose. May increase serum BUN, creatinine, potassium, ALT, AST. May decrease serum sodium, platelet count, leukocytes.

Availability (Rx)

Capsules, Extended-Release: 75 mg.

Administration/handling

IV

Reconstitution
• To 1-mg vial, add 1–2 mL preservative-free Sterile Water for Injection or 0.9% NaCl to provide concentration of 1 mg/mL or 0.5 mg/mL, respectively.
• Do not further dilute.

Rate of Administration
• Administer over 20–30 min.

Storage
• Use IV solution immediately following reconstitution.
• IV solution appears clear; discard if cloudy or precipitate forms.
• Discard unused portion.

PO
• Give after meals or with food, antacids.
• Do not break, crush, or open extended-release capsule. Swallow whole.

**IV incompatibilities**

Amino acid injection, calcium gluconate, DOBUTamine (Dobutrex), DOPamine (Intropin), gentamicin (Garamycin), tobramycin (Nebcin).

**IV Compatibilities**

Insulin, potassium.

**Indications/routes/dosage**

**Moderate to Severe Rheumatoid Arthritis (RA), Osteoarthritis, Ankylosing Spondylitis**

**PO:** ADULTS, ELDERLY *(Immediate-Release):* Initially, 25–50 mg 2–3 times/day; increased by 25–50 mg/wk up to 200 mg/day. *(Extended-Release):* Initially, 75 mg once daily. May increase to 75 mg twice daily. **Maximum:** 150 mg/day. **CHILDREN 2 YRS AND OLDER (Immediate-Release):** 1–2 mg/kg/day in 2–4 divided doses. **Maximum:** 4 mg/kg/day not to exceed 150–200 mg/day. **RECTAL:** ADULTS, ELDERLY, CHILDREN: Initially, 50 mg once daily. Maintenance: 50–200 mg/day in divided doses. **Maximum:** 200 mg/day (daily dose), 100 mg (single dose).

**Acute Gouty Arthritis**

**PO:** RECTAL: ADULTS, ELDERLY *(Immediate-Release):* 50 mg 3 times/day for 3–5 days until pain is tolerable, then rapidly reduce dose to complete cessation of medication.

**Acute Bursitis, Tendonitis**

**PO:** ADULTS, ELDERLY: *(Immediate-Release):* 75–150 mg/day in 3–4 divided doses for 7–14 days. *(Extended-Release):* 75–150 mg/day in 1–2 doses/day for 7–14 days. **RECTAL:** ADULTS, ELDERLY, CHILDREN: 50 mg up to 3 times/day.

**Acute Pain**
PO: ADULTS, ELDERLY: *(Tivorbex)*: 20 mg 3 times/day or 40 mg 2–3 times/day.

**Patient Ductus Arteriosus**

**IV: NEONATES:** Initially, 0.2 mg/kg. Subsequent doses are based on age, as follows: NEONATES OLDER THAN 7 DAYS: 0.25 mg/kg for 2nd and 3rd doses. NEONATES 2–7 DAYS: 0.2 mg/kg for 2nd and 3rd doses. NEONATES LESS THAN 48 HRS: 0.1 mg/kg for 2nd and 3rd doses. In general, dosing interval is 12 hrs if urine output is greater than 1 mL/kg/hr after prior dose, 24 hrs if urine output is less than 1 mL/kg/hr but greater than 0.6 mL/kg/hr. Dose is held if urine output is less than 0.6 mL/kg/hr or if neonate is anuric.

**Dosage in Renal Impairment**

**Mild to moderate impairment:** No dose adjustment. **Severe impairment:** Not recommended.

**Dosage in Hepatic Impairment**

Use caution.

**Side effects**

**Frequent (11%–3%):** Headache, nausea, vomiting, dyspepsia, dizziness. **Occasional (less than 3%):** Depression, tinnitus, diaphoresis, drowsiness, constipation, diarrhea. **Patent ductus arteriosus:** Bleeding abnormalities. **Rare:** Hypertension, confusion, urticaria, pruritus, rash, blurred vision.

**Adverse effects/toxic reactions**

Paralytic ileus, ulceration of esophagus, stomach, duodenum, small intestine may occur. Pts with renal impairment may develop hyperkalemia with worsening of renal impairment. May aggravate depression or other psychiatric disturbances, epilepsy, parkinsonism. Nephrotoxicity (dysuria, hematuria, proteinuria, nephrotic syndrome) occurs rarely. Metabolic acidosis/alkalosis, bradycardia occur rarely in neonates with patent ductus arteriosus.

**Nursing considerations**
**Baseline assessment**
Assess onset, type, location, duration of pain, fever, inflammation. Inspect appearance of affected joints for immobility, deformities, skin condition. Question medical history as listed in Precautions.

**Intervention/evaluation**
Monitor serum BUN, creatinine, potassium, LFT. Monitor for evidence of nausea, dyspepsia. Assist with ambulation if dizziness occurs. Evaluate for therapeutic response: relief of pain, stiffness, swelling; increased joint mobility; reduced joint tenderness; improved grip strength. Observe for weight gain, edema, bleeding, bruising. In neonates, also monitor heart rate, heart sounds for murmur, B/P, urine output, EKG, serum sodium, glucose, platelets.

**Patient/family teaching**
- Avoid aspirin, alcohol during therapy (increases risk of GI bleeding).
- If GI upset occurs, take with food, milk.
- Avoid tasks that require alertness, motor skills until response to drug is established.
- Report ringing in ears, persistent stomach pain, unusual bruising/bleeding.

<table>
<thead>
<tr>
<th>inFLIXimab</th>
</tr>
</thead>
<tbody>
<tr>
<td>in-flix-i-mab</td>
</tr>
</tbody>
</table>

**Remicade**

**CLASSIFICATION**
- PHARMACOTHERAPEUTIC: Tumor necrosis factor (TNF) blocking agent. Monoclonal antibody.
- CLINICAL: Antirheumatic, disease-modifying, GI, immunosuppressant agent.

- **BLACK BOX ALERT** - Risk of severe/fatal opportunistic infections (tuberculosis, sepsis, fungal), reactivation of latent infections. Rare cases of very aggressive, usually fatal hepatosplenic T-cell lymphoma reported in adolescents, young adults with Crohn’s disease.

Do not confuse inFLIXimab with riTUXimab, or Remicade with Reminyl.
Uses

In combination with methotrexate, reduces signs/symptoms, inhibits progression of structural damage, improves physical function in moderate to severe active rheumatoid arthritis (RA), psoriatic arthritis. Reduces signs/symptoms, induces and maintains remission in moderate to severe active Crohn’s disease. Reduces number of draining enterocutaneous/rectovaginal fistulas, maintains fistula closure in fistulizing Crohn’s disease. Reduces sign/symptoms of active ankylosing spondylitis. Treatment of chronic severe plaque psoriasis in pts who are candidates for systemic therapy. Reduces sign/symptoms, induces and maintains clinical remission and mucosal healing, eliminates corticosteroid use in moderate to severe active ulcerative colitis.

Precautions

Contraindications: Hypersensitivity to inFLIXimab. Moderate to severe HF (doses greater than 5 mg/kg should be avoided). Sensitivity to murine proteins, sepsis, serious active infection. Cautions: Hematologic abnormalities, history of COPD, preexisting or recent-onset CNS demyelinating disorders, seizures, mild HF, history of recurrent infections, conditions predisposing pt to infections (e.g., diabetes), pts exposed to tuberculosis, elderly pts, chronic hepatitis B virus infection.

Action

Binds to tumor necrosis factor (TNF), inhibiting functional activity of TNF (induction of proinflammatory cytokines, enhanced leukocytic migration, activation of neutrophils/eosinophils). Therapeutic Effect: Prevents disease and allows diseased joints to heal.

Pharmacokinetics

Absorbed into GI tissue; primarily distributed in vascular compartment. Half-life: 8–9.5 days.

Lifespan considerations

Pregnancy/Lactation: Unknown if distributed in breast milk. Children: Safety
and efficacy not established. **Elderly:** Use cautiously due to higher rate of infection.

**Interactions**

**DRUG:** Anakinra, abatacept may increase risk of infection. **Immunosuppressants** may reduce frequency of infusion reactions, antibodies to inFLIXimab. **Live virus vaccines** may decrease immune response (do not give concurrently). **HERBAL:** Echinacea may decrease effects. **FOOD:** None known. **LAB VALUES:** May increase serum alkaline phosphatase, ALT, AST, bilirubin.

**Availability (Rx)**

**Injection, Powder for Reconstitution:** 100 mg.

**Administration/handling**

**IV**

**Reconstitution**
- Reconstitute each vial with 10 mL Sterile Water for Injection, using 21-gauge or smaller needle. Direct stream of Sterile Water for Injection to glass wall of vial.
- Swirl vial gently to dissolve contents (do not shake).
- Allow solution to stand for 5 min and inject into 250-mL bag 0.9% NaCl; gently mix. Concentration should range between 0.4 and 4 mg/mL.
- Begin infusion within 3 hrs after reconstitution.

**Rate of Administration**
- Administer IV infusion over at least 2 hrs using a low protein-binding filter.

**Storage**
- Refrigerate vials.
- Solution should appear colorless to light yellow and opalescent; do not use if discolored or if particulate forms.

**IV incompatibilities**

Do not infuse in same IV line with other agents.
Indications/routes/dosage

- Premedicate with antihistamines, acetaminophen, steroids to prevent/manage infusion reactions.

**Rheumatoid Arthritis (RA)**

**IV Infusion:** ADULTS, ELDERLY: (in combination with methotrexate): 3 mg/kg followed by additional doses at 2 and 6 wks after first infusion, then q8wks thereafter. Range: 3–10 mg/kg at 4- to 8-wk intervals.

**Crohn’s Disease**

**IV Infusion:** ADULTS, ELDERLY, CHILDREN 6 YRS AND OLDER: 5 mg/kg followed by additional doses at 2 and 6 wks after first infusion, then q8wks thereafter. For adults who respond then lose response, consideration may be given to treatment with 10 mg/kg.

**Ankylosing Spondylitis**

**IV Infusion:** ADULTS, ELDERLY: 5 mg/kg followed by additional doses at 2 and 6 wks after first infusion, then q6wks thereafter.

**Psoriatic Arthritis**

**IV Infusion:** ADULTS, ELDERLY: 5 mg/kg followed by additional doses at 2 and 6 wks after first infusion, then q8wks thereafter. May be used with or without methotrexate.

**Plaque Psoriasis**

**IV Infusion:** ADULTS, ELDERLY: 5 mg/kg followed by additional doses at 2 and 6 wks after first infusion, then q8wks thereafter.

**Ulcerative Colitis**

**IV Infusion:** ADULTS, ELDERLY, CHILDREN 6 YRS AND OLDER: 5 mg/kg followed by additional doses at 2 and 6 wks after first infusion, then q8wks thereafter.

**Dosage in Renal/Hepatic Impairment**
No dose adjustment.

**Side effects**

**Frequent (22%–10%):** Headache, nausea, fatigue, fever. **Occasional (9%–5%):** Fever/chills during infusion, pharyngitis, vomiting, pain, dizziness, bronchitis, rash, rhinitis, cough, pruritus, sinusitis, myalgia, back pain. **Rare (4%–1%):** Hypotension or hypertension, paresthesia, anxiety, depression, insomnia, diarrhea, UTI.

**Adverse effects/toxic reactions**

Serious infections, including sepsis, occur rarely. Potential for hypersensitivity reaction, lupus-like syndrome, severe hepatic reaction, HF.

**Nursing considerations**

**Baseline assessment**

Evaluate baseline hydration status (skin turgor urinary status). Question history of CNS disorders, COPD, HF. Screen for active infection. Pts should be evaluated for active tuberculosis and tested for latent infection prior to initiating treatment and periodically during therapy. Induration of 5 mm or greater with tuberculin skin test should be considered a positive test result when assessing if treatment for latent tuberculosis is necessary. Verify that pt has not received live vaccines prior to initiation.

**Intervention/evaluation**

Monitor urinalysis, erythrocyte sedimentation rate (ESR), B/P. Monitor for signs of infection. Monitor daily pattern of bowel activity, stool consistency. **Crohn’s disease:** Monitor C-reactive protein, frequency of stools. Assess for abdominal pain. **Rheumatoid arthritis (RA):** Monitor C-reactive protein. Assess for decreased pain, swollen joints, stiffness.

**Patient/family teaching**

- Report persistent fever, cough, abdominal pain, swelling of ankles/feet.
- Treatment may depress your immune system and reduce your ability to fight
infection.
• Report symptoms of infection such as body aches, chills, cough, fatigue, fever. Avoid those with active infection.
• Do not receive live vaccines.
• Expect frequent tuberculosis screening.
• Report travel plans to possible endemic areas.

**insulin**

**in-su-lin**

**Rapid-acting:** (Afrezza): **INHALATION POWDER, INSULIN ASPART:** (Fiasp, Novolog), **INSULIN GLULISINE:** (Apidra), **INSULIN LISPRO:** (Humalog) **Short-acting:** **REGULAR INSULIN:** (Humulin R, Novolin R) **Intermediate-acting:** **NPH:** (Humulin N, Novolin N) **Long-acting:** **INSULIN DEGLUDEC:** (Tresiba), **INSULIN DETEMIR:** (Levemir), **INSULIN GLARGINE:** (Basaglar, Lantus, Toujeo)

**HumaLOG Mix 75/25:** lispro suspension 75% and lispro solution 25%.
**HumuLIN Mix 50/50:** NPH 50% and regular 50%. **HumuLIN 70/30,** **NovoLIN 70/30:** NPH 70% and rapid-acting regular 30%. **NovoLOG Mix 70/30:** aspart suspension 70% and aspart solution 30%. **Ryzodeg 70/30:** degludec suspension 70% and aspart solution 30%. **Soliqua 100/33:** glargine 100 units/mL and lixisenatide (a GLP-1 receptor agonist) 33 mcg/mL. **Xultophy 100/3.6:** degludec 100 units/mL and liraglutide (a GLP-1 receptor agonist) 3.6 mg/mL.

**CLASSIFICATION**

**PHARMACOTHERAPEUTIC:** Exogenous insulin.
**CLINICAL:** Antidiabetic.

■ **BLACK BOX ALERT** ■ (Afrezza): Acute bronchospasms reported in pts with asthma and COPD.

**Do not confuse NovoLOG with HumaLOG or NovoLIN.**

**Uses**

Treatment of type 1 diabetes (insulin dependent) and type 2 diabetes (non–
insulin dependent) to improve glycemic control. **OFF-LABEL:** **Insulin aspart,** **insulin lispro,** **insulin regular:** Gestational diabetes, mild to moderate diabetic ketoacidosis, mild to moderate hyperosmolar hyperglycemic state. **Insulin NPH:** Gestational diabetes.

**Precautions**

**Contraindications:** Hypersensitivity to insulin, use during episodes of hypoglycemia. **Afrezza:** Chronic lung disease. **Cautions:** Pts at risk for hypokalemia; renal/hepatic impairment, elderly. **Afrezza:** Must be used with a long-acting insulin in type 1 diabetes. Not recommended for use in diabetic ketoacidosis or in smokers. Pts with active lung cancer, history of lung cancer or at risk for lung cancer.

**Action**

Acts via specific receptor to regulate metabolism of carbohydrates, protein, and fats. Acts on liver, skeletal muscle, and adipose tissue. **Liver:** Stimulates hepatic glycogen synthesis, synthesis of fatty acids. **Muscle:** Increases protein, glycogen synthesis. **Adipose tissue:** Stimulates lipoproteins to provide free fatty acids, triglyceride synthesis. **Therapeutic Effect:** Controls serum glucose levels.

**Pharmacokinetics**

**Rapid-Acting**

**Lifespan considerations**

**Pregnancy/Lactation:** Insulin is the drug of choice for diabetes in pregnancy; close medical supervision is needed. Following delivery, insulin needs may drop for 24–72 hrs, then rise to pre-pregnancy levels. Not distributed in breast milk; lactation may decrease insulin requirements. **Children:** No age-related precautions noted. **Elderly:** Decreased vision, fine motor tremors may lead to inaccurate self-dosing.

**Interactions**

**DRUG:** Alcohol may increase risk of hypoglycemia. **Beta blockers** (e.g., *carvedilol, metoprolol*) may alter effects; may mask signs, prolong periods of hypoglycemia. **Glucocorticoids, thiazide diuretics** may increase serum glucose. **HERBAL:** Garlic, ginger, ginseng may increase risk of hypoglycemia. **FOOD:** None known. **LAB VALUES:** May decrease serum magnesium, phosphate, potassium.

**Availability (Rx)**

**Rapid-Acting**
(Afrezza) Inhalation Powder: 4 units, 8 units, 12 units as single-use inhalation cartridges. Aspart (NovoLOG): 100 units/mL vial, 3-mL cartridge, 3-mL Flex-Pen. Glulisine (Apidra): 100 units/mL vial, 3-mL cartridge. Lispro (HumaLOG): 100 units/mL vial, 3-mL cartridge, 3-mL pen.

Short-Acting
Regular (HumuLIN R): 100 units/mL vial, U-500 Kwik Pen. Regular (NovoLIN R): 100 units/mL vial, 3-mL cartridge, 3-mL Innolet prefilled syringe.

Intermediate-Acting
NPH (HumuLIN N): 100 units/mL vial, 3-mL pen. NPH (NovoLIN N): 100 units/mL vial, 3-mL cartridge, 3-mL Innolet prefilled syringe.

Long-Acting
Detemir (Levemir): 100 units/mL vial, 3-mL Flex-Pen. Glargine (Lantus): 100 units/mL vial, 3-mL cartridge.

Intermediate- and Short-Acting Mixtures
HumuLIN 50/50, HumuLIN 70/30, HumaLOG Mix 75/25, HumaLOG Mix 50/50, NovoLIN 70/30, NovoLOG Mix 70/30.

Administration/handling

IV
Regular and Insulin Glulisine (Apidra)
• Use only if solution is clear.
• May give undiluted.

Rapid-Acting
Afrezza
• Administer using a single inhalation/cartridge. Give at beginning of a meal.
Aspart (NovoLOG)
• May give subcutaneous, IV infusion.
• Can mix with NPH (draw aspart into syringe first; inject immediately after
mixing).
• After first use, stable at room temperature for 28 days.
• Administer 5–10 min before meals.

Glulisine (Apidra)
• May mix with NPH (draw glulisine into syringe first; inject immediately after mixing).
• After first use, stable at room temperature for 28 days.
• Administer 15 min before or within 20 min after starting a meal.

Lispro (HumaLOG)
• For subcutaneous use only.
• May mix with NPH. Stable for 28 days at room temperature; syringe is stable for 14 days if refrigerated.
• After first use, stable at room temperature for 28 days.
• Administer 15 min before or immediately after meals.

Short-Acting

Regular (HumuLIN R, NovoLIN R)
• May give subcutaneous, IM, IV.
• May mix with NPH for immediate use or for storage for future use. Stable for 1 mo at room temperature, 3 mos if refrigerated.
• Can mix with Sterile Water for Injection or 0.9% NaCl.
• After first use, stable at room temperature for 28 days.
• Administer 30 min before meals.

Intermediate-Acting

NPH (HumuLIN N, NovoLIN N)
• For subcutaneous use only.
• May mix with aspart (NovoLOG) or lispro (HumaLOG). Draw aspart or lispro first and use immediately.
• May mix with regular (HumuLIN R, NovoLIN R) insulin. Draw regular insulin first, use immediately or may store for future use (up to 28 days).
• After first use, stable at room temperature for 28 days.
• Administer 15 min before meals when mixed with aspart or lispro; 30 min before meals when mixed with regular insulin.

Long-Acting
**Degludec (Tresiba)**
- For subcutaneous use only.
- Do not mix with other insulins.
- After first use, stable at room temperature for 56 days.
- May take once daily any time of day.

**Detemir (Levemir)**
- For subcutaneous use only.
- Do not mix with other insulins.
- After first use, stable at room temperature for 42 days.
- Evening dose given at dinner or at bedtime. Twice-daily regimens can be given 12 hrs after morning dose.

**Glargine (Lantus, Toujeo)**
- For subcutaneous use only.
- Do not mix with other insulins.
- After first use, stable at room temperature for 28 days.
- Administer once daily at same time. Meal timing is not applicable.

**Subcutaneous**
- Check serum glucose concentration before administration; dosage highly individualized.
- Subcutaneous injections may be given in thigh, abdomen, upper arm, buttocks, upper back if there is adequate adipose tissue.
- Rotation of injection sites is essential; maintain careful record.
- Prefilled syringes should be stored in vertical or oblique position to avoid plugging; plunger should be pulled back slightly and syringe rocked to remix solution before injection.

**IV incompatibilities**
DiltiaZEM (Cardizem), DOPamine (Intropin), nafcillin (Nafcil).

**IV Compatibilities**
Amiodarone (Cordarone), ampicillin/sulbactam (Unasyn), ceFAZolin (Ancef), digoxin (Lanoxin), DOBUTamine (Dobutrex), famotidine (Pepcid), gentamicin, heparin, magnesium sulfate, metoclopramide (Reglan), midazolam (Versed), milrinone (Primacor), morphine, nitroglycerin, potassium chloride, propofol
(Diprivan), vancomycin (Vancocin).
Indications/routes/dosage

Note: Insulin requirements vary dramatically among pts, requiring dosage adjustment.

**Type 1 Diabetes:** Multiple daily injections, guided by glucose monitoring or continuous subcutaneous insulin infusions, is standard of care.

**Usual initial dose:** 0.2-0.6 unit/kg/day in divided doses. **Usual maintenance:** 0.5–1.2 units/kg/day in divided doses.

**Type 2 Diabetes:** General goal is to achieve Hgb A1c less than 7% using safe medication titration. Dual therapy (metformin and a second antihyperglycemic agent) is recommended in pts who fail to achieve glycemic goals after 3 mos with lifestyle interventions and metformin monotherapy.

**Afrezza:** Dosage based on metabolic needs, blood glucose results, glycemic goal control.

### Dosage in Renal Impairment

<table>
<thead>
<tr>
<th>Creatinine Clearance</th>
<th>Dose</th>
</tr>
</thead>
<tbody>
<tr>
<td>10–50 mL/min</td>
<td>75% normal dose</td>
</tr>
<tr>
<td>Less than 10 mL/min</td>
<td>25–50% normal dose</td>
</tr>
</tbody>
</table>

### Dosage in Hepatic Impairment

Insulin requirement may be reduced.

### Side effects

**Occasional:** Localized redness, swelling, itching (due to improper insulin injection technique), allergy to insulin cleansing solution. **Infrequent:** Somogyi effect (rebound hyperglycemia) with chronically excessive insulin dosages. Systemic allergic reaction (rash, angioedema, anaphylaxis), lipodystrophy (depression at injection site due to breakdown of adipose tissue), lipohypertrophy (accumulation of subcutaneous tissue at injection site due to inadequate site rotation). **Rare:** Insulin resistance.

### Adverse effects/toxic reactions
Severe hypoglycemia (due to hyperinsulinism) may occur with insulin overdose, decrease/delay of food intake, excessive exercise, pts with brittle diabetes. Diabetic ketoacidosis may result from stress, illness, omission of insulin dose, long-term poor insulin control.

**Nursing considerations**

**Baseline assessment**
Obtain serum glucose level, Hgb A1c. Discuss lifestyle to determine extent of learning, emotional needs. If given IV, obtain serum chemistries (esp. serum potassium).

**Intervention/evaluation**
Assess for hypoglycemia (refer to pharmacokinetics table for peak times and duration): cool, wet skin, tremors, dizziness, headache, anxiety, tachycardia, numbness in mouth, hunger, diplopia. Assess sleeping pt for restlessness, diaphoresis. Check for hyperglycemia: polyuria (excessive urine output), polyphagia (excessive food intake), polydipsia (excessive thirst), nausea/vomiting, dim vision, fatigue, deep and rapid breathing (Kussmaul respirations). Be alert to conditions altering glucose requirements: fever, trauma, increased activity/stress, surgical procedure.

**Patient/family teaching**
- Instruct on proper technique for drug administration, testing of glucose, signs/symptoms of hypoglycemia and hyperglycemia.
- Diet and exercise are essential parts of treatment; do not skip/delay meals.
- Carry candy, sugar packets, other sugar supplements for immediate response to hypoglycemia.
- Wear or carry medical alert identification.
- Check with physician when insulin demands are altered (e.g., fever, infection, trauma, stress, heavy physical activity).
- Do not take other medication without consulting physician.
- Weight control, exercise, hygiene (including foot care), not smoking are integral parts of therapy.
- Protect skin, limit sun exposure.
- Inform dentist, physician, surgeon of medication before any treatment is given.
**interferon alfa-2b**
in-ter-feer-on
Intron-A

**Fixed-Combination(s)**
**Rebetron:** interferon alfa-2b/ribavirin (an antiviral): 3 million units/200 mg.

**CLASSIFICATION**
PHARMACOTHERAPEUTIC: Biologic response modifier, immunomodulator.
CLINICAL: Antineoplastic.

■ **BLACK BOX ALERT** ■ May cause or aggravate fatal or life-threatening autoimmune disorders, ischemia, neuropsychiatric symptoms (profound depression, suicidal thoughts/behaviors), infectious disorders.

Do not confuse interferon alfa-2b with interferon alfa-2a, interferon alfa-n3, or peginterferon alfa-2b, or Intron with Peg-Intron.

**Uses**
Treatment of hairy cell leukemia, condylomata acuminata (genital, venereal warts), malignant melanoma, AIDS-related Kaposi’s sarcoma, chronic hepatitis C virus infection (including children 3 yrs of age and older), chronic hepatitis B virus infection (including children 1 yr and older), follicular non-Hodgkin’s lymphoma. **OFF-LABEL:** Treatment of bladder, cervical, renal carcinoma; chronic myelocytic leukemia; laryngeal papillomatosis; multiple myeloma; cutaneous T-cell lymphoma; mycosis fungoides; West Nile virus.

**Precautions**
**Contraindications:** Hypersensitivity to interferon alfa-2b. Decompensated hepatic disease, autoimmune hepatitis. **In combination with ribavirin:** Women who are pregnant, males with pregnant partners, pts with hemoglobinemias (e.g., sickle cell anemia), CrCl less than 50 mL/min). **Cautions:** Renal/hepatic impairment, seizure disorder, compromised CNS function, cardiac diseases, myelosuppression, concurrent use of medications causing myelosuppression,
pulmonary impairment, multiple sclerosis, diabetes, thyroid disease, coagulopathy, hypertension, preexisting eye disorders, history of psychiatric disorders. History of autoimmune disorders, MI, arrhythmias, cardiac abnormalities.

**Action**

Inhibits viral replication in virus-infected cells, suppresses cell proliferation, augments specific cytotoxicity of lymphocytes. **Therapeutic Effect:** Prevents rapid growth of malignant cells; inhibits hepatitis virus.

**Pharmacokinetics**

Well absorbed after IM, subcutaneous administration. Undergoes proteolytic degradation during reabsorption in kidneys. **Half-life:** 2–3 hrs.

**Lifespan considerations**

**Pregnancy/Lactation:** If possible, avoid use during pregnancy. Breastfeeding not recommended. **Children:** Safety and efficacy not established. **Elderly:** Neurotoxicity, cardiotoxicity may occur more frequently. Age-related renal impairment may require dosage adjustment.

**Interactions**

**DRUG:** Bone marrow depressants (e.g., alemtuzumab, methotrexate) may increase myelosuppression. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** May increase PT, aPTT, LDH, serum alkaline phosphatase, ALT, AST. May decrease Hgb, Hct, leukocyte, platelet counts.

**Availability (Rx)**

**Injection, Powder for Reconstitution:** 10 million units, 18 million units, 50 million units.

**Injection, Solution:** 6 million units/mL, 10 million units/mL.

**Administration/handling**
**IV**

**Reconstitution**
- Prepare immediately before use.
- Reconstitute with diluent provided by manufacturer.
- Withdraw desired dose and further dilute with 100 mL 0.9% NaCl to provide final concentration of at least 10 million international units/100 mL.

**Rate of Administration**
- Administer over 20 min.

**Storage**
- Refrigerate unopened vials.
- Following reconstitution, stable for 24 hrs if refrigerated.

**IM, Subcutaneous**

**IM**
- Rotate sites. Preferred sites are anterior thigh, deltoid, and superolateral buttock. Administer in evening (if possible).

**SQ**
- Reconstitute with recommended amount of Sterile Water for Injection. Agitate gently; do not shake. Rotate sites. Preferred sites are anterior thigh, abdomen (except around navel), outer upper arm.

**IV incompatibilities**

D₅W. Do not mix with other medications via Y-site administration.

**IV Compatibilities**

0.9% NaCl, lactated Ringer’s.

**Indications/routes/dosage**

**Hairy Cell Leukemia**

**IM, SQ: ADULTS:** 2 million units/m² 3 times/wk for up to 2–6 mos. May continue treatment for sustained response. If severe adverse reactions occur, modify dose or temporarily discontinue drug. Discontinue for disease progression or failure to respond after 6 months.
**Condylomata Acuminata**

**Intralesional:** **ADULTS:** 1 million units/lesion 3 times/wk for 3 wks. May administer a second course at 12–16 wks. Use only 10 million–unit vial, and reconstitute with no more than 1 mL diluent. **Maximum:** 5 lesions per treatment.

**AIDS-Related Kaposi’s Sarcoma**

**IM, SQ:** **ADULTS:** 30 million units/m² 3 times/wk. Use only 50 million–unit vials. Continue until disease progression or maximal response achieved after 16 wks. If severe adverse reactions occur, modify dose or temporarily discontinue drug.

**Chronic Hepatitis C Virus Infection**

**IM, SQ:** **ADULTS:** 3 million units 3 times/wk for up to 6 mos. For pts who tolerate therapy and whose ALT level normalizes within 16 wks, therapy may be extended for up to 18–24 mos. May be used in combination with ribavirin. **CHILDREN, 3–17 YRS (WITH HIV CO-INFECTION):** 3–5 million units/m² 3 times/wk with ribavirin for 48 wks.

**Chronic Hepatitis B Virus Infection**

**IM, SQ:** **ADULTS:** 30–35 million units wkly, either as 5 million units/day or 10 million units 3 times/wk for 16 wks.

**SQ:** **CHILDREN 1–17 YRS:** 3 million units/m² 3 times/wk for 1 wk, then 6 million units/m² 3 times/wk for 16–24 wks. **Maximum:** 10 million units 3 times/wk.

**Malignant Melanoma**

**IV:** **ADULTS:** Initially, 20 million units/m² 5 times/wk for 4 wks. **Maintenance:** 10 million units subcutaneously 3 times/wk for 48 wks.

**Follicular Non-Hodgkin’s Lymphoma**

**SQ:** **ADULTS:** 5 million units 3 times/wk for up to 18 mos.

**Dosage in Renal Impairment**

Do not use when combined with ribavirin.
Dosage in Hepatic Impairment
No dose adjustment (see Contraindications).

Side effects

Frequent: Flu-like symptoms (fever, fatigue, headache, myalgia, anorexia, chills), rash (hairy cell leukemia, Kaposi’s sarcoma only). Pts with Kaposi’s sarcoma: All previously mentioned side effects plus depression, dyspepsia, dry mouth or thirst, alopecia, rigors. Occasional: Dizziness, pruritus, dry skin, dermatitis, altered taste. Rare: Confusion, leg cramps, back pain, gingivitis, flushing, tremor, anxiety, eye pain.

Adverse effects/toxic reactions
Hypersensitivity reactions occur rarely. Severe flu-like symptoms appear dose-related.

Nursing considerations

Baseline assessment
CBC, blood chemistries, urinalysis, renal function, LFT should be performed before initial therapy and routinely thereafter.

Intervention/evaluation
Offer emotional support. Monitor all levels of clinical function (numerous side effects). Encourage PO intake, particularly during early therapy. Monitor for worsening depression, suicidal ideation, associated behaviors.

Patient/family teaching
• Clinical response occurs in 1–3 mos.
• Flu-like symptoms tend to diminish with continued therapy.
• Some symptoms may be alleviated or minimized by bedtime doses.
• Do not have immunizations without physician’s approval (drug lowers resistance).
• Avoid contact with those who have recently received live virus vaccine.
• Avoid tasks that require alertness, motor skills until response to drug is established.
• Sips of tepid water may relieve dry mouth.
• Report depression, thoughts of suicide, unusual behavior.

**interferon beta-1a**

*in-ter-feer-on*

**Avonex**

**Rebif**

**CLASSIFICATION**

**PHARMACOTHERAPEUTIC**: Biologic response modifier.

**CLINICAL**: Multiple sclerosis agent.

**Do not confuse Avonex with Avelox, or interferon beta-1a with interferon beta-1b.**

**Uses**

Treatment of relapsing multiple sclerosis to slow progression of physical disability, decrease frequency of clinical exacerbations.

**Precautions**

**Contraindications**: Hypersensitivity to natural or recombinant interferon, human albumin (only for albumin-containing products). **Cautions**: Depression, severe psychiatric disorders, hepatic impairment, increased serum ALT at baseline, alcohol abuse, cardiovascular disease, seizure disorders, myelosuppression.

**Action**

Alters expression and response to surface antigens and may enhance immune cell activity. **Therapeutic Effect**: Slows progression of multiple sclerosis.

**Pharmacokinetics**

Peak serum levels attained 3–15 hrs after IM administration. Biologic markers increase within 12 hrs and remain elevated for 4 days. **Half-life**: 10 hrs
(Avonex); 69 hrs (Rebif).

Lifespan considerations

Interactions

DRUG: Alcohol, hepatotoxic drugs (e.g., acetaminophen, simvastatin) may increase risk of hepatic injury. HERBAL: None significant. FOOD: None known. LAB VALUES: May increase serum glucose, BUN, alkaline phosphatase, bilirubin, calcium, ALT, AST. May decrease Hgb, neutrophil, platelet, WBC.

Availability (Rx)

Injection, Powder for Reconstitution (Avonex): 30 mcg. Injection Solution (Prefilled Syringe): 22 mcg/0.5 mL (Rebif), 30 mcg/0.5 mL (Avonex Prefilled Syringe), 44 mcg/0.5 mL (Rebif). Titration Pack (Prefilled Syringe [Rebif]): 8.8 mcg/0.2 mL, 22 mcg/0.5 mL.

Administration/handling

IM (Avonex) Syringe

• Refrigerate syringe.
• Allow to warm to room temperature before use.
• May store up to 7 days at room temperature.

IM (Avonex) Vial

• Refrigerate vials (may store at room temperature up to 30 days).
• Following reconstitution, may refrigerate again but use within 6 hrs if refrigerated.
• Reconstitute 30-mcg MicroPin (6.6 million international units) vial with 1.1 mL diluent (supplied by manufacturer).
• Gently swirl to dissolve medication; do not shake.
• Discard if discolored or particulate forms.
• Discard unused portion (contains no preservative).

**Subcutaneous (Rebif)**
• Refrigerate. May store at room temperature up to 30 days. Avoid heat, light.
• Administer at same time of day 3 days each wk. Separate doses by at least 48 hrs.

**Indications/routes/dosage**

**Relapsing Multiple Sclerosis**

**IM (Avonex): ADULTS:** 30 mcg once wkly.

**SQ (Rebif): ADULTS:** *(Target dose 44 mcg 3 times/wk):* Initially, 8.8 mcg 3 times/wk for 2 wks, then 22 mcg 3 times/wk for 2 wks, then 44 mcg 3 times/wk thereafter. *(Target dose 22 mcg 3 times/wk):* Initially, 4.4 mcg 3 times/wk for 2 wks, then 11 mcg 3 times/wk for 2 wks, then 22 mcg 3 times/wk thereafter.

**Dosage in Renal Impairment**
No dose adjustment.

**Dosage in Hepatic Impairment (Rebif)**
Use with caution in pts with history of active hepatic disease or ALT more than 2.5 times upper limit of normal (ULN).

**Side effects**

**Frequent (67%–11%):** Headache, flu-like symptoms, myalgia, upper respiratory tract infection, depression with suicidal ideation, generalized pain, asthenia, chills, sinusitis, infection. **Occasional (9%–4%):** Abdominal pain, arthralgia, chest pain, dyspnea, malaise, syncope. **Rare (3%):** Injection site reaction, hypersensitivity reaction.

**Adverse effects/toxic reactions**
Anemia occurs in 8% of pts. Hepatic failure has been reported.
Nursing considerations

Baseline assessment
Obtain CBC, BMP, LFT. Assess home situation for support of therapy.

Intervention/evaluation
Assess for headache, flu-like symptoms, myalgia. Periodically monitor lab results, re-evaluate injection technique. Assess for depression, suicidal ideation.

Patient/family teaching
• Do not change schedule, dosage without consulting physician.
• Follow guidelines for reconstitution of product and administration, including aseptic technique.
• Use puncture-resistant container for used needles, syringes; dispose of used needles, syringes properly.
• Injection site reactions may occur. These do not require discontinuation of therapy, but type and extent should be carefully noted. Report flu-like symptoms (fever, chills, fatigue, muscle aches).

interferon beta-1b
in-ter-feer-on

Betaseron
Extavia

CLASSIFICATION
PHARMACOTHERAPEUTIC: Biologic response modifier.
CLINICAL: Multiple sclerosis agent.
Do not confuse interferon beta-1b with interferon beta-1a.

Uses
Reduces frequency of clinical exacerbations in pts with relapsing-remitting multiple sclerosis (recurrent attacks of neurologic dysfunction).

Precautions
Contraindications: Hypersensitivity to albumin, interferon. Cautions: Depression, severe psychiatric disorders, hepatic/renal impairment, alcohol abuse, cardiovascular disease, seizure disorders, myelosuppression, pulmonary disease.

Action

Exact mechanism unknown. Participates in immunoregulation by enhancing oxidative metabolism of macrophages, antibody-dependent cellular cytotoxicity and activating natural killer cells. Therapeutic Effect: Improves MRI lesions, decreases relapse rate and disease severity in multiple sclerosis.

Pharmacokinetics

Slowly absorbed following subcutaneous administration. Half-life: 8 min–4.3 hrs.

Lifespan considerations

Pregnancy/Lactation: Spontaneous abortions reported. Discontinuation of the drug before conception is recommended. Unknown if distributed in breast milk. Children: Safety and efficacy not established. Elderly: No information available.

Interactions

DRUG: None significant. HERBAL: None significant. FOOD: None known. LAB VALUES: May increase bilirubin, ALT, AST. May decrease neutrophil, lymphocyte, WBC.

Availability (Rx)

Injection, Powder for Reconstitution: 0.3 mg.

Administration/handling

Subcutaneous

- Store vials at room temperature.
• After reconstitution, stable for 3 hrs if refrigerated.
• Use within 3 hrs of reconstitution.
• Discard if discolored or precipitate forms.
• Reconstitute 0.3-mg (9.6 million international units) vial with 1.2 mL diluent (supplied by manufacturer) to provide concentration of 0.25 mg/mL (8 million units/mL).
• Gently swirl to dissolve medication; do not shake.
• Withdraw 1 mL solution and inject subcutaneously into arms, abdomen, hips, thighs using 27-gauge needle.
• Discard unused portion (contains no preservative).

Indications/routes/dosage

Relapsing-Remitting Multiple Sclerosis

**SQ:ADULTS:** Initially, 0.0625 mg every other day; gradually increase by 0.0625 mg every 2 wks. Target dose: 0.25 mg every other day.

Dosage in Renal/Hepatic Impairment

No dose adjustment.

Side effects

**Frequent (85%–21%):** Injection site reaction, headache, flu-like symptoms, fever, asthenia, myalgia, sinusitis, diarrhea, dizziness, altered mental status, constipation, diaphoresis, vomiting. **Occasional (15%–4%):** Malaise, drowsiness, alopecia.

Adverse effects/toxic reactions

Seizures occur rarely.

Nursing considerations

**Baseline assessment**

Obtain CBC, BMP, LFT. Assess home situation for support of therapy.
Intervention/evaluation

Patient/family teaching

• Report flu-like symptoms (fever, chills, fatigue, muscle aches); occur commonly but decrease over time.
• Wear sunscreen, protective clothing if exposed to sunlight, ultraviolet light until tolerance known.

interferon gamma-1b
in-ter-feer-on
Actimmune

CLASSIFICATION
PHARMACOTHERAPEUTIC: Biologic response modifier.
CLINICAL: Immunologic agent.

Uses

Reduces frequency, severity of serious infections due to chronic granulomatous disease. Delays time to disease progression in pts with severe, malignant osteopetrosis.

Precautions

Contraindications: Hypersensitivity to interferon gamma-1b, Escherichia coli–derived products. Cautions: Seizure disorders, compromised CNS function, preexisting cardiac disease (e.g., ischemia, HF, arrhythmias), hepatic disease, myelosuppression.

Action

Exact mechanism unknown. Enhances oxidative metabolism of macrophages,
antibody-dependent cellular cytotoxicity; activates natural killer cells. **Therapeutic Effect:** Decreases signs/symptoms of serious infections in chronic granulomatous disease.

**Pharmacokinetics**

Slowly absorbed after subcutaneous administration. **Half-life:** 3–6 hrs.

**Lifespan considerations**

**Pregnancy/Lactation:** Unknown if drug crosses placenta or is distributed in breast milk. **Children:** Safety and efficacy not established in pts younger than 1 yr. Flu-like symptoms may occur more frequently. **Elderly:** No information available.

**Interactions**

**DRUG:** Bone marrow depressants (e.g., alemtuzumab, methotrexate) may increase myelosuppression. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** May increase serum ALT, AST, alkaline phosphatase, LDH, triglycerides, cortisol concentrations. May decrease leukocytes, neutrophils, platelets.

**Availability (Rx)**

**Injection Solution:** 100 mcg/0.5 mL (2 million units).

**Administration/handling**

- Avoid excessive agitation of vial; do not shake.

**Subcutaneous**

- Refrigerate vials. Do not freeze.
- Do not keep at room temperature for more than 12 hrs; discard after 12 hrs.
- Vials are single dose; discard unused portion.
- Solution is clear, colorless. Do not use if discolored or precipitate forms.
- When given 3 times/wk, rotate injection sites.
- Administer into right and left deltoid or anterior thigh.
Indications/routes/dosage

Chronic Granulomatous Disease; Severe, Malignant Osteopetrosis

SQ: ADULTS, ELDERLY, CHILDREN OLDER THAN 1 YR: 50 mcg/m² (1 million units/m²) 3 times/wk in pts with body surface area (BSA) greater than 0.5 m²; 1.5 mcg/kg/dose 3 times/wk in pts with BSA 0.5 m² or less.

Dosage in Renal/Hepatic Impairment

No dose adjustment.

Side effects

Frequent (52%–14%): Fever, headache, rash, chills, fatigue, diarrhea. Occasional (13%–10%): Vomiting, nausea. Rare (6%–3%): Weight loss, myalgia, anorexia.

Adverse effects/toxic reactions

May exacerbate preexisting CNS dysfunction (manifested as decreased mental status, gait disturbance, dizziness), cardiac abnormalities.

Nursing considerations

Baseline assessment

CBC, serum electrolytes, urinalysis, renal function, LFT should be performed before initial therapy and at 3-mo intervals during course of treatment.

Intervention/evaluation

Patient/family teaching

• Flu-like symptoms (fever, chills, fatigue, muscle aches) are generally mild and tend to disappear as treatment continues. Symptoms may be minimized with bedtime administration.
• Avoid tasks that require alertness, motor skills until response to drug is
established.

• If home use is prescribed, follow guidelines for proper technique of administration and for care in the proper disposal of needles, syringes.
• Vials should remain refrigerated.

**Interleukin-2 (aldesleukin)**

*in-ter-loo-kin*

**Proleukin**

**CLASSIFICATION**

PHARMACOTHERAPEUTIC: Biologic response modifier.

CLINICAL: Antineoplastic.

■ **BLACK BOX ALERT** ■ High-dose therapy is associated with capillary leak syndrome resulting in significant hypotension and reduced organ perfusion. Use restricted to pts with normal cardiac/pulmonary function. Increased risk of disseminated infection (sepsis, bacterial endocarditis). Withhold treatment for pts developing moderate-to-severe lethargy or drowsiness (continued treatment may result in coma). Must be administered by personnel trained in administration/handling of chemotherapeutic agents.

Do not confuse aldesleukin with oprelvekin.

**Uses**

**Precautions**

Contraindications: Hypersensitivity to aldesleukin. Abnormal pulmonary function or thallium stress test results, bowel ischemia or perforation, coma or toxic psychosis lasting longer than 48 hrs, GI bleeding requiring surgery, intubation lasting more than 72 hrs, organ allografts, pericardial tamponade, renal dysfunction requiring dialysis for longer than 72 hrs, repetitive or difficult-to-control seizures; retreatment in pts who experience any of the following toxicities: angina, MI, recurrent chest pain with EKG changes, sustained ventricular tachycardia, uncontrolled or unresponsive cardiac rhythm
disturbances. **Extreme Caution:** Pts with normal thallium stress tests and pulmonary function tests who have history of cardiac or pulmonary disease. **Cautions:** Pts with fixed requirements for large volumes of fluid (e.g., those with hypercalcemia), history of seizures, renal/hepatic impairment, autoimmune disease, inflammatory disorders.

**Action**

Promotes proliferation, differentiation, recruitment of T and B cells, lymphokine-activated and natural killer cells, thymocytes. **Therapeutic Effect:** Enhances cytolytic activity in lymphocytes.

**Pharmacokinetics**

Primarily distributed into plasma, lymphocytes, lungs, liver, kidney, spleen. Metabolized to amino acids in cells lining the kidneys. **Half-life:** 80–120 min.

**Lifespan considerations**

**Pregnancy/Lactation:** Avoid use in those of either sex not practicing effective contraception. **Children:** Safety and efficacy not established. **Elderly:** Age-related renal impairment may require dosage adjustment; will not tolerate toxicity.

**Interactions**

**DRUG:** Anti-hypertensives (e.g., amlodipine, lisinopril, valsartan) may increase hypotensive effect. **Cardiotoxic, hepatotoxic, myelotoxic, nephrotoxic medications** may increase risk of toxicity. **Glucocorticoids** may decrease effects. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** May increase serum BUN, alkaline phosphatase, bilirubin, creatinine, ALT, AST. May decrease serum calcium, magnesium, phosphorus, potassium, sodium.

**Availability (Rx)**

**Injection, Powder for Reconstitution (Proleukin):** 22 million units (1.3 mg) (18 million units/mL = 1.1 mg/mL when reconstituted).
Administration/handling

**Alert** Hold administration in pts who develop moderate to severe lethargy or drowsiness (continued administration may result in coma).

**IV**

Reconstitution
- Reconstitute 22 million units vial with 1.2 mL Sterile Water for Injection to provide concentration of 18 million units/mL (1.1 mg/mL).
- Bacteriostatic Water for Injection or NaCl should not be used to reconstitute because of increased aggregation.
- During reconstitution, direct Sterile Water for Injection at the side of vial. Swirl contents gently to avoid foaming. Do not shake.

Rate of Administration
- Further dilute dose in 50 mL $D_5W$ to a final concentration between 0.49 and 1.1 million international units/mL (30–70 mcg/mL) and infuse over 15 min. Do not use an in-line filter.
- Solution should be warmed to room temperature before infusion.
- Monitor diligently for drop in mean arterial B/P (sign of capillary leak syndrome [CLS]). Continued treatment may result in significant hypotension (less than 90 mm Hg or a 20 mm Hg drop from baseline systolic pressure), edema, pleural effusion, altered mental status.

Storage
- Refrigerate vials; do not freeze.
- Reconstituted solution is stable for 48 hrs refrigerated or at room temperature (refrigeration preferred).

**IV incompatibilities**

Ganciclovir (Cytovene), pentamidine (Pentam), prochlorperazine (Compazine), promethazine (Phenergan).

**IV Compatibilities**

Calcium gluconate, DOPamine (Intropin), heparin, LORazepam (Ativan), magnesium, potassium.
**Indications/routes/dosage**

**Metastatic Melanoma, Metastatic Renal Cell Carcinoma**

**IV: ADULTS 18 YRS AND OLDER:** 600,000 units/kg q8h for 14 doses; followed by 9 days of rest, then another 14 doses for a total of 28 doses per course. Course may be repeated if tumor shrinkage observed after rest period of at least 7 wks from date of hospital discharge.

**Dosage in Renal/Hepatic Impairment**

No dose adjustment. Do not initiate if serum creatinine greater than 1.5 mg/dL.

**Dosage Modification for Toxicity**

Withhold or interrupt therapy; do not reduce dose. Retreatment contraindicated with the following toxicities: Sustained ventricular tachycardia, uncontrolled arrhythmias; chest pain/EKG changes consistent with angina or MI; cardiac tamponade, repetitive/refractory seizures; GI bleeding; bowel ischemia/perforation; renal failure requiring dialysis; coma lasting more than 48 hrs.

**Side effects**

Side effects are generally self-limited and resolve within 2–3 days after discontinuing therapy. **Frequent (89%–48%):** Fever, chills, nausea, vomiting, hypotension, diarrhea, oliguria/anuria, altered mental status, irritability, confusion, depression, sinus tachycardia, pain (abdominal, chest, back), fatigue, dyspnea, pruritus. **Occasional (47%–17%):** Edema, erythema, rash, stomatitis, anorexia, weight gain, infection (UTI, injection site, catheter tip), dizziness. **Rare (15%–4%):** Dry skin, sensory disorders (vision, speech, taste), dermatitis, headache, arthralgia, myalgia, weight loss, hematuria, conjunctivitis, proteinuria.

**Adverse effects/toxic reactions**

Anemia, thrombocytopenia, leukopenia occur commonly. GI bleeding, pulmonary edema occur occasionally. Capillary leak syndrome (CLS) results in hypotension (systolic pressure less than 90 mm Hg or a 20 mm Hg drop from baseline systolic pressure), extravasation of plasma proteins and fluid into
extravascular space, loss of vascular tone. May result in cardiac arrhythmias, angina, MI, respiratory insufficiency. Fatal malignant hyperthermia, cardiac arrest, CVA, pulmonary emboli, bowel perforation/gangrene, severe depression leading to suicide occur in less than 1% of pts.

**Nursing considerations**

**Baseline assessment**
Pts with bacterial infection and with indwelling central lines should be treated with antibiotic therapy before treatment begins. All pts should be neurologically stable with a negative CT scan before treatment begins. CBC, BMP, LFT, chest X-ray should be performed before therapy begins and daily thereafter.

**Intervention/evaluation**
Monitor CBC with differential, amylase, electrolytes, renal function, LFT, weight, pulse oximetry. Discontinue medication at first sign of hypotension and hold for moderate to severe lethargy (physician must decide whether therapy should continue). Assess for altered mental status (irritability, confusion, depression), weight gain/loss. Maintain strict I&O. Assess for extravascular fluid accumulation (rales in lungs, edema in dependent areas).

**Patient/family teaching**
- Nausea may decrease during therapy.
- At home, increase fluid intake (protects against renal impairment).
- Do not have immunizations without physician’s approval (drug lowers resistance).
- Avoid exposure to persons with infection.
- Report fever, chills, lower back pain, difficulty with urination, unusual bleeding/bruising, black tarry stools, blood in urine, petechial rash (pinpoint red spots on skin).
- Report symptoms of depression or suicidal ideation immediately.

**ipilimumab**
**ip-i-lim-ue-mab**
**Yervoy**
**CLASSIFICATION**

**PHARMACOTHERAPEUTIC:** Human cytotoxic T-lymphocyte antigen 4 (CTLA-4)-blocking antibody.

**CLINICAL:** Antineoplastic.

---

**BLACK BOX ALERT**

Severe and fatal immune-mediated adverse reactions due to T-cell activation and proliferation are capable of involving any organ system. Specific reactions include enterocolitis, hepatitis, dermatitis, neuropathy, endocrinopathy. Majority of immune-mediated reactions may initially manifest during treatment or weeks to months after treatment. Permanently discontinue treatment and initiate high-dose corticosteroid therapy for severe immune-mediated adverse reactions. Assess all pts for signs/symptoms of enterocolitis, hepatitis, dermatitis (including toxic epidermal necrolysis), neuropathy, endocrinopathy, and evaluate clinical chemistries, including hepatic function tests and thyroid tests at baseline and before each treatment.

---

**Uses**

Treatment of unresectable or metastatic melanoma in adults and children 12 yrs of age and older. Adjuvant treatment of pts with cutaneous melanoma with pathologic involvement of regional lymph nodes and who have undergone complete resection, including total lymphadenectomy.

**Precautions**

**Contraindications:** Hypersensitivity to ipilimumab. **Cautions:** Hepatic impairment, chronic peripheral neuropathy, thyroid/adrenal/pituitary dysfunction, autoimmune disorders (ulcerative colitis, Crohn’s disease, lupus, sarcoidosis).

**Action**

Augments T-cell activation and proliferation. Binds to cytotoxic T-lymphocyte-associated antigen 4 (CTLA-4) and blocks interaction of CTLA-4 with its ligands. **Therapeutic Effect:** Inhibits tumor cell growth and metastasis.
Pharmacokinetics
Metabolized in liver. Steady state reached by third dose. **Half-life:** 14.7 days.

*Lifespan considerations*

**Pregnancy/Lactation:** May cause fetal harm. Use effective contraception during treatment and for at least 3 mos after discontinuation. Unknown if distributed in breast milk. Discontinue drug or discontinue breastfeeding. **Children:** Safety and efficacy not established. **Elderly:** No age-related precautions noted.

Interactions

**DRUG:** None significant. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** May increase serum ALT, AST, bilirubin; eosinophils.

Availability (Rx)

**Injection, Solution:** 5 mg/mL (10 mL, 40 mL vials).

Administration/handling

**IV**

Use sterile, nonpyrogenic, low protein-binding in-line filter. Use dedicated line only.

**Reconstitution**

- Calculate number of vials needed for injection.
- Inspect for particulate matter or discoloration.
- Allow vials to stand at room temperature for approximately 5 min.
- Withdraw proper volume and transfer to infusion bag. Dilute in NaCl or D₅W with final concentration ranging from 1–2 mg/mL.
- Mix diluted solution by gentle inversion. Do not shake or agitate.

**Rate of Administration**

- Infuse over 90 min. Flush with 0.9% NaCl or D₅W at end of infusion.

**Storage**

- Solution should be translucent to white or pale yellow with amorphous particles.
- Discard vial if cloudy or discolored.
• Refrigerate vials until time of use.
• May store diluted solution either under refrigeration or at room temperature for no more than 24 hrs.

Indications/routes/dosage

Metastatic Melanoma
**IV:** **ADULTS, CHILDREN 12 YRS of AGE and OLDER:** 3 mg/kg q3wks for maximum of 4 doses. Doses may be delayed due to toxicity, but all doses must be given within 16 wks of initial dose.

**<WARNING>** Pts who are presenting with severe immune-mediated adverse reactions must immediately discontinue drug therapy and start predniSONE 1 mg/kg/day.

Cutaneous Melanoma
**IV:** **ADULTS:** 10 mg/kg q3wks for 4 doses, then 10 mg/kg q12wks for up to 3 yrs. If toxicity occurs, doses are omitted (not delayed).

Dosage Modification
Hold scheduled dose for moderate immune-mediated adverse reactions. Pts with complete or partial resolution of adverse reactions and who are receiving less than 7.5 mg/day of predniSONE may resume scheduled doses. Permanently discontinue for persistent moderate adverse reactions or inability to reduce corticosteroid dose to 7.5 mg/day, failure to complete full treatment course in 16 wks, any severe or life-threatening adverse reactions.

Dosage in Renal/Hepatic Impairment
No dose adjustment.

Hepatotoxicity During Treatment
**ALT/AST greater than 2.5 times upper limit of normal (ULN) or bilirubin greater than 1.5–3 times ULN:** Withhold treatment. **ALT/AST greater than 5 times ULN or bilirubin greater than 3 times ULN:** Permanently discontinue.

Side effects
Frequent (42%): Fatigue. Occasional (32%–29%): Diarrhea, pruritus, rash, colitis.

Adverse effects/toxic reactions
Severe and fatal immune-mediated adverse reactions have occurred. Enterocolitis (7% of pts) may present with fever, ileus, abdominal pain, GI bleeding, intestinal perforation, severe dehydrating diarrhea. Endocrinopathies (4% of pts), including hypopituitarism, adrenal insufficiency, hypogonadism, hypothyroidism, may present with fatigue, headache, mental status change, unusual bowel habits, hypotension and may require emergent hormone replacement therapy. Dermatitis including toxic epidermal necrolysis (2% of pts) may present with full-thickness ulceration or necrotic, bullous, hemorrhagic manifestations. Hepatotoxicity (1% of pts), defined as LFT greater than 2.5–5 times ULN, may present with right upper abdominal pain, jaundice, black/tarry stools, bruising, dark-colored urine, nausea, vomiting. Neuropathy (1% of pts), including Guillain-Barré syndrome or myasthenia gravis, may present with weakness, sensory alterations, paresthesia, paralysis. Other serious adverse reactions such as pneumonitis, meningitis, nephritis, eosinophilia, pericarditis, myocarditis, angiopathy, temporal arteritis, vasculitis, polymyalgia rheumatica, conjunctivitis, blepharitis, episcleritis, scleritis, leukocytoclastic vasculitis, erythema multiforme, psoriasis, pancreatitis, arthritis, autoimmune thyroiditis reported. Anti-ipilimumab antibodies reported in 1.1% of pts. All severe immune-mediated adverse reactions require immediate high-dose corticosteroid therapy.

Nursing considerations
Baseline assessment
Obtain baseline CBC, complete metabolic profile, LFT, TSH, free T₄, urine pregnancy. Screen for history of hepatic impairment, chronic neuropathy, thyroid/adrenal/pituitary dysfunction, autoimmune disorders. Focused assessment relating to possible adverse reactions includes abdominal area (inspection, auscultation, percussion, palpation, bowel pattern, symmetry), skin (color, lesions, mucosal inspection, edema), neurologic (mental status, gait, numbness, tingling, pain, strength, visual acuity), hormonal glands (lymph node
inspection/palpation, pyrexia, goiter, palpitations). Question possibility of pregnancy or plans of breastfeeding. Receive full medication history including herbal products.

**Intervention/evaluation**
Monitor vital signs, LFT, thyroid panel before each dose. Continue focused assessment and screen for life-threatening immune-mediated adverse reactions. If adverse reactions occur, immediately notify physician and initiate proper treatment. Report suspected pregnancy. Obtain CBC, blood cultures for fever, suspected infection. EKG for palpitations, chest pain, difficulty breathing, dizziness. If predniSONE therapy initiated, monitor capillary blood glucose and screen for side effects.

**Patient/family teaching**
• Inform pt that serious and fatal adverse reactions indicate inflammation to certain systems: intestines (diarrhea, dark/tarry stools, abdominal pain), liver (yellowing of the skin, dark-colored urine, right upper quadrant pain, bruising), skin (rash, mouth sores, blisters, ulcers), nerves (weakness, numbness, tingling, difficulty breathing, paralysis), hormonal glands (headaches, weight gain, palpitations, changes in mood or behavior, dizziness), eyes (blurry vision, double vision, eye pain/redness).
• PredniSONE therapy may be started if adverse reactions occur.
• May cause fetal harm, stillbirth, premature delivery.
• Blood levels will be drawn before each dose.
• Report any chest pain, palpitations, fever, swollen glands, stomach pain, vomiting, or any sign of adverse reactions.

**ipratropium**
ip-ra-troe-pee-um

**Atrovent HFA**
PMS-Ipratropium

**Fixed-Combination(s)**
Combivent, DuoNeb: ipratropium/albuterol (a bronchodilator): *Aerosol*: 18 mcg/90 mcg per actuation. *Solution*: 0.5 mg/2.5 mg per 3 mL.
CLASSIFICATION
PHARMACOTHERAPEUTIC: Anticholinergic.
CLINICAL: Bronchodilator.
Do not confuse Atrovent with Alupent or Serevent, or ipratropium with tiotropium.

Uses

**Inhalation, Nebulization:** Maintenance treatment of bronchospasm due to COPD, bronchitis, emphysema, asthma. Not indicated for immediate bronchospasm relief. **Nasal Spray:** Symptomatic relief of rhinorrhea associated with the common cold and allergic/nonallergic rhinitis.

Precautions

**Contraindications:** History of hypersensitivity to ipratropium, atropine. **Cautions:** Narrow-angle glaucoma, prostatic hypertrophy, bladder neck obstruction, myasthenia gravis.

Action

Blocks action of acetylcholine at parasympathetic sites in bronchial smooth muscle. Application to nasal mucosa inhibits serous/seromucous gland secretions. **Therapeutic Effect:** Causes bronchodilation, inhibits nasal secretions.

Pharmacokinetics

<table>
<thead>
<tr>

<td>4–8 hrs</td>
</tr>
</tbody>
</table>

Minimal systemic absorption after inhalation. Metabolized in liver (systemic absorption). Primarily excreted in feces. **Half-life:** 1.5–4 hrs (nasal).

Lifespan considerations

**Pregnancy/Lactation:** Unknown if distributed in breast milk.
Children/Elderly: No age-related precautions noted.

Interactions

DRUG: Anticholinergics (e.g., glycopyrrolate, scopolamine), medications with anticholinergic properties may increase toxicity. HERBAL: None significant. FOOD: None known. LAB VALUES: None significant.

Availability (Rx)

Aerosol for Oral Inhalation (Atrovent HFA): 17 mcg/actuation. Solution, Intranasal Spray: 0.03%; 0.06%. Solution for Nebulization: 0.02% (500 mcg).

Administration/handling

Inhalation

• Do not shake. Prime before first use or if not used for more than 3 days.
• Instruct pt to exhale completely, place mouthpiece between lips, inhale deeply through mouth while fully depressing top of canister. Hold breath as long as possible before exhaling slowly.
• Allow at least 1 minute between inhalations.
• Rinse mouth with water immediately after inhalation (prevents mouth/throat dryness).

Nebulization

• May be administered with or without dilution in 0.9% NaCl.
• Stable for 1 hr when mixed with albuterol.
• Give over 5–15 min.

Nasal

• Store at room temperature.
• Initial pump priming requires 7 actuations of pump.
• If used regularly as recommended, no further priming is required. If not used for more than 4 hrs, pump will require 2 actuations, or if not used for more than 7 days, the pump will require 7 actuations to reprime.
Indications/routes/dosage

Bronchodilator for COPD
Inhalation:  ADULTS, ELDERLY, CHILDREN OLDER THAN 12 YRS: 2 inhalations 4 times/day. **Maximum:** 12 inhalations per 24 hrs.
**Nebulization:**  ADULTS, ELDERLY, CHILDREN OLDER THAN 12 YRS: 500 mcg (1 unit dose vial) 3–4 times/day (doses 6–8 hrs apart).

Asthma Exacerbation
**Note:** Should be given in combination with a short-acting beta-adrenergic agonist.
Inhalation:  ADULTS, ELDERLY, CHILDREN OLDER THAN 12 YRS: 8 inhalations q20min as needed for up to 3 hrs. CHILDREN 6–12 YRS: 4–8 inhalations q20min as needed for up to 3 hrs. CHILDREN 5 YRS OR YOUNGER: 2 inhalations q20 min for 1 hr.
**Nebulization:**  ADULTS, ELDERLY, CHILDREN OLDER THAN 12 YRS: 500 mcg q20min for 3 doses, then as needed. CHILDREN 6–12 YRS: 250–500 mcg q20min for 3 doses, then as needed. CHILDREN 5 YRS OR YOUNGER: 250 mcg q20 min for 1 hr.

Rhinorrhea (Perennial Allergic/Nonallergic Rhinitis)
**Intranasal** *(0.03%)*:  ADULTS, ELDERLY, CHILDREN 6 YRS AND OLDER: 2 sprays per nostril 2–3 times/day.

Rhinorrhea (Common Cold)
**Intranasal** *(0.06%)*:  ADULTS, ELDERLY, CHILDREN 12 YRS AND OLDER: 2 sprays per nostril 3–4 times/day for up to 4 days. CHILDREN 5–11 YRS: 2 sprays per nostril 3 times/day for up to 4 days.

Rhinorrhea (Seasonal Allergy)
**Intranasal** *(0.06%)*:  ADULTS, ELDERLY, CHILDREN 5 YRS AND OLDER: 2 sprays per nostril 4 times/day for up to 3 wks.

Dosage in Renal/Hepatic Impairment
No dose adjustment.
Side effects

**Frequent: Inhalation (6%–3%)**: Cough, dry mouth, headache, nausea. **Nasal**: Dry nose/mouth, headache, nasal irritation. **Occasional: Inhalation (2%)**: Dizziness, transient increased bronchospasm. **Rare (less than 1%): Inhalation**: Hypotension, insomnia, metallic/unpleasant taste, palpitations, urinary retention. **Nasal**: Diarrhea, constipation, dry throat, abdominal pain, nasal congestion.

Adverse effects/toxic reactions

Worsening of angle-closure glaucoma, acute eye pain, hypotension occur rarely.

Nursing considerations

**Baseline assessment**
Auscultate lung sounds. Question history of glaucoma, urinary retention, myasthenia gravis.

**Intervention/evaluation**

**Patient/ family teaching**
- Increase fluid intake (decreases lung secretion viscosity).
- Do not take more than 2 inhalations at any one time (excessive use may produce paradoxical bronchoconstriction, decreased bronchodilating effect).
- Rinsing mouth with water immediately after inhalation may prevent mouth and throat dryness.
- Avoid excessive use of caffeine derivatives (chocolate, coffee, tea, cola, cocoa).

**irbesartan**
ir-be-sar-tan
Apo-Irbesartan
Avapro

**Fixed-Combination(s)**

**Avalide:** irbesartan/hydroCHLOROthiazide (a diuretic): 150 mg/12.5 mg, 300 mg/12.5 mg, 300 mg/25 mg.

**CLASSIFICATION**

**PHARMACOTHERAPEUTIC:** Angiotensin II receptor antagonist.

**CLINICAL:** Antihypertensive.

- **BLACK BOX ALERT** - May cause fetal injury, mortality if used during second or third trimester of pregnancy. Discontinue as soon as possible once pregnancy is detected.

**Do not confuse Avapro with Anaprox.**

**Uses**

Treatment of hypertension alone or in combination with other antihypertensives. Treatment of diabetic nephropathy in pts with type 2 diabetes. **OFF-LABEL:** Reduce proteinuria in children with chronic kidney disease.

**Precautions**

**Contraindications:** Hypersensitivity to irbesartan. Concomitant use with aliskiren in pts with diabetes. **Cautions:** Renal impairment, unstented unilateral or bilateral renal artery stenosis, dehydration, HF, idiopathic or hereditary angioedema or angioedema associated with ACE inhibitor therapy.

**Action**

Blocks vasoconstriction, aldosterone-secreting effects of angiotensin II, inhibiting binding of angiotensin II to AT_{1} receptors. **Therapeutic Effect:** Produces vasodilation, decreases peripheral resistance, decreases B/P.
Pharmacokinetics

<table>
<thead>
<tr>
<th>Route</th>
<th>Onset</th>
<th>Peak</th>
<th>Duration</th>
</tr>
</thead>
<tbody>
<tr>
<td>PO</td>
<td>—</td>
<td>1–2 hrs</td>
<td>Greater than 24 hrs</td>
</tr>
</tbody>
</table>

Rapidly, completely absorbed after PO administration. Protein binding: 90%. Metabolized in liver. Excreted in feces (80%), urine (20%). Not removed by hemodialysis. **Half-life:** 11–15 hrs.

**Lifespan considerations**

**Pregnancy/Lactation:** Unknown if distributed in breast milk. May cause fetal or neonatal morbidity or mortality. **Children:** Safety and efficacy not established. **Elderly:** No age-related precautions noted.

**Interactions**

**DRUG:** Diuretics (e.g., furosemide, HCTZ) produce additive hypotensive effects. Potassium-sparing diuretics (e.g., spironolactone, triamterene), potassium supplements may increase risk of hyperkalemia. NSAIDs (e.g., ibuprofen, ketorolac, naproxen) may decrease antihypertensive effect.

**HERBAL:** Ephedra, ginseng, yohimbe may worsen hypertension. Garlic may increase antihypertensive effect. **FOOD:** None known. **LAB VALUES:** May slightly increase serum BUN, creatinine. May decrease Hgb.

**Availability (Rx)**

**Tablets:** 75 mg, 150 mg, 300 mg.

**Administration/handling**

**PO**

• Give without regard to meals.

**Indications/routes/dosage**

**Hypertension**
PO: ADULTS, ELDERLY, CHILDREN 13 YRS AND OLDER: Initially, 75–150 mg/day. May increase to 300 mg/day. CHILDREN 6–12 YRS: Initially, 75 mg/day. May increase to 150 mg/day.

Diabetic Nephropathy
PO: ADULTS, ELDERLY: Target dose of 300 mg once daily.

Dosage in Renal/Hepatic Impairment
No dose adjustment.

Side effects
Occasional (9%–3%): Upper respiratory tract infection, fatigue, diarrhea, cough. Rare (2%–1%): Heartburn, dizziness, headache, nausea, rash.

Adverse effects/toxic reactions
Overdose may manifest as hypotension, syncope, tachycardia. Bradycardia occurs less often.

Nursing considerations

Baseline assessment
Obtain B/P, apical pulse immediately before each dose in addition to regular monitoring (be alert to fluctuations). Question possibility of pregnancy. Assess medication history (esp. diuretic therapy).

Intervention/evaluation

Patient/family teaching
• May cause fetal or neonatal morbidity or mortality.
• Avoid tasks that require alertness, motor skills until response to drug is
established (possible dizziness effect); ensure that appropriate birth control measures are in place.

- Report any sign of infection (sore throat, fever).
- Avoid exercising during hot weather (risk of dehydration, hypotension).

<table>
<thead>
<tr>
<th>irinotecan</th>
</tr>
</thead>
<tbody>
<tr>
<td>eye-ri-noe-tee-kan</td>
</tr>
<tr>
<td>Camptosar</td>
</tr>
<tr>
<td>Onivyde</td>
</tr>
</tbody>
</table>

**CLASSIFICATION**

PHARMACOTHERAPEUTIC: DNA topoisomerase inhibitor.

CLINICAL: Antineoplastic.

■ **BLACK BOX ALERT** ■ *(Camptosar, Onivyde)*: Can induce both early and late forms of severe diarrhea. Early diarrhea (during or shortly after administration) accompanied by salivation, rhinitis, lacrimation, diaphoresis, flushing. Late diarrhea (occurring more than 24 hrs after administration) can be prolonged and life-threatening. *(Camptosar)*: May produce severe, profound myelosuppression. Administer under supervision of experienced cancer chemotherapy physician. *(Onivyde)*: Severe, life-threatening, or fatal neutropenic fever/sepsis occurred. Withhold for ANC below 1,500/mm$^3$ or neutropenic fever. Monitor blood cell counts.

**Uses**

**Camptosar**: Treatment of metastatic carcinoma of colon or rectum. **Onivyde**: Treatment of metastatic adenocarcinoma of the pancreas (in combination with 5-fluorouracil and leucovorin) after disease progression following gemcitabine-based therapy. **OFF-LABEL**: Non–small-cell lung cancer; small-cell lung cancer; CNS tumor; cervical, gastric, pancreatic, ovarian, esophageal cancer; Ewing’s sarcoma; brain tumor.

**Precautions**

**Contraindications**: Hypersensitivity to irinotecan. **Cautions**: Pt previously
receiving pelvic, abdominal irradiation (increased risk of myelosuppression), pts older than 65 yrs, hepatic dysfunction, hyperbilirubinemia, renal impairment, preexisting pulmonary disease.

**Action**

Interacts with topoisomerase I, an enzyme that relieves torsional strain in DNA by inducing reversible single-strand breaks. Prevents religation of these single-stranded breaks, resulting in damage to double-strand DNA, cell death. **Therapeutic Effect:** Produces cytotoxic effect on cancer cells.

**Pharmacokinetics**

Metabolized in liver. Protein binding: 95% (metabolite). Excreted in urine and eliminated by biliary route. **Half-life:** 6–12 hrs; metabolite, 10–20 hrs.

**Lifespan considerations**

**Pregnancy/Lactation:** May cause fetal harm. Unknown if distributed in breast milk. Breastfeeding not recommended. **Children:** Safety and efficacy not established. **Elderly:** Risk of diarrhea significantly increased.

**Interactions**

**DRUG:** CYP3A4 inducers (e.g., phenytoin, PHENobarbital, carBAMazepine) may decrease concentration/effects. CYP3A4 inhibitors (e.g., ketoconazole) increase concentration. Avoid live vaccines during treatment. **HERBAL:** St. John’s wort may decrease irinotecan effectiveness. **FOOD:** None known. **LAB VALUES:** May increase serum alkaline phosphatase, AST. May decrease Hgb, leukocytes, platelets.

**Availability (Rx)**

**Injection Solution (Conventional):** 20 mg/mL (2 mL, 5 mL, 15 mL, 25 mL). **(Liposomal):** 43 mg/10 mL.

**Administration/handling**
IV

Camptosar
Reconstitution
• Dilute in D₅W (preferred) or 0.9% NaCl to concentration of 0.12–2.8 mg/mL.
Rate of Administration
• Administer all doses as IV infusion over 30–90 min.
• Assess for extravasation (flush site with Sterile Water for Injection, apply ice if extravasation occurs).
Storage
• Store vials at room temperature, protect from light.
• Solution diluted with D₅W is stable for 24 hrs at room temperature or 48 hrs if refrigerated.
• Solution diluted with 0.9% NaCl is stable for 24 hrs at room temperature.
• Do not refrigerate solution if diluted with 0.9% NaCl.

Onivyde
Reconstitution
• Withdraw dose from vial and dilute with 500 mL D₅W or 0.9% NaCl. Mix gently.
Rate of Administration
• Infuse over 90 min.
Storage
• Refrigerate vials; do not freeze.
• Protect from light.
• Stable for 4 hrs at room temperature or 24 hrs refrigerated.

⚠️ IV incompatibility
Gemcitabine (Gemzar).

Indications/routes/dosage
Note: Genotyping of UGTIAI available. Pts who are homozygous for the UGTIAI*28 allele are at increased risk for neutropenia. Decreased dose is recommended.
Carcinoma of the Colon, Rectum (Camptosar)

**IV (Single-Agent Therapy):** ADULTS, ELDERLY:

(WEEKLY REGIMEN): Initially, 125 mg/m² once wkly for 4 wks, followed by a rest period of 2 wks. Additional courses may be repeated q6wks. Dosage may be adjusted in 25–50 mg/m² increments/decrements to as high as 150 mg/m² or as low as 50 mg/m².

(THREE-WEEK REGIMEN): 350 mg/m² q3wks. Dosage may be adjusted to as low as 200 mg/m² in decrements of 25–50 mg/m².

(In Combination with Leucovorin and 5-Fluorouracil): REGIMEN ONE: 125 mg/m² on days 1, 8, 15, 22. Dose may be adjusted to 100 mg/m², then 75 mg/m², then decrements of approximately 20%. REGIMEN TWO: 180 mg/m² on days 1, 15, 29. Dose may be adjusted to 150 mg/m², then 120 mg/m², then decrements of approximately 20%.

Pancreatic Cancer (Onivyde)

**IV Infusion:** ADULTS, ELDERLY: 70 mg/m² once q2wks (in combination with leucovorin and 5-fluorouracil).

Dosage in Renal Impairment

No dose adjustment.

Dosage in Hepatic Impairment

<table>
<thead>
<tr>
<th>Bilirubin</th>

</tr>
</thead>
<tbody>
<tr>
<td>More than upper limit of normal to 2 mg/dL or less:</td>
<td>Reduce dose one level</td>
</tr>
<tr>
<td>More than 2 mg/dL:</td>
<td>Not recommended</td>
</tr>
</tbody>
</table>

Side effects

**Expected (64%–32%):** Nausea, alopecia, vomiting, diarrhea. **Frequent (29%–22%):** Constipation, fatigue, fever, asthenia, skeletal pain, abdominal pain, dyspnea. **Occasional (19%–16%):** Anorexia, headache, stomatitis, rash.

Adverse effects/toxic reactions

Hematologic toxicity characterized by anemia, leukopenia, thrombocytopenia, and neutropenia, sepsis occur frequently. Camptosar may cause severe/fatal
interstitial lung disease.

**Nursing considerations**

**Baseline assessment**
Offer emotional support. Assess hydration status, electrolytes, CBC before each dose. Premedicate with antiemetics on day of treatment, starting at least 30 min before administration. Inform pt of possibility of alopecia.

**Intervention/evaluation**

**Patient/ family teaching**
- Report diarrhea, vomiting, fever, light-headedness, dizziness.
- Do not have immunizations without physician’s approval (drug lowers resistance).
- Avoid contact with those who have recently received live virus vaccine.
- Avoid crowds, those with infections.

<table>
<thead>
<tr>
<th>iron dextran</th>
</tr>
</thead>
<tbody>
<tr>
<td>iron dex-tran</td>
</tr>
<tr>
<td>Dexiron 🌺</td>
</tr>
<tr>
<td>Infed</td>
</tr>
<tr>
<td>Infufer 🌺</td>
</tr>
<tr>
<td>DexFerrum</td>
</tr>
</tbody>
</table>

**CLASSIFICATION**

**PHARMACOTHERAPEUTIC**: Trace element.

**CLINICAL**: Hematinic iron preparation.

**BLACK BOX ALERT** Potentially fatal anaphylactic-type reaction has been associated with parenteral administration. Test dose should be given prior to first therapeutic dose.
Do not confuse DexFerrum with Desferal, or iron dextran with iron sucrose.

Uses
Treatment of anemia, iron deficiency. Use only when PO administration is not feasible or when rapid replenishment of iron is warranted.

Precautions

Contraindications: Hypersensitivity to iron formulation. All anemias not associated with iron deficiency anemia (pernicious, aplastic, normocytic, refractory). Caution: Serious hepatic impairment. History of allergies, bronchial asthma, rheumatoid arthritis, preexisting cardiac disease. Avoid use during acute kidney infection.

Action

Pharmacokinetics
Readily absorbed after IM administration. Most absorption occurs within 72 hrs; remainder within 3–4 wks. Bound to protein to form hemosiderin, ferritin, or transferrin. No physiologic system of elimination. Small amounts lost daily in shedding of skin, hair, nails and in feces, urine, perspiration. Half-life: 5–20 hrs.

Lifespan considerations
Pregnancy/Lactation: May cross placenta in some form (unknown). Trace distributed in breast milk. Children/Elderly: No age-related precautions noted.

Interactions
DRUG: None significant. HERBAL: None significant. FOOD: None known.
LAB VALUES: None significant.

**Availability (Rx)**

**Injection Solution (Infed):** 50 mg/mL.

**Administration/handling**

- **Alert:** Test dose is generally given before full dosage; monitor pt for several min after injection due to potential for anaphylactic reaction.

**IV**

**Reconstitution**

- May give undiluted or dilute in 250–1,000 mL 0.9% NaCl for infusion.
- Avoid dilution in dextrose (increased pain/phlebitis).

**Rate of Administration**

- Do not exceed IV bolus administration rate of 50 mg/min (1 mL/min). Too-rapid IV rate may produce flushing, chest pain, hypotension, tachycardia, shock.
- Infuse diluted solution over 1–6 hrs.
- Pt must remain recumbent 30–45 min after IV administration (minimizes postural hypotension).

**Storage**

- Store at room temperature.

**IV incompatibilities**

Do not mix with other medications.

**Indications/routes/dosage**

- 0.5-mL test dose (0.25 mL in infants). Give prior to initiating iron dextran therapy.
- **Alert:** Discontinue oral iron preparations before administering iron dextran. Dosage expressed in terms of milligrams of elemental iron. Dosage individualized based on degree of anemia, pt weight, presence of any bleeding. Use periodic hematologic determinations as guide to therapy.
- **Alert:** Not normally given in first 4 mos of life.
Iron Deficiency Anemia

**IV: ADULTS, ELDERLY, CHILDREN WEIGHING MORE THAN 15 KG:**
Dose in mL (50 mg elemental iron/mL) = \(0.0442\) (desired Hgb less observed Hgb) \(\times\) lean body weight (in kg) + \((0.26 \times\) lean body weight). Give 2 mL or less once daily until total dose reached. **CHILDREN WEIGHING 5–15 KG:** Dose in mL (50 mg elemental iron/mL) = \(0.0442\) (desired Hgb less observed Hgb) \(\times\) body weight (in kg) + \((0.26 \times\) body weight). Give 2 mL or less once daily until total dose reached.

**Maximum Daily Dosages**

**ADULTS WEIGHING MORE THAN 50 KG:** 100 mg. **CHILDREN WEIGHING MORE THAN 10 KG:** 100 mg. **CHILDREN WEIGHING 5–10 KG:** 50 mg. **CHILDREN WEIGHING LESS THAN 5 KG:** 25 mg.

**Dosage in Renal/Hepatic Impairment**
No dose adjustment.

**Side effects**
**Frequent:** Allergic reaction (rash, pruritus), backache, myalgia, chills, dizziness, headache, fever, nausea, vomiting, flushed skin, pain/redness at injection site, brown discoloration of skin, metallic taste.

**Adverse effects/toxic reactions**
Anaphylaxis occurs rarely in first few min following injection. Leukocytosis, lymphadenopathy occur rarely.

**Nursing considerations**

**Baseline assessment**
Do not give concurrently with oral iron form (excessive iron may produce excessive iron storage [hemosiderosis]). Be alert to pts with rheumatoid arthritis (RA), iron deficiency anemia (acute exacerbation of joint pain, swelling may occur).
**Intervention/evaluation**

**Patient/family teaching**

- Pain, brown staining may occur at injection site.
- Oral iron should not be taken when receiving iron injections.
- Stools often become black with iron therapy, but this is harmless unless accompanied by red streaking, sticky consistency of stool, abdominal pain/cramping, which should be reported to physician.
- Oral hygiene, hard candy, gum may reduce metallic taste.
- Immediately report fever, back pain, headache.

<table>
<thead>
<tr>
<th>iron sucrose</th>
</tr>
</thead>
<tbody>
<tr>
<td>iron soo-krose</td>
</tr>
<tr>
<td>Venofer</td>
</tr>
</tbody>
</table>

**CLASSIFICATION**

**PHARMACOTHERAPEUTIC**: Trace element.

**CLINICAL**: Hematinic iron preparation.

**Do not confuse iron sucrose with iron dextran.**

**Uses**

Treatment of iron deficiency anemia in chronic kidney disease. **OFF-LABEL**: Chemotherapy-associated anemia.

**Precautions**

**Contraindications**: Hypersensitivity to iron sucrose. **Cautions**: History of allergies, bronchial asthma; hepatic impairment, rheumatoid arthritis, preexisting cardiac disease. Pts at risk for significant hypotension.

**Action**

Essential component in formation of Hgb. Necessary for effective erythropoiesis,
transport and utilization of oxygen. Serves as cofactor of several essential enzymes. **Therapeutic Effect:** Replenishes body iron stores in pts on chronic hemodialysis who have iron deficiency anemia and are receiving erythropoietin.

**Pharmacokinetics**

Distributed mainly in blood and to some extent in extravascular fluid. Iron sucrose is dissociated into iron and sucrose by reticuloendothelial system. Sucrose component is eliminated mainly by urinary excretion. **Half-life:** 6 hrs.

**Lifespan considerations**

**Pregnancy/Lactation:** Unknown if drug crosses placenta or is distributed in breast milk. **Children:** Safety and efficacy not established. **Elderly:** Age-related renal impairment may require dosage adjustment.

**Interactions**

**DRUG:** None significant. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** Increases Hgb, Hct; serum ferritin, transferrin.

**Availability (Rx)**

**Injection Solution:** 20 mg of elemental iron/mL in 2.5-mL, 5-mL, 10-mL vials.

**Administration/handling**

Administer directly into dialysis line during hemodialysis.

**IV**

**Reconstitution**

- May give undiluted as slow IV injection or IV infusion. For IV infusion, dilute 100-mg (5-mL) vial in maximum of 100 mL 0.9% NaCl immediately before infusion. (Do not dilute to concentration less than 1 mg/mL in children.)
- Dilute large doses in maximum of 250 mL 0.9% NaCl.

**Rate of Administration**

- For IV injection, administer 100–200 mg (5–10 mL) over 2–5 min.
- For IV infusion, administer 100 mg over at least 15 min; 300 mg over 1.5 hrs;
400 mg over 2.5 hrs; 500 mg over 3.5–4 hrs.

Storage
- Store at room temperature.
- Following dilution, stable for 7 days at room temperature or if refrigerated.

IV incompatibilities
Do not mix with other medications or add to parenteral nutrition solution for IV infusion.

Indications/routes/dosage

Iron Deficiency Anemia
Dosage is expressed in terms of milligrams of elemental iron.

**IV: ADULTS, ELDERLY (HEMODIALYSIS-DEPENDENT PTS):** 5 mL iron sucrose (100 mg elemental iron) delivered during dialysis; administer 1–3 times/wk to total dose of 1,000 mg in 10 doses. Give no more than 3 times/wk.

**CHILDREN 2 YRS AND OLDER:** 0.5 mg/kg/dose (Maximum: 100 mg) q2wks for 6 doses. **(PERITONEAL DIALYSIS–DEPENDENT PTS):** Two infusions of 300 mg over 90 min 14 days apart followed by a single 400-mg dose over 2 1/2 hrs 14 days later. **CHILDREN 2 YRS AND OLDER:** 0.5 mg/kg/dose (Maximum: 100 mg) q4wks for 3 doses. **(NON–DIALYSIS-DEPENDENT PTS):** 200 mg over 2–5 min on 5 different occasions within 14 days. **CHILDREN 2 YRS AND OLDER:** 0.5 mg/kg/dose (Maximum: 100 mg) q4wks for 3 doses.

Dosage in Renal/Hepatic Impairment
No dose adjustment.

Side effects
**Frequent (36%–23%):** Hypotension, leg cramps, diarrhea.

Adverse effects/toxic reactions
Too-rapid IV administration may produce severe hypotension, headache,
vomiting, nausea, dizziness, paresthesia, abdominal/muscle pain, edema, cardiovascular collapse. Hypersensitivity reaction occurs rarely.

**Nursing considerations**

**Intervention/evaluation**
Initially, monitor Hgb, Hct, serum ferritin, transferrin monthly, then q2–3mos thereafter. Reliable serum iron values can be obtained 48 hrs following administration.

<table>
<thead>
<tr>
<th>isavuconazonium</th>
</tr>
</thead>
<tbody>
<tr>
<td>eye-sa-vue-kon-a-zoe-nee-um</td>
</tr>
</tbody>
</table>

*Cressemba*

◆ **CLASSIFICATION**

PHARMACOTHERAPEUTIC: Azole antifungal derivative.

CLINICAL: Antifungal.

**Uses**

Treatment of invasive aspergillosis and invasive mucormycosis in pts 18 yrs and older.

**Precautions**

**Contraindications:** Hypersensitivity to isavuconazonium or isavuconazole, concomitant use of strong CYP3A inhibitors (e.g., ketoconazole, ritonavir), strong CYP3A inducers (e.g., carBAMazepine, rifAMPin, St. John’s wort), history of short QT syndrome. **Cautions:** Renal/hepatic impairment, hypersensitivity to other azoles. Pts at risk for acute pancreatitis; concomitant use of nephrotoxic medications; pts at risk for hypokalemia, hypomagnesemia. Concomitant use of medications that prolong QT interval.

**Action**

Isavuconazonium is the prodrug of isavuconazole. Interferes with fungal
cytochrome activity, decreasing ergosterol synthesis, inhibiting fungal cell membrane formation. **Therapeutic Effect:** Damages fungal cell wall membrane.

### Pharmacokinetics

Widely distributed. Metabolized in liver. Protein binding: greater than 99%. Peak plasma concentration: 2–3 hrs. Excreted in feces (46%), urine (46%). **Half-life:** 130 hrs.

### Lifespan considerations

**Pregnancy/Lactation:** May cause fetal harm. Avoid pregnancy. Avoid breastfeeding while taking Cresemba. **Children:** Safety and efficacy not established in pts younger than 18 yrs. **Elderly:** No age-related precautions noted.

### Interactions

**DRUG:** Strong CYP3A4 inhibitors (e.g., ketoconazole, ritonavir) may increase concentration/effect. **Strong CYP3A4 inducers** (e.g., carBAMazepine, rifAMPin) may decrease concentration/effect. **Medications that prolong QT interval** (e.g., amiodarone, azithromycin, ceritinib, haloperidol, moxifloxacin) may increase the risk of QT interval prolongation, cardiac arrhythmias. May increase concentration/effects of **atorvastatin, buPROPion, cycloSPORINE, digoxin, midazolam, mycophenolate mofetil/sirolimus, tacrolimus.** **HERBAL:** St. John’s wort may decrease concentration/effect. **FOOD:** None known. **LAB VALUES:** May increase serum alkaline phosphatase, ALT, AST, bilirubin. May decrease serum potassium, magnesium.

### Availability (Rx)

**Injection Powder:** 372 mg/vial (equivalent to 200 mg isavuconazole). **Capsules:** 186 mg (equivalent to 100 mg isavuconazole).

### Administration/handling

**IV**
Reconstitution
• Reconstitute vial with 5 mL Sterile Water for Injection.
• Gently shake until completely dissolved.
• Visually inspect for particulate matter or discoloration. Solution may contain visible translucent to white particles.
• Inject reconstituted solution into 250 mL 0.9% NaCl or 5% Dextrose injection.
• Gently invert bag to mix. Do not shake or agitate. Do not use pneumatic transport system.
• Diluted solution may also contain visible translucent to white particles (which will be removed by in-line filter).

Administration
• Do not give as IV push or bolus. Flush IV line with 0.9% NaCl or 5% Dextrose injection prior to and after infusion.

Rate of Administration
• Infuse over 60 min (minimum) using 0.2- to 1.2-micron in-line filter.

Storage
• Diluted solution may be stored at room temperature up to 6 hrs or refrigerated up to 24 hrs.
• Do not freeze.

PO
• Give without regard to meals.
• Do not cut, crush, divide, or open capsules.

Indications/routes/dosage

Note: 372 mg is equivalent to 200 mg isavuconazole.

Invasive Aspergillosis, Invasive Mucormycosis

Dosage in Renal Impairment
No dose adjustment.

Dosage in Hepatic Impairment

Mild to moderate impairment: No dose adjustment. Severe impairment: Not specified; use caution.

Side effects

Frequent (28%–17%): Nausea, vomiting, diarrhea, abdominal pain, headache, dyspnea. Occasional (15%–6%): Peripheral edema, constipation, fatigue, insomnia, back pain, delirium, agitation, confusion, disorientation, chest pain, rash, pruritus, hypotension, anxiety, dyspepsia, injection site reaction, decreased appetite.

Adverse effects/toxic reactions

Severe hepatic injury including cholestasis, hepatitis, hepatic failure reported in pts with underlying medical conditions (e.g., hematologic malignancies). Infusion-related reactions including chills, dizziness, dyspnea, hypoesthesia, hypotension, paresthesia may occur. Acute respiratory failure, renal failure, Stevens-Johnson syndrome, serious hypersensitivity reaction (including anaphylaxis) were reported.

Nursing considerations

Baseline assessment

Obtain baseline LFT. Confirm negative pregnancy test before initiating treatment. Specimens for fungal culture, histopathology should be obtained prior to initiating therapy. Receive full medication history and screen for interactions/contraindications. Question history of hypersensitivity reaction, hepatic impairment.

Intervention/evaluation

Patient/family teaching

- Swallow capsule whole; do not chew, crush, cut, or open capsules.
- Treatment may cause fetal harm. Females of reproductive potential should use effective contraception. Immediately report suspected pregnancy.
- Do not take herbal products such as St. John’s wort.
- Report liver problems such as upper abdominal pain, bleeding, dark or amber-colored urine, nausea, vomiting, or yellowing of the skin or eyes.
- Report decreased urinary output, extremity swelling, dark-colored urine; skin changes such as rash, skin bubbling, or sloughing.

**isoniazid**
eye-soe-nye-a-zid

**Isotamine**

**Fixed-Combination(s)**

**Rifamate:** isoniazid/rifAMPin (antitubercular): 150 mg/300 mg.

**Rifater:** isoniazid/pyrazinamide/rifAMPin (antitubercular): 50 mg/300 mg/120 mg.

**CLASSIFICATION**

**PHARMACOTHERAPEUTIC:** Isonicotinic acid derivative.

**CLINICAL:** Antitubercular.

■ **BLACK BOX ALERT** ■ Severe, potentially fatal hepatitis may occur.

**Uses**

Treatment of susceptible active tuberculosis due to *Mycobacterium tuberculosis*. Treatment of latent tuberculosis caused by *Mycobacterium tuberculosis*.

**Precautions**

**Contraindications:** Hypersensitivity to isoniazid (including drug-induced hepatitis), acute hepatic disease, hepatic injury or severe adverse reactions with previous isoniazid therapy. **Cautions:** Chronic hepatic disease, alcoholism,
severe renal impairment. Pregnancy, pts at risk for peripheral neuropathy, HIV infection, history of hypersensitivity reactions to latent TB infection medications.

**Action**

Inhibits mycolic acid synthesis. Causes disruption of bacterial cell wall, loss of acid-fast properties in susceptible mycobacteria. **Therapeutic Effect:** Bactericidal against actively growing intracellular, extracellular susceptible mycobacteria.

**Pharmacokinetics**

**Note:** Isoniazid is metabolized by acetylation. The rate of acetylation is genetically determined (e.g., 50% of black and caucasian pts are slow inactivators; Eskimo and Asian pts are rapid inactivators. Slower inactivation may lead to higher blood levels and increased adverse effects.

Readily absorbed from GI tract. Protein binding: 10%–15%. Widely distributed (including to CSF). Metabolized in liver. Primarily excreted in urine. Removed by hemodialysis. **Half-life:** (Fast acetylators): 30–100 min; (slow acetylators): 2–5 hrs.

**Lifespan considerations**

**Pregnancy/Lactation:** Prophylaxis usually postponed until after delivery. Crosses placenta. Distributed in breast milk. **Children:** No age-related precautions noted. **Elderly:** More susceptible to developing hepatitis.

**Interactions**

**DRUG:** Alcohol may increase isoniazid metabolism, risk of hepatotoxicity. May increase toxicity of carBAMazepine, phenytoin. **Hepatotoxic medications (e.g., acetaminophen, simvastatin)** may increase risk of hepatotoxicity. May decrease ketoconazole concentration. **HERBAL:** None significant. **FOOD:** Foods containing tyramine may cause hypertensive crisis. **LAB VALUES:** May increase serum bilirubin, ALT, AST.

**Availability (Rx)**
**Oral Solution**: 50 mg/5 mL. **Solution, Injection**: 100 mg/mL. **Tablets**: 100 mg, 300 mg.

**Administration/handling**

**PO**
- Give 1 hr before or 2 hrs following meals (may give with food to decrease GI upset, but will delay absorption).
- Administer at least 1 hr before antacids, esp. those containing aluminum.

**Indications/routes/dosage**

**Active Tuberculosis (in Combination with One or More Antituberculars)**

**IM/PO**: **ADULTS, ELDERLY**: 5 mg/kg once daily. **Usual dose**: 300 mg. **CHILDREN WEIGHTING LESS THAN 40 KG**: 10–15 mg/kg once daily. **Maximum**: 300 mg.

**Note**: Give isoniazid with rifAMPin, pyrazinamide, and with or without ethambutol for 8 wks, then give with rifAMPin for 18 wks.

**Latent Tuberculosis**

**Note**: Give for 9 mos.

**IM/PO**: **ADULTS, ELDERLY**: 5 mg/kg once daily (**Maximum**: 300 mg) or 15 mg/kg twice wkly (**Maximum**: 900 mg). **CHILDREN**: 10–20 mg/kg/day as a single daily dose. **Maximum**: 300 mg/day or 20–40 mg/kg 2 times/wk. **Maximum**: 900 mg/dose.

**Dosage in Renal Impairment**

No dose adjustment.

**Dosage in Hepatic Impairment**

Use caution. Contraindicated with acute hepatic disease.

**Side effects**
Frequent: Nausea, vomiting, diarrhea, abdominal pain. Rare: Pain at injection site, hypersensitivity reaction.

Adverse effects/toxic reactions
Neurotoxicity (ataxia, paresthesia), optic neuritis, hepatotoxicity occur rarely.

Nursing considerations

Baseline assessment
Question for history of hypersensitivity reactions, hepatic injury or disease, sensitivity to nicotinic acid or chemically related medications. Ensure collection of specimens for culture, sensitivity. Evaluate initial LFT.

Intervention/evaluation
Monitor LFT, assess for hepatitis: anorexia, nausea, vomiting, weakness, fatigue, dark urine, jaundice (withhold concurrent INH therapy and inform physician promptly). Assess for paresthesia of extremities (pts esp. at risk for neuropathy may be given pyridoxine prophylactically: malnourished, elderly, diabetics, pts with chronic hepatic disease [including alcoholics]). Be alert for fever, skin eruptions (hypersensitivity reaction).

Patient/family teaching
• Do not skip doses; continue to take isoniazid for full length of therapy (6–24 mos).
• Take preferably 1 hr before or 2 hrs following meals (with food if GI upset).
• Avoid alcohol during treatment.
• Do not take any other medications, including antacids, without consulting physician.
• Must take isoniazid at least 1 hr before antacid.
• Avoid tuna, sauerkraut, aged cheeses, smoked fish (consult list of tyramine-containing foods), which may cause hypertensive reaction (red/itching skin, palpitations, light-headedness, hot or clammy feeling, headache).
• Report any new symptom, immediately for vision difficulties, nausea/vomiting, dark urine, yellowing of skin/eyes (jaundice), fatigue, paresthesia of extremities.
isosorbide dinitrate

eye-soe-sor-bide

ISDN

IsoDitrate ER

Dilatrate-SR

Isordil

isosorbide mononitrate

Apo-ISMN

Fixed-Combination(s)

BiDil: isosorbide dinitrate/hydrALAZINE (a vasodilator): 20 mg/37.5 mg.

CLASSIFICATION
PHARMACOTHERAPEUTIC: Nitrate.

CLINICAL: Antianginal.

Do not confuse Imdur with Imuran, Inderal, or K-Dur, Isordil with Inderal, Isuprel, or Plendil.

Uses

Dinitrate: Prevention and treatment of angina pectoris due to coronary artery disease. Mononitrate: Treatment (immediate release only) and prevention of angina pectoris due to coronary artery disease.

Precautions

Contraindications: Hypersensitivity to nitrates, concurrent use of sildenafil, tadalafil, vardenafil. Cautions: Inferior wall MI, head trauma, increased intracranial pressure (ICP), orthostatic hypotension, blood volume depletion from diuretic therapy, systolic B/P less than 90 mm Hg, hypertrophic cardiomyopathy, alcohol consumption.
**Action**

Stimulates intracellular cyclic guanosine monophosphate. **Therapeutic Effect:** Relaxes vascular smooth muscle of arterial, venous vasculature. Decreases preload, afterload, cardiac oxygen demand.

**Pharmacokinetics**

</table>

Dinitrate poorly absorbed and metabolized in liver to its active metabolite isosorbide mononitrate. Mononitrate well absorbed after PO administration. Primarily excreted in urine. **Half-life:** Dinitrate, 1–4 hrs; mononitrate, 4 hrs.

**Lifespan considerations**

**Pregnancy/Lactation:** Unknown if drug crosses placenta or is distributed in breast milk. **Children:** Safety and efficacy not established. **Elderly:** May be more sensitive to hypotensive effects. Age-related renal impairment may require dosage adjustment.

**Interactions**

**DRUG:** Alcohol, antihypertensives (e.g., amLODOpine, lisinopril, valsartan) may increase risk of orthostatic hypotension. **Sildenafil, tadalafil, vardenafil** may potentiate hypotensive effects (concurrent use of these agents is contraindicated). **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** May increase urine catecholamine, urine vanillylmandelic acid levels.

**Availability (Rx)**

**Dinitrate**

**Tablets:** 5 mg, 10 mg, 20 mg, 30 mg, 40 mg.
**Capsules, Extended-Release:** 40 mg.  **Tablets, Extended-Release:** 40 mg.

**Mononitrate**

**Tablets:** 10 mg, 20 mg.

**Tablets, Extended-Release:** 30 mg, 60 mg, 120 mg.

**Administration/handling**

**PO**

- Best if taken on an empty stomach.
- Do not administer around the clock.
- Oral tablets may be crushed.
- Do not crush/break sustained-, extended-release form.

**Indications/routes/dosage**

**Angina**

**PO (Isosorbide Dinitrate) (Immediate-Release):** ADULTS, ELDERLY: Initially, 5–20 mg 2–3 times/day. **Maintenance:** 10–40 mg (or between 5–80 mg) 2–3 times/day.

**(Sustained-Release):** ADULTS, ELDERLY: 40 mg 1–2 times/day. A nitrate-free interval of greater than 18 hrs is recommended. **Maximum:** 160 mg/day.

**PO (Isosorbide Mononitrate) (Immediate-Release):** ADULTS, ELDERLY: 20 mg twice daily given 7 hrs apart to decrease tolerance development. In pts with small stature, may start at 5 mg twice daily and titrate to at least 10 mg twice daily in first 2–3 days of therapy.

**(Sustained-Release):** Initially, 30–60 mg/day in morning as a single dose. May increase dose at 3-day intervals to 120 mg once daily. **Maximum daily single dose:** 240 mg.

**Dosage in Renal/Hepatic Impairment**

No dose adjustment.

**Side effects**
Frequent: Headache (may be severe) occurs mostly in early therapy, diminishes rapidly in intensity, usually disappears during continued treatment. Occasional: Transient flushing of face/neck, dizziness, weakness, orthostatic hypotension, nausea, vomiting, restlessness. GI upset, blurred vision, dry mouth. Sublingual: Frequent: Burning, tingling at oral point of dissolution.

Adverse effects/toxic reactions
Discontinue if blurred vision occurs. Severe orthostatic hypotension manifested by syncope, pulselessness, cold/clammy skin, diaphoresis has been reported. Tolerance may occur with repeated, prolonged therapy, but may not occur with extended-release form. Minor tolerance with intermittent use of sublingual tablets. High dosage tends to produce severe headache.

Nursing considerations

Baseline assessment
Record onset, type (sharp, dull, squeezing), radiation, location, intensity, duration of anginal pain; precipitating factors (exertion, emotional stress). If headache occurs during management therapy, administer medication with meals.

Intervention/evaluation
Assist with ambulation if light-headedness, dizziness occurs. Assess for facial/neck flushing. Monitor number of anginal episodes, orthostatic B/P.

Patient/family teaching
• Do not chew, crush, dissolve, or divide sublingual, extended-release, sustained-release forms.
• Take sublingual tablets while sitting down.
• Go from lying to standing slowly (prevents dizziness effect).
• Take oral form on empty stomach (however, if headache occurs during management therapy, take medication with meals).
• Dissolve sublingual tablet under tongue; do not swallow.
• Avoid alcohol (intensifies hypotensive effect).
• If alcohol is ingested soon after taking nitrates, possible acute hypotensive episode (marked drop in B/P, vertigo, pallor) may occur.
• Report signs/symptoms of hypotension, angina.

itraconazole
it-ra-kon-a-azole
Onmel
Sporanox

♦ CLASSIFICATION
PHARMACOTHERAPEUTIC: Imidazole/triazole type antifungal.
CLINICAL: Antifungal.

■ BLACK BOX ALERT ■ Serious cardiovascular events, including HF, ventricular tachycardia, torsades de pointes, death, have occurred due to concurrent use with colchicine (pts with renal/hepatic impairment), dofetilide, dronedarone, eplerenone, ergot alkaloids, felodipine, fesoterodine, irinotecan, ivabradine, levomethadyl, lovastatin, lurasidone, methadone, midazolam (oral), pimozide, quiNIDine, ranolazine, simvastatin, solifenacin, ticagrelor, or triazolam. Negative inotropic effects observed following IV administration. Contraindicated for treatment of onychomycosis in pts with HF, ventricular dysfunction.

Do not confuse itraconazole with fluconazole, or Sporanox with Suprax or Topamax.

Uses

Precautions

Contraindications: Hypersensitivity to itraconazole, other azoles. Treatment of onychomycosis in pts with evidence of ventricular dysfunction (e.g., HF or history of HF); concurrent use of dofetilide, dronedarone, eplerenone, ergot
derivatives, felodipine, irinotecan, lovastatin, lurasidone, methadone, midazolam (oral), pimozide, ranolazine, simvastatin, ticagrelor, triazolam, quiNIDine; concurrent use with colchicine, fesoterodine, solifenacin in pts with renal/hepatic impairment; treatment of onychomycosis in women who are pregnant or are intending to become pregnant. **Cautions:** Preexisting hepatic impairment (not recommended in pts with active hepatic disease, elevated LFTs), renal impairment, pts with risk factors for HF (e.g., COPD, myocardial ischemia).

**Action**

Inhibits synthesis of ergosterol (vital component of fungal cell formation). **Therapeutic Effect:** Damages fungal cell membrane, altering its function. Fungistatic.

**Pharmacokinetics**

Moderately absorbed from GI tract. Absorption is increased when taken with food. Protein binding: 99%. Widely distributed, primarily in fatty tissue, liver, kidneys. Metabolized in liver. Primarily excreted in urine. Not removed by hemodialysis. **Half-life:** 16–26 hrs.

**Lifespan considerations**

**Pregnancy/Lactation:** Distributed in breast milk. **Children:** Safety and efficacy not established. **Elderly:** Age-related renal impairment may require dosage adjustment.

**Interactions**

**DRUG:** May increase concentration/toxicity of calcium channel–blocking agents (e.g., felodipine, NIFEdipine), carBAMazepine, cycloSPORINE, digoxin, ergot alkaloids, HMG-CoA reductase inhibitors (e.g., lovastatin, simvastatin), midazolam, oral antidiabetic agents (e.g., glyBURIDe, glipiZIDE), protease inhibitors (e.g., indinavir, ritonavir, saquinavir), sirolimus, tacrolimus, triazolam, warfarin. CYP3A4 inducers (e.g., carBAMazepine, isoniazid, PHENobarbital, phenytoin, rifAMPin) may decrease concentration/effects. May inhibit metabolism of busulfan, DOCEtaxel, vinca alkaloids. **Erythromycin** may increase risk of cardiac
toxicity. **Antacids, H₂ antagonists, proton pump inhibitors** may decrease absorption. **HERBAL:** St. John’s wort may decrease concentration. **FOOD:** Grapefruit products may alter absorption. **LAB VALUES:** May increase serum alkaline phosphatase, bilirubin, ALT, AST, LDH. May decrease serum potassium.

**Availability (Rx)**
Capsules: 100 mg. **Oral Solution:** 10 mg/mL. **Tablet:** 200 mg.

**Administration/handling**

**PO**
- Give capsules and tablets with food (increases absorption).
- Give solution on empty stomach. Swish vigorously in mouth, then swallow.

**Indications/routes/dosage**

**Note:** Capsules/tablets are not bioequivalent with oral solution.

**Blastomycosis, Histoplasmosis**
**PO:** **ADULTS, ELDERLY:** Initially, 200 mg once daily. May increase in increments of 100 mg/day up to 400 mg/day. **Life-threatening infections:** 200 mg 3 times/day for first 3 days of therapy. Continue for at least 3 mos.

**Aspergillosis**
**PO:** **ADULTS, ELDERLY:** 200–400 mg daily for 3 mos. **Life-threatening infections:** 200 mg 3 times/day for first 3 days of therapy. Continue 200–400 mg/day for at least 3 mos.

**Esophageal Candidiasis**
**PO:** **ADULTS, ELDERLY:** Swish 100–200 mg (10–20 mL) in mouth for several seconds, then swallow once daily for a minimum of 3 wks. Continue for 2 wks after resolution of symptoms. **Maximum:** 200 mg/day.

**Oropharyngeal Candidiasis**
PO: ADULTS, ELDERLY: 200 mg (10 mL) oral solution, swish and swallow once daily for 7–14 days.

Onychomycosis (Fingernail)
PO: ADULTS, ELDERLY: 200 mg twice daily for 7 days, off for 21 days, repeat 200 mg twice daily for 7 days.

Onychomycosis (Toenail)
PO: ADULTS, ELDERLY: 200 mg once daily for 12 wks.

Dosage in Renal/Hepatic Impairment
Use caution.

Side effects
Frequent (11%–9%): Nausea, rash. Occasional (5%–3%): Vomiting, headache, diarrhea, hypertension, peripheral edema, fatigue, fever. Rare (2% or less): Abdominal pain, dizziness, anorexia, pruritus.

Adverse effects/toxic reactions
Hepatitis (anorexia, abdominal pain, unusual fatigue/weakness, jaundiced skin/sclera, dark urine) occurs rarely.

Nursing considerations

Baseline assessment
Determine baseline temperature, LFT. Assess allergies. Receive full medication history (numerous contraindications/cautions).

Intervention/evaluation
Assess for signs, symptoms of hepatic dysfunction. Monitor LFT in pts with preexisting hepatic impairment.

Patient/ family teaching
• Take capsules with food, liquids if GI distress occurs.
• Therapy will continue for at least 3 mos, until lab tests, clinical presentation indicate infection is controlled.
• Immediately report unusual fatigue, yellow skin, dark urine, pale stool, anorexia, nausea, vomiting.
• Avoid grapefruit products.

ivabradine
eye-vab-ra-deen
Corlanor

CLASSIFICATION
PHARMACOTHERAPEUTIC: Hyperpolarization-activated cyclic nucleotide-gated (HCN) channel blocker.
CLINICAL: Reduces risk of worsening HF.

Uses
To reduce the risk of hospitalization for worsening HF in pts with stable, symptomatic chronic HF with left ventricular ejection fraction less than or equal to 35%, who are in sinus rhythm with a resting heart rate greater than or equal to 70 bpm, and either are on maximally tolerated dose of beta blockers or have a contraindication to beta blocker use.

Precautions
Contraindications: Hypersensitivity to ivabradine. Acute decompensated HF, B/P less than 90/50 mm Hg, sick sinus syndrome; sinoatrial block or third-degree AV block (unless a functional pacemaker is present), resting heart rate less than 60 bpm prior to initiation, severe hepatic impairment, pacemaker dependence (heart rate maintained exclusively by a pacemaker), concomitant use of strong CYP3A4 inhibitors. Cautions: History of atrial fibrillation, hypertension. Avoid concomitant use of diltiaZEM or verapamil. Avoid use in pts with second-degree heart block (unless a functioning pacemaker is present). Pts at risk for bradycardia. Not recommended with pacemakers set to rate of 60 bpm or greater.
**Action**

Reduces spontaneous pacemaker activity of the cardiac sinus node by blocking HCN channels that are responsible for cardiac current, which regulates heart rate. Does not affect ventricular repolarization or myocardial contractility. Also inhibits retinal current involved in reducing bright light in retina. **Therapeutic Effect:** Reduces heart rate.

**Pharmacokinetics**

Widely distributed. Metabolized in liver and intestines. Protein binding: 70%. Peak plasma concentration: 1 hr. Eliminated in feces, urine (% not specified). **Half-life:** 6 hrs.

**Lifespan considerations**

**Pregnancy/Lactation:** May cause fetal harm. Females of reproductive potential should use effective contraception. Unknown if distributed in breast milk. Must either discontinue drug or discontinue breastfeeding. If treatment is decided to be absolutely necessary, pregnant pts should be closely monitored for destabilizing HF, esp. during the first trimester. Pregnant women with chronic HF in the third trimester should be closely monitored for preterm birth. **Children:** Safety and efficacy not established. **Elderly:** No age-related precautions noted.

**Interactions**

**DRUG:** Beta blockers (e.g., labetalol, metoprolol), negative chronotropes (e.g., amiodarone, digoxin, diltiazEM, verapamil) may increase risk of bradycardia. **DiltiazEM, verapamil** may increase concentration/effect; may further increase risk of bradycardia. **Strong CYP3A4 inhibitors** (e.g., clarithromycin, itraconazole) may increase concentration/effect. **CYP3A4 inducers** (e.g., phenytoin, rifAMPin) may decrease concentration/effect. **HERBAL:** St. John’s wort may decrease concentration/effect. **FOOD:** Grapefruit products may increase concentration/effect. **LAB VALUES:** None significant.

**Availability (Rx)**
Tablets: 5 mg, 7.5 mg.

Administration/handling

PO
• Give with meals. May divide 5-mg tablet, providing 2.5-mg dose.

Indications/routes/dosage

HF

PO: ADULTS, ELDERLY: Initially, 5 mg twice daily for 14 days, then adjust dose to resting heart rate of 50–60 bpm. Further adjustments based on resting heart rate and tolerability. **Maximum dose:** 7.5 mg twice daily. (See Dose Modification below). **Pts with history of conduction defects, pts in whom bradycardia could lead to hemodynamic compromise:** Initiate therapy at 2.5 mg twice daily.

Dose Modification
Adjust dose to maintain a resting heart between 50–60 bpm as follows:

<table>
<thead>
<tr>
<th>Heart rate</th>
<th>Dose Adjustment</th>
</tr>
</thead>
<tbody>
<tr>
<td>Greater than 60 bpm</td>
<td>Increase by 2.5 mg (given twice daily) up to maximum dose of 7.5 mg daily.</td>
</tr>
<tr>
<td>50–60 bpm</td>
<td>Maintain dose.</td>
</tr>
<tr>
<td>Less than 50 bpm or symptomatic bradycardia</td>
<td>Decrease by 2.5 mg (given twice daily); if current dose is 2.5 mg twice daily, permanently discontinue.</td>
</tr>
</tbody>
</table>

Dosage in Renal Impairment
**Mild to moderate impairment:** No dose adjustment. **Severe impairment:** Use caution.

Dosage in Hepatic Impairment
**Mild impairment:** No dose adjustment. **Moderate impairment:** ADULTS, ADOLESCENTS, CHILDREN 6 YRS AND OLDER: 150 mg once daily. CHILDREN 2–5 YRS: (14 KG OR GREATER): 75 mg granule packet once daily. **Severe**
impairment: ADULTS, ADOLESCENTS, CHILDREN 6 YRS AND OLDER: 150 mg once daily or less frequently. CHILDREN 2–5 YRS: (14 KG OR GREATER): 75 mg granule packet once daily or less frequently. (LESS THAN 14 KG): 50 mg granule packet once daily or less frequently.

**Side effects**

Occasional (10%–3%): Bradycardia, hypertension, phosphenes (visual disturbances, luminous phenomena), visual brightness.

**Adverse effects/toxic reactions**

May increase risk of atrial fibrillation (8.3% of pts). Bradycardia, sinus arrest, or heart block may occur. Bradycardia occurred in 10% of pts. Risk factors for bradycardia may include sinus node dysfunction, conduction defects (e.g., first- or second-degree AV block, bundle branch block), ventricular dyssynchrony, or use of negative chronotropic drugs. Phosphenes, a transient enhanced brightness in the visual field (which may include halos, stroboscopic or kaleidoscopic effect, colored bright lights, or multiple images) may occur. Phosphenes are usually triggered by sudden variations in light intensity and generally occur within the first 2 mos of treatment. Other adverse reactions such as angioedema, diplopia, erythema, hypotension, pruritus, rash, syncope, urticaria, vertigo, visual impairment occur rarely. Overdose may lead to severe and prolonged bradycardia requiring temporary cardiac pacing or infusion of IV beta-stimulating agents.

**Nursing considerations**

**Baseline assessment**

Obtain baseline HR, B/P. Confirm negative pregnancy test before initiating therapy. Receive full medication history and screen for interactions. Screen for contraindications as listed in Precautions. Question history of atrial fibrillation, bradycardia, hypertension.

**Intervention/evaluation**

Frequently monitor HR, B/P. Diligently monitor for atrial fibrillation,
bradycardia, syncope. If symptomatic bradycardia occurs, temporary cardiac pacing or infusion of beta-stimulating agents may be warranted. Immediately report suspected pregnancy. Monitor for hypersensitivity reaction. Monitor for visual changes. Initiate fall precautions.

**Patient/family teaching**

- Take medication with meals.
- Avoid grapefruit products, herbal supplements such as St. John’s wort.
- Treatment may cause fetal harm. Female pts of reproductive potential should use effective contraception during treatment.
- Report symptoms of low heart rate such as confusion, dizziness, fatigue, fainting, low blood pressure, pallor.
- Report symptoms of atrial fibrillation such as chest pressure, palpitations, shortness of breath.
- Treatment may cause luminous phenomena (phosphenes), a transient visual brightness that may include halos, light sensitivity, or colored bright lights.
- Avoid tasks that require alertness, motor skills until response to drug is established.
- Report allergic reactions such as hives, itching, rash, tongue swelling.

### Fixed-combination(s)

**Orkambi**: ivacaftor/lumacaftor (cystic fibrosis transmembrane conductance regulator): 125 mg/200 mg.

**CLASSIFICATION**

**PHARMACOTHERAPEUTIC**: Cystic fibrosis transmembrane conductance regulator potentiator.

**CLINICAL**: Cystic fibrosis agent.

### Uses

A cystic fibrosis transmembrane regulator (CFTR) potentiator used for the
treatment of cystic fibrosis (CF) in pts 2 yrs of age and older having one mutation in the CFTR gene that is responsive to ivacaftor.

**Precautions**

**Contraindications:** Hypersensitivity to ivacaftor. **Cautions:** Moderate to severe hepatic/renal impairment.

**Action**

Potentiates a specific protein to facilitate, regulate chloride ions, water transport. In cystic fibrosis pts with a specific gene mutation (G551D), a defect in chloride and water transport results in formation of thick mucus in lungs. **Therapeutic Effect:** Improves lung function, fewer respiratory exacerbations.

**Pharmacokinetics**

Readily absorbed. Peak concentration occurs in 4 hrs. Metabolized in liver. Protein binding: 99%. Primarily excreted in feces. **Half-life:** 12 hrs.

**Lifespan considerations**

**Pregnancy/Lactation:** Distributed in breast milk. **Children:** Safety and efficacy not established in children younger than 2 yrs. **Elderly:** No age-related precautions noted.

**Interactions**

**DRUG:** Strong CYP3A4 inducers (e.g., carBAMazepine, rifAMPin) substantially decrease concentration/effects. Concurrent use not recommended. **Strong CYP3A4 inhibitors (e.g., clarithromycin, ketoconazole)** significantly increase concentration. **Moderate CYP3A4 inhibitors (e.g., erythromycin, fluconazole)** may increase concentration and should not be given concurrently. **HERBAL:** St. John’s wort decreases concentration/effects. **FOOD:** Grapefruit products, Seville oranges should be avoided (increases concentration). **High-fat meals** increase absorption. **LAB VALUES:** May increase serum ALT, AST.
Availability (Rx)

Oral Granules: 50 mg, 75 mg. Tablets, Film-Coated: 150 mg.

Administration/handling

PO
• Give with a high-fat meal (e.g., eggs, butter, peanut butter, cheese pizza).

Indications/routes/dosage

Cystic Fibrosis

PO: ADULTS, CHILDREN 6 YRS AND OLDER: One 150-mg tablet q12h with fat-containing food. Total daily dose: 300 mg. CHILDREN 2–6 YRS, WEIGHING 14 KG OR MORE: 75-mg packet q12hr. CHILDREN 2–6 YRS, WEIGHING LESS THAN 14 KG: 50-mg packet q12hr.

Concurrent Use with Moderate CYP3A4 Inhibitors (e.g., fluconazole)

PO: ADULTS, CHILDREN 6 YRS AND OLDER: 150 mg once daily.

Concurrent Use with Strong CYP3A4 Inhibitors (e.g., clarithromycin, ketoconazole)

PO: ADULTS, CHILDREN 6 YRS AND OLDER: 150 mg twice wkly.

Dosage in Renal Impairment

Mild to moderate impairment: No dose adjustment. Severe impairment, ESRD: Use caution.

Dosage in Hepatic Impairment

Mild impairment: No dose adjustment. Moderate impairment: ADULTS, ELDERLY: 150 mg once daily. CHILDREN WEIGHING 14 KG OR MORE: 75 mg once daily. CHILDREN WEIGHING LESS THAN 14 KG: 50 mg once daily. Severe impairment: 150 mg once daily or q48h. Use caution.
Side effects

**Frequent (24%–10%):** Headache, nasal congestion, abdominal discomfort, diarrhea, nausea, rash. **Occasional (6%–5%):** Rhinitis, dizziness, arthralgia, bacteria in sputum. **Rare (4% and Less):** Myalgia, wheezing, acne.

Adverse effects/toxic reactions

Upper respiratory infection occurs in 22% of pts, nasopharyngitis in 15%. Increase in ALT, AST occurs in 6% of pts.

Nursing considerations

**Baseline assessment**

If the pt’s genotype is unknown, an FDA-cleared CF mutation test should be used to detect presence of a CFTR mutation. Assess LFT prior to and periodically during therapy.

**Intervention/evaluation**

Patients who develop increased serum ALT, AST levels should be closely monitored until the abnormalities resolve. Dosing should be interrupted if transaminases (serum ALT or AST) are greater than 5 times upper limit of normal. Transaminases should be obtained every 3 mos during the first year of treatment and annually thereafter.

**Patient/family teaching**

- Always take medication with fatty food.
- Avoid grapefruit products and Seville oranges.
- Adhere to routine laboratory testing as a part of treatment regimen.
- Report headache, diarrhea, rash, signs and symptoms of respiratory infection.
PHARMACOTHERAPEUTIC: Epothilone microtubule inhibitor, antimitotic agent.

CLINICAL: Antineoplastic.

■ BLACK BOX ALERT ■ Combination therapy with capecitabine is contraindicated in pts with serum ALT or AST greater than 2.5 times upper limit of normal (ULN) or bilirubin greater than 1 times ULN. Increased risk of toxicity, neutropenia-related mortality.

Uses

Combination therapy with capecitabine for treatment of metastatic or locally advanced breast cancer in pts after failure of anthracycline, taxane therapy. As monotherapy, treatment of metastatic or locally advanced breast cancer in pts after failure of anthracycline, taxane, and capecitabine therapy. OFF-LABEL: Treatment of endometrial cancer.

Precautions

Contraindications: Hypersensitivity to ixabepilone. Severe hypersensitivity reaction (grade 3 or 4) to Cremophor, baseline neutrophil count less than 1,500 cells/mm\(^3\) or platelet count less than 100,000 cells/mm\(^3\). Combination Capecitabine Therapy: Serum ALT or AST greater than 2.5 times the upper limit of normal, bilirubin greater than 1 times the upper limit of normal. Cautions: Diabetes, existing moderate to severe neuropathy, history of cardiovascular disease. Monotherapy: Serum ALT or AST greater than 5 times upper limit of normal bilirubin greater than 3 times upper limit of normal.

Action

Binds directly on microtubules during active stage of G2 and M phases of cell cycle, preventing formation of microtubules, an essential part of the process of separation of chromosomes. Therapeutic Effect: Blocks cells in mitotic phase of cell division, leading to cell death.

Pharmacokinetics
Metabolized in liver. Protein binding: 77%. Excreted in feces (65%), urine (21%). **Half-life**: 52 hrs.

**Lifespan considerations**

**Pregnancy/Lactation**: May cause fetal harm. Unknown if distributed in breast milk. **Children**: Safety and efficacy not established. **Elderly**: Higher incidence of severe adverse reactions in those older than 65 yrs.

**Interactions**

**DRUG**: CYP3A4 inhibitors (e.g., atazanavir, clarithromycin, indinavir, itraconazole, ketoconazole, nefazodone, ritonavir, voriconazole) may increase concentration. CYP3A4 inducers (e.g., carBAMazepine, dexamethasone, phenytoin, rifAMPin) may decrease concentration. **HERBAL**: St. John’s wort may decrease plasma concentration. **FOOD**: Grapefruit products may increase plasma concentration. **LAB VALUES**: May increase serum ALT, AST, bilirubin. May decrease WBCs, Hgb, platelets.

**Availability (Rx)**

**Injection, Solution: Kit**: 15-mg kit supplied with diluent for Ixempra, 8 mL; 45 mg supplied with diluent for Ixempra, 23.5 mL.

**Administration/handling**

**IV**

**Reconstitution**

- Withdraw diluent and slowly inject into vial.
- Gently swirl and invert until powder is completely dissolved.
- Further dilute with 250 mL lactated Ringer’s.
- Solution may be stored in vial for a maximum of 1 hr at room temperature.
- Final concentration for infusion must be between 0.2 mg/mL and 0.6 mg/mL.
- Mix infusion bag by manual rotation.

**Rate of Administration**

- Administer through an in-line filter of 0.2 to 1.2 microns.
- Infuse over 3 hrs. Administration must be completed within 6 hrs of reconstitution.
Storage
• Refrigerate kit.
• Prior to reconstitution, kit should be removed from refrigerator and allowed to stand at room temperature for approximately 30 min.
• When vials are initially removed from refrigerator, a white precipitate may be observed in the diluent vial.
• This precipitate will dissolve to form a clear solution once diluent warms to room temperature.
• Once diluted with lactated Ringer’s, solution is stable at room temperature and room light for a maximum of 6 hrs.

Indications/routes/dosage

Alert An H₁ antagonist (diphenhydrAMINE 50 mg PO or equivalent) and an H₂ antagonist (raNITIdine 150–300 mg PO or equivalent) must be given prior to beginning treatment with ixabepilone. Pts who experienced a previous hypersensitivity reaction to ixabepilone require pretreatment with corticosteroids (e.g., dexamethasone 20 mg IV 30 min before infusion, or PO 1 hr before infusion) in addition to pretreatment with H₁ and H₂ antagonists.

Breast Cancer
IV: ADULTS, ELDERLY: 40 mg/m² infused over 3 hrs q3 wks. Maximum: 88 mg.

Monotherapy Dosage Adjustments for Hepatic Impairment

Mild Hepatic Impairment (ALT and AST Less Than 2.5 Times Upper Limit of Normal [ULN] and Bilirubin Less Than 1 Time ULN)
IV: ADULTS, ELDERLY: 40 mg/m² infused over 3 hrs q3 wks.

Mild Hepatic Impairment (ALT and AST Greater Than 2.5 Times ULN and Less Than 10 Times ULN and Bilirubin Greater Than 1 Time ULN and Less Than 1.5 Times ULN)
IV: ADULTS, ELDERLY: 32 mg/m² infused over 3 hrs q3 wks.
Moderate Hepatic Impairment (ALT and AST Less Than 10 Times ULN and Bilirubin Greater Than 1.5 Times ULN and Less Than 3 Times ULN)

IV Infusion: ADULTS, ELDERLY: 20–30 mg/m\(^2\) infused over 3 hrs q3 wks (initiate at 20 mg/m2; may increase up to a maximum of 30 mg/m2 in subsequent cycles if tolerated).

Dosage with Strong CYP3A4 Inhibitors/Inducers

Inhibitors: Consider dose reduction to 20 mg/m\(^2\).
Inducers: Consider dose increase to 60 mg/m\(^2\).

Dosage in Renal Impairment
No dose adjustment.

Dose Modification
Dosage adjustment based on grade of neuropathy, hematologic conditions.

Hematologic

Neutrophils less than 500 cells/mm\(^3\) for 7 days or longer: Reduce dose by 20%. Neutropenic fever: Reduce dose by 20%. Platelets less than 25,000 cells/mm\(^3\) (less than 50,000 cells/mm\(^3\) with bleeding): Reduce dose by 20%.

Neuropathy

Grade 2 for 7 days or longer or grade 3 for less than 7 days: Reduce dose by 20%. Grade 3 for 7 days or longer: Discontinue treatment. Grade 3 (other than neuropathy): Reduce dose by 20%. Grade 4: Discontinue treatment.

Side effects

Common (62%): Peripheral sensory neuropathy. Frequent (56%–46%): Fatigue, asthenia, myalgia, arthralgia, alopecia, nausea. Occasional (29%–11%): Vomiting, stomatitis, mucositis, diarrhea, musculoskeletal pain, anorexia, constipation, abdominal pain, headache. Rare (9%–5%): Skin rash, nail disorder, edema, hand-foot syndrome (blistering/rash/peeling of skin on palms of hands, soles of feet), pyrexia, dizziness, pruritus, gastroesophageal reflux disease
(GERD), hot flashes, taste disorder, insomnia.

**Adverse effects/toxic reactions**

Neuropathy occurs early during treatment; 75% of new onset or worsening neuropathy occurred during first 3 cycles. Diabetics may be at increased risk for severe neuropathy manifested as grade 4 neutropenia. Neutropenia, leukopenia occur commonly; anemia, thrombocytopenia occur rarely.

**Nursing considerations**

**Baseline assessment**

Question possibility of pregnancy. Obtain baseline CBC, serum chemistries, LFT before treatment begins as baseline and monitor for hepatotoxicity, peripheral neuropathy (most frequent cause of drug discontinuation). Offer emotional support.

**Intervention/evaluation**

**Patient/family teaching**

- Avoid crowds, those with known infection.
- Avoid contact with those who have recently received live virus vaccine.
- Do not have immunizations without physician’s approval (drug lowers resistance).
- Promptly report fever over 100.5°F, chills, numbness, tingling, burning sensation, erythema of hands/feet.

ixazomib
ix-az-oh-mib
Ninlaro
CLASSIFICATION
PHARMACOTHERAPEUTIC: Proteasome inhibitor.
CLINICAL: Antineoplastic.
Do not confuse ixazomib with bortezomib, carfilzomib, idelalisib, or ixekizumab.

Uses
Treatment of multiple myeloma (in combination with lenalidomide and dexamethasone) in pts who have received at least 1 prior therapy.

Precautions
Contraindications: Severe hypersensitivity to ixazomib. Cautions: Baseline neutropenia, thrombocytopenia; hepatic/renal impairment, chronic peripheral edema, predisposing factors to infection (e.g., diabetes, renal failure, open wounds). Concomitant use of strong CYP3A inducers not recommended.

Action
Inhibits activity of beta 5 subunit of the 20S proteasome, leading to cell cycle arrest and tumor cell death (apoptosis). Therapeutic Effect: Inhibits tumor cells growth and metastasis.

Pharmacokinetics
Well absorbed following oral administration. Widely distributed. Metabolized in liver. Protein binding: 99%. Peak plasma concentration: 1 hr. Excreted in urine (62%), feces (22%). Not removed by hemodialysis. Half-life: 9.5 days.

Lifespan considerations
Pregnancy/Lactation: Avoid pregnancy; may cause fetal harm/malformations. Female and male pts of reproductive potential should use effective contraception during treatment and up to 3 mos after discontinuation. Unknown if distributed in breast milk. Breastfeeding not recommended. Children: Safety and efficacy not established. Elderly: No age-related precautions noted.
Interactions

**DRUG:** Strong CYP3A inducers (e.g., carBAMazepine, phenytoin, rifAMPin) may decrease concentration/effect; avoid use. **HERBAL:** St. John’s wort may decrease concentration/effect. **FOOD:** High-fat meals may decrease absorption/concentration. **LAB VALUES:** Expected to decrease neutrophils, platelets.

Availability (Rx)

**Capsules:** 2.3 mg, 3 mg, 4 mg.

Administration/handling

**PO**

- Capsule contents are hazardous; use cytotoxic precautions during handling and disposal.
- Administer capsule whole; do not break, cut, crush, or open.
- Give at least 1 hr before or 2 hrs after food.
- Give on the same day each wk and at the same time that day. If a dose is missed, do not administer within 72 hrs of next scheduled dose.
- If vomiting occurs after dosing, do not readminister; give dose at next scheduled time.

Indications/routes/dosage

**Multiple Myeloma**

**Note:** ANC should be 1,000 cells/mm³ or greater, platelets 75,000 cells/mm³ or greater, nonhematologic toxicities at baseline or grade 1 or less prior to initiating a new cycle of therapy.

**PO:** **ADULTS, ELDERLY:** 4 mg once wkly on days 1, 8, and 15 of 28-day cycle, in combination with lenalidomide 25 mg daily (on days 1–21 of 28-day cycle) and dexamethasone 40 mg (on days 1, 8, 15, and 22 of 28-day cycle). Continue until disease progression or unacceptable toxicity.

Dose Reduction Schedule
Initial dose: 4 mg. First dose reduction: 3 mg. Second dose reduction: 2.3 mg. Unable to tolerate 2.3-mg dose: Permanently discontinue.

**Dose Modification**

Based on Common Terminology Criteria for Adverse Events (CTCAE).

**Thrombocytopenia**

Platelet count less than 30,000 cells/mm$^3$: Withhold ixazomib and lenalidomide until platelet count is 30,000 cells/mm$^3$ or greater, then resume ixazomib at the same dose and resume lenalidomide at reduced dose level (see manufacturer guidelines).

Recurrence of platelet count less than 30,000 cells/mm$^3$: Withhold ixazomib and lenalidomide until platelet count is 30,000 cells/mm$^3$ or greater, then resume ixazomib at reduced dose level and resume lenalidomide at the same dose.

Additional occurrences: Alternate dose modification of ixazomib and lenalidomide.

**Neutropenia**

Absolute neutrophil count (ANC) less than 500 cells/mm$^3$: Withhold ixazomib and lenalidomide until ANC is 500 cells/mm$^3$ or greater, then resume ixazomib at the same dose and resume lenalidomide at reduced dose level (see manufacturer guidelines).

Recurrence of ANC less than 500 cells/mm$^3$: Withhold ixazomib and lenalidomide until ANC is 500 cells/mm$^3$ or greater, then resume ixazomib at reduced dose level and resume lenalidomide at the same dose.

Additional occurrences: Alternate dose modification of ixazomib and lenalidomide.

**Rash**

Grade 2 or 3 rash: Withhold lenalidomide until resolved to grade 1 or 0, then resume lenalidomide at next lower dose level (see manufacturer guidelines) and resume ixazomib at the same dose.

Recurrence of grade 2 or 3 rash: Withhold ixazomib and lenalidomide until recovery to grade 1 or 0, then resume ixazomib at reduced dose level and resume lenalidomide at the same dose.

Grade 4 rash: Permanently discontinue.
Additional occurrences: Alternate dose modification of ixazomib and lenalidomide.

Peripheral Neuropathy
Grade 1 (with pain) or grade 2: Withhold ixazomib until resolved to baseline or improved to grade 1 or 0 without pain (at prescriber’s discretion), then resume ixazomib at the same dose.
Grade 2 (with pain) or grade 3: Withhold ixazomib until resolved to baseline or improved to grade 1 or 0 without pain (at prescriber’s discretion), then resume ixazomib at reduced dose level.
Grade 4: Permanently discontinue.

Any Other Nonhematologic Toxicity
Grade 3 or 4: Withhold ixazomib until resolved to baseline or improved to grade 1 or 0 (at physician’s discretion), then resume ixazomib at reduced dose level.

Dosage in Renal Impairment
Mild to moderate impairment: Not specified; use caution. Severe impairment (CrCl less than 30 mL/min), end-stage renal disease: Reduce starting dose to 3 mg.

Dosage in Hepatic Impairment
Mild impairment: No dose adjustment. Moderate to severe impairment: Reduce starting dose to 3 mg.

Side effects
Frequent (42%–26%): Diarrhea, constipation, nausea. Occasional (22%–5%): Vomiting, back pain, blurry vision, dry eye.

Adverse effects/toxic reactions
Neutropenia, thrombocytopenia are expected responses to therapy. Thrombocytopenia reported in 78% of pts; neutropenia in 67% of pts. Severe diarrhea may lead to discontinuation of treatment. Peripheral neuropathy
reported in 28% of pts (sensory neuropathies were the most common type). Peripheral edema occurred in 28% of pts. Dermatologic toxicities including maculopapular and macular rash may occur. Infectious processes including upper respiratory tract infection (19% of pts), conjunctivitis (6% of pts) may occur. Other toxic reactions including neutrophilic dermatosis, posterior reversible encephalopathy, Stevens-Johnson syndrome, thrombotic thrombocytopenic purpura, transverse myelitis, treatment-induced hepatotoxicity, tumor lysis syndrome, occur rarely.

Nursing considerations

Baseline assessment

Intervention/evaluation
Monitor ANC, platelet count at least monthly, more frequently during first 3 cycles; LFT in pts with hepatic impairment. Consider concomitant granulocyte colony-stimulating factor (e.g., filgrastim, pegfilgrastim) in pts with neutropenia. Monitor for dehydration, electrolyte imbalance if diarrhea occurs. Offer antiemetics for nausea, antidiarrheals for diarrhea. Monitor for infection (esp. in pts with neutropenia); dermal toxicity, skin rashes, petechiae; peripheral neuropathy (with or without pain); peripheral edema. Monitor daily pattern bowel activity, stool consistency. Monitor for side effects of dexamethasone (e.g., hyperglycemia, weight loss, decreased appetite), lenalidomide (see prescribing information). Reversible posterior leukoencephalopathy syndrome should be considered in pts with altered mental status, confusion, headache, seizures, visual disturbances. Obtain visual acuity if vision becomes blurry.

Patient/family teaching
• Treatment may depress your immune system and reduce your ability to fight
infection. Report symptoms of infection such as body aches, chills, cough, fatigue, fever. Avoid those with active infection.

- Female and male pts of reproductive potential should use effective contraception during treatment and up to 3 mos after last dose. Do not breastfeed. Immediately report suspected pregnancy.
- Do not take ixazomib and dexamethasone at the same time. Take dexamethasone with food to minimize GI upset.
- Swallow capsules whole; do not chew, crush, or open. Take dose at least 1 hr before or 2 hrs after any food.
- Do not expose the capsule contents to the skin or eyes. If eyes are exposed to the capsule powder, thoroughly flush eyes with water. If skin is exposed to the capsule powder, thoroughly wash skin with soap and water.
- Treatment may cause nerve pain; extreme sensitivity to touch; muscle weakness; or prickling, tingling, numbness in your hands and feet.
- Report swelling of the legs, ankles, feet.
- Report neurologic changes such as blurry vision, confusion, headache, seizures; may indicate life-threatening brain swelling.
- Treatment may increase risk of bleeding.
- Do not take herbal supplements, esp. St. John’s wort.

**ixekizumab**

**ix-ee-kiz-ue-mab**

**Taltz**

**CLASSIFICATION**

PHARMACOTHERAPEUTIC: Human interleukin-17A antagonist. Monoclonal antibody.

CLINICAL: Antipsoriasis agent.

Do not confuse ixekizumab with daclizumab, eculizumab, gevokizumab, secukinumab, or ustekinumab.

**Uses**

Treatment of moderate to severe plaque psoriasis in adults who are candidates for systemic therapy or phototherapy.
Precautions

**Contraindications:** Hypersensitivity to ixekizumab. **Cautions:** Baseline neutropenia, thrombocytopenia; inflammatory bowel disease (Crohn’s disease, ulcerative colitis), HIV infection, concomitant immunosuppressant therapy, conditions predisposing to infection (e.g., diabetes, renal failure, open wounds), pts who have been exposed to tuberculosis. Concomitant use of live vaccines not recommended.

Action

Binds to and inhibits interaction of interleukin-17A receptor, a cytokine that is involved in inflammatory and immune response. May reduce epidermal neutrophils in psoriatic plaques. **Therapeutic Effect:** Alters biologic immune response; reduces inflammation.

Pharmacokinetics

Widely distributed. Degraded into small peptides and amino acids via catabolic pathway. Peak plasma concentration: 4 days. Steady state reached in 8–10 wks. Elimination not specified. **Half-life:** 13 days.

*Lifespan considerations*

**Pregnancy/Lactation:** Unknown if distributed in breast milk. However, human immunoglobulin G is present in breast milk and is known to cross placenta. **Children:** Safety and efficacy not established in pts younger than 18 yrs. **Elderly:** No age-related precautions noted.

Interactions

**DRUG:** Avoid use of live vaccines. May decrease therapeutic response. **HERBAL:** Echinacea may decrease effect. **FOOD:** None known. **LAB VALUES:** May decrease neutrophils, platelets. May decrease diagnostic effect of *Coccidioides immitis* skin test.

Availability (Rx)

**Auto-injector Pen:** 80 mg/mL. **Prefilled Syringe:** 80 mg/mL.
Administration/handling

Subcutaneous

• Follow instructions for preparation according to manufacturer guidelines.
• Remove auto-injector or prefilled syringe from refrigerator and allow to warm to room temperature (approx. 30 mins) with needle cap intact.
• Visually inspect for particulate matter or discoloration. Solution should appear clear, colorless to slightly yellow in color. Do not use if solution is cloudy, discolored, or if visible particles are observed.

Administration

• Insert needle subcutaneously into upper arms, outer thigh, or abdomen, and inject solution.
• Do not inject into areas of active skin disease or injury such as sunburns, skin rashes, inflammation, skin infections, or active psoriasis.
• Rotate injection sites.

Storage

• Refrigerate until time of use.
• Do not freeze.
• Do not shake.
• Protect from light.

Indications/routes/dosage

Plaque Psoriasis

SQ:ADULTS, ELDERLY: Initially, 160 mg (two injections of 80 mg) once, then 80 mg at wks 2, 4, 6, 8, 10, 12, then 80 mg once q4wks.

Dosage in Renal Impairment

Not specified; use caution.

Dosage in Hepatic Impairment

Not specified; use caution.

Side effects
Occasional (17%): Injection site reactions (pain, erythema). Rare (2%): Nausea.

Adverse effects/toxic reactions
May increase risk of infection including tuberculosis. Infections including upper respiratory tract infection (14% of pts), nasopharyngitis (14% of pts), tinea infections (2% of pts) have occurred. Cytopenias including neutropenia (11% of pts), thrombocytopenia (3% of pts) were reported. May cause exacerbation of Crohn’s disease and ulcerative colitis. Hypersensitivity reactions, including angioedema, occur rarely. Immunogenicity (auto-ixekizumab antibodies) occurred in less than 9% of pts.

Nursing considerations

Baseline assessment
Obtain CBC in pts with known history of neutropenia, thrombocytopenia. Screen for active infection. Pts should be evaluated for active tuberculosis and tested for latent infection prior to initiating treatment and periodically during therapy. Induration of 5 mm or greater with tuberculin skin testing should be considered a positive test result when assessing if treatment for latent tuberculosis is necessary. Consider administration of age-appropriate immunizations (if applicable) before initiation. Question history of Crohn’s disease, ulcerative colitis, hypersensitivity reaction. Conduct dermatologic exam; record characteristics of psoriatic lesions.

Intervention/evaluation
Monitor for symptoms of tuberculosis, including pts who tested negative for latent tuberculosis infection prior to initiating therapy. Interrupt or discontinue treatment if serious infection, opportunistic infection, or sepsis occurs, and initiate appropriate antimicrobial therapy. Assess skin for improvement of lesions. Monitor for hypersensitivity reaction, symptoms of inflammatory bowel disease.

Patient/family teaching
• A healthcare provider will show you how to properly prepare and inject your
medication. You must demonstrate correct preparation and injection techniques before using medication at home.

- Treatment may depress your immune system response and reduce your ability to fight infection. Report symptoms of infection such as body aches, chills, cough, fatigue, fever. Avoid people with active infection.
- Do not receive live vaccines.
- Expect frequent tuberculosis screening.
- Report travel plans to possible endemic areas.
- Immediately report difficulty breathing, itching, hives, rash, swelling of the face or tongue; may indicate allergic reaction.
- Treatment may cause worsening of Crohn’s disease or cause inflammatory bowel disease. Report abdominal pain, diarrhea, weight loss.

Canadian trade name

Non-Crushable Drug

High Alert drug

underlined underlined – top prescribed drug
ketoconazole  
kee-toe-kon-a-zole  
Apo-Ketoconazole
Extina  
Nizoral  
Nizoral AD  
Xolegel

CLASSIFICATION
PHARMACOTHERAPEUTIC: Imidazole derivative.  
CLINICAL: Antifungal.

■ BLACK BOX ALERT ■ Potentially fatal hepatotoxicity has occurred; serious cardiovascular events (QT prolongation, torsades de pointes, ventricular tachycardia, ventricular fibrillation, fatalities) have occurred.

Do not confuse Nizoral with Nasarel, Neoral, or Nitrol.

Uses

PO: Treatment of susceptible fungal infections, including histoplasmosis, blastomycosis, coccidioidomycosis, paracoccidioidomycosis, chromomycosis.  
Precautions

Contraindications: Hypersensitivity to ketoconazole. Acute or chronic liver disease; concurrent use with ALPRAZolam, colchicine, dofetilide, dronedarone, eplerenone, ergot derivatives, irinotecan, lurasidone, methadone, midazolam (oral), pimozide, quiNIDine, ranolazine, statins, tolvaptan, triazolam. Cautions: Hepatic impairment, concomitant use of drugs decreasing gastric acidity (e.g., antacids, H₂ antagonists, proton pump inhibitors), adrenal insufficiency.

Action

Alters cell wall permeability, inhibits phospholipids/enzymes of fungi. Therapeutic Effect: Damages fungal cell membrane, altering its function. Fungistatic.

Pharmacokinetics

Well absorbed from GI tract following PO administration (absorption decreases as pH of gastric contents increases). Protein binding: 93%–96%. Metabolized in liver. Primarily excreted in bile. Negligible systemic absorption following topical absorption. Ketoconazole is not detected in plasma after shampooing, topical administration. Half-life: 8 hrs.

Lifespan considerations

Interactions

DRUG: May increase concentration/toxicity of cycloSPORINE, digoxin, ergot alkaloids, midazolam, protease inhibitors (e.g., indinavir, ritonavir, saquinavir), sirolimus, tacrolimus, triazolam, warfarin. Isoniazid, rifAMPin may decrease concentration/effects. Antacids, H₂ antagonists (e.g., cimetidine, famotidine), proton pump inhibitors (e.g., omeprazole) may decrease
absorption. **HERBAL: St. John’s wort** may decrease concentration. **FOOD:** None known. **LAB VALUES:** May increase serum alkaline phosphatase, bilirubin, ALT, AST. May decrease serum corticosteroid, testosterone.

**Availability (Rx)**

**Foam (Extina):** 2%. **Gel (Xolegel):** 2%. **Shampoo (Nizoral AD [OTC]):** 1%. **Tablets (Nizoral):** 200 mg.

**Administration/handling**

**PO**

- Give with food to minimize GI irritation.
- Tablets may be crushed.
- Ketoconazole requires acidity; give antacids, anticholinergics, H₂ blockers at least 2 hrs following dosing.

**Shampoo**

- Apply to wet hair, massage for 1 min, rinse thoroughly, reapply for 3 min, rinse.

**Topical**

- Apply, rub gently into affected/surrounding area.

**Indications/routes/dosage**

**Usual Dosage**

**PO: ADULTS, ELDERLY:** 200–400 mg once daily. **CHILDREN 2 YRS AND OLDER:** 3.3–6.6 mg/kg once daily.

**Topical: ADULTS, ELDERLY:** Apply to affected area 1–2 times/day for 2–4 wks.

**Shampoo: ADULTS, ELDERLY:** Use twice wkly for up to 8 wks, allowing at least 3 days between shampooing. Use intermittently to maintain control.

**Dosage in Renal Impairment**
No dose adjustment.

**Dosage in Hepatic Impairment**
Use caution.

**Side effects**

**Occasional (10%–3%):** Nausea, vomiting. **Rare (less than 2%):** Abdominal pain, diarrhea, headache, dizziness, photophobia. **Topical:** Burning, irritation, pruritus.

**Adverse effects/toxic reactions**

Hematologic toxicity (thrombocytopenia, hemolytic anemia, leukopenia) occurs occasionally. Hepatotoxicity may occur within first wk to several mos after starting therapy. Anaphylaxis occurs rarely.

**Nursing considerations**

**Baseline assessment**
Confirm culture or histologic test for accurate diagnosis; therapy may begin before results known. Receive full medication history and screen for contraindications. Question history of hepatic impairment.

**Intervention/evaluation**
Monitor LFT; be alert for hepatotoxicity: dark urine, pale stools, jaundice, fatigue, anorexia, nausea, or vomiting (unrelieved by giving medication with food). Monitor CBC for hematologic toxicity. Monitor daily pattern of bowel activity, stool consistency. Assess for dizziness, provide assistance as needed. Evaluate skin for rash, urticaria, pruritus. Monitor adrenal function. **Topical:** Check for localized burning, pruritus, irritation.

**Patient/family teaching**
- Prolonged therapy (wks or mos) is usually necessary.
- Avoid alcohol.
- May cause dizziness; avoid tasks that require alertness, motor skills until
response to drug is established.
• Take antacids, antiulcer medications at least 2 hrs after ketoconazole.
• Report dark urine, pale stool, yellow skin or eyes, vomiting, increased irritation in topical use, onset of other new symptoms.
• Rub well into affected areas.
• Avoid contact with eyes.
• Keep skin clean, dry; wear light clothing for ventilation.
• Separate personal items in direct contact with affected area.

ketorolac
kee-toe-role-ak
Acular
Acular LS
Acuvail
Apo-Ketorolac
Novo-Ketorolac
Sprix
Toradol

CLASSIFICATION
PHARMACOTHERAPEUTIC: NSAID.
CLINICAL: Analgesic, intraocular anti-inflammatory.

BLACK BOX ALERT
Increased risk of serious cardiovascular thrombotic events, including myocardial infarction, CVA. Increased risk of severe GI reactions, including ulceration, bleeding, perforation.

Do not confuse Acular with Acthar or Ocular, ketorolac with Ketalar, or Toradol with Foradil, Inderal, TEGretol, or traMADol.

Uses
PO, injection, nasal: Short-term (5 days or less) relief of mild to moderate pain.
Ophthalmic: Relief of ocular itching due to seasonal allergic conjunctivitis. Treatment postop for inflammation following cataract extraction, pain following
incisional refractive surgery. **OFF-LABEL:** Prevention, treatment of ocular inflammation (ophthalmic form).

**Precautions**

**Contraindications:** Hypersensitivity to ketorolac, aspirin or other NSAIDs. Intracranial bleeding, hemorrhagic diathesis, incomplete hemostasis, high risk of bleeding; concomitant use of aspirin, NSAIDs, probenecid or pentoxifylline; labor and delivery, advanced renal impairment or risk of renal failure, active or history of peptic ulcer disease, chronic inflammation of GI tract, recent or history of GI bleeding/ulceration. Perioperative pain in setting of CABG surgery. Prophylaxis before major surgery. **Cautions:** Hepatic impairment, history of GI tract disease, asthma, coagulation disorders, receiving anticoagulants, fluid retention, HF, renal impairment, inflammatory bowel disease, smoking, use of alcohol, elderly, debilitated.

**Action**

Inhibits prostaglandin synthesis, reduces prostaglandin levels in aqueous humor. **Therapeutic Effect:** Reduces intensity of pain stimulus, reduces intraocular inflammation.

**Pharmacokinetics**

Readily absorbed from GI tract after IM administration. Protein binding: 99%. Metabolized in liver. Primarily excreted in urine. Not removed by hemodialysis. **Half-life:** 5–9 hrs (increased in renal impairment, in elderly).

**Lifespan considerations**

**Pregnancy/Lactation:** Unknown if distributed in breast milk. Avoid use during third trimester (may adversely affect fetal cardiovascular system: premature closure of ductus arteriosus). **Children:** Safety and efficacy not established, but doses of 0.5 mg/kg have been used. **Elderly:** GI bleeding, ulceration more likely to cause serious adverse effects. Age-related renal impairment may increase risk of hepatic/renal toxicity; decreased dosage recommended.
Interactions

**DRUG:** May decrease effects of antihypertensives (e.g., amLODIPine, lisinopril), diuretics (e.g., furosemide, HCTZ). Aspirin, NSAIDs, other salicylates may increase risk of GI side effects, bleeding. May increase risk of bleeding with heparin, oral anticoagulants (e.g., warfarin), thrombolytics. May increase concentration, risk of toxicity of lithium. May increase risk of methotrexate toxicity. Probenecid may increase concentration.

**HERBAL:** Cat’s claw, dong quai, evening primrose, feverfew, garlic, ginkgo, ginseng, horse chestnut, red clover may decrease antiplatelet activity, risk of bleeding.

**FOOD:** None known.

**LAB VALUES:** May prolong bleeding time. May increase serum ALT, AST, BUN, potassium, creatinine.

Availability (Rx)

**Injection Solution:** 15 mg/mL, 30 mg/mL. **Nasal Spray (Sprix):** 1.7-g bottle provides 8 sprays (15.75 mg/spray). **Ophthalmic Solution:** 0.4% (Acular LS), 0.45% (Acuvail), 0.5% (Acular). **Tablets:** 10 mg.

Administration/handling

**IV**
- Give undiluted as IV push.
- Give over at least 15 sec.

**IM**
- Give deep IM slowly into large muscle mass.

**PO**
- Give with food, milk, antacids if GI distress occurs.

**Ophthalmic**
- Place gloved finger on lower eyelid and pull out until pocket is formed between eye and lower lid. Place prescribed number of drops into pocket.
- Instruct pt to close eye gently for 1–2 min (so that medication will not be squeezed out of the sac) and to apply digital pressure to lacrimal sac at inner...
canthus for 1 min to minimize system absorption.

**IV incompatibility**
Promethazine (Phenergan).

**IV Compatibilities**
FentaNYL (Sublimaze), HYDROmophine (Dilaudid), morphine, nalbuphine (Nubain).

**Indications/routes/dosage**

*Note:* Total duration is 5 days (parenteral and oral). Do not increase dose/frequency; supplement with low-dose opioids if needed.

**Pain Management**

**PO:** ADULTS, ELDERLY: Initially, 20 mg (10 mg for elderly), then 10 mg q4–6h. **Maximum:** 40 mg/24 hrs.

**IM:** ADULTS YOUNGER THAN 65 YRS: 60 mg once or 30 mg q6h. **Maximum:** 120 mg/24 hrs. ADULTS 65 YRS AND OLDER, PTS WITH RENAL IMPAIRMENT, PTS WEIGHING LESS THAN 50 KG: 30 mg once or 15 mg q6h. **Maximum:** 60 mg/24 hrs.

**IV:** ADULTS YOUNGER THAN 65 YRS: 30 mg once or 30 mg q6h. **Maximum:** 120 mg/24 hrs. ADULTS 65 YRS AND OLDER, PTS WITH RENAL IMPAIRMENT, PTS WEIGHING LESS THAN 50 KG: 15 mg once or 15 mg q6h. **Maximum:** 60 mg/24 hrs.

**Nasal Spray:** ADULTS YOUNGER THAN 65 YRS, PTS WEIGHING 50 KG OR GREATER: 31.5 mg (1 spray each nostril) q6–8h. **Maximum daily dose:** 126 mg. ADULTS 65 YRS AND OLDER, PTS WEIGHING LESS THAN 50 KG: 15.75 (1 spray in one nostril) mg q6–8h. **Maximum daily dose:** 63 mg.

**Allergic Conjunctivitis**

**Ophthalmic:** ADULTS, ELDERLY, CHILDREN 2 YRS AND OLDER: 1 drop (0.5%) 4 times/day.
Cataract Extraction

**Ophthalmic: ADULTS, ELDERLY:** 1 drop (0.5%) 4 times/day. Begin 24 hrs after surgery and continue for 2 wks.

Corneal Refractive Surgery

**Ophthalmic: ADULTS, ELDERLY:** 1 drop (0.4%) 4 times/day for 3 days.

Dosage in Renal Impairment

See dosage section.

Dosage in Hepatic Impairment

Use caution.

Side effects

**Frequent (17%–12%):** Headache, nausea, abdominal cramps/pain, dyspepsia. **Occasional (9%–3%):** Diarrhea. **Nasal:** Nasal discomfort, rhinalgia, increased lacrimation, throat irritation, rhinitis. **Ophthalmic:** Transient stinging, burning. **Rare (3%–1%):** Constipation, vomiting, flatulence, stomatitis. **Ophthalmic:** Ocular irritation, allergic reactions (manifested by pruritus, stinging), superficial ocular infection, keratitis.

Adverse effects/toxic reactions

Peptic ulcer, GI bleeding, gastritis, severe hepatic reaction (cholestasis, jaundice) occur rarely. Nephrotoxicity (glomerular nephritis, interstitial nephritis, nephrotic syndrome) may occur in pts with preexisting renal impairment. Acute hypersensitivity reaction (fever, chills, joint pain) occurs rarely.

Nursing considerations

Baseline assessment

Assess onset, type, location, duration of pain. Obtain baseline renal/hepatic function tests.
**Intervention/evaluation**

Monitor renal function, LFT, urinary output. Monitor daily pattern of bowel activity, stool consistency. Observe for occult blood loss. Assess for therapeutic response: relief of pain, stiffness, swelling; increased joint mobility; reduced joint tenderness; improved grip strength. Monitor for bleeding (may also occur with ophthalmic route due to systemic absorption).

**Patient/ family teaching**

- Avoid aspirin, alcohol.
- Report abdominal pain, bloody stools, or vomiting blood.
- If GI upset occurs, take with food, milk.
- **Ophthalmic:** Transient stinging, burning may occur upon instillation.
- Do not administer while wearing soft contact lenses.

Canadian trade name

underlined underlined – top prescribed drug
labetalol
la-bayt-a-lol
Apo-Labetalol
Trandate

**Fixed-Combination(s)**

**Normozide:** labetalol/hydroCHLORothiazide (a diuretic): 100 mg/25 mg, 200 mg/25 mg, 300 mg/25 mg.

**CLASSIFICATION**

**PHARMACOTHERAPEUTIC:** Alpha-, beta-adrenergic blocker.

**CLINICAL:** Antihypertensive.

Do not confuse labetalol with atenolol, betaxolol, metoprolol or propranolol, or Trandate with traMADol or TRENtal.

**Uses**

Management of hypertension. IV for severe hypertension. **OFF-LABEL:** Management of preeclampsia, severe hypertension in pregnancy, hypertension during acute ischemic stroke, pediatric hypertension.

**Precautions**

**Contraindications:** Hypersensitivity to labetalol. Bronchial asthma, history of obstructive airway disease, cardiogenic shock, uncompensated HF, second- or third-degree heart block (except in pts with functioning pacemaker), severe bradycardia, conditions associated with severe, prolonged hypotension.

**Cautions:** Compensated HF, severe anaphylaxis to allergens, myasthenia gravis,
psychiatric disease, hepatic impairment, pheochromocytoma, diabetes; concurrent use with digoxin, verapamil, or diltiazEM; arterial obstruction, elderly. Pts with peripheral vascular disease, Raynaud’s disease.

**Action**

Blocks alpha_1-, beta_1-, beta_2- (large doses) adrenergic receptor sites. **Therapeutic Effect:** Slows sinus heart rate; decreases peripheral vascular resistance, B/P.

**Pharmacokinetics**

<table>

**Lifespan considerations**

**Pregnancy/Lactation:** Drug crosses placenta. Small amount distributed in breast milk. **Children:** Safety and efficacy not established. **Elderly:** Age-related peripheral vascular disease may increase susceptibility to decreased peripheral circulation. May have increased risk of orthostatic hypotension.

**Interactions**

**DRUG:** May decrease effects of beta_2-adrenergic agonists (e.g., arformoterol, salmeterol), theophylline. Beta blockers (e.g., carvedilol, metoprolol), calcium channel blockers (e.g., diltiazem, verapamil), digoxin may increase risk of bradycardia. **HERBAL:** Ephedra, ginseng, yohimbe may worsen hypertension. Garlic may increase antihypertensive effect. Licorice may cause water retention, increased serum sodium, decreased serum potassium. **FOOD:** None known. **LAB VALUES:** May increase serum antinuclear antibody titer (ANA), BUN, LDH, alkaline phosphatase, bilirubin, creatinine, potassium, triglycerides, lipoprotein, uric acid, ALT, AST.
Availability (Rx)

**Injection Solution:** 5 mg/mL. **Tablets:** 100 mg, 200 mg, 300 mg.

Administration/handling

**IV**

- **Prolonged duration of action:** Monitor several hrs after administration. Excessive administration may result in prolonged hypotension and/or bradycardia.

**Reconstitution**
- For IV infusion, dilute in D$_5$W to provide concentration of 1–2 mg/mL.

**Rate of Administration**
- For IV push, administer at a rate of 10 mg/min.
- For IV infusion, administer at rate of 2 mg/min initially. Rate is adjusted according to B/P.
- Monitor B/P immediately before and q5–10min during IV administration (maximum effect occurs within 5 min).

**Storage**
- Store at room temperature.
- After dilution, IV solution is stable for 72 hrs.
- Solution appears clear, colorless to light yellow.
- Discard if discolored or precipitate forms.

**PO**

- Give without regard to food.
- Tablets may be crushed.

**IV incompatibilities**

Amphotericin B complex (Abelcet, AmBisome, Amphotec), ceftraroline (Teflaro), cefTRIAXone (Rocephin), furosemide (Lasix), heparin, nafcillin (Nafcil).

**IV Compatibilities**
Amiodarone (Cordarone), calcium gluconate, dexmedetomidine (Precedex),
diltiazEM (Cardizem), DOBUTamine (Dobutrex), DOPamine (Intropin),
enalapril (Vasotec), fentaNYL (Sublimaze), HYDROmorphine (Dilaudid),
lidocaine, LORazepam (Ativan), magnesium sulfate, midazolam (Versed),
milrinone (Primacor), morphine, nitroglycerin, norepinephrine (Levophed),
potassium chloride, potassium phosphate, propofol (Diprivan).

Indications/routes/dosage

**Hypertension**

**PO:** ADULTS, ELDERLY: Initially, 100 mg twice daily. Adjust in increments
of 100 mg twice daily q2–3days. Usual dose: 100–300 mg twice daily. May
require up to 2,400 mg/day. **CHILDREN:** 1–3 mg/kg/day in 2 divided doses.
**Maximum:** 10–12 mg/kg/day up to 1,200 mg/day.

**Severe Hypertension, Hypertensive Crisis**

**IV:** ADULTS: Initially, 10–20 mg (bolus over 2 min). Additional doses of 40–
80 mg may be given at 10-min intervals, up to total dose of 300
mg. **CHILDREN:** 0.2–1 mg/kg/dose. **Maximum:** 40 mg/dose.

**IV Infusion:** ADULTS: Initially, 2 mg/min up to total dose of 300 mg.
**CHILDREN:** 0.2–1 mg/kg/hr. **Maximum:** 3 mg/kg/hr or 40 mg/dose.

**Dosage in Renal Impairment**

No dose adjustment.

**Dosage in Hepatic Impairment**

Use caution.

**Side effects**

**Frequent (20%–11%):** Drowsiness, dizziness, excessive fatigue. **Occasional
(10% or less):** Dyspnea, peripheral edema, depression, anxiety, constipation,
diarrhea, nasal congestion, weakness, diminished sexual function, transient scalp
tingling, insomnia, nausea, vomiting, abdominal discomfort. **Rare:** Altered taste,
dry eyes, increased urination, paresthesia.
Adverse effects/toxic reactions

May precipitate, aggravate HF due to decreased myocardial stimulation. Abrupt withdrawal may precipitate myocardial ischemia, producing chest pain, diaphoresis, palpitations, headache, tremor. May mask signs, symptoms of acute hypoglycemia (tachycardia, B/P changes) in diabetic pts. Rapid reduction of blood pressure may cause CVA, optic nerve infarction, ischemic changes on EKG. May cause severe orthostatic hypotension.

Nursing considerations

Baseline assessment
Assess baseline renal function, LFT. Assess B/P, apical pulse immediately before drug administration (if pulse is 60/min or less or systolic B/P is lower than 90 mm Hg, withhold medication, contact physician). Question history of bradycardia, HF, second- or third-degree heart block, myasthenia gravis.

Intervention/evaluation
Monitor B/P for hypotension. Assess pulse for quality, irregular rate, bradycardia. Monitor EKG for cardiac arrhythmias. Assist with ambulation if dizziness occurs. Assess for evidence of HF: dyspnea (particularly on exertion or lying down), night cough, peripheral edema, distended neck veins. Monitor I&O (increase in weight, decrease in urine output may indicate HF).

Patient/family teaching
• Do not discontinue drug except upon advice of physician (abrupt discontinuation may precipitate heart failure).
• Slowly go from lying to standing.
• Compliance with therapy regimen is essential to control hypertension, arrhythmias.
• Avoid tasks that require alertness, motor skills until response to drug is established.
• Report shortness of breath, excessive fatigue, weight gain, prolonged dizziness, headache.
• Do not use nasal decongestants, OTC cold preparations (stimulants) without physician approval.
• Limit alcohol.

**lacosamide**

la-koe-sa-myde

Vimpat

**CLASSIFICATION**
PHARMACOTHERAPEUTIC: Succinimide (Schedule V).
CLINICAL: Anticonvulsant.
Do not confuse lacosamide with zonisamide.

**Uses**

Monotherapy or adjunctive therapy for treatment of partial-onset seizures in pts 17 yrs and older.

**Precautions**

**Contraindications:** Hypersensitivity to lacosamide. **Cautions:** Renal/hepatic impairment, cardiac conduction problems (e.g., marked first-degree AV block, second-degree or higher AV block, sick sinus syndrome without pacemaker), myocardial ischemia, HF, pts at risk of suicide.

**Action**

Selectively enhances slow inactivation of sodium channels, stabilizing hyperexcitable neuronal membranes and inhibits neuronal firing. **Therapeutic Effect:** Reduces seizure frequency.

**Pharmacokinetics**

Completely absorbed following PO administration. Protein binding: 15%. Peak plasma concentration: 1–4 hrs after oral dosing and is reached at the end of IV infusion. Primarily excreted in urine. Steady-state levels achieved in 3 days. Removed by hemodialysis. **Half-life:** 13 hrs.

**Lifespan considerations**
Pregnancy/Lactation: Use in pregnancy if benefits outweigh risk. Unknown if distributed in breast milk. Children: Safety and efficacy not established in pts younger than 17 yrs. Elderly: No age-related precautions noted.

Interactions

DRUG: Strong CYP2C9 inhibitors (e.g., fluconazole), strong CYP3A4 inhibitors (e.g., clarithromycin, ketoconazole) may increase concentration/effects. HERBAL: None significant. FOOD: None known. LAB VALUES: May increase serum ALT; proteinuria.

Availability (Rx)

Injection Solution: 10 mg/mL (20 mL). Oral Solution: 10 mg/mL. Tablets: 50 mg, 100 mg, 150 mg, 200 mg.

Administration/handling

PO

• Give without regard to meals.
• Do not break, crush, dissolve, or divide film-coated tablets.
• Oral solution should be administered with a calibrated measuring device.
• Discard any unused portion after 7 wks.

IV

• Appears as a clear, colorless solution.
• Discard unused portion or if precipitate or discoloration is present. May give without further dilution.
• If mixing with diluent, may be stored for 24 hrs at room temperature. Infuse over 30–60 min.

IV Compatibilities

0.9% NaCl, D₅W, lactated Ringer’s.
Indications/routes/dosage

Note: IV dose is same as oral dose. May give undiluted or mixed in compatible diluent and infused over 30–60 min.

Partial-Onset Seizures

Monotherapy
PO/IV: ADULTS, CHILDREN 17 YRS AND OLDER: Initially, 100 mg twice daily. May increase by 50 mg twice daily at wkly intervals. Maintenance: 150–200 mg twice daily.

Adjunctive Therapy
PO/IV: ADULTS, CHILDREN 17 YRS AND OLDER: Initially, 50 mg twice daily. May increase by 50 mg twice daily at wkly intervals. Maintenance: 100–200 mg twice daily. Maximum: 400 mg/day.

Switch from IV to PO
When switching from IV to PO form, use same equivalent daily dosage and frequency as IV administration.

Switch from PO to IV
When switching from PO to IV form, initial total daily IV dosage should be equivalent to total daily dosage and frequency of PO form and should be infused IV over 30–60 min.

Dosage in Renal Impairment
Use caution when titrating. Mild to moderate impairment: No dose adjustment. Severe impairment, end-stage renal disease: Maximum: 300 mg/day.

Dosage in Hepatic Impairment
Use caution when titrating. Mild to moderate impairment: Maximum: 300 mg/day. Severe impairment: Not recommended.

Side effects

Frequent (31%–13%): Dizziness, headache. Occasional (11%–5%): Nausea,
double vision, vomiting, fatigue, blurred vision, ataxia, tremor, nystagmus. Rare (4%–2%): Vertigo, diarrhea, gait disturbances, memory impairment, depression, pruritus, injection site discomfort.

**Adverse effects/toxic reactions**

Increased risk of suicidal ideation, behavior. Dose-dependent prolongations in PR interval noted. Leukopenia, anemia, thrombocytopenia occur rarely.

**Nursing considerations**

**Baseline assessment**

Review history of seizure disorder (intensity, frequency, duration, level of consciousness). Initiate seizure precautions. Renal function, LFT, CBC should be performed before therapy begins and periodically during therapy. Question history of cardiac conduction disorders, depression, suicidal ideation and behavior.

**Intervention/evaluation**

Observe for recurrence of seizure activity. Assess for clinical improvement (decrease in intensity/frequency of seizures). Assist with ambulation if dizziness occurs. Assess for suicidal ideation, depression, behavioral changes. Drug should be withdrawn gradually (over a minimum of 1 wk) to minimize potential for increased seizure frequency. Monitor ECG for QT prolongation.

**Patient/family teaching**

- Strict maintenance of drug therapy is essential for seizure control.
- Avoid tasks that require alertness, motor skills until response to drug is established.
- Avoid alcohol.
- Report depression, suicidal ideation, unusual behavioral changes.

**lactulose**

**lak-tyoo-lose**

Apo-Lactulose
**CLASSIFICATION**

PHARMACOTHERAPEUTIC: Lactose derivative.

CLINICAL: Hyperosmotic laxative, ammonia detoxicant.

Do not confuse lactulose with lactose.

**Uses**

Prevention, treatment of portal-systemic encephalopathy (including hepatic precoma, coma); treatment of constipation.

**Precautions**

**Contraindications:** Hypersensitivity to lactulose. Pts requiring a low-galactose diet. **Cautions:** Diabetes, hepatic impairment, dehydration.

**Action**

Inhibits diffusion of NH₃ into blood by converting NH₃ to NH₄⁺; enhances diffusion of NH₃ from blood to gut, where it is converted to NH₄⁺; produces osmotic effect in colon. **Therapeutic Effect:** Promotes increased peristalsis, bowel evacuation; decreases serum ammonia concentration.

**Pharmacokinetics**

Poorly absorbed from GI tract. Extensively metabolized in colon. Primarily excreted in feces.

**Lifespan considerations**

**Pregnancy/Lactation:** Unknown if drug crosses placenta or is distributed in breast milk. **Children:** Avoid use in pts younger than 6 yrs (usually unable to describe symptoms). **Elderly:** No age-related precautions noted.
Interactions

**DRUG:** None significant. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** May decrease serum potassium (GI loss).

Availability (Rx)

**Packets (Kristalose):** 10 g, 20 g. **Solution, Oral:** 10 g/15 mL.

Administration/handling

**PO**
- Store solution at room temperature.
- Solution appears pale yellow to yellow, viscous liquid. Cloudiness, darkened solution does not indicate potency loss.
- Drink water, juice, milk with each dose (aids stool softening, increases palatability).
- Mix packets with 4 oz water.

**Rectal**
- Lubricate anus with petroleum jelly before enema insertion.
- Insert carefully (prevents damage to rectal wall) with nozzle toward navel.
- Squeeze container until entire dose expelled.
- Instruct pt to retain 30–60 min in divided doses.
- **Maximum:** 60 mL/day (40 g/day).

Indications/routes/dosage

**Constipation**

**PO:** **ADULTS, ELDERLY:** 15–30 mL (10–20 g)/day, up to 60 mL (40 g)/day. **CHILDREN:** 1.5–3 mL/kg/day (1–2 g/kg/day). **Maximum:** 40 g/day (60 mL/day).

**Prevention of Portal-Systemic Encephalopathy**

**ADULTS, ELDERLY:** 30–45 mL (20–30 g) 3–4 times/day. Adjust dose q1–2
days to produce 2–3 soft stools/day. **CHILDREN:** 40–90 mL/day (26.7–60 g/day) in divided doses 3–4 times/day. **INFANTS:** 2.5–10 mL/day (1.7–6.7 g/day) in 3–4 divided doses. Adjust dose q1–2 days to produce 2–3 soft stools/day.

**Treatment of Portal-Systemic Encephalopathy**

**PO:** **ADULTS, ELDERLY:** Initially, 30–45 mL (20–30 g) every hr to induce rapid laxation. Then, 30–45 mL 3–4 times/day. Adjust dose q1–2 days to produce 2–3 soft stools/day.

**Rectal Administration (as Retention Enema)**

200 g (300 mL) diluted with 700 mL water or NaCl via rectal balloon catheter. Retain 30–60 min q4–6h. (Transition to oral prior to stopping rectal administration.)

**Dosage in Renal/Hepatic Impairment**

No dose adjustment.

**Side effects**

*Occasional:* Abdominal cramping, flatulence, increased thirst, abdominal discomfort. *Rare:* Nausea, vomiting.

**Adverse effects/toxic reactions**

Severe diarrhea may cause dehydration, electrolyte imbalance. Long-term use may result in laxative dependence, chronic constipation, loss of normal bowel function.

**Nursing considerations**

**Baseline Assessment**

Question usual stool pattern, frequency, characteristics. Conduct neurological exam in pts with elevated serum ammonia levels, symptoms of encephalopathy. Assess hydration status.
Intervention/evaluation

Patient/family teaching

• Evacuation occurs in 24–48 hrs of initial dose.
• Institute measures to promote defecation: increase fluid intake, exercise, high-fiber diet.
• Drink plenty of fluids.
• If therapy was started to treat high ammonia levels, notify physician if worsening of confusion, lethargy, weakness occurs.

| lamiVUDine | la-miv-yoo-deen |
| Apo-LamiVUDine | |
| Epivir | |
| Epivir-HBV | |
| Heptovir | |

Fixed-Combination(s)

**Combivir**: lamiVUDine/zidovudine (an antiviral): 150 mg/300 mg. **Epzicom**: lamiVUDine/abacavir (an antiviral): 300 mg/600 mg. **Triumeq**: lamiVUDine/abacavir (antiretroviral)/dolutegravir (integrase inhibitor): 300 mg/600 mg/50 mg. **Trizivir**: lamiVUDine/zidovudine/abacavir (an antiviral): 150 mg/300 mg/300 mg.

CLASSIFICATION

PHARMACOTHERAPEUTIC: Nucleoside reverse transcriptase inhibitor.

CLINICAL: Antiviral.

❖ BLACK BOX ALERT ❖ Serious, sometimes fatal lactic acidosis, severe hepatomegaly with steatosis (fatty liver) have occurred. Pts must be
monitored for chronic hepatitis B virus infection for several months following therapy. Do not use Epivir-HBV for treatment of HIV infection.

Do not confuse Epivir with Combivir, or lamiVUDine with lamoTRIgine.

Uses

**Epivir:** Treatment of HIV infection in combination with at least two other antiretroviral agents. **Epivir-HBV:** Treatment of chronic hepatitis B virus infection associated with evidence of hepatitis B viral replication and active hepatic inflammation. **OFF-LABEL:** Prophylaxis in health care workers at risk of acquiring HIV after occupational exposure to virus. Use as part of multidrug regimen.

Precautions

**Contraindications:** Hypersensitivity to lamiVUDine. **Cautions:** Use in children with history of pancreatitis or risk factors for developing pancreatitis. Use in combination with interferon alfa with or without ribavirin in HIV/HBV coinfected pts; renal/hepatic impairment.

Action

Inhibits HIV reverse transcriptase by viral DNA chain termination. Inhibits RNA-, DNA-dependent DNA polymerase, an enzyme necessary for HIV, hepatitis B virus replication. **Therapeutic Effect:** Slows HIV replication, reduces progression of HIV infection, chronic hepatitis B virus infection.

Pharmacokinetics

Rapidly, completely absorbed from GI tract. Protein binding: less than 36%. Widely distributed (crosses blood-brain barrier). Primarily excreted unchanged in urine. Not removed by hemodialysis or peritoneal dialysis. **Half-life:** Children: 2 hrs. Adults: 5–7 hrs.

📚 Lifespan considerations
**Pregnancy/Lactation:** Drug crosses placenta. Unknown if distributed in breast milk. Breastfeeding not recommended (possibility of HIV transmission). **Children:** Safety and efficacy not established in pts younger than 3 mos. **Elderly:** Age-related renal impairment may require dosage adjustment.

**Interactions**

**DRUG:** Zalcitabine may inhibit absorption of both drugs; avoid concurrent administration. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** May increase Hgb, neutrophil count; serum amylase, ALT, AST, bilirubin.

**Availability (Rx)**

**Oral Solution:** 5 mg/mL (Epivir-HBV), 10 mg/mL (Epivir). **Tablets:** 100 mg (Epivir-HBV), 150 mg (Epivir), 300 mg (Epivir).

**Administration/handling**

**PO**
- Give without regard to meals.

**Indications/routes/dosage**

**Note:** Epivir tablets/oral solution contain a higher dose of lamivudine than Epivir-HBV tablets/oral solution.

**HIV Infection (Epivir)**

**PO:** **ADULTS, ELDERLY:** 150 mg twice daily or 300 mg once daily. **CHILDREN 4 MOS–16 YRS:** (Oral Solution): 4 mg/kg twice daily (up to 150 mg/dose). **INFANTS 1–3 MOS:** 4 mg/kg twice daily. **NEONATES YOUNGER THAN 30 DAYS:** 2 mg/kg twice daily. **Tablets:** **25 KG OR MORE:** 150 mg 2 times/day or 300 mg once daily. **20–24 KG:** 75 mg in am and 150 mg in pm or 225 mg once daily. **14–19 KG:** 75 mg 2 times/day or 150 mg once daily.
Chronic Hepatitis B (Epivir HBV)
**PO: ADULTS:** 100 mg/day. **CHILDREN 2–17 YRS:** 3 mg/kg/day. **Maximum:** 100 mg/day.

**Dosage in Renal Impairment**
Dosage and frequency are modified based on creatinine clearance.

<table>
<thead>
<tr>
<th>Creatinine Clearance</th>
<th>Dosage HIV</th>
<th>Dosage Hepatitis B</th>
</tr>

<td>50 mg first dose, then 25 mg once/daily</td>
<td>35 mg first dose, then 10 mg once/daily</td>
</tr>
</tbody>
</table>

**Hemodialysis:** Dosing post-HD recommended.

**Dosage in Hepatic Impairment**
No dose adjustment.

**Side effects**

**Frequent (35%–10%):** Headache, nausea, malaise, fatigue, nasal disturbances, diarrhea, cough, musculoskeletal pain, neuropathy, insomnia, anorexia, dizziness, fever, chills. **Occasional (9%–5%):** Depression, myalgia, abdominal cramps, dyspepsia, arthralgia.

**Adverse effects/toxic reactions**
Pancreatitis occurs in 13% of pediatric pts. Anemia, neutropenia, thrombocytopenia occur rarely. Lactic acidosis, severe hepatomegaly with steatosis have been reported. May cause hepatitis B virus reactivation when treatment is discontinued.

**Nursing considerations**

**Baseline assessment**
Obtain baseline renal function test, LFT, CD4 count, viral load. Screen HIV pts for hepatitis B virus infection before initiating therapy.
**Intervention/evaluation**

Monitor serum BUN, creatinine, amylase, lipase, ALT, AST, bilirubin. Assess for headache, nausea, cough. Monitor daily pattern of bowel activity, stool consistency. Modify diet or administer laxative as needed. Assess for dizziness, sleep pattern. If pancreatitis in children occurs, movement aggravates abdominal pain; sitting up, flexing at the waist may relieve the pain.

**Patient/family teaching**

- Continue therapy for full length of treatment.
- Doses should be evenly spaced.
- LamiVUDine is not a cure for HIV infection, nor does it reduce risk of transmission to others.
- Avoid tasks requiring alertness, motor skills until response to drug is established.
- Avoid alcohol.
- Closely monitor for symptoms of pancreatitis (severe, steady abdominal pain often radiating to the back, clammy skin, hypotension; nausea/vomiting may accompany abdominal pain).

---

**lamoTRIgine**

la-moe-tri-jeen

**Apo-LamoTRIgine**

**LaMICtal**

LaMICtal ODT

LaMICtal XR

**CLASSIFICATION**

**PHARMACOTHERAPEUTIC**: Phenyltriazine.

**CLINICAL**: Anticonvulsant.

■ **BLACK BOX ALERT** ■ Severe, potentially life-threatening skin rashes have been reported, including Stevens-Johnson syndrome. Risk increased with coadministration with valproic acid and rapid-dose titration.

Do not confuse LaMICtal with LamISIL or Lomotil, or lamoTRIgine with labetalol or lamiVUDine.
Uses

Immediate-Release: Adjunctive therapy in adults and children 2 yrs of age and older with generalized tonic-clonic seizures, partial seizures, and generalized seizures of Lennox-Gastaut syndrome. Conversion to monotherapy in adults treated with another enzyme-inducing antiepileptic drug (EIAED) (e.g., valproic acid, carBAMazepine, phenytoin, PHENobarbital, or primidone as the single antiepileptic drug). Long-term maintenance treatment of bipolar disorder. Treatment of pts 2 yrs and older with primary generalized tonic-clonic seizures.

Extended-release: Adjunctive therapy for primary generalized tonic-clonic and partial-onset seizures in pts 13 yrs and older. Conversion to monotherapy in pt 13 yrs and older with partial seizures receiving treatment with a single antiepileptic drug (AED).

Precautions

Contraindications: Hypersensitivity to lamoTRIgine. Cautions: Renal/hepatic impairment, pts at high risk of suicide, pts taking estrogen-containing oral contraceptives, history of adverse hematologic reaction.

Action

May block voltage-sensitive sodium channels, stabilizing neuronal membranes, regulating presynaptic transmitter release of excitatory amino acids. Therapeutic Effect: Reduces frequency of seizure activity. Delays time to occurrence of acute mood episodes (mania, depression, hypomania).

Lifespan considerations

Pregnancy/Lactation: Distributed in breast milk. Breastfeeding not recommended. Increased fetal risk of oral cleft formation has been noted with use during pregnancy. Children: Safety and efficacy not established in pts younger than 18 yrs with bipolar disorder or in pts younger than 13 yrs with epilepsy. Elderly: Age-related renal impairment may require dosage adjustment.

Interactions
DRUG: CarBAMazepine, PHENobarbital, primidone, phenytoin, rifAMPin may decrease concentration. Valproic acid may increase concentration/effects. May decrease effects of oral contraceptives. HERBAL: Evening primrose may decrease seizure threshold. FOOD: None known. LAB VALUES: None significant.

Availability (Rx)

Tablets: 25 mg, 100 mg, 150 mg, 200 mg. Tablets (Chewable): 5 mg, 25 mg. Tablets (Orally Disintegrating): 25 mg, 50 mg, 100 mg, 200 mg. Tablets (Extended-Release): 25 mg, 50 mg, 100 mg, 200 mg, 250 mg, 300 mg.

Administration/handling

PO

• Give without regard to food.
• Chewable tablets may be dispensed in water or diluted fruit juice, or swallowed whole.
• Extended-release tablets must be swallowed whole; do not break, crush, dissolve, or divide.
• Place orally disintegrating tablet on tongue, allow to dissolve. Pt must not break, cut, or chew. Can be swallowed without regard to food or water.

Indications/routes/dosage

Lennox-Gastaut, Primary Generalized Tonic-Clonic Seizures, Partial Seizures

PO: ADULTS, ELDERLY, CHILDREN OLDER THAN 12 YRS: Initially, 25 mg/day for 2 wks, then increase to 50 mg/day for 2 wks. After 4 wks, may increase by 50 mg/day at 1- to 2-wk intervals. Maintenance: 225–375 mg/day in 2 divided doses. CHILDREN 2–12 YRS: Initially, 0.3 mg/kg/day in 1–2 divided doses for 2 wks, then increase to 0.6 mg/kg/day in 1–2 divided doses for 2 wks. After 4 wks, may increase by 0.6 mg/kg/day at 1- to 2-wk intervals. Maintenance: 4.5–7.5 mg/kg/day in 2 divided doses. Maximum: 300 mg/day in
2 divided doses.

**Adjusted Dosage with Antiepileptic Drugs Containing Valproic Acid**

**PO: ADULTS, ELDERLY, CHILDREN OLDER THAN 12 YRS:** Initially, 25 mg every other day for 2 wks, then increase to 25 mg/day for 2 wks. After 4 wks, may increase by 25–50 mg/day at 1- to 2-wk intervals. **Maintenance:** 100–400 mg/day in 2 divided doses (100–200 mg/day when taking lamoTRIgine with valproic acid alone). **CHILDREN 2–12 YRS:** Initially, 0.15 mg/kg/day in 1–2 divided doses for 2 wks, then increase to 0.3 mg/kg/day in 1–2 divided doses for 2 wks. After 4 wks, may increase by 0.3 mg/kg/day at 1- to 2-wk intervals. **Maintenance:** 1–5 mg/kg/day in 2 divided doses. **Maximum:** 200 mg/day in 2 divided doses.

**Adjusted Dosage with EIAED without Valproic Acid**

**PO: ADULTS, ELDERLY, CHILDREN OLDER THAN 12 YRS:** Initially, 50 mg/day for 2 wks, then increase to 100 mg/day in 2 divided doses for 2 wks. After 4 wks, may increase by 100 mg/day at 1- to 2-wk intervals. **Maintenance:** 300–500 mg/day in 2 divided doses. **CHILDREN 2–12 YRS:** Initially, 0.6 mg/kg/day in 1–2 divided doses for 2 wks, then increase to 1.2 mg/kg/day in 1–2 divided doses for 2 wks. After 4 wks, may increase by 1.2 mg/kg/day at 1- to 2-wk intervals. **Maintenance:** 5–15 mg/kg/day in 2 divided doses. **Maximum:** 400 mg/day in 2 divided doses.

**Usual Maintenance Range for Extended-Release Tablets**

**PT TAKING VALPROIC ACID:** 200–250 mg once daily. **PT TAKING EIAED WITHOUT VALPROIC ACID:** 400–600 mg once daily. **PT NOT TAKING EIAED:** 300–400 mg once daily.

**Conversion to Monotherapy for Pts Receiving EIAEDs**

**PO: ADULTS, ELDERLY, CHILDREN 16 YRS AND OLDER:** 500 mg/day in 2 divided doses. Titrate to desired dose while maintaining EIAED at fixed level, then withdraw EIAED by 20% each wk over a 4-wk period.

**Conversion to Monotherapy for Pts Receiving Valproic Acid**
PO: ADULTS, ELDERLY, CHILDREN 16 YRS AND OLDER: Titrate lamotrigine to 200 mg/day, maintaining valproic acid dose. Maintain lamotrigine dose and decrease valproic acid to 500 mg/day, no greater than 500 mg/day, then maintain 500 mg/day for 1 wk. Increase lamotrigine to 300 mg/day and decrease valproic acid to 250 mg/day. Maintain for 1 wk, then discontinue valproic acid and increase lamotrigine by 100 mg/day each wk until maintenance dose of 500 mg/day reached.

Bipolar Disorder
PO: ADULTS, ELDERLY: Initially, 25 mg/day for 2 wks, then 50 mg/day for 2 wks, then 100 mg/day for 1 wk, then 200 mg/day beginning with wk 6.

Bipolar Disorder in Pts Receiving EIAEDs
PO: ADULTS, ELDERLY: 50 mg/day for 2 wks, then 100 mg/day for 2 wks, then 200 mg/day for 1 wk, then 300 mg/day for 1 wk, then up to usual maintenance dose 400 mg/day in divided doses.

Bipolar Disorder in Pts Receiving Valproic Acid
PO: ADULTS, ELDERLY: 25 mg/day every other day for 2 wks, then 25 mg/day for 2 wks, then 50 mg/day for 1 wk, then 100 mg/day. Usual maintenance dose with valproic acid: 100 mg/day.

Usual Dosage for LaMICtal XR
Adjunct Therapy: Range: 200–600 mg/day.
Conversion to Monotherapy: Range: 250–500 mg/day.

Discontinuation Therapy
A dosage reduction of approximately 50%/wk over at least 2 wks is recommended.

Dosage in Renal Impairment
Decreased dosage may be effective in pts with significant renal impairment.

Dosage in Hepatic Impairment
Mild impairment: No dose adjustment. Moderate to severe impairment without ascites: Reduce dose by 25%. Severe impairment with ascites: Reduce dose by 50%.

Side effects

Frequent (38%–14%): Dizziness, headache, diplopia, ataxia, nausea, blurred vision, drowsiness, rhinitis. Occasional (10%–5%): Rash, pharyngitis, vomiting, cough, flu-like symptoms, diarrhea, dysmenorrhea, fever, insomnia, dyspepsia. Rare: Constipation, tremor, anxiety, pruritus, vaginitis, hypersensitivity reaction.

Adverse effects/toxic reactions

Abrupt withdrawal may increase seizure frequency. Serious rashes, including Stevens-Johnson syndrome, have been reported. May increase risk of suicidal thoughts and behavior.

Nursing considerations

Baseline assessment

Review history of seizure disorder (type, onset, intensity, frequency, duration, LOC), medication history (esp. other anticonvulsants), other medical conditions (e.g., renal impairment). Initiate seizure precautions. Assess baseline mood, behavior. Question history of suicidal thought and behavior.

Intervention/evaluation

Patient/ family teaching

• Take medication only as prescribed; do not abruptly discontinue medication after long-term therapy.
• Avoid alcohol.
• Avoid tasks that require alertness, motor skills until response to drug is established.
• Carry identification card/bracelet to note anticonvulsant therapy.
• Strict maintenance of drug therapy is essential for seizure control.
• Report any rash, fever, swelling of glands, worsening depression, suicidal ideation, unusual changes in behavior, worsening of seizure control.
• May cause photosensitivity reaction; avoid exposure to sunlight, ultraviolet light.

lansoprazole
lan-soe-pra-azole
Apo-Lansoprazole
First Lansoprazole
Prevacid
Prevacid Solu-Tab
Prevacid 24HR

Fixed-Combination(s)

Prevacid NapraPac: lansoprazole/naproxen (an NSAID): 15 mg/375 mg, 15 mg/500 mg. Prevpac: Combination card containing amoxicillin 500 mg (4 capsules), lansoprazole 30 mg (2 capsules), clarithromycin 500 mg (2 tablets).

CLASSIFICATION
PHARMACOTHERAPEUTIC: Proton pump inhibitor.
CLINICAL: Anti-ulcer agent.

Do not confuse lansoprazole with ARIPiprazole or dextansoprazole, or Prevacid with Pravachol, PriLOSEC, or Prinivil.

Uses
Short-term treatment (4 wks and less) of healing, symptomatic relief of active duodenal ulcer; short-term treatment (8 wks and less) for healing, symptomatic relief of erosive esophagitis. Long-term treatment of pathologic hypersecretory conditions, including Zollinger-Ellison syndrome. Short-term treatment (8 wks
and less) of active benign gastric ulcer, *H. pylori*–associated duodenal ulcer (part of multidrug regimen), maintenance treatment for healed duodenal ulcer. Treatment of gastroesophageal reflux disease (GERD), NSAID-associated gastric ulcer. Reduce risk of NSAID-associated gastric ulcer in pts with history of gastric ulcer requiring NSAIDs. OTC: Relief of frequent heartburn (2 or more days/wk). IV: Short-term treatment of erosive esophagitis. OFF-LABEL: Stress ulcer prophylaxis in critically ill.

**Precautions**

**Contraindications:** Hypersensitivity to lansoprazole, other proton pump inhibitors. **Cautions:** Hepatic impairment. May increase risk of hip, wrist, spine fractures; GI infections.

**Action**

Inhibits the (H⁺, K⁺)–ATPase enzyme system, blocking the final step in gastric acid secretion. **Therapeutic Effect:** Suppresses gastric acid secretion.

**Pharmacokinetics**

Rapid, complete absorption (food may decrease absorption) once drug has left stomach. Protein binding: 97%. Distributed primarily to gastric parietal cells. Metabolized in liver. Excreted in bile and urine. Not removed by hemodialysis. **Half-life:** 1.5 hrs (increased in hepatic impairment, elderly).

**Lifespan considerations**

**Pregnancy/Lactation:** Unknown if distributed in breast milk. **Children:** Safety and efficacy not established. **Elderly:** No age-related precautions noted but doses greater than 30 mg not recommended.

**Interactions**

**DRUG:** May decrease concentration of atazanavir. May interfere with absorption of ampicillin, digoxin, iron salts, ketoconazole. Sucralfate may delay absorption. May increase effect of warfarin. May decrease effect of clopidogrel. **HERBAL:** St. John’s wort may decrease concentration/effect.
FOOD: Food may decrease absorption. LAB VALUES: May increase serum LDH, alkaline phosphatase, bilirubin, cholesterol, creatinine, ALT, AST, triglycerides, uric acid; Hgb, Hct. May produce abnormal albumin/globulin ratio, electrolyte balance, platelet, RBC, WBC count.

**Availability (Rx)**

**Administration/handling**

PO
- Best if taken before breakfast
- Do not cut/crush delayed-release capsules.
- If pt has difficulty swallowing capsules, open capsules, sprinkle granules on 1 tbsp of applesauce, give immediately. Do not crush or allow pt to chew granules.

PO (Solu-Tab)
- Place tablet on tongue; allow to dissolve, then swallow.
- May give via oral syringe or nasogastric tube.
- May dissolve in 4 mL (15 mg) or 10 mL (30 mg) water.

**Indications/routes/dosage**

**Duodenal Ulcer**
PO: ADULTS, ELDERLY: 15 mg/day, for up to 4 wks. Maintenance: 15 mg/day.

**Erosive Esophagitis**
PO: ADULTS, ELDERLY: 30 mg/day, for up to 8 wks. If healing does not occur within 8 wks (in 5%–10% of cases), may give for additional 8 wks. Maintenance: 15 mg/day. CHILDREN 1–11 YRS, WEIGHING GREATER
THAN 30 KG: 30 mg/day for up to 12 wks; WEIGHING 30 KG OR LESS: 15 mg/day for up to 12 wks.

**Gastric Ulcer**
**PO: ADULTS:** 30 mg/day for up to 8 wks.

**NSAID Gastric Ulcer**
**PO: ADULTS, ELDERLY:** (Healing): 30 mg/day for up to 8 wks. (Prevention): 15 mg/day for up to 12 wks.

**Gastroesophageal Reflux Disease (GERD)**
**PO: ADULTS:** 15 mg/day for up to 8 wks.
**CHILDREN 12–17 YRS:** 30 mg/day up to 8 wks. **CHILDREN 1–11 YRS,**
**WEIGHING GREATER THAN 30 KG:** 30 mg/day for up to 8 wks; **WEIGHING 30 KG OR LESS:** 15 mg/day for up to 8 wks.

**H. Pylori Infection**
**PO: ADULTS, ELDERLY:** (triple drug therapy including amoxicillin, clarithromycin) 30 mg q12h for 10–14 days or (with amoxicillin) 30 mg 3 times/day for 14 days.

**Pathologic Hypersecretory Conditions (Including Zollinger-Ellison Syndrome)**
**PO: ADULTS, ELDERLY:** Initially, 60 mg/day. Individualize dosage according to pt needs and for as long as clinically indicated. Administer doses greater than 120 mg/day in divided doses.

**Heartburn (OTC)**
**PO: ADULTS, ELDERLY:** 15 mg once daily for 14 days. May repeat q4mos.

**Dosage in Renal Impairment**
No dose adjustment.

**Dosage in Hepatic Impairment**
Consider dose reduction in severe impairment.
Side effects

**Occasional (3%–2%):** Diarrhea, abdominal pain, rash, pruritus, altered appetite. **Rare (1%):** Nausea, headache.

Adverse effects/toxic reactions

Bilirubinemia, eosinophilia, hyperlipidemia occur rarely. May increase risk of *C. difficile* infection. Chronic use may increase risk of osteoporosis, fractures.

Nursing considerations

Baseline assessment

Obtain baseline lab values. Assess for epigastric/abdominal pain, evidence of GI bleeding, ecchymosis.

Intervention/evaluation

Monitor CBC, hepatic/renal function tests. Assess for therapeutic response (relief of GI symptoms). Question if diarrhea, abdominal pain, nausea occurs. Obtain *C. difficile* PCR test in pts with persistent diarrhea, fever, abdominal pain.

Patient/ family teaching

• Do not chew, crush delayed-release capsules.
• For pts who have difficulty swallowing capsules, open capsules, sprinkle granules on 1 tbsp of applesauce, swallow immediately.

**lapatinib**

la-pa-tin-ib

Tykerb

CLASSIFICATION

PHARMACOTHERAPEUTIC: Tyrosine kinase inhibitor.
CLINICAL: Antineoplastic.

BLACK BOX ALERT

Hepatotoxicity (serum ALT or AST more than
3 times upper limit of normal [ULN] and total bilirubin more than 2 times ULN), possibly severe, has occurred.

Do not confuse lapatinib with dasatinib, erlotinib, or imatinib.

**Uses**

Combination treatment with capecitabine for the treatment of human epidermal growth receptor type 2 (HER2)–overexpressing advanced or metastatic breast cancer in pts who have received prior therapy including an anthracycline, a taxane, and trastuzumab. Combination treatment with letrozole for treatment of postmenopausal women with HER2-overexpressing hormone receptor–positive metastatic breast cancer for whom hormonal therapy is indicated. **OFF-LABEL:** Treatment (in combination with trastuzumab) of HER2-overexpressing metastatic breast cancer that progressed on prior trastuzumab-containing therapy. Treatment of HER2-overexpressing metastatic breast cancer with brain metastasis.

**Precautions**

**Contraindications:** Hypersensitivity to lapatinib. **Cautions:** Left ventricular function abnormalities, prolonged QT interval or medications known to prolong QT interval, hepatic impairment. History of treatment with anthracyclines, chest wall irradiation. Avoid concurrent use with strong CYP3A4 inhibitors or inducers.

**Action**

Inhibitory action against kinases targeting intracellular components of epidermal growth factor receptor ErbB1 and a second receptor, human epidermal receptor (HER2 [ErbB2]). **Therapeutic Effect:** Inhibits tumor cell growth and metastasis.

**Pharmacokinetics**

**Lifespan considerations**

**Pregnancy/Lactation:** May cause fetal harm. Unknown if distributed in breast milk. **Children:** Safety and efficacy not established. **Elderly:** No age-related precautions noted.

**Interactions**

**DRUG:** QT interval–prolonging medications (e.g., amiodarone, azithromycin, ceritinib, haloperidol, moxifloxacin) may increase risk of QT interval prolongation, cardiac arrhythmias. May increase **digoxin** levels. **CYP3A4 inhibitors** (e.g., clarithromycin, ketoconazole, ritonavir) may increase plasma concentration. **CYP3A4 inducers** (e.g., carBAMazepine, phenytoin, rifAMPin) may decrease plasma concentration. **HERBAL:** St. John’s wort decreases plasma concentration. **FOOD:** Grapefruit products may increase plasma concentration (potential for torsades, myelotoxicity). **LAB VALUES:** May increase serum ALT, AST, bilirubin. May decrease neutrophils, Hgb, platelets.

**Availability (Rx)**

**Tablets:** 250 mg.

**Administration/handling**

**PO**

- Do not break, crush, dissolve, or divide film-coated tablets.
- Give at least 1 hr before or 1 hr after food. Take full dose at same time each day.

**Indications/routes/dosage**
Breast Cancer

PO: ADULTS, ELDERLY: (With capecitabine): 1,250 mg (5 tablets) once daily. (With letrozole): 1,500 mg once daily continuously with letrozole. Continue until disease progresses or unacceptable toxicity.

Dose Modification

Cardiac Toxicity
Discontinue with decreased left ventricular ejection fraction grade 2 or higher, or in pts with an ejection fraction that drops to lower limit of normal. May be started at a reduced dose (1,000 mg/day) at a minimum of 2 wks when ejection fraction returns to normal and pt is asymptomatic.

Pulmonary Toxicity
Discontinue with symptoms indicative of interstitial lung disease or pneumonitis grade 3 or higher.

Severe Hepatic Impairment
With capecitabine: 750 mg/day. With letrozole: 1,000 mg/day.

CYP3A4 Inhibitors/Inducers
Concomitant use of CYP3A4 inhibitors may require dose reduction of lapatinib (e.g., decrease to 500 mg/day with careful monitoring); CYP3A4 inducers may require dose increase of lapatinib (e.g., increase to 4,500 mg with capecitabine or 5,500 mg with letrozole).

Dosage in Renal Impairment
No dose adjustment.

Dosage in Hepatic Impairment
Mild to moderate impairment: No dose adjustment. Severe impairment: See dose modification.

Side effects
**Common (65%–44%):** Diarrhea, hand-foot syndrome (blistering/rash/peeling of skin on palms of hands, soles of feet), nausea. **Frequent (28%–26%):** Rash, vomiting. **Occasional (15%–10%):** Mucosal inflammation, stomatitis, extremity pain, back pain, dry skin, insomnia.

**Adverse effects/toxic reactions**

Decreases in left ventricular ejection grade 3 or higher have been observed; 20% decrease relative to baseline is considered toxic.

**Nursing considerations**

**Baseline assessment**

Screen for home medications that prolong QT interval. Obtain baseline EKG. Question for possibility of pregnancy. Obtain baseline CBC, serum chemistries before treatment begins and monthly thereafter.

**Intervention/evaluation**

**Patient/family teaching**

- Avoid crowds, those with known infection.
- Avoid contact with those who recently received live virus vaccine.
- Do not have immunizations without physician’s approval (drug lowers resistance).
- Promptly report fever, unusual bruising/bleeding from any site.
- Ensure use of appropriate birth control measures in women.
- Treatment may cause severe lung inflammation; report shortness of breath, severe cough, lung pain.
- Report liver problems such as upper abdominal pain, bleeding, dark or amber-colored urine, nausea, vomiting, or yellowing of the skin or eyes.
ledipasvir/sofosbuvir
le-dip-as-vir/soe-fos-bue-vir

Harvoni

CLASSIFICATION
PHARMACOTHERAPEUTIC: Combination nucleotide analog NS5A inhibitor and nucleotide analog NS5B polymerase inhibitor.

CLINICAL: Antihepacvirus.

BLACK BOX ALERT Test all pts for hepatitis B virus (HBV) infection prior to initiation. HBV reactivation was reported in HCV/HBV co-infected pts who were undergoing or had completed treatment with HCV direct-acting antivirals and were not receiving HBV antiviral therapy. HBV reactivation may cause fulminant hepatitis, hepatic failure, and death.

Do not confuse ledipasvir with daclatasvir, elbasvir, or ombitasvir, or sofosbuvir with dasabuvir.

Uses

Treatment of chronic hepatitis C virus (HCV) in adults and children 12 yrs and older or weighing at least 35 kg with genotype 1, 4, 5, or 6 infection without cirrhosis or with compensated cirrhosis; genotype 1 infection in adults with decompensated cirrhosis, in combination with ribavirin; genotype 1 or 4 infection in adults who are liver transplant recipients without cirrhosis or with compensated cirrhosis, in combination with ribavirin. Treatment in pediatric pts 12 yrs and older and weighing at least 35 kg with HCV genotype 1, 4, 5, or 6 infection without cirrhosis or with compensated cirrhosis.

Precautions

Note: If used with ribavirin, the Contraindications and Cautions for the use of ribavirin also apply.

Contraindications: Hypersensitivity to ledipasvir, sofosbuvir. Cautions: Advanced hepatic disease, HIV infection, hepatitis B virus infection. Concomitant use of amiodarone (with or without beta blockers) in pts with underlying cardiac disease. Concomitant use of P-glycoprotein (P-gp) inducers
not recommended.

**Action**

Ledipasvir inhibits HCV NS5A protein, essential for viral replication. Sofosbuvir is converted to its active form and inhibits NS5B RNA-dependent RNA polymerase, also essential for viral replication. **Therapeutic Effect:** Inhibits viral replication of HCV.

**Pharmacokinetics**

Widely absorbed. Ledipasvir is metabolized by oxidative processes. Sofosbuvir is metabolized in liver. Protein binding: 99.8% (ledipasvir), 61%–65% (sofosbuvir). Peak plasma concentration: 4–4.5 hrs (ledipasvir), 0.8–1 hr (sofosbuvir). Ledipasvir is excreted in feces (87%) and urine (1%). Sofosbuvir is excreted in urine (80%), feces (14%). **Half-life:** 47 hrs (ledipasvir), 0.4 hr (sofosbuvir).

**Lifespan considerations**

**Pregnancy/Lactation:** Unknown if ledipasvir or sofosbuvir is distributed in breast milk. When administered with ribavirin, therapy is contraindicated in pregnant women and in men whose female partners are pregnant. **Children:** Safety and efficacy not established in pts younger than 12 yrs of age or weight less than 35 kg. **Elderly:** No age-related precautions noted.

**Interactions**

**DRUG:** May enhance bradycardic effect of amiodarone. May increase concentration of rosuvastatin. Aluminum- or magnesium-containing antacids, H₂-receptor antagonists (e.g., famotidine), proton pump inhibitors (e.g., omeprazole), anticonvulsants (e.g., carBAMazepine), antimycobacterials (e.g., rifAMPin) may decrease concentration/effects. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** May increase serum bilirubin.

**Availability (Rx)**
Tablets (Fixed-Dose Combination): 90 mg (ledipasvir)/400 mg (sofosbuvir).

Administration/handling

PO
• Give with or without food.

Indications/Routes/Dosage

Hepatitis C Virus Infection

PO: ADULTS, ELDERLY, CHILDREN 12 YRS OF AGE AND OLDER WHO WEIGH AT LEAST 35 KG: 1 tablet (ledipasvir/sofosbuvir) once daily. See manufacturer guidelines for treatment with ribavirin.

Treatment Regimen and Duration for Adults

Genotype 1
Treatment-naïve without cirrhosis or with compensated cirrhosis (Child-Pugh A): Ledipasvir/sofosbuvir for 12 wks. Treatment for 8 wks may be considered in treatment-naïve genotype 1 pts without cirrhosis who have HCV-RNA level less than 6 million international units/mL prior to initiation. Treatment-experienced without cirrhosis: Ledipasvir/sofosbuvir for 12 wks. Treatment-experienced with compensated cirrhosis (Child-Pugh A): Ledipasvir/sofosbuvir for 24 wks. Ledipasvir/sofosbuvir plus ribavirin for 12 wks may be considered in treatment-experienced genotype 1 pts with cirrhosis who are eligible for ribavirin. Treatment-naïve and treatment-experienced with decompensated cirrhosis (Child-Pugh B or C): Ledipasvir/sofosbuvir plus ribavirin for 12 wks.

Genotype 1 or 4
Treatment-naïve and treatment-experienced liver transplant recipients without cirrhosis or with compensated cirrhosis (Child-Pugh A): Ledipasvir/sofosbuvir plus ribavirin for 12 wks.

Treatment Regimen and Duration for Children

Genotype 1
Treatment-naïve without cirrhosis or with compensated cirrhosis (Child-
Treatment-naïve and treatment-experienced without cirrhosis or with compensated cirrhosis (Child-Pugh A): Ledipasvir/sofosbuvir for 12 wks.

Dosage in Renal Impairment
Mild to moderate impairment: No dose adjustment. Severe impairment: Not specified; use caution.

Dosage in Hepatic Impairment
No dose adjustment.

Side Effects
Occasional (16%–4%): Fatigue, headache, nausea, diarrhea. Rare (3%): Insomnia. (Treatment with ribavirin): Frequent (31%–29%): Asthenia, headache. Occasional (18%–5%): Fatigue, myalgia, irritability, dizziness. Rare (3%): Dyspnea.

Adverse Effects/Toxic Reactions
HBV reactivation was reported in pts co-infected with HBV/HCV; may result in fulminant hepatitis, hepatic failure, death. Cardiac arrest, symptomatic bradycardia, pacemaker implantation was reported in pts taking concomitant amiodarone. Bradycardia usually occurred within hrs to days, but may occur up to 2 wks after initiation. Pts with underlying cardiac disease, advanced hepatic disease, or pts taking concomitant beta blockers are at an increased risk for bradycardia when used concomitantly with amiodarone. Psychiatric disorders including depression may occur.

Nursing Considerations

Baseline Assessment
Obtain LFT, HCV-RNA level; pregnancy test in females of reproductive
potential; CBC for pts treated with ribavirin. Confirm HCV genotype. Test all pts for HBV infection prior to initiation. Receive full medication history and screen for contraindications/interactions, esp. concomitant use of amiodarone. Question for history of chronic anemia, HBV infection, HIV infection, liver transplantation.

**Intervention/Evaluation**
Periodically monitor LFT, HCV-RNA level for treatment effectiveness. Closely monitor for exacerbation of hepatitis or HBV reactivation. If unable to discontinue amiodarone, consider inpatient cardiac monitoring for at least 48 hrs, followed by outpatient or self-monitoring of heart rate for at least 2 wks after initiation. Cardiac monitoring is also recommended in pts who discontinue amiodarone just prior to initiation. In females of reproductive potential who are taking concomitant ribavirin, reinforce birth control compliance and obtain monthly pregnancy tests. Monitor for new-onset or worsening of depression

**Patient/Family Teaching**
- Pts who take amiodarone (an antiarrhythmic) during therapy may require inpatient and outpatient cardiac monitoring (and in some cases pacemaker implantation) due to an increased risk of slow heart rate or cardiac arrest. If amiodarone therapy cannot be withheld or stopped, immediately report symptoms of slow heart rate such as chest pain, confusion, dizziness, fainting, light-headedness, memory problems, palpitations, weakness.
- Treatment may be used in combination with ribavirin (inform pt of contraindications/adverse effects of ribavirin therapy). If therapy includes treatment with ribavirin, females of reproductive potential and males with female partners of reproductive potential should avoid pregnancy during treatment.
  - Do not breastfeed.
  - There is an increased risk of drug interactions with other medications.
  - Do not take newly prescribed medications unless approved by prescriber who originally started treatment.
  - Do not take herbal products.
  - Avoid alcohol.
  - Report signs of depression.
**leflunomide**
lee-floo-noe-myde

Apo-Leflunomide

**Class**: Immunomodulatory agent.

**Clinical**: Anti-inflammatory, antirheumatic.

- **BLACK BOX ALERT** - Do not use during pregnancy. Women of childbearing potential must be counseled regarding fetal risk, use of reliable contraceptives confirmed, possibility of pregnancy excluded. Severe hepatic injury may occur.

**Uses**

**Precautions**
- **Contraindications**: Hypersensitivity to leflunomide. Pregnancy or plans for pregnancy. Severe hepatic impairment. **Cautions**: Hepatic/renal impairment, hepatitis B or C virus infection, pts with immunodeficiency or bone marrow dysplasias, breastfeeding mothers, history of new/recurrent infections, latent TB, significant hematologic abnormalities, diabetes, concomitant use of neurotoxic medications, elderly pts.

**Action**
Inhibits pyrimidine synthesis, resulting in antiproliferative and anti-inflammatory effects. **Therapeutic Effect**: Reduces signs/symptoms of RA, retards structural damage.
Pharmacokinetics

Well absorbed after PO administration. Protein binding: greater than 99%. Metabolized in GI wall, liver. Excreted through renal, biliary systems. Not removed by hemodialysis. **Half-life:** 16 days.

Lifespan considerations

**Pregnancy/Lactation:** Can cause fetal harm. Contraindicated in pregnancy. Unknown if distributed in breast milk. Breastfeeding not recommended. **Children:** Safety and efficacy not established in pts younger than 18 yrs. **Elderly:** No age-related precautions noted.

Interactions

**DRUG:** RifAMPin may increase concentration/effects. **Hepatotoxic medications** (e.g., acetaminophen, ketoconazole, simvastatin) may increase risk of side effects, hepatotoxicity. Use of **live virus vaccine** not recommended. **HERBAL:** Echinacea may decrease effects. **FOOD:** None known. **LAB VALUES:** May increase serum ALT, AST, alkaline phosphatase, bilirubin.

Availability (Rx)

**Tablets:** 10 mg, 20 mg.

Administration/handling

**PO**

• Give without regard to food.

Indications/routes/dosage

**Rheumatoid Arthritis (RA)**

**PO:** **ADULTS, ELDERLY:** Initially, 100 mg/day for 3 days, then 10–20 mg/day. (Loading dose may be omitted in pts at increased risk of hepatitis or toxicity.)
Dosage in Renal Impairment
No dose adjustment.

Dosage in Hepatic Impairment
ALT 2–3 Times Upper Limit of Normal (ULN): Not recommended. Persistent ALT Level Greater Than 3 Times ULN: Discontinue and initiate accelerated drug elimination. Cholestyramine 8 g 3 times/day for 11 days or activated charcoal 50 g q12h for 11 days.

Side effects
Frequent (20%–10%): Diarrhea, respiratory tract infection, alopecia, rash, nausea.

Adverse effects/toxic reactions
May cause immunosuppression. Transient thrombocytopenia, leukopenia, hepatotoxicity occur rarely. Interstitial lung disease, peripheral neuropathy.

Nursing considerations

Baseline assessment
Obtain pregnancy test in females or reproductive potential. Question plans of breastfeeding. Obtain baseline CBC, LFT. Assess limitations in activities of daily living due to rheumatoid arthritis (RA). Obtain baseline evaluation for active TB, latent TB.

Intervention/evaluation
Monitor tolerance to medication. Assess symptomatic relief of RA (relief of pain; improved range of motion, grip strength, mobility). Monitor LFT, CBC, signs/symptoms of severe infection or pulmonary symptoms.

Patient/family teaching
• May take without regard to food.
• Improvement may take longer than 8 wks.
Avoid pregnancy.

lenalidomide
len-a-lid-o-myde

Revlimid

CLASSIFICATION
PHARMACOTHERAPEUTIC: Isoxazole immunomodulator.
CLINICAL: Immunosuppressive agent.

BLACK BOX ALERT
Analogue to thalidomide. High potential for significant birth defects. Hematologic toxicity (thrombocytopenia, neutropenia) occurs in 80% of pts. Greatly increases risk for DVT, pulmonary embolism in multiple myeloma pts.

Do not confuse lenalidomide with thalidomide.

Uses

Precautions

Action
Inhibits secretion of pro-inflammatory cytokines, increases secretion of anti-inflammatory cytokines. Enhances cell-mediated immunity by stimulation of T cells. **Therapeutic Effect:** Inhibits myeloma cell growth; induces cell cycle arrest and cell death.

**Pharmacokinetics**

Well absorbed following PO administration. Protein binding: 30%. Excreted in urine. **Half-life:** 3 hrs (increased in renal impairment).

phasis

**Lifespan considerations**

**Pregnancy/Lactation:** Contraindicated in women who are or may become pregnant, who are not using two reliable forms of contraception, or who are not abstinent. Can cause severe birth defects, fetal death. Unknown if distributed in breast milk; breastfeeding not recommended. **Children:** Safety and efficacy not established in pts younger than 18 yrs. **Elderly:** Age-related renal impairment may require caution in dosage selection. Risk of toxic reactions greater in those with renal insufficiency.

**Interactions**

**DRUG:** May increase toxic effects of abatacept, anakinra, bisphosphonate derivatives, canakinumab, clozapine, leflunomide, natalizumab, nivolumab, rilonacept, tofacitinib, vedolizumab. May increase immunosuppressive effects of certolizumab, fingolimod, ocrelizumab. May increase neutropenic effect of deferiprone, clozapine. Denosumab, dipyrene, pimecrolimus may increase risk of toxicity. May decrease therapeutic effect of nivolumab. Dexamethasone, erythropoiesis-stimulating agents, estrogens may increase risk of thrombosis. Ocrelizumab, roflumilast, tocilizumab may increase immunosuppressive effects. May increase concentration effect of digoxin. May increase toxic effect of live vaccines; may diminish therapeutic effect of vaccines.

**HERBAL:** Avoid echinacea (has immunostimulant properties). **FOOD:** None known. **LAB VALUES:** May decrease WBC count, Hgb, Hct platelets, troponin I, serum creatinine, sodium, T₃, T₄. May decrease serum bilirubin, glucose, potassium, magnesium.
Availability (Rx)

Capsules: 2.5 mg, 5 mg, 10 mg, 15 mg, 25 mg.

Administration/handling

- Store at room temperature.
- Do not break, crush, dissolve, or divide capsules.
- Swallow whole with water.

Indications/routes/dosage

Myelodysplastic Syndrome

PO: ADULTS, ELDERLY: 10 mg once daily.

Dosage Adjustments for Myelodysplastic Syndrome

Platelets:

Thrombocytopenia within 4 wks with 10 mg/day

Baseline platelets 100,000 cells/mm$^3$ or greater: If platelets less than 50,000 cells/mm$^3$, hold treatment. Resume at 5 mg/day when platelets return to 50,000 cells/mm$^3$ or greater. Baseline platelets less than 100,000 cells/mm$^3$: If platelets fall to 50% of baseline, hold treatment. Resume at 5 mg/day if baseline is 60,000 cells/mm$^3$ or greater and platelets return to 50,000 cells/mm$^3$ or greater. Resume at 5 mg/day if baseline is less than 60,000 cells/mm$^3$ and platelets return to 30,000 cells/mm$^3$ or greater.

Thrombocytopenia after 4 wks with 10 mg/day: If platelets less than 30,000 cells/mm$^3$ OR less than 50,000 cells/mm$^3$ with platelet transfusion, hold treatment. Resume at 5 mg/day when platelets return to 30,000 cells/mm$^3$ or greater.

Thrombocytopenia developing with 5 mg/day: If platelets less than 30,000 cells/mm$^3$ OR less than 50,000 cells/mm$^3$ with platelet transfusion, hold treatment. Resume at 5 mg every other day when platelets return to 30,000 cells/mm$^3$ or greater.

Neutrophils:

Neutropenia within 4 wks with 10 mg/day

Baseline absolute neutrophil count (ANC) 1,000/mcl or greater: If ANC less
than 750 cells/mm³, hold treatment. Resume at 5 mg/day when ANC 1,000 cells/mm³ or greater. **Baseline ANC less than 1,000 cells/mm³:** If ANC less than 500 cells/mm³, hold treatment. Resume at 5 mg/day when ANC 500 cells/mm³ or greater.

**Neutropenia after 4 wks with 10 mg/day:** If ANC less than 500 cells/mm³ for 7 days or longer or associated with fever, hold treatment. Resume at 5 mg/day when ANC 500 cells/mm³ or greater.

**Neutropenia developing with 5 mg/day:** If ANC less than 500 cells/mm³ for 7 days or longer or associated with fever, hold treatment. Resume at 5 mg every other day when ANC 500 cells/mm³ or greater.

**Mantle Cell Lymphoma**

PO: ADULTS, ELDERLY: 25 mg once daily on days 1–21 of repeated 28-day cycle. Continue until disease progression or unacceptable toxicity.

**Multiple Myeloma**

PO: ADULTS, ELDERLY: 25 mg/day on days 1–21 of repeated 28-day cycle (in combination with dexamethasone). Continue until disease progression or unacceptable toxicity.

**Multiple Myeloma following auto-HSCT**

PO: ADULTS, ELDERLY: 10 mg once daily continuously on days 1–28 of repeated 28-day cycle.

**Dosage Adjustments for Multiple Myeloma**

**Platelets:**

**Thrombocytopenia:** If platelets fall to less than 30,000 cells/mm³, hold treatment, monitor CBC. Resume at 15 mg/day when platelets 30,000 cells/mm³ or greater. For each subsequent fall to less than 30,000 cells/mm³, hold treatment and resume at 5 mg/day less than previous dose when platelets return to 30,000 cells/mm³ or greater. Do not dose to less than 5 mg/day.

**Neutrophils:**

**Neutropenia:** If neutrophils fall to less than 1,000 cells/mm³, hold treatment, add G-CSF, follow CBC wkly. Resume at 25 mg/day when neutrophils return to 1,000 cells/mm³ and neutropenia is the only toxicity. Resume at 15 mg/day if other toxicity is present. For each subsequent fall to less than 1,000 cells/mm³,
hold treatment and resume at 5 mg/day less than previous dose when neutrophils return to 1,000 cells/mm$^3$ or greater. Do not dose to less than 5 mg/day.

**Dosage in Renal Impairment**

<table>
<thead>
<tr>
<th>Condition</th>

<th>Creatinine Clearance Less Than 30 mL/min (Nondialysis Dependent)</th>
<th>Creatinine Clearance Less Than 30 mL/min (Dialysis Dependent)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Myelodysplastic syndrome</td>
<td>5 mg once daily</td>
<td>2.5 mg once daily</td>
<td>2.5 mg once daily (give after dialysis)</td>
</tr>
<tr>
<td>Multiple myeloma</td>
<td>10 mg once daily</td>
<td>15 mg q48h</td>
<td>5 mg once daily (give after dialysis)</td>
</tr>
</tbody>
</table>

**Dosage in Hepatic Impairment**

No dose adjustment.

**Side effects**

**Frequent (49%–31%)**: Diarrhea, pruritus, rash, fatigue. **Occasional (24%–12%)**: Constipation, nausea, arthralgia, fever, back pain, peripheral edema, cough, dizziness, headache, muscle cramps, epistaxis, asthenia, dry skin, abdominal pain. **Rare (10%–5%)**: Extremity pain, vomiting, generalized edema, anorexia, insomnia, night sweats, myalgia, dry mouth, ecchymosis, rigors, depression, dysgeusia, palpitations.

**Adverse effects/toxic reactions**

Significant increased risk of deep vein thrombosis (DVT), pulmonary embolism. Thrombocytopenia occurs in 62% of pts, neutropenia in 59% of pts, and anemia in 12% of pts. Upper respiratory infection (nasopharyngitis, pneumonia, sinusitis, bronchitis, rhinitis), UTI occur occasionally. Cellulitis, peripheral neuropathy, hypertension, hypothyroidism occur in approximately 6% of pts.

**Nursing considerations**

**Baseline assessment**

Obtain baseline CBC. Due to high potential for human birth defects/fetal death, female pts must avoid pregnancy 4 wks before therapy, during therapy, during
dose interruptions, and 4 wks following therapy. Two reliable forms of contraception must be used even if pt has history of infertility unless it is due to hysterectomy or menopause that has occurred for at least 24 consecutive mos. Confirm two negative pregnancy tests before therapy initiation. Screen for risk of arterial, venous thrombosis. Offer emotional support.

**Intervention/evaluation**

Monitor CBC, BMP, serum magnesium as appropriate. Perform pregnancy tests on women of childbearing potential: wkly during the first 4 wks, then at 4-wk intervals in pts with regular menstrual cycles or q2wks in pts with irregular menstrual cycles. Monitor for hematologic toxicity; obtain CBC wkly during first 8 wks of therapy and at least monthly thereafter. Observe for signs, symptoms of thromboembolism (shortness of breath, chest pain, extremity pain, swelling, stroke-like symptoms).

**Patient/family teaching**

• Two reliable forms of birth control must be used at least 4 wks before, during, and for 4 wks following therapy.
• A pregnancy test must be performed within 10–14 days and 24 hrs before therapy begins.
• Males must always use a latex or synthetic condom during any sexual contact with females of childbearing potential even if they have undergone a successful vasectomy.
• Avoid crowds; avoid those with active infection.
• Treatment may cause blood clots in the arms, legs, or lungs; report arm or leg pain/swelling, difficulty breathing, chest pain.

| lenvatinib
| len-va-ti-nib
| Lenvima

**CLASSIFICATION**

**PHARMACOTHERAPEUTIC**: Kinase inhibitor.

**CLINICAL**: Antineoplastic.

Do not confuse lenvatinib with dasatinib, ibrutinib, imatinib.
Uses

Treatment of locally recurrent or metastatic, progressive, radioactive iodine–refractory differentiated thyroid cancer. Treatment of advanced renal cell carcinoma (RCC) in combination with everolimus after one course of another antineoplastic.

Precautions

Contraindications: Hypersensitivity to lenvatinib. Cautions: Electrolyte imbalance (hypokalemia, hypomagnesemia), hepatic/renal impairment. History of cardiac dysfunction (HF, pulmonary edema, right or left ventricular dysfunction), GI perforation/hemorrhage, hypertension, long QT interval syndrome, medications that prolong QT interval, thromboembolic events (e.g., CVA, DVT), pituitary/thyroid disease.

Action

Inhibits tyrosine kinase receptor activity of vascular endothelial growth factor (VEGF) receptors. Inhibits tumor angiogenesis, growth, progression. Therapeutic Effect: Inhibits tumor cell growth and metastasis.

Pharmacokinetics

Lifespan considerations

Pregnancy/Lactation: Avoid pregnancy; may cause fetal harm. Female pts of reproductive potential must use effective contraception during treatment for at least 2 wks after discontinuation. Potentially distributed in breast milk. Must either discontinue drug or discontinue breastfeeding. Treatment may reduce fertility in both female and male pts. Children: Safety and efficacy not established. Elderly: No age-related precautions noted.
Interactions

**DRUG:** CYP3A4 inhibitors (e.g., ketoconazole, ritonavir) may increase concentration/effect. CYP3A4 inducers (e.g., carBAMazepine, rifAMPin) may decrease concentration/effect. Amiodarone, ciprofloxacin, quiNIDine may increase risk of QT interval prolongation. **Hormonal contraceptives** may increase risk of thromboembolic events. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** May increase serum alkaline phosphatase, ALT/AST, amylase, bilirubin, cholesterol, creatinine, lipase. May decrease serum albumin, glucose, magnesium; platelets. May increase or decrease serum calcium, potassium.

Availability (Rx)

**Capsules:** 4 mg, 10 mg.

Administration/handling

**PO**
- Give without regard to food.
- Administer same time each day.
- Do not cut, crush, divide, or open capsules.
- Should be swallowed whole. May be dissolved with 15 mL water or apple juice by first adding whole capsule to liquid; leave for 10 min, stir for 3 min, then administer. Then add 15 mL to glass, swirl, swallow additional liquid.

Indications/routes/dosage

**Thyroid Cancer**

**PO:** ADULTS, ELDERS: 24 mg once daily. Continue until disease progression or unacceptable toxicity.

**RCC**

**PO:** ADULTS, ELDERS: 18 mg once daily (in combination with everolimus). Continue until disease progression or unacceptable toxicity.
Dose Modification

Based on Common Terminology Criteria for Adverse Events (CTCAE).

<table>
<thead>
<tr>
<th>Adverse Reaction</th>
<th>Modification</th>

</tr>
</thead>
<tbody>
<tr>
<td>First occurrence</td>
<td>Interrupt until resolved to grade 0 or 1 or baseline</td>
<td>20 mg once daily</td>
</tr>
<tr>
<td>Second occurrence</td>
<td>Interrupt until resolved to grade 0 or 1 or baseline</td>
<td>14 mg once daily</td>
</tr>
<tr>
<td>Third occurrence</td>
<td>Interrupt until resolved to grade 0 or 1 or baseline</td>
<td>10 mg once daily</td>
</tr>
</tbody>
</table>

Adjusted dose for RCC is lower.

Arterial Thrombotic Event

Discontinue treatment.

Cardiac Dysfunction/Hemorrhagic Event

**PO: ADULTS, ELDERLY:** Interrupt treatment for grade 3 event until improved to grade 0 to 1 or baseline. Either resume at reduced dose or discontinue (depending on the severity and persistence). Discontinue for grade 4 event.

GI Perforation/Fistula Formation

Discontinue treatment.

Hypertension

**PO: ADULTS, ELDERLY:** Interrupt treatment for grade 3 hypertension that persists despite optimal antihypertensive therapy. Resume at reduced dose when hypertension is controlled at less than or equal to grade 2. Discontinue for life-threatening hypertension.

Proteinuria

**PO: ADULTS, ELDERLY:** Interrupt treatment for greater than or equal to 2 g proteinuria/24 hrs. Resume at reduced dose when proteinuria less than 2 g/24 hrs. Discontinue if nephrotic syndrome occurs.

QT Prolongation

**PO: ADULTS, ELDERLY:** Interrupt treatment for grade 3 or greater. Resume at reduced dose when QT prolongation resolved to grade 0 or 1 or baseline.
Renal Failure/Impairment or Hepatotoxicity
**PO: ADULTS, ELDERLY:** Interrupt treatment for grade 3 or 4 renal failure/impairment or hepatotoxicity until resolved to grade 0 or 1 or baseline. Either resume at reduced dose or discontinue (depending on the severity and persistence). Discontinue if hepatic failure occurs.

Reversible Posterior Leukoencephalopathy Syndrome (RPLS)
**PO: ADULTS, ELDERLY:** Interrupt treatment until fully resolved. Resume at reduced dose or discontinue (depending on the severity and persistence of neurologic symptoms).

Other Adverse Reactions
**PO: ADULTS, ELDERLY:** Reduce dose according to dose modification table. Due to limited data, there are no recommendations on resuming treatment in pts with grade 4 adverse events that resolve.

Dosage in Renal Impairment
**Mild to moderate impairment:** No dose adjustment. **Severe impairment:** 14 mg once daily.

Dosage in Hepatic Impairment
**Mild to moderate impairment:** No dose adjustment. **Severe impairment:** 14 mg once daily.

Side effects
**Frequent (73%–29%):** Hypertension, diarrhea, fatigue, asthenia, malaise, arthralgia, myalgia, decreased appetite, weight decreased, nausea, stomatitis, glossitis, mouth ulceration, mucosal inflammation, headache, vomiting, dysphonia, abdominal pain, constipation. **Occasional (25%–7%):** Oral pain, glossodynia, cough, peripheral edema, rash, dysgeusia, dry mouth, dizziness, dyspepsia, insomnia, alopecia, hypotension, dehydration, hyperkeratosis.

Adverse effects/toxic reactions
Serious adverse effects may include arterial thromboembolic events (5% of pts);
cardiac dysfunction (7% of pts); dental and oral infections including gingivitis, parotitis, pericoronitis, periodontitis, sialoadenitis, tooth abscess, tooth infection (10% of pts); GI perforation/fistula formation (2% of pts); hemorrhagic events (35% of pts); hepatotoxicity (4% of pts); hypertension (73% of pts); grade 3 or greater hypocalcemia (9% of pts); impairment of thyroid-stimulating hormone (57% of pts); palmar-plantar erythrodysesthesia (32% of pts); proteinuria (34% of pts); QT interval prolongation (9% of pts); renal failure (14% of pts); urinary tract infection (11% of pts). Reverse posterior leukoencephalopathy occurs rarely. The median onset of hypertension was 16 days. The most frequently reported hemorrhagic event was epistaxis. The primary risk factor for renal failure was dehydration and hypovolemia related to diarrhea and vomiting.

**Nursing considerations**

**Baseline assessment**

**Intervention/evaluation**
Monitor B/P after 1 wk, then every 2 wks for the first 2 mos, then at least monthly thereafter. Monitor LFT every 2 wks for the first 2 mos, then at least monthly thereafter. Monitor for proteinuria periodically. If urine dipstick proteinuria is greater than or equal to 2+, obtain a 24-hr urine protein test. Monitor blood calcium levels at least monthly and replace as needed depending on severity, presence of EKG changes, persistence of hypocalcemia. Monitor and correct other electrolyte abnormalities as needed. Initiate medical management for nausea, vomiting, diarrhea prior to any interruption or dose reduction. Reversible posterior leukoencephalopathy syndrome should be considered in pts with altered mental status, confusion, headache, seizures, visual disturbances. Immediately report abdominal pain, GI bleeding, hemoptyis (may indicate GI perforation/fistula formation). Obtain cardiac echocardiogram, EKG if cardiac
decompensation is suspected.

**Patient/family teaching**

- Blood levels will be monitored regularly.
- Treatment may cause fetal harm. Female pts of childbearing potential should use effective contraception during treatment and up to 2 wks following discontinuation. Immediately report suspected pregnancy.
- Therapy may reduce fertility in both female and male pts.
- Report liver problems such as upper abdominal pain, bruising, dark or amber-colored urine, nausea, vomiting, or yellowing of the skin or eyes; heart problems such as chest tightness, dizziness, fainting, palpitations, shortness of breath; kidney problems such as dark-colored urine, decreased urine output, extremity swelling, flank pain; skin changes such as rash, skin bubbling, sloughing.
- Neurologic changes including blurry vision, confusion, headache, one-sided weakness, seizures, trouble speaking may indicate high blood pressure crisis, stroke, or life-threatening brain swelling.
- Report mouth ulceration, jaw pain.
- Swallow capsules whole; do not chew, crush, cut, or open capsules.
- Treatment may increase risk of GI bleeding, nosebleeds.
- Drink plenty of fluids.

### letrozole

Let-roe-zole

Apo-Letrozole

Femara

**CLASSIFICATION**

PHARMACOTHERAPEUTIC: Aromatase inhibitor, hormone.

CLINICAL: Antineoplastic.

Do not confuse Femara with Famvir, Femhrt, or Provera, or letrozole with anastrozole.

### Uses

First-line treatment of hormone receptor–positive or hormone receptor unknown locally advanced or metastatic breast cancer. Treatment of advanced breast cancer in postmenopausal women with disease progression following
antiestrogen therapy. Postsurgical treatment for postmenopausal women with hormone receptor–positive early breast cancer. Extended treatment of early breast cancer after 5 yrs of tamoxifen. **OFF-LABEL:** Treatment of ovarian (epithelial), endometrial cancer.

**Precautions**

**Contraindications:** Hypersensitivity to letrozole, other aromatase inhibitors. Use in women who are or may become pregnant. **Cautions:** Hepatic impairment, hyperlipidemia.

**Action**

Decreases circulating estrogen by inhibiting aromatase, an enzyme that catalyzes the final step in estrogen production (inhibits conversion of androgens to estrogens). **Therapeutic Effect:** Inhibits growth of breast cancers stimulated by estrogens.

**Pharmacokinetics**

Rapidly, completely absorbed. Metabolized in liver. Primarily excreted in urine. Unknown if removed by hemodialysis. **Half-life:** Approximately 2 days.

**Lifespan considerations**

**Pregnancy/Lactation:** Unknown if distributed in breast milk. May cause fetal harm. **Children:** Safety and efficacy not established. **Elderly:** No age-related precautions noted.

**Interactions**

**DRUG:** Tamoxifen may reduce concentration. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** May increase serum calcium, cholesterol, GGT, ALT, AST, bilirubin.

**Availability (Rx)**

**Tablets:** 2.5 mg.
Administration/handling

PO
• Give without regard to food.

Indications/routes/dosage

Breast Cancer (Advanced)
PO: ADULTS, ELDERLY: 2.5 mg/day. Continue until tumor progression is evident.

Breast Cancer (Early–Adjuvant Treatment)
PO: ADULTS, ELDERLY: (Postmenopausal): 2.5 mg/day for planned duration of 5 yrs. Discontinue at relapse.

Breast Cancer (Early–Extended Adjuvant Treatment)
PO: ADULTS, ELDERLY: (Postmenopausal): 2.5 mg/day for planned duration of 5 yrs (after 5 yrs of tamoxifen). Discontinue at relapse.

Dosage in Renal Impairment
No dose adjustment.

Dosage in Severe Hepatic Impairment
PO: ADULTS, ELDERLY: 2.5 mg every other day.

Side effects
Frequent (21%–9%): Musculoskeletal pain (back, arm, leg), nausea, headache.
Occasional (8%–5%): Constipation, arthralgia, fatigue, vomiting, hot flashes, diarrhea, abdominal pain, cough, rash, anorexia, hypertension, peripheral edema.
Rare (4%–1%): Asthenia, drowsiness, dyspepsia, weight gain, pruritus.

Adverse effects/toxic reactions
Pleural effusion, pulmonary embolism, bone fracture, thromboembolic disorder,
MI occur rarely.

**Nursing considerations**

**Baseline assessment**
Obtain baseline CBC, chemistries, renal function, LFT. Obtain pregnancy test prior to beginning therapy. Offer emotional support.

**Intervention/evaluation**
Assist with ambulation if asthenia, dizziness occurs. Assess for headache. Offer antiemetic for nausea, vomiting. Monitor CBC, thyroid function, electrolytes, renal function, LFT. Monitor for evidence of musculoskeletal pain; offer analgesics for pain relief.

**Patient/family teaching**
- Report if nausea, asthenia, hot flashes become unmanageable.
- Discuss importance of negative pregnancy test prior to beginning therapy; discuss nonhormonal methods of birth control.
- Explain possible risk to fetus if pt is or becomes pregnant before or during therapy.

---

**leucovorin**

lo-ko-e-vor-in

**CLASSIFICATION**

PHARMACOTHERAPEUTIC: Folic acid antagonist.
CLINICAL: Antidote.

Do not confuse leucovorin with Leukeran.

**Uses**
Antidote for folic acid antagonists (methotrexate, trimethoprim, pyrimethamine). Treatment of megaloblastic anemias when folate deficient. Palliative treatment of advanced colon cancer (with fluorouracil). IV rescue therapy after high-dose methotrexate for osteosarcoma or orally to diminish toxicity and impaired methotrexate elimination. **OFF-LABEL:** Adjunctive cofactor therapy in
methanol toxicity. Prevents pyrimethamine hematologic toxicity in HIV-positive pts.

**Precautions**

**Contraindications:** Hypersensitivity to leucovorin. Pernicious anemia, other megaloblastic anemias secondary to vitamin $B_{12}$ deficiency. **Cautions:** Renal impairment.

**Action**

Competes with methotrexate for same transport processes into cells (limits methotrexate action on normal cells). **Therapeutic Effect:** Reverses toxic effects of folic acid antagonists. Reverses folic acid deficiency.

**Pharmacokinetics**

Readily absorbed from GI tract. Widely distributed. Metabolized in liver, intestinal mucosa. Primarily excreted in urine. **Half-life:** 15 min; metabolite, 30–35 min.

**Lifespan considerations**

**Pregnancy/Lactation:** Unknown if drug crosses placenta or is distributed in breast milk. **Children:** May increase risk of seizures by counteracting anticonvulsant effects of barbiturates, hydantoins. **Elderly:** Age-related renal impairment may require dosage adjustment when used for rescue from effects of high-dose methotrexate therapy.

**Interactions**

**DRUG:** May decrease effects of anticonvulsants (e.g., phenytoin). May increase 5-fluorouracil toxicity/effects when taken in combination. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** May decrease platelets, WBCs (when used in combination with 5-fluorouracil).

**Availability (Rx)**
Injection, Powder for Reconstitution: 50 mg, 100 mg, 200 mg, 350 mg, 500 mg. Injection, Solution: 10 mg/mL. Tablets: 5 mg, 10 mg, 15 mg, 25 mg.

Administration/handling

IV

Strict adherence to timing of 5-fluorouracil following leucovorin therapy must be maintained.

Reconstitution

• Reconstitute each 50-mg vial with 5 mL Sterile Water for Injection or Bacteriostatic Water for Injection containing benzyl alcohol to provide concentration of 10 mg/mL.
• Due to benzyl alcohol in 1-mg ampule and in Bacteriostatic Water for Injection, reconstitute doses greater than 10 mg/m² with Sterile Water for Injection.
• Further dilute with 100–1,000 mL D₅W or 0.9% NaCl.

Rate of Administration

• Do not exceed 160 mg/min if given by IV infusion (due to calcium content).

Storage

• Store powdered vials for parenteral use at room temperature.
• Refrigerate solution for injection vials.
• Injection appears as clear, yellowish solution.
• Use immediately if reconstituted with Sterile Water for Injection; stable for 7 days if reconstituted with Bacteriostatic Water for Injection. Diluted solutions stable for 24 hrs at room temperature or 4 days refrigerated.

PO

• Scored tablets may be crushed.

IV incompatibilities

Amphotericin B complex (Abelcet, AmBisome, Amphotec), droperidol (Inapsine), foscarnet (Foscavir).

IV Compatibilities
CISplatin (Platinol AQ), cyclophosphamide (Cytoxan), DOXOrubicin (Adriamycin), etoposide (VePesid), filgrastim (Neupogen), 5-fluorouracil, gemcitabine (Gemzar), granisetron (Kytril), heparin, methotrexate, metoclopramide (Reglan), mitoMYcin (Mutamycin), piperacillin and tazobactam (Zosyn), vinBLASTine (Velban), vinCRIStine (Oncovin).

Indications/routes/dosage

Rescue in High-Dose Methotrexate Therapy
PO, IV, IM: ADULTS, ELDERLY, CHILDREN: 15 mg (approximately 10 mg/m²) started 24 hrs after starting methotrexate infusion; continue q6h for 10 doses, until methotrexate level is less than 0.05 micromole/L. Additional dose adjusted based on methotrexate levels.

Folic Acid Antagonist Overdose
PO: ADULTS, ELDERLY, CHILDREN: 5–15 mg/day.

Megaloblastic Anemia Secondary to Folate Deficiency
IM/IV: ADULTS, ELDERLY, CHILDREN: 1 mg or less per day.

Colon Cancer

For rescue therapy in cancer chemotherapy, refer to specific protocols used for optimal dosage and sequence of leucovorin administration.
IV: ADULTS, ELDERLY: (In Combination with 5-fluorouracil): 200 mg/m² daily for 5 days. Repeat course at 4-wk intervals for 2 courses, then 4- to 5-wk intervals or 20 mg/m² daily for 5 days. Repeat course at 4-wk intervals for 2 courses, then 4- to 5-wk intervals.

Dosage in Renal/Hepatic Impairment
No dose adjustment.

Side effects

Frequent: When combined with chemotherapeutic agents: diarrhea, stomatitis, nausea, vomiting, lethargy, malaise, fatigue, alopecia, anorexia. Occasional:
Urticaria, dermatitis.

**Adverse effects/toxic reactions**

Excessive dosage may negate chemotherapeutic effects of folic acid antagonists. Anaphylaxis occurs rarely. Diarrhea may cause rapid clinical deterioration.

**Nursing considerations**

**Baseline assessment**

Obtain baseline CBC, LFT, renal function. Give as soon as possible, preferably within 1 hr, for treatment of accidental overdosage of folic acid antagonists.

**Intervention/evaluation**

Monitor for vomiting (may need to change from oral to parenteral therapy). Observe elderly, debilitated closely due to risk for severe toxicities. Assess CBC, BMP, LFT.

**Patient/family teaching**

- Explain purpose of medication in treatment of cancer.
- Report allergic reaction, vomiting.

---

**CLASSIFICATION**

**PHARMACOTHERAPEUTIC**: Gonadotropin-releasing hormone (GnRH) analogue.

**CLINICAL**: Antineoplastic.
Uses

Precautions

**Contraindications:** Hypersensitivity to leuprolide, GnRH, GnRH-agonist analogue. Pregnancy or women who may become pregnant, breastfeeding (Lupron Depot 3.75 mg and 11.25 mg), abnormal, undiagnosed vaginal bleeding (Lupron Depot 3.75 mg and 11.25 mg). 22.5 mg, 30 mg, 45 mg Lupron Depot contraindicated in women. **Cautions:** History of psychiatric illness, QTc prolongation or medications that prolong QTc interval, preexisting cardiac disease, chronic alcohol use, steroid therapy, seizures or medications that decrease seizures threshold.

Action
Inhibits gonadotropin secretion; suppresses ovarian and testicular steroidogenesis due to decreased LH/FSH levels. Decreases testosterone and estrogen. **Therapeutic Effect:** Produces pharmacologic castration, decreases growth of abnormal prostate tissue in males; causes endometrial tissue to become inactive, atrophic in females; decreases rate of pubertal development in children with central precocious puberty.

Pharmacokinetics
Rapidly, well absorbed after subcutaneous administration. Absorbed slowly after IM administration. Protein binding: 43%–49%. **Half-life:** 3–4 hrs.

Lifespan considerations

**Pregnancy/Lactation:** Depot: Contraindicated in pregnancy. May cause spontaneous abortion. **Children:** Long-term safety not established. **Elderly:** No age-related precautions noted.
Interactions

**DRUG:** QT interval–prolonging medications (e.g., amiodarone, azithromycin, ceritinib, haloperidol, moxifloxacin) may increase risk of QT interval prolongation, cardiac arrhythmias. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** May increase serum prostatic acid phosphatase (PAP). Initially increases, then decreases serum testosterone. May increase serum ALT, AST, alkaline phosphatase, glucose, LDH, LDL, cholesterol, triglycerides. May decrease platelets, WBC.

Availability (Rx)

**Injection Depot Formulation:** **Eligard:** 7.5 mg, 22.5 mg, 30 mg, 45 mg. **Lupron Depot-Ped:** 7.5 mg, 11.25 mg (3-month), 11.25 (monthly), 15 mg, 30 mg. **Lupron Depot:** 3.75 mg, 11.25 mg, 22.5 mg, 30 mg, 45 mg. **Injection Solution (Lupron):** 5 mg/mL.

Administration/handling

□ ALERT□ May be carcinogenic, mutagenic, teratogenic. Handle with extreme care during preparation/administration.

**IM**

**Lupron Depot**
- Store at room temperature.
- Protect from light, heat.
- Do not freeze vials.
- Reconstitute only with diluent provided. Follow manufacturer’s instructions for mixing.
- Do not use needles less than 22 gauge; use syringes provided by the manufacturer (0.5-mL low-dose insulin syringes may be used as an alternative).
- Administer immediately.

**Eligard**
- Refrigerate.
- Allow to warm to room temperature before reconstitution.
- Follow manufacturer’s instructions for mixing.
- Following reconstitution, administer within 30 min.
Subcutaneous

Lupron

- Refrigerate vials.
- Injection appears clear, colorless.
- Discard if discolored or precipitate forms.
- Administer into deltoid muscle, anterior thigh, abdomen.
Indications/routes/dosage

Advanced Prostatic Carcinoma
IM (Lupron Depot): ADULTS, ELDERLY: 7.5 mg q1mo, 22.5 mg q3mos, 30 mg q4mos, or 45 mg q6mos.
SQ (Eligard): ADULTS, ELDERLY: 7.5 mg every mo, 22.5 mg q3mos, 30 mg q4mos, or 45 mg q6mos.
SQ(Lupron): ADULTS, ELDERLY: 1 mg/day.

Endometriosis
IM (Lupron Depot): ADULTS, ELDERLY: 3.75 mg/mo for up to 6 mos or 11.25 mg q3mos for up to 2 doses.

Uterine Leiomyomata
IM(with Iron [Lupron Depot]): ADULTS, ELDERLY: 3.75 mg/mo for up to 3 mos or 11.25 mg as a single injection.

Precocious Puberty
IM (Lupron Depot-Ped): CHILDREN GREATER THAN 37.5 KG: 15 mg q1mo. GREATER THAN 25 KG TO 37.5 KG: 11.25 mg q1mo. 25 KG OR LESS: 7.5 mg q1mo. Titrate dose upward by 3.75 mg/mo if down regulation not achieved. LUPRON DEPOT-PED (3 MOS): 11.25 mg or 30 mg q12wks.
SQ (Lupron): CHILDREN: Initially, 50 mcg/kg/day. Titrate upward by 10 mcg/kg/day if down regulation is not achieved.

Dosage in Renal/Hepatic Impairment
No dose adjustment.

Side effects
Frequent: Hot flashes (ranging from mild flushing to diaphoresis), migraines, hyperhidrosis. Females: Amenorrhea, spotting. Occasional: Arrhythmias, palpitations, blurred vision, dizziness, edema, headache, burning, pruritus, swelling at injection site, nausea, insomnia, weight gain. Females: Deepening
voice, hirsutism, decreased libido, increased breast tenderness, vaginitis, altered mood. **Males:** Constipation, decreased testicle size, gynecomastia, impotence, decreased appetite, angina. **Rare: Males:** Thrombophlebitis.

**Adverse effects/toxic reactions**

Occasionally, signs/symptoms of prostatic carcinoma worsen 1–2 wks after initial dosing (subsides during continued therapy). Increased bone pain and, less frequently, dysuria, hematuria, weakness, paresthesia of lower extremities may be noted. MI, pulmonary embolism occur rarely.

**Nursing considerations**

**Baseline assessment**

Question for possibility of pregnancy before initiating therapy. Obtain serum testosterone, prostatic acid phosphates (PAP) periodically during therapy. Serum testosterone, PAP should increase during first wk of therapy. Serum testosterone then should decrease to baseline level or less within 2 wks, PAP within 4 wks. Question medical history as listed in Precautions. Offer emotional support.

**Intervention/evaluation**

**Patient/ family teaching**

- Hot flashes tend to decrease during continued therapy.
- Temporary exacerbation of signs/symptoms of disease may occur during first few wks of therapy.
- Use contraceptive measures.
- Report persistent, regular menstruation; pregnancy.
- Avoid tasks that require alertness, motor skills until response to drug is established (potential for dizziness).

**levalbuterol**
Lee-val-bue-ter-ole
Xopenex
Xopenex HFA

CLASSIFICATION
PHARMACOTHERAPEUTIC: Beta₂ agonist.
CLINICAL: Bronchodilator.
Do not confuse Xopenex with Xanax.

Uses
Treatment, prevention of bronchospasm due to reversible obstructive airway disease (e.g., asthma, bronchitis, emphysema).

Precautions

Contraindications: History of hypersensitivity to albuterol or levalbuterol.
Cautions: Cardiovascular disorders (cardiac arrhythmias, HF), seizures, hypertension, hyperthyroidism, diabetes, glaucoma, hypokalemia.

Action
Stimulates beta₂-adrenergic receptors in lungs, resulting in relaxation of bronchial smooth muscle. Therapeutic Effect: Relieves bronchospasm, reduces airway resistance.

Pharmacokinetics

<table>

<td>5–6 hrs</td>
</tr>
<tr>
<td>Nebulization</td>
<td>10–17 min</td>
<td>1.5 hrs</td>
<td>5–8 hrs</td>
</tr>
</tbody>
</table>

Half-life: 3.3–4 hrs.

Lifespan considerations
**Pregnancy/Lactation:** Crosses placenta. Unknown if distributed in breast milk. **Pregnancy Category C.** **Children:** Safety and efficacy not established in pts younger than 12 yrs. **Elderly:** Lower initial dosages recommended.

**Interactions**

**DRUG:** Beta blockers (e.g., carvedilol, metoprolol) antagonize effects; may produce severe bronchospasm. May decrease digoxin concentration. **MAOIs** (e.g., phenelzine, tranylcypromine), tricyclic antidepressants (e.g., amitriptyline, desipramine) may potentiate cardiovascular effects. **Diuretics** (e.g., furosemide, HCTZ) may increase hypokalemia. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** May decrease serum potassium.

**Availability (Rx)**

**Inhalation Aerosol:** 45 mcg/activation. **Solution for Nebulization:** 0.31 mg in 3-mL vials, 0.63 mg in 3-mL vials, 1.25 mg in 3-mL vials, 1.25 mg in 0.5-mL vials.

**Administration/handling**

**Nebulization**

- No diluent necessary.
- Protect from light, excessive heat. Store at room temperature.
- Once foil is opened, use within 2 wks.
- Use within 1 wk and protect from light after removal from pouch
- Discard if solution is not colorless.
- Do not mix with other medications.
- Concentrated solution (1.25 mg in 0.5 mL) should be diluted with 2.5 mL 0.9% NaCl prior to use.
- Give over 5–15 min.

**Inhalation**

- Shake well before inhalation.
- Prime before initial use or if not used for more than 3 days.
• Following first inhalation, wait 2 min before inhaling second dose (allows for deeper bronchial penetration).
• Rinsing mouth with water immediately after inhalation prevents mouth/throat dryness.

**Indications/routes/dosage**

**Treatment/Prevention of Bronchospasm**

**Nebulization:** **ADULTS, ELDERLY, CHILDREN 12 YRS AND OLDER:** Initially, 0.63 mg 3 times/day 6–8 hrs apart. May increase to 1.25 mg 3 times/day with dose monitoring. **CHILDREN 5–11 YRS:** Initially, 0.31 mg 3 times/day. **Maximum:** 0.63 mg 3 times/day. **CHILDREN 4 YRS OR YOUNGER:** 0.31–1.25 mg q4–6h as needed.

**Inhalation:** **ADULTS, ELDERLY, CHILDREN 4 YRS AND OLDER:** 1–2 inhalations q4–6h.

**Acute Asthma Exacerbation**

**Nebulization:** **ADULTS, ELDERLY, CHILDREN 12 YRS AND OLDER:** 1.25–2.5 mg q20min for 3 doses, then 1.25–5 mg q1–4h as needed. **CHILDREN YOUNGER THAN 12 YRS:** 0.075 mg/kg (minimum dose: 1.25 mg) q20min for 3 doses, then 0.075–0.15 mg/kg q1–4h as needed.

**Inhalation:** **ADULTS, ELDERLY, CHILDREN 12 YRS AND OLDER:** 4–8 puffs q20min for up to 4 hrs, then q1–4h. **CHILDREN YOUNGER THAN 12 YRS:** 4–8 puffs q20min for 3 doses, then q1–4h.

**Dosage in Renal/Hepatic Impairment**

No dose adjustment.

**Side effects**

**Occasional (11%–4%):** Nervousness, tremor, rhinitis, flu-like illness. **Rare (less than 3%):** Tachycardia, dizziness, anxiety, viral infection, dyspepsia, dry mouth, headache, chest pain.

**Adverse effects/toxic reactions**
Excessive sympathomimetic stimulation may produce palpitations, premature heart contraction, tachycardia, chest pain, slight increase in B/P followed by substantial decrease, chills, diaphoresis, blanching of skin. Too-frequent or excessive use may decrease bronchodilating effectiveness, lead to severe, paradoxical bronchoconstriction.

**Nursing considerations**

**Baseline assessment**
Assess lung sounds, pulse, B/P, oxygen saturation. Note color, amount of sputum.

**Intervention/evaluation**
Monitor rate, depth, rhythm, type of respiration; quality/rate of pulse, EKG, serum potassium, ABG determinations. Assess lung sounds for wheezing (bronchoconstriction). Observe for paradoxical bronchospasm.

**Patient/family teaching**
• Increase fluid intake (decreases lung secretion viscosity).
• Rinsing mouth with water immediately after inhalation may prevent mouth/throat dryness.
• Avoid excessive use of caffeine derivatives (chocolate, coffee, tea, cola, cocoa).
• Report if palpitations, tachycardia, chest pain, tremors, dizziness, headache occurs or shortness of breath is not relieved.

</table>
USES

Adjunctive therapy in treatment of partial-onset, myoclonic, and/or primary generalized tonic-clonic seizures.

PRECAUTIONS

Contraindications: Hypersensitivity to levETIRAcetam. Cautions: Renal impairment, pts with depression at high risk for suicide.

ACTION

Exact mechanism unknown. May inhibit voltage-dependent calcium channels, facilitate GABA inhibitory transmission, reduce potassium current, or bind to synaptic proteins that modulate neurotransmitter release. Therapeutic Effect: Prevents seizure activity.

PHARMACOKINETICS

Rapidly, completely absorbed following PO administration. Protein binding: less than 10%. Metabolized primarily by enzymatic hydrolysis. Primarily excreted in urine as unchanged drug. Half-life: 6–8 hrs.

LIFESPAN CONSIDERATIONS

INTERACTIONS

DRUG: None significant. HERBAL: None significant. FOOD: None known. LAB VALUES: May decrease Hgb, Hct, RBC, WBC.
Availability (Rx)

**Injection, Solution:** 100 mg/mL. **Oral Solution:** 100 mg/mL. **Tablets:** 250 mg, 500 mg, 750 mg, 1,000 mg.

**Tablets, Extended-Release:** 500 mg, 750 mg.

Administration/handling

■ **IV**

**Rate of Infusion**
- Infuse over 15 min.

**Reconstitution**
- Dilute with 100 mL 0.9% NaCl or D₅W.

**Storage**
- Store at room temperature.
- Stable for 24 hrs following dilution.

■ **IV incompatibilities**

Data not available.

■ **IV Compatibilities**

DiazePAM (Valium), LORazepam (Ativan), valproate (Depacon).

**PO**
- Give without regard to food.
- Use oral solution for pts weighing 20 kg or less.
- Use tablets or oral solution for pts weighing more than 20 kg.
- Oral solution should be administered with a calibrated measuring device.
- Swallow extended-release and immediate-release tablets whole; do not break, crush, dissolve, or divide.

Indications/routes/dosage

**Partial-Onset Seizures**
IV/PO: ADULTS, ELDERLY, CHILDREN 17 YRS AND OLDER: (Immediate-Release Tablets, Oral Solution, Tablets for Oral Suspension):
Initially, 500 mg q12h. May increase by 1,000 mg/day q2wks. Maximum: 3,000 mg/day in 2 divided doses. Extended-Release Tablets: 1,000 mg once daily. May increase in increments of 1,000 mg/day q2wks. Maximum: 3,000 mg once daily.

IV/PO: CHILDREN 4–16 YRS: (Oral Solution, Tablets): 20 mg/kg/day in 2 divided doses. May increase q2wks by 10 mg/kg/dose up to 60 mg/kg/day in 2 divided doses. Maximum: 3,000 mg/day. (Tablets): GREATER THAN 40 KG: 500 mg twice daily. May increase q2wks by 500 mg/dose. Maximum: 1,500 mg twice daily. 20–40 kg: 250 mg twice daily. May increase q2wks by 250 mg/dose. Maximum: 750 mg twice daily. CHILDREN 6 MOS TO YOUNGER THAN 4 YRS: (Oral Solution): 20 mg/kg/day in 2 divided doses. May increase q2wks by 10 mg/kg/dose. Maximum: 50 mg/kg/day in 2 divided doses. CHILDREN 1 MO TO YOUNGER THAN 6 MOS: (Oral Solution): 14 mg/kg/day in 2 divided doses. May increase q2wks by 7 mg/kg/dose. Maximum: 42 mg/kg/day in 2 divided doses.

Myoclonic Seizures
PO/IV: ADULTS, ELDERLY, CHILDREN 12 YRS AND OLDER: (Immediate-Release Tablets, Oral Solution, Tablets for Oral Suspension):
Initially, 500 mg q12h. May increase by 1,000 mg/day q2wks. Maximum: 3,000 mg/day in 2 divided doses.

Tonic-Clonic Seizures
PO, IV: ADULTS, ELDERLY, CHILDREN 16 YRS AND OLDER: (Immediate-Release Tablets, Oral Solution, Tablets for Oral Suspension): Initially, 500 mg twice daily. May increase by 1,000 mg/day q2wks up to recommended dose of 1,500 mg 2 times/day. CHILDREN 6–15 YRS: Initially, 10 mg/kg twice daily. May increase by 20 mg/kg/day q2wks up to recommended dose of 30 mg/kg 2 times/day.

Dosage in Renal Impairment
Dosage is modified based on creatinine clearance. Note: CrCl less than 50 mL/min: Not recommended with Keppra XR.

**Dosage in Hepatic Impairment**

No dose adjustment.

**Side effects**

**Frequent (15%–10%):** Drowsiness, asthenia, headache, infection. **Occasional (9%–3%):** Dizziness, pharyngitis, pain, depression, anxiety, vertigo, rhinitis, anorexia. **Rare (less than 3%):** Amnesia, emotional lability, cough, sinusitis, anorexia, diplopia.

**Adverse effects/toxic reactions**

Acute psychosis, agitation, delirium, impulsivity have been reported. Sudden discontinuance increases risk of seizure activity. Serious dermatological reactions, including Stevens-Johnson syndrome and toxic epidermal necrolysis, have been reported.

**Nursing considerations**

**Baseline assessment**

**Intervention/evaluation**

Observe for recurrence of seizure activity. Assess for clinical improvement
(decrease in intensity/frequency of seizures). Monitor renal function tests. Observe for suicidal ideation, depression, behavioral changes. Assist with ambulation if dizziness occurs.

**Patient/ family teaching**
- Drowsiness usually diminishes with continued therapy.
- Avoid tasks that require alertness, motor skills until response to drug is established.
- Avoid alcohol.
- Do not abruptly discontinue medication (may precipitate seizures).
- Strict maintenance of drug therapy is essential for seizure control.
- Report mood swings, hostile behavior, suicidal ideation, unusual changes in behavior.

**CLASSIFICATION**
- **PHARMACOTHERAPEUTIC**: Fluoroquinolone.
- **CLINICAL**: Antibiotic.

- **BLACK BOX ALERT**
  - May increase risk of tendonitis, tendon rupture. (Risk increased with concurrent corticosteroids, organ transplant, pts older than 60 yrs.) May exacerbate myasthenia gravis.

**Uses**

Treatment of susceptible infections due to *S. pneumoniae*, *S. aureus*, *E. faecalis*, *H. influenzae*, *M. catarrhalis*, *Serratia marcescens*, *K. pneumoniae*, *E. coli*, *P.*
mirabilis, P. aeruginosa, C. pneumoniae, Legionella pneumophila, Mycoplasma pneumoniae, including acute bacterial exacerbation of chronic bronchitis, acute bacterial sinusitis, community-acquired pneumonia, nosocomial pneumonia, complicated and uncomplicated UTI, acute pyelonephritis, complicated and uncomplicated mild to moderate skin/skin structure infections, prostatitis. Inhalation anthrax (postexposure); plague. **Ophthalmic:** Treatment of superficial infections to conjunctiva (0.5%), cornea (1.5%). **OFF-LABEL:** Urethritis, traveler’s diarrhea, diverticulitis, enterocolitis, Legionnaire’s disease, peritonitis. Treatment of prosthetic joint infection.

**Precautions**

**Contraindications:** Hypersensitivity to levofloxacin, other fluoroquinolones. **Cautions:** Known or suspected CNS disorders, seizure disorder, renal impairment, bradycardia, rheumatoid arthritis, elderly, hypokalemia, hypomagnesemia, myasthenia gravis, severe cerebral arteriosclerosis, prolonged QT interval, medications that potentiate QT interval prolongation, diabetes, pts at risk for tendon rupture, tendonitis (e.g., renal failure, concomitant use of corticosteroids, organ transplant recipient, rheumatoid arthritis, elderly, strenuous physical activity or exercise).

**Action**

Inhibits DNA enzyme gyrase in susceptible microorganisms, interfering with bacterial cell replication, repair. **Therapeutic Effect:** Bactericidal.

**Pharmacokinetics**

Well absorbed after PO, IV administration. Protein binding: 50%. Widely distributed. Excreted unchanged in urine. Partially removed by hemodialysis. **Half-life:** 6–8 hrs.

**Lifespan considerations**

**Pregnancy/Lactation:** Distributed in breast milk. Avoid use in pregnancy. **Children:** Safety and efficacy not established in pts younger than 18 yrs. **Elderly:** Age-related renal impairment may require dosage adjustment.
Interactions

**DRUG:** Antacids, iron preparations, sucralfate, zinc decrease absorption. NSAIDs may increase risk of CNS stimulation, seizures. **Medications that prolong QT interval** (e.g., amiodarone, FLUoxetine, haloperidol, sotalol, quiNIDine) may increase risk of arrhythmias. May increase effects of **warfarin.**

**HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** May alter serum glucose.

Availability (Rx)

**Infusion Premix:** 250 mg/50 mL, 500 mg/100 mL, 750 mg/150 mL. **Injection, Solution:** 25 mg/mL. **Ophthalmic Solution:** 0.5%. **Oral Solution:** 25 mg/mL. **Tablets:** 250 mg, 500 mg, 750 mg.

Administration/handling

- **IV**

  **Reconstitution**
  - For infusion using single-dose vial, withdraw desired amount (10 mL for 250 mg, 20 mL for 500 mg). Dilute each 10 mL (250 mg) with minimum 40 mL 0.9% NaCl, D₅W, providing a concentration of 5 mg/mL.

  **Rate of Administration**
  - Administer no less than 60 min for 250 mg or 500 mg; 90 min for 750 mg.

  **Storage**
  - Available in single-dose 20-mL (500-mg) vials and premixed with D₅W, ready to infuse.
  - Diluted vials stable for 72 hrs at room temperature, 14 days if refrigerated.

- **PO**

  - Do not administer antacids (aluminum, magnesium), sucralfate, iron or multivitamin preparations with zinc within 2 hrs of administration (significantly reduces absorption).
  - Give tablets without regard to food.
  - Give oral solution 1 hr before or 2 hrs after meals.
**Ophthalmic**

- Place a gloved finger on lower eyelid and pull out until a pocket is formed between eye and lower lid.
- Place prescribed number of drops into pocket.
- Instruct pt to close eye gently (so that medication will not be squeezed out of the sac) and to apply digital pressure to lacrimal sac for 1–2 min to minimize systemic absorption.

**IV incompatibilities**

Furosemide (Lasix), heparin, insulin, nitroglycerin, propofol (Diprivan).

**IV Compatibilities**

Dexmedetomidine (Precedex), DOBUTamine (Dobutrex), DOPamine (Intropin), fentaNYL (Sublimaze), lidocaine, (Ativan), magnesium, morphine.

**Indications/routes/dosage**

**Usual Dosage Range**

**PO, IV: ADULTS, ELDERLY:** 250–500 mg q24h; 750 mg q24h for severe or complicated infections.

**Bacterial Conjunctivitis**

**Ophthalmic: ADULTS, ELDERLY, CHILDREN 1 YR AND OLDER (QUIXIN) (0.5%):** 1–2 drops q2h for 2 days while awake (up to 8 times/day), then 1–2 drops q4h while awake up to 4 times/day.

**Dosage in Renal Impairment**

Normal renal function dosage of 250 mg/day:

<table>
<thead>
<tr>
<th>Creatinine Clearance</th>
<th>Dosage</th>
</tr>
</thead>
<tbody>
<tr>
<td>20–49 mL/min</td>
<td>No change</td>
</tr>
<tr>
<td>10–19 mL/min</td>

**Dosage in Hepatic Impairment**
No dose adjustment.

**Side effects**

Occasional (3%–1%): Diarrhea, nausea, abdominal pain, dizziness, drowsiness, headache. **Ophthalmic:** Local burning/discomfort, margin crusting, crystals/scales, foreign body sensation, ocular itching, altered taste. Rare (less than 1%): Flatulence; pain, inflammation, swelling in calves, hands, shoulder; chest pain, difficulty breathing, palpitations, edema, tendon pain. **Ophthalmic:** Corneal staining, keratitis, allergic reaction, eyelid swelling, tearing, reduced visual acuity.

**Adverse effects/toxic reactions**

Antibiotic-associated colitis, other superinfections (abdominal cramps, severe watery diarrhea, fever) may occur. Superinfection (genital/anal pruritus, ulceration/changes in oral mucosa, moderate to severe diarrhea) may occur from altered bacterial balance in GI tract. Hypersensitivity reactions, including photosensitivity (rash, pruritus, blisters, edema, sensation of burning skin), have
occurred in pts receiving fluoroquinolones. May increase risk of tendonitis, tendon rupture, peripheral neuropathy; CNS effects including agitation, anxiety, confusion, depression, dizziness, hallucinations, nightmares, paranoia, tremors, vertigo. May exacerbate muscle weakness in pts with myasthenia gravis.

Nursing considerations

Baseline assessment
Question for hypersensitivity to levoFLOXacin, other fluoroquinolones. Question history as listed in Precautions. Receive full medication history, and screen for interactions, esp. medications that prolong QT interval. Obtain baseline EKG.

Intervention/evaluation

Patient/ family teaching
• It is essential to complete drug therapy despite symptom improvement. Early discontinuation may result in antibacterial resistance or increase risk of recurrent infection.
• Report any episodes of diarrhea, esp. the first few mos after final dose. Frequent diarrhea, fever, abdominal pain, blood-streaked stool may indicate infectious diarrhea, which may be contagious to others.
• Severe allergic reactions, such as hives, palpitations, rash, shortness of breath, tongue swelling, may occur.
• Tendon inflammation/swelling, tendon rupture may occur; report bruising, pain, swelling in tendon areas or snapping, popping of tendons.
• Immediately report nervous system problems such as anxiety, confusion, dizziness, nervousness, nightmares, thoughts of suicide, seizures, tremors, trouble sleeping.
• Treatment may cause heart problems such as low heart rate, palpitations;
permanent nerve damage such as burning, numbness, tingling, weakness.
• Do not take aluminum- or magnesium-containing antacids, multivitamins, zinc or iron products at least 2 hrs before or 6 hrs after dose.
• Drink plenty of fluids.

levothyroxine

le-voe-thy-rox-een

Eltroxin
Levoxyl
Synthroid
Tirosint
Unithroid

Fixed-Combination(s)

With liothyronine, T₃ (Thyrolar).

CLASSIFICATION
PHARMACOTHERAPEUTIC: Synthetic isomer of thyroxine.
CLINICAL: Thyroid hormone (T₄).

■ BLACK BOX ALERT ■ Ineffective, potentially toxic for weight reduction. High doses increase risk of serious, life-threatening toxic effects, especially when used with some anorectic drugs.

Do not confuse levothyroxine with levoFLOXacin or liothyronine, or Synthroid with Symmetrel.

Uses

PO: Treatment of hypothyroidism, pituitary thyroid-stimulating hormone (TSH) suppression. IV: Myxedema coma. OFF-LABEL: Management of hemodynamically unstable potential organ donors.

Precautions
Contraindications: Hypersensitivity to levothyroxine. Acute MI, untreated subclinical or overt thyrotoxicosis, uncorrected adrenal insufficiency. Capsule: Inability to swallow capsules. Cautions: Elderly pts, angina pectoris, hypertension, other cardiovascular disease, adrenal insufficiency, myxedema, diabetes mellitus and insipidus, swallowing disorders.

Action

Converts to T₃, then binds to thyroid receptor proteins exerting metabolic effects through DNA and protein synthesis. Therapeutic Effect: Involved in normal metabolism, growth and development. Increases basal metabolic rate, enhances gluconeogenesis, stimulates protein synthesis.

Pharmacokinetics

Variable, incomplete absorption from GI tract. Protein binding: greater than 99%. Widely distributed. Deiodinated in peripheral tissues, minimal metabolism in liver. Eliminated by biliary excretion. Half-life: 6–7 days.

Lifespan considerations

Pregnancy/Lactation: Does not cross placenta. Minimal distribution in breast milk. Children: No age-related precautions noted. Caution in neonates in interpreting thyroid function tests. Elderly: May be more sensitive to thyroid effects; individualized dosage recommended.

Interactions

DRUG: Cholestyramine, colestipol, aluminum- and magnesium-containing antacids may decrease absorption (do not administer within 4 hrs). Estrogens may cause decrease in serum-free thyroxine. May enhance effects of oral anticoagulants (e.g., warfarin). Sympathomimetics (e.g., norepinephrine, phenylephrine) may increase risk of coronary insufficiency, effects of levothyroxine. May decrease effects of insulin, oral hypoglycemic agents. HERBAL: None significant. FOOD: None known. LAB VALUES: None known.
Availability (Rx)

Capsules (Tirosint): 13 mcg, 25 mcg, 50 mcg, 75 mcg, 88 mcg, 100 mcg, 112 mcg, 125 mcg, 137 mcg, 150 mcg. Injection, Powder for Reconstitution: 100 mcg, 200 mcg, 500 mcg. Tablets: 25 mcg, 50 mcg, 75 mcg, 88 mcg, 100 mcg, 112 mcg, 125 mcg, 137 mcg, 150 mcg, 175 mcg, 200 mcg, 300 mcg.

Administration/handling

⚠️ Do not interchange brands (known issues with bioequivalence between manufacturers).

حذر IV

Reconstitution
• Reconstitute 200-mcg or 500-mcg vial with 5 mL 0.9% NaCl to provide concentration of 40 or 100 mcg/mL, respectively; shake until clear.

Rate of Administration
• Use immediately; discard unused portions.
• Give each 100 mcg or less over 1 min.

Storage
• Store vials at room temperature.

PO
• Administer in the morning on an empty stomach, 30 min before food.
• Administer before breakfast to prevent insomnia.
• Tablets may be crushed.
• Take 4 hrs apart from antacids, iron, calcium supplements.

حذر IV incompatibilities

Do not use or mix with other IV solutions.

Indications/routes/dosage

Note: Doses based on clinical response and laboratory parameters. IV dose is 50% of oral dose.
Hypothyroidism

PO: ADULTS, CHILDREN IN WHOM GROWTH AND PUBERTY ARE COMPLETE, OLDER ADULTS RECENTLY TREATED FOR HYPOTHYROIDISM OR WHO HAVE BEEN HYPOTHYROID FOR ONLY A FEW MOS: 1.6 mcg/kg/day as single daily dose. Usual maintenance: 100–125 mcg/day. ADULTS YOUNGER THAN 50 YRS WITH CARDIAC DISEASE, OLDER THAN 50 YRS WITHOUT CARDIAC DISEASE: Initially, 25–50 mcg/day. Adjust dose by 12.5–25 mcg/day at 6–8-wk intervals. ADULTS (OLDER THAN 50 YRS WITH CARDIAC DISEASE): Initially, 12.5–25 mcg/day. Adjust dose by 12.5–25 mcg/day at 6–8-wk intervals. CHILDREN OLDER THAN 12 YRS, GROWTH AND PUBERTY INCOMPLETE: 2–3 mcg/kg/day. CHILDREN 6–12 YRS: 4–5 mcg/kg/day. CHILDREN 1–5 YRS: 5–6 mcg/kg/day. CHILDREN 6–12 MOS: 6–8 mcg/kg/day. CHILDREN 3–5 MOS: 8–10 mcg/kg/day. CHILDREN YOUNGER THAN 3 MOS: 10–15 mcg/kg/day.

Myxedema Coma

IV: ADULTS, ELDERLY: Initially, 300–500 mcg, then 50–100 mcg once daily until able to tolerate PO administration.

Pituitary Thyroid-Stimulating Hormone (TSH) Suppression

PO: ADULTS, ELDERLY: Doses greater than 2 mcg/kg/day usually required to suppress TSH below 0.1 milliunits/L.

Dosage in Renal/Hepatic Impairment

No dose adjustment.

Side effects

Occasional: Reversible hair loss at start of therapy in children. Rare: Dry skin, GI intolerance, rash, urticaria, pseudotumor cerebri, severe headache in children.

Adverse effects/toxic reactions

Excessive dosage produces signs/symptoms of hyperthyroidism (weight loss, palpitations, increased appetite, tremors, anxiety, tachycardia, hypertension,
headache, insomnia, menstrual irregularities). Cardiac arrhythmias occur rarely. Long-term therapy may decrease bone mineral density.

**Nursing considerations**

**Baseline assessment**
Obtain baseline TSH, T\(_3\), T\(_4\), weight, vital signs. Signs/symptoms of diabetes, diabetes insipidus, adrenal insufficiency, hypopituitarism may become intensified. Treat with adrenocortical steroids before thyroid therapy in coexisting hypothyroidism and hypoadrenalism.

**Intervention/evaluation**
Monitor pulse for rate, rhythm (report pulse greater than 100 or marked increase). Observe for tremors, anxiety. Assess appetite, sleep pattern. **Children:** *(Undertreatment)*: May decrease intellectual development, linear growth. *(Overtreatment)*: Adversely affects brain maturation, accelerates bone age. Monitor thyroid function tests.

**Patient/family teaching**
- Do not discontinue drug therapy; replacement for hypothyroidism is lifelong.
- Follow-up office visits, thyroid function tests are essential.
- Take medication at the same time each day, preferably in the morning.
- Monitor pulse for rate, rhythm; report irregular rhythm or pulse rate over 100 beats/min.
- Promptly report chest pain, weight loss, anxiety, tremors, insomnia.
- Children may have reversible hair loss, increased aggressiveness during first few mos of therapy.
- Full therapeutic effect may take 1–3 wks.

**lidocaine**
lye-doe-kane
**Lidoderm**
Xylocaine
Fixed-Combination(s)

**EMLA:** lidocaine/prilocaine (an anesthetic): 2.5%/2.5%. **Lidostine:** lidocaine/EPINEPHrine (a sympathomimetic): 10%/0.1%. **Lidocaine with EPINEPHrine:** lidocaine/EPINEPHrine (a sympathomimetic): 2%/1:50,000, 1%/1:100,000, 1%/1:200,000, 0.5%/1:200,000. **Synéra:** lidocaine/tetracaine (an anesthetic): 70 mg/70 mg.

**CLASSIFICATION**

**PHARMACOTHERAPEUTIC:** Amide anesthetic.

**CLINICAL:** Class 1B antiarrhythmic, anesthetic.

---

**Uses**

**Antiarrhythmic:** Rapid control of acute ventricular arrhythmias following MI, cardiac catheterization, cardiac surgery. **Local anesthetic:** Infiltration/nerve block for dental/surgical procedures, childbirth. **Topical anesthetic:** Local skin disorders (minor burns, insect bites, prickle heat, skin manifestations of chickenpox, abrasions). Mucous membranes (local anesthesia of oral, nasal, laryngeal mucous membranes; local anesthesia of respiratory, urinary tracts; relief of discomfort of pruritus ani, hemorrhoids, pruritus vulvae). **Dermal patch:** Relief of chronic pain in postherpetic neuralgia, alldynia (painful hypersensitivity).

---

**Precautions**

**Contraindications:** Hypersensitivity to lidocaine. Adams-Stokes syndrome, hypersensitivity to amide-type local anesthetics, supraventricular arrhythmias, Wolff-Parkinson-White syndrome. Severe degree of SA, AV, or intraventricular heart block (except in pts with functioning pacemaker). **Cautions:** Hepatic disease, marked hypoxia, severe respiratory depression, hypovolemia, incomplete heart. History of malignant hyperthermia, shock, elderly pts, HF.

---

**Action**

**Anesthetic:** Inhibits conduction of nerve impulses. **Therapeutic Effect:** Causes temporary loss of feeling/sensation. **Antiarrhythmic:** Suppresses automaticity of conduction tissue; increases electrical stimulation threshold of ventricle, His-
Purkinje system; and spontaneous depolarization of ventricle during diastole. Blocks initiation/conduction of nerve impulses by decreasing neuronal membrane’s permeability to sodium ions. **Therapeutic Effect:** Inhibits ventricular arrhythmias.

### Pharmacokinetics

<table>
<thead>
<tr>
<th>Route</th>
<th>Onset</th>
<th>Peak</th>
<th>Duration</th>
</tr>
</thead>
<tbody>
<tr>
<td>IV</td>
<td>30–90 sec</td>
<td>N/A</td>
<td>10–20 min</td>
</tr>
<tr>
<td>Local anesthetic</td>
<td>2.5 min</td>
<td>N/A</td>
<td>30–60 min</td>
</tr>
</tbody>
</table>

Completely absorbed after IV administration. Protein binding: 60%–80%. Widely distributed. Metabolized in liver. Primarily excreted in urine. Minimally removed by hemodialysis. **Half-life:** 1–2 hrs.

### Lifespan considerations

**Pregnancy/Lactation:** Crosses placenta. Distributed in breast milk. **Children:** No age-related precautions noted. **Elderly:** More sensitive to adverse effects. Dose, rate of infusion should be reduced. Age-related renal impairment may require dosage adjustment.

### Interactions

**DRUG:** Class 1 antiarrhythmics (e.g., propafenone, quinidine) may increase cardiac effects. **HERBAL:** St. John’s **wort** may decrease concentration. **FOOD:** None known. **LAB VALUES:** IM lidocaine may increase creatine kinase (CK) level. **Therapeutic serum level:** 1.5–6 mcg/mL; **toxic serum level:** greater than 6 mcg/mL.

### Availability (Rx)

**Cream, Topical:** 4%. **Infusion Premix:** 0.4% (4 mg/mL in 250 mL, 500 mL); 0.8% (8 mg/mL in 250 mL, 500 mL). **Injection, Solution:** 0.5% (5 mg/mL), 1% (10 mg/mL), 2% (20 mg/mL). **Jelly, Topical:** 2%. **Solution, Topical:** 4%. **Solution, Viscous:** 2%. **Transdermal, Topical (Lidoderm):** 5%.
**Administration/handling**

**Alert** Resuscitative equipment, drugs (including O₂) must always be readily available when administering lidocaine by any route.

**IV**

**Alert** Use only lidocaine without preservative, clearly marked *for IV use.*

**Reconstitution**

- For IV infusion, prepare solution by adding 2 g to 250–500 mL D₅W or 0.9% NaCl to provide concentration of 8 mg/mL or 4 mg/mL, respectively.
- Commercially available preparations of 0.4% and 0.8% may be used for IV infusion. **Maximum concentration:** 4 g/250 mL (16 mg/mL).

**Rate of Administration**

- For IV push, use 1% (10 mg/mL) or 2% (20 mg/mL).
- Administer IV push at rate of 25–50 mg/min.
- Administer for IV infusion at rate of 1–4 mg/min (1–4 mL); use volume control IV set.

**Storage**

- Store premix solutions at room temperature.

**Topical**

- Not for ophthalmic use.
- For skin disorders, apply directly to affected area or put on gauze or bandage, which is then applied to the skin.
- For mucous membrane use, apply to desired area per manufacturer’s insert.
- Administer lowest dosage possible that still provides anesthesia.

**Dermal Patch**

Avoid exposing to external heat source. Patch should not get wet (do not wear while bathing/swimming). Patch may be cut to appropriate size.

**IV incompatibilities**

Amphotericin B complex (Abelcet, AmBisome, Amphotec).

**IV Compatibilities**
Amiodarone (Cordarone), calcium gluconate, dexmedetomidine (Precedex), digoxin (Lanoxin), diltiazEM (Cardizem), DOBUTamine (Dobutrex), DOPamine (Intropin), enalapril (Vasotec), furosemide (Lasix), heparin, insulin, nitroglycerin, potassium chloride.

**Indications/routes/dosage**

**Ventricular Arrhythmias**

**IV: ADULTS, ELDERLY:** Initially, 1–1.5 mg/kg. Refractory ventricular tachycardia, fibrillation: Repeat dose at 0.5–0.75 mg/kg q10–15min after initial dose for a maximum of 3 doses. Total dose not to exceed 3 mg/kg. Follow with continuous infusion (1–4 mg/min) after return of circulation. Reappearance of arrhythmia during infusion: 0.5 mg/kg, reassess infusion. **CHILDREN, INFANTS:** Initially, 1 mg/kg (**Maximum:** 100 mg). May repeat second dose of 0.5–1 mg/kg if start of infusion longer than 15 min. **Maintenance:** 20–50 mcg/kg/min as IV infusion.

**Local Anesthesia**

**Infiltration, Nerve Block:** ADULTS: Local anesthetic dosage varies with procedure, degree of anesthesia, vascularity, duration. **Maximum dose:** 4.5 mg/kg or 300 mg. Do not repeat within 2 hrs.

**Topical Local Anesthesia**

**Topical:** ADULTS, ELDERLY: Apply to affected areas as needed.

**Treatment of Localized Pain**

**Alert** Transdermal patch may contain conducting metal (e.g., aluminum). Remove patch prior to MRI.

**Topical (Dermal Patch):** ADULTS, ELDERLY: Apply to intact skin over most painful area. **Maximum:** Up to 3 patches at a time for up to 12 hrs in a 24-hr period.

**Dosage in Renal Impairment**

No dose adjustment.
Dosage in Hepatic Impairment
Use caution.

Side effects
CNS effects generally dose-related and of short duration. Occasional: Infiltration/Nerve Block: Pain at injection site. Topical: Burning, stinging, tenderness at application site. Rare: Generally associated with high dose: Drowsiness, dizziness, disorientation, light-headedness, tremors, apprehension, euphoria, sensation of heat, cold, numbness; blurred or double vision, tinnitus, nausea.

Adverse effects/toxic reactions
Serious adverse reactions to lidocaine are uncommon, but high dosage by any route may produce cardiovascular depression, bradycardia, hypotension, arrhythmias, heart block, cardiovascular collapse, cardiac arrest. Potential for malignant hyperthermia, CNS toxicity may occur, esp. with regional anesthesia use, progressing rapidly from mild side effects to tremors, drowsiness, seizures, vomiting, respiratory depression. Methemoglobinemia (evidenced by cyanosis) has occurred following topical application of lidocaine for teething discomfort and laryngeal anesthetic spray.

Nursing considerations
Baseline assessment
Question for hypersensitivity to lidocaine, amide anesthetics. Obtain baseline B/P, pulse, respiratory rate, EKG, serum electrolytes.

Intervention/evaluation
Monitor EKG, vital signs closely during and following drug administration for cardiac performance. If EKG shows arrhythmias, prolongation of PR interval or QRS complex, inform physician immediately. Assess pulse for rhythm, rate, quality. Assess B/P for evidence of hypotension. Monitor for therapeutic serum level (1.5–6 mcg/mL). For lidocaine given by all routes, monitor vital signs, LOC. Drowsiness should be considered a warning sign of high serum levels of
lidocaine. **Therapeutic serum level:** 1.5–6 mcg/mL; **toxic serum level:** greater than 6 mcg/mL.

**Patient/ family teaching**
- **Local anesthesia:** Due to loss of feeling/sensation, protective measures may be needed until anesthetic wears off (no ambulation, including special positions for some regional anesthesia).
- **Oral mucous membrane anesthesia:** Do not eat, drink, chew gum for 1 hr after application (swallowing reflex may be impaired, increasing risk of aspiration; numbness of tongue, buccal mucosa may lead to bite trauma).
- **IV infusions:** Report dizziness, numbness, double vision, nausea, pain/burning, respiratory difficulty.
- **Topical:** Report irritation, pain, numbness, swelling, blurred vision, tinnitus, respiratory difficulty.

---

**linaclotide**
**lin-a-kloe-tide**
**Constella**
**Linzess**

**CLASSIFICATION**
**PHARMACOTHERAPEUTIC:** Guanylate cyclase-C (cGMP) agonist.
**CLINICAL:** Anti-constipation agent.

■ **BLACK BOX ALERT** ■ Contraindicated in pediatric pts 6 yrs of age and younger. Avoid use in pediatric patients 7 yrs through 17 yrs old.

---

**Uses**
Treatment of irritable bowel syndrome with constipation, chronic idiopathic constipation.

**Precautions**
**Contraindications:** Hypersensitivity to linaclotide. Pediatric patients 6 yrs and younger, known or suspected mechanical GI obstruction. **Cautions:** Diarrhea.
**Action**
Binds on the luminal surface of GI epithelium. Increases cGMP, which stimulates chloride and bicarbonate into intestinal lumen. **Therapeutic Effect:** Increases intestinal fluid, accelerates transit.

**Pharmacokinetics**
Metabolized within GI tract. Minimal distribution beyond GI tissue. Minimal systemic absorption. **Half-life:** N/A.

**Lifespan considerations**
**Pregnancy/Lactation:** Unknown if distributed in breast milk. **Children:** Avoid use in pediatric pts 7 yrs through 17 yrs. Contraindicated in pediatric pts 6 yrs and younger. **Elderly:** No age-related precautions noted.

**Interactions**
**DRUG:** None significant. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** None significant.

**Availability (Rx)**
**Capsules:** 72 mcg, 145 mcg, 290 mcg.

**Administration/handling**
**PO**
- Give on empty stomach at least 30 min prior to first meal of day.
- Do not break or crush.
- For pts with swallowing difficulty, capsule may be opened and sprinkled on applesauce or into 30 mL bottled water.

**Indications/routes/dosage**
Irritable Bowel Syndrome with Constipation
PO: ADULTS 18 YRS AND OLDER, ELDERLY: 290 mcg once daily.

Chronic Idiopathic Constipation
PO: ADULTS 18 YRS AND OLDER, ELDERLY: 72–145 mcg once daily.

Dosage in Renal/Hepatic Impairment
No dose adjustment.

Side effects
Frequent (16%): Diarrhea (may begin within first 2 wks of initiation of treatment). Occasional (7%–2%): Abdominal pain, flatulence, headache, abdominal distention. Rare (1% and Less): Gastroesophageal reflux, vomiting.

Adverse effects/toxic reactions
Severe diarrhea was reported in 2% of pts. Viral gastroenteritis was noted in 3% of pts. Fecal incontinence, dehydration was reported in 1%. Dose reduced or suspended secondary to diarrhea, other GI adverse reaction.

Nursing considerations

Baseline assessment

Intervention/evaluation
For pts with irritable bowel syndrome, assess for improvement in symptoms (relief from bloating, cramping, urgency, abdominal discomfort). Monitor daily bowel activity, stool consistency. Monitor serum electrolytes in pts with prolonged, frequent, or excessive use of medication.

Patient/family teaching
• Institute measures to promote defecation: increase fluid intake, exercise, high-
fiber diet.
• Report new/worsening episodes of abdominal pain, severe diarrhea.
• Do not break, crush, or open capsule. Take whole.

### Fixed-Combination(s)

**Glyxambi**: linagliptin/empagliflozin (an antidiabetic): 5 mg/10 mg, 5 mg/25 mg.  
**Jentadueto**: linagliptin/metFORMIN (an antidiabetic): 2.5 mg/500 mg; 2.5 mg/850 mg; 2.5 mg/1,000 mg.  
**Jentadueto XR**: linagliptin/metFORMIN (extended-release): 2.5 mg/1,000 mg; 5 mg/1,000 mg.

#### CLASSIFICATION

**PHARMACOTHERAPEUTIC**: Dipeptidyl peptidase-4 (DDP-4) inhibitor (gliptin).  
**CLINICAL**: Antidiabetic agent.  
Do not confuse linagliptin with SAXagliptin or SITagliptin.

### Uses

Adjunctive treatment to diet and exercise to improve glycemic control in pts with type 2 diabetes alone or in combination with other antidiabetic agents.

### Precautions

**Contraindications**: Hypersensitivity to linagliptin, other DD4 inhibitors.  
**Cautions**: Concurrent use of other hypoglycemics. Not recommended for use in type 1 diabetes, diabetic ketoacidosis, history of pancreatitis, HF.

### Action

Slows inactivation of incretin hormones by inhibiting DDP-4 enzyme.  
**Therapeutic Effect**: Incretin hormones increase insulin synthesis/release from pancreas and decrease glucagon secretion. Lowers serum glucose levels.
Pharmacokinetics
Rapidly absorbed following PO administration. Peak plasma concentration: 1.5 hrs. Extensive tissue distribution. Protein binding: 70%–99%. Minimal metabolism (90% excreted as unchanged metabolite). Excreted primarily in enterohepatic system (80%), urine (5%). **Half-life:** 12 hrs.

Lifespan considerations
**Pregnancy/Lactation:** Unknown if distributed in breast milk. **Children:** Safety and efficacy not established. **Elderly:** No age-related precautions noted.

Interactions
**DRUG:** CYP3A4 inducers (e.g., rifAMPin) may decrease concentration. Insulin, metFORMIN, SAXagliptin, SITagliptin, sulfonylureas may increase risk of hypoglycemia. **HERBAL:** Ginseng, ginger, other herbs with hypoglycemic activity may increase risk of hypoglycemia. **FOOD:** None known. **LAB VALUES:** Decreases serum glucose. May increase serum uric acid.

Availability (Rx)
**Tablets:** 5 mg.

Administration/handling
**PO**
• May give without regard to food.

Indications/routes/dosage
**Note:** Dose reduction of insulin and/or insulin secretagogues may be needed.

Type 2 Diabetes Mellitus
**PO:** **ADULTS, ELDERLY:** 5 mg once daily.
Dosage in Renal/Hepatic Impairment
No dose adjustment.

Side effects
Occasional (5%): Nasopharyngitis. Rare (less than 2%): Cough, headache.

Adverse effects/toxic reactions
Hypoglycemia reported in 7% of pts. Concomitant use of hypoglycemic medication may increase hypoglycemic risk. Pancreatitis, hypersensitivity reactions (angioedema, rash, urticaria, pruritus, bronchospasm) occur rarely.

Nursing considerations

Baseline assessment
Check blood glucose, hemoglobin A1c level. Assess pt’s understanding of diabetes management, routine glucose monitoring. Receive full medication history including herbal products.

Intervention/evaluation

Patient/family teaching
• Diabetes requires lifelong control.
• Diet and exercise are principal parts of treatment; do not skip or delay meals.
• Test blood glucose regularly.
• When taking combination drug therapy or when glucose demands are altered (fever, infection, trauma, stress, heavy physical activity), have hypoglycemic treatment available (glucagon, oral dextrose).
Monitor daily calorie intake.

**linezolid**
lin-**ez**-oh-lid

**Apo-Linezolid**

**Zyvox**

**Zyvoxam**

**CLASSIFICATION**

**PHARMACOTHERAPEUTIC**: Oxazolidinone.

**CLINICAL**: Antibiotic.

*Do not confuse Zyvox with Zosyn or Zovirax.*

**Uses**

Treatment of susceptible infections due to aerobic and facultative, gram-positive microorganisms, including *E. faecium* (vancomycin-resistant strains only), *S. aureus* (including methicillin-resistant strains), *S. agalactiae, S. pneumoniae* (including multidrug-resistant strains), *S. pyogenes*. Treatment of pneumonia (community-acquired and hospital-acquired), skin, soft tissue infections (including diabetic foot infections), bacteremia caused by susceptible vancomycin-resistant (VRE) organisms. **OFF-LABEL**: Treatment of prosthetic joint infection. Septic arthritis.

**Precautions**

**Contraindications**: Hypersensitivity to linezolid. Concurrent use or within 2 wks of MAOIs. **Cautions**: History of seizures, preexisting myelosuppression, medications that may cause bone marrow depression, uncontrolled hypertension, pheochromocytoma, carcinoid syndrome, untreated hyperthyroidism, diabetes, chronic infection; concurrent use of SSRIs, SNRIs, tricyclic antidepressants, triptans, buPROPion.

**Action**

Binds to bacterial ribosomal RNA sites, preventing formation of a complex
essential for bacterial translation. **Therapeutic Effect:** Bacteriostatic against enterococci, staphylococci; bactericidal against streptococci.

**Pharmacokinetics**
Rapidly, extensively absorbed after PO administration. Protein binding: 31%. Metabolized in liver by oxidation. Excreted in urine. **Half-life:** 4–5.4 hrs.

**Lifespan considerations**

- **Pregnancy/Lactation:** Unknown if distributed in breast milk. **Children:** Safety and efficacy not established. **Elderly:** No age-related precautions noted.

**Interactions**

- **DRUG:** CYP3A4 inducers (e.g., carBAmazepine, phenytoin) may decrease concentration/effects. **Adrenergic medications** (sympathomimetics) may increase effects. **SSRIs** (e.g., escitalopram, paroxetine, sertraline), **SNRIs** (e.g., duloxetine, venlafaxine) may increase risk of serotonin syndrome.
- **HERBAL:** Supplements containing caffeine, tyrosine, or tryptophan may precipitate hypertensive crisis. **FOOD:** Excessive amounts of tyramine-containing foods, beverages may cause significant hypertension. **LAB VALUES:** May decrease Hgb, neutrophils, platelets, WBC. May increase serum ALT, AST, alkaline phosphatase, amylase, bilirubin, BUN, creatinine, LDH, lipase.

**Availability (Rx)**

- **Injection Premix:** 2 mg/mL in 100-mL, 300-mL bags. **Powder for Oral Suspension:** 100 mg/5 mL. **Tablets:** 600 mg.

**Administration/handling**

- **IV**
  - **Rate of Administration**
    - Infuse over 30–120 min.
    - Should be administered without further dilution.
Storage
• Store at room temperature.
• Protect from light.
• Yellow color does not affect potency.

PO
• Give without regard to meals.
• Use suspension within 21 days after reconstitution. Gently invert 3–5 times before administration.
• Do not shake.

- IV incompatibilities
Amphotericin B complex (Abelcet, AmBisome, Amphotec), co-trimoxazole (Bactrim), diazePAM (Valium), erythromycin (Erythrocin), pentamidine (Pentam IV), phenytoin (Dilantin).

- IV Compatibilities
Calcium gluconate, dexmedetomidine (Precedex), heparin, magnesium, potassium chloride.

Indications/routes/dosage

Vancomycin-Resistant Infections (VRE)
PO, IV: ADULTS, ELDERLY, CHILDREN OLDER THAN 11 YRS: 600 mg q12h. CHILDREN 11 YRS AND YOUNGER: 10 mg/kg q8–12h. Maximum: 600 mg/dose.

Pneumonia, Complicated Skin/Skin Structure Infections
PO, IV: ADULTS, ELDERLY, CHILDREN OLDER THAN 11 YRS: 600 mg q12h. CHILDREN 11 YRS AND YOUNGER: 10 mg/kg q8h. Maximum: 600 mg/dose.

Uncomplicated Skin/Skin Structure Infections
PO: ADULTS, ELDERLY: 600 mg q12h. CHILDREN OLDER THAN 11
YRS: 600 mg q12h. CHILDREN 5–11 YRS: 10 mg/kg/dose q12h. Maximum: 600 mg/dose. CHILDREN YOUNGER THAN 5 YRS: 10 mg/kg q8h. Maximum: 600 mg/dose.

**Usual Neonate Dosage**

PO, IV: NEONATES: 10 mg/kg/dose q8–12h.

**Dosage in Renal/Hepatic Impairment**

No dose adjustment. Administer after HD on dialysis days.

**Side effects**

Occasional (9%–2%): Diarrhea, nausea, vomiting, insomnia, constipation, rash, dizziness, fever, headache. Rare (less than 2%): Altered taste, vaginal candidiasis, fungal infection, tongue discoloration.

**Adverse effects/toxic reactions**

Thrombocytopenia, myelosuppression occur rarely. Antibiotic-associated colitis, other superinfections (abdominal cramps, severe watery diarrhea, fever) may result from altered bacterial balance in GI tract.

**Nursing considerations**

**Baseline assessment**

Obtain appropriate culture specimens for sensitivity testing prior to therapy. Obtain baseline CBC, chemistries. Question medical history as listed in Precautions. Receive full medication history and screen for interactions.

**Intervention/evaluation**

Monitor daily pattern of bowel activity, stool consistency. Mild GI effects may be tolerable, but increasing severity may indicate onset of antibiotic-associated colitis. Be alert for superinfection: fever, vomiting, diarrhea, anal/genital pruritus, oral mucosal changes (ulceration, pain, erythema). Monitor CBC, platelets, Hgb, chemistries.
**Patient/ family teaching**

- Continue therapy for full length of treatment.
- Doses should be evenly spaced.
- May cause GI upset (may take with food, milk).
- Excessive amounts of tyramine-containing foods (red wine, aged cheese) may cause severe reaction (severe headache, neck stiffness, diaphoresis, palpitations).
- Avoid alcohol.
- Report persistent diarrhea, nausea, vomiting.

**liraglutide**

*leer-a-gloo-tide*

*Saxenda*

*Victoza*

**Fixed-combination(s)**

*Xultophy*: liraglutide 3.6 mg/mL and insulin degludec 100 units/mL.

**CLASSIFICATION**

**PHARMACOTHERAPEUTIC**: Antihyperglycemic (glucagon-like peptide-1 [GLP-1]) receptor agonist.

**CLINICAL**: Antidiabetic agent.

- **BLACK BOX ALERT**

Causes dose-dependent and treatment duration–dependent thyroid C-cell tumors, including medullary thyroid cancer.

**Uses**

*Saxenda*: Adjunct to diet and increased physical activity for chronic weight management in adults with body mass index (BMI) of 30 kg/m² or greater, or 27 kg/m² or greater, with at least one co-morbid condition (e.g., hypertension, diabetes, dyslipidemia). *Victoza*: Adjunct to diet and exercise to improve glycemic control in adult pts with type 2 diabetes. Reduce risk of major cardiovascular events in adults with type 2 diabetes and established cardiovascular (CV) disease.
Precautions

**Contraindications:** Hypersensitivity to liraglutide. Personal or family history of medullary thyroid carcinoma (MTC), pts with multiple endocrine neoplasia syndrome type 2 (MEN2). *(Saxenda):* Pregnancy. **Cautions:** History of pancreatitis, cholelithiasis, alcohol abuse, renal/hepatic impairment. History of angioedema to other GLP-1 receptor agonists. Do not use in type 1 diabetes or diabetic ketoacidosis. Medications requiring a narrow therapeutic index or requiring rapid GI absorption.

Action

Stimulates release of insulin from pancreatic beta cells, mimics enhancement of glucose-dependent insulin secretion, suppresses elevated glucagon secretion, slows gastric emptying. **Therapeutic Effect:** Improves glycemic control by increasing postmeal insulin secretion, emptying, increasing satiety.

Pharmacokinetics

Maximum concentration achieved in 8–12 hrs. Protein binding: 98%. Metabolized to large proteins without a specific organ as major route of elimination. **Half-life:** 13 hrs.

Life Span Considerations

**Pregnancy/Lactation:** Unknown if distributed in breast milk. **Children:** Safety and efficacy not established. **Elderly:** No age-related precautions noted.

Interactions

**DRUG:** Liraglutide has potential to alter absorption of concurrently administered oral medications. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** Decreases glucose serum levels (when used in combination with insulin secretagogues [e.g., sulfonylureas]).

Availability (Rx)

Subcutaneous, Solution (Prefilled Pen): *(Victoza):* 18 mg/3 mL. *(Saxenda):*
(Prefilled Pen) 18 mg/3 mL. Delivers doses of 0.6 mg, 1.2 mg, 1.8 mg, 2.4 mg, or 3 mg.

**Administration/handling**

**Subcutaneous**
- Insert needle subcutaneously into upper arms, outer thigh, or abdomen, and inject solution.
- Do not inject into areas of active skin disease or injury such as sunburns, skin rashes, inflammation, skin infections, or active psoriasis.
- Rotate injection sites.

**Storage**
- Refrigerate prefilled pens.
- Discard if freezing occurs.
- Discard pen 30 days after initial use.

**Indications/routes/dosage**

**Diabetes (Victoza) With or Without CV Disease**

**SQ: ADULTS, ELDERLY:** Initial dose: 0.6 mg once daily for at least 1 wk. *(Note: This dose is intended to reduce GI symptoms during initial titration; it is not effective for glycemic control.)* After 1 wk, increase dose to 1.2 mg. If 1.2-mg dose does not result in acceptable glycemic control, dose can be increased to 1.8 mg.

**Weight Management (Saxenda)**

**SQ: ADULTS, ELDERLY:** Initially, 0.6 mg once daily for one week. Increase wkly by 0.6 mg/day to a target dose of 3 mg once daily. *(Note: Evaluate change in weight 16 wks after initiation. Discontinue if less than 4% of baseline weight not achieved.)*

**Dosage in Renal/Hepatic Impairment**

Use caution.
Side effects

Frequent (greater than 13%): Headache, nausea, diarrhea, liraglutide antibody resistance. Occasional (13%–6%): Diarrhea, vomiting, dizziness, nervousness, dyspepsia. Rare (less than 6%): Weakness, decreased appetite.

Adverse effects/toxic reactions

Serious hypoglycemia may occur when used concurrently with insulin analogue (e.g., sulfonylurea); consider lowering dose.

Nursing considerations

Baseline assessment

Check blood glucose concentration before administration. Discuss pt’s lifestyle to determine extent of learning, emotional needs. Ensure follow-up instruction if pt/family does not thoroughly understand diabetes management or glucose testing technique. Dose is gradually increased to improve GI tolerance.

Intervention/evaluation

Monitor blood glucose level, food intake. Assess for hypoglycemia (cool wet skin, tremors, dizziness, anxiety, headache, tachycardia, numbness in mouth, hunger, diplopia) or hyperglycemia (polyuria, polyphagia, polydipsia, nausea, vomiting, dim vision, fatigue, deep rapid breathing). Be alert to conditions that alter glucose requirements (fever, increased activity/stress, surgical procedures). Consider lowering dose of insulin analogue to reduce risk of hypoglycemia.

Patient/family teaching

• A health care provider will show you how to properly prepare and inject your medication. You must demonstrate correct preparation and injection techniques before using medication at home.
• Diabetes requires lifelong control.
• Prescribed diet, exercise are principal parts of treatment; do not skip/delay meals.
• Continue following dietary instructions, regular exercise program, regular testing of blood glucose level.
• Serious hypoglycemia may occur when used concurrently with insulin analogue (e.g., sulfonylurea).
• Have source of glucose available to treat symptoms of low blood sugar.

**lisdexamfetamine**

lis-dex-am-fet-a-meen

**Vyvanse**

CLASSIFICATION

PHARMACOTHERAPEUTIC: Amphetamine (Schedule II).

CLINICAL: CNS stimulant.

■ BLACK BOX ALERT ■ Potential for drug abuse dependency exists. Assess for abuse potential and monitor for abuse potential/dependence.

Do not confuse lisdexamfetamine with dextroamphetamine, or Vyvanse with Glucovance, Vivactil, or Vytorin.

**Uses**

Treatment of attention-deficit/hyperactivity disorder (ADHD), moderate to severe binge eating disorder (BED).

**Precautions**

**Contraindications:** Hypersensitivity to lisdexamfetamine, amphetamine products. Concurrent use or within 2 wks of use of MAOI. **Cautions:** Hyperthyroidism, glaucoma, agitated states, cardiovascular conditions (hypertension, recent MI, ventricular arrhythmias), elderly, psychiatric/seizures, preexisting psychosis or bipolar disorder, Tourette syndrome. Avoid use in pts with serious structural cardiac abnormalities, cardiomyopathy, arrhythmias, CAD. History of alcohol or drug abuse.

**Action**

Enhances action of DOPamine, norepinephrine by blocking reuptake from synapses, increasing levels in extraneuronal space. **Therapeutic Effect:**
Improves attention span in ADHD.

**Pharmacokinetics**
Rapidly absorbed. Converted to dextroamphetamine. Excreted in urine. **Half-life:** Less than 1 hr.

**Lifespan considerations**

**Pregnancy/Lactation:** Has potential for fetal harm. Distributed in breast milk. **Children:** Safety and efficacy not established in pts younger than 6 yrs. **Elderly:** No age-related precautions noted.

**Interactions**

**DRUG:** MAOIs (e.g., phenelzine, selegiline) may prolong/intensify effects. May decrease sedative effect of antihistamines (e.g., diphenhydramine). May decrease hypotensive effects of antihypertensives (e.g., amLODIPine, lisinopril, valsartan). Effects may be decreased by chlorproM AZINE, haloperidol, lithium, urinary acidifying agents (ammonium chloride, sodium acid phosphate). May increase absorption of PHENobarbital, phenytoin. Tricyclic antidepressants (e.g., amitriptyline, doxepin) may increase cardiovascular effects. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** May increase plasma corticosteroid.

**Availability (Rx)**

**Capsules:** 10 mg, 20 mg, 30 mg, 40 mg, 50 mg, 60 mg, 70 mg.

**Administration/handling**

**PO**
- May be given in the morning without regard to food.
- Administer capsule whole; pt must not chew.
- Capsules may be opened and dissolved in water and taken immediately.
Indications/routes/dosage

ADHD

Note: Assess for cardiac disease and risk of abuse before initiating.

PO: ADULTS, CHILDREN 6 YRS AND OLDER: Initially, 30 mg once daily in the morning. May increase dosage in increments of 10 or 20 mg/day at wkly intervals until optimal response obtained. Maximum: 70 mg/day.

BED

PO: ADULTS, ELDERLY: Initially, 30 mg once daily in morning. May increase by 20 mg/day at wkly intervals to a target dose of 50–70 mg once daily. Maximum: 70 mg/day.

Dosage in Renal Impairment

CrCl 30 mL/min or greater: Maximum: 70 mg/day. CrCl 15–29 mL/min: Maximum: 50 mg/day. CrCl less than 15 mL/min or end-stage renal disease: Maximum: 30 mg/day.

Dosage in Hepatic Impairment

No dose adjustment.

Side effects

Frequent (39%): Decreased appetite. Occasional (19%–9%): Insomnia, upper abdominal pain, headache, irritability, vomiting, weight decrease. Rare (6%–2%): Nausea, dry mouth, dizziness, rash, affect change, fatigue, tic.

Adverse effects/toxic reactions

Abrupt withdrawal following prolonged administration of high dosage may produce extreme fatigue (may last for wks). Prolonged administration to children with ADHD may produce a suppression of weight and/or height patterns. May produce cardiac irregularities, psychotic syndrome.

Nursing considerations
**Baseline assessment**
Assess attention span, impulse control, interaction with others. Question history of cardiomyopathy, glaucoma, hypertension, hyperthyroidism, psychiatric disorder, renal impairment. Receive full medication history and screen for interactions.

**Intervention/evaluation**
Monitor for CNS stimulation, increase in B/P, weight loss, pulse, sleep pattern, appetite; palpitations, cardiac arrhythmia. Observe for signs of hostility, aggression, depression.

**Patient/family teaching**
- Take early in day.
- May mask extreme fatigue.
- Report pronounced dizziness, decreased appetite, dry mouth, weight loss, new or worsened psychiatric problems, palpitations, dyspnea.
- Suddenly stopping treatment may cause extreme fatigue that can last for wks. Discontinuance must be done under the close supervision of health care professional.

### lisinopril
lye-sin-o-pril
Apo-Lisinopril
Prinivil
Qbrelis
**Zestril**

**Fixed-Combination(s)**
- **Prinzide/Zestoretic:** lisinopril/hydroCHLORothiazide (a diuretic): 10 mg/12.5 mg, 20 mg/12.5 mg, 20 mg/25 mg.

**CLASSIFICATION**
**PHARMACOTHERAPEUTIC:** ACE inhibitor.
**CLINICAL:** Antihypertensive.
Do not confuse lisinopril with fosinopril, or Prinivil with Plendil, Pravachol, Prevacid, PriLOSEC, Proventil, or Restoril, or Zestril with Desyrel, Restoril, Vistaril, Zetia, or Zostrix.
Do not confuse lisinopril’s combination form Zestoretic with PriLOSEC.

Uses
Treatment of hypertension in adults and children 6 yrs and older. Used alone or in combination with other antihypertensives. Adjunctive therapy in management of HF. Treatment of acute MI within 24 hrs in hemodynamically stable pts to improve survival. Treatment of left ventricular dysfunction following MI.

Precautions
Contraindications: Hypersensitivity to lisinopril, other ACE inhibitors. History of angioedema from treatment with ACE inhibitors, idiopathic or hereditary angioedema. Concomitant use with aliskiren in pts with diabetes. Cautions: Renal impairment, unstented unilateral/bilateral renal artery stenosis, volume depletion, ischemic heart disease, cerebrovascular disease, severe aortic stenosis, hypertrophic cardiomyopathy, HF, systolic B/P less than 100, dialysis, hyponatremia; before, during, or immediately after major surgery. Concomitant use of potassium supplements.

Action
Competitive inhibitor of angiotensin-converting enzyme (ACE) (prevents conversion of angiotensin I to angiotensin II, a potent vasoconstrictor; may inhibit angiotensin II at local vascular, renal sites). Decreases plasma angiotensin II, increases plasma renin activity, decreases aldosterone secretion. Therapeutic Effect: Reduces blood pressure.

Pharmacokinetics

<table>
<thead>
<tr>
<th>Route</th>
<th>Onset</th>
<th>Peak</th>
<th>Duration</th>
</tr>
</thead>
</table>

BLACK BOX ALERT ■ May cause fetal injury, mortality. Discontinue as soon as possible once pregnancy is detected.
Incompletely absorbed from GI tract. Protein binding: 25%. Primarily excreted unchanged in urine. Removed by hemodialysis. **Half-life:** 12 hrs (increased in renal impairment).

**Lifespan considerations**

**Pregnancy/Lactation:** Crosses placenta. Unknown if distributed in breast milk. **Children:** Safety and efficacy not established. **Elderly:** May be more sensitive to hypotensive effects.

**Interactions**

**DRUG:** Diuretics (e.g., furosemide, HCTZ) may increase hypotensive effects. May increase concentration, risk of toxicity of lithium. **NSAIDs** (e.g., ibuprofen, ketorolac, naproxen) may decrease effects. **Potassium-sparing diuretics** (e.g., spironolactone, triamterene), **potassium supplements** may cause hyperkalemia. May increase hypoglycemic effect of **oral hypoglycemic agents** (e.g., glyBURIDE, metFORMIN). **HERBAL:** Ephedra, ginseng, licorice, yohimbe may worsen hypertension. **Black cohosh, periwinkle** may increase antihypertensive effect. **FOOD:** None known. **LAB VALUES:** May increase serum BUN, alkaline phosphatase, bilirubin, creatinine, potassium, ALT, AST. May decrease serum sodium. May cause positive ANA titer.

**Availability (Rx)**

**Solution, Oral:** (Qbrelis) 1 mg/mL. **Tablets:** 2.5 mg, 5 mg, 10 mg, 20 mg, 30 mg, 40 mg.

**Administration/handling**

**PO**

- Give without regard to food.
- Tablets may be crushed.

**Indications/routes/dosage**
Hypertension (Used Alone)

**PO: ADULTS:** Initially, 10 mg/day. May increase by 5–10 mg/day at 1- to 2-wk intervals. Range: 10–40 mg/day. **ELDERLY:** Initially, 2.5–5 mg/day. May increase by 2.5–5 mg/day at 1- to 2-wk intervals. **Maximum:** 40 mg/day. **CHILDREN 6 YRS OR OLDER:** Initially, 0.07 mg/kg once daily (up to 5 mg). Titrate at 1- to 2-wk intervals. **Maximum:** 40 mg/day.

Hypertension (in Combination with Other Antihypertensives)

*Alert:* If possible, discontinue diuretics 48–72 hrs prior to initiating lisinopril therapy. **PO: ADULTS, ELDERLY:** Initially, 2.5–5 mg/day titrated to pt’s needs. Range: 10–40 mg/day.

**HF**

**PO: ADULTS, ELDERLY:** Initially, 2.5–5 mg/day. May increase by no more than 10 mg/day at intervals of at least 2 wks to a target dose of 20–40 mg once daily.

**Improve Survival in Pts after MI**

**PO: ADULTS, ELDERLY:** Initially, 5 mg, then 5 mg after 24 hrs, 10 mg after 48 hrs, then 10 mg/day for 6 wks. For pts with systolic B/P greater than 100–120 mm Hg, give 2.5 mg/day for 3 days, then 2.5–5 mg/day. Discontinue if systolic B/P less than 90 mm Hg for more than 1 hr.

**Dosage in Renal Impairment**

**CrCl less than 30 mL/min:** Not recommended in children. Titrate to pt’s needs after giving the following initial dose:

<table>
<thead>
<tr>
<th>Creatinine Clearance</th>
<th>Initial Dose</th>
</tr>
</thead>
<tbody>
<tr>
<td>10–30 mL/min</td>
<td>5 mg</td>
</tr>
<tr>
<td>Less than 10 mL/min or Dialysis</td>
<td>2.5 mg</td>
</tr>
</tbody>
</table>

**HF**
CrCl less than 30 mL/min or serum creatinine greater than 3 mg/dL: Initial dose: 2.5 mg.

Acute MI
Creatinine clearance 30 mL/min or less: Initial dose: 2.5 mg.

Dosage in Hepatic Impairment
No dose adjustment.

Side effects
Frequent (12%–5%): Headache, dizziness, postural hypotension. Occasional (4%–2%): Chest discomfort, fatigue, rash, abdominal pain, nausea, diarrhea, upper respiratory infection. Rare (1% or less): Palpitations, tachycardia, peripheral edema, insomnia, paresthesia, confusion, constipation, dry mouth, muscle cramps.

Adverse effects/toxic reactions
Excessive hypotension (“first-dose syncope”) may occur in pts with HF, severe salt/volume depletion. Angioedema (swelling of face and lips), hyperkalemia occur rarely. Agranulocytosis, neutropenia may be noted in pts with collagen vascular disease (scleroderma, systemic lupus erythematosus). Nephrotic syndrome may be noted in pts with history of renal disease.

Nursing considerations

Baseline assessment
Obtain BMP (esp. serum BUN, creatinine, sodium, potassium; CrCl, GFR. Obtain B/P, apical pulse immediately before each dose in addition to regular monitoring (be alert to fluctuations). In pts with renal impairment, autoimmune disease, taking drugs that affect leukocytes or immune response, CBC and differential count should be performed before beginning therapy and q2wks for 3 mos, then periodically thereafter. Question history of aortic stenosis, cardiac disease, cardiomyopathy, renal impairment or stenosis.
**Intervention/evaluation**

**Patient/ family teaching**

• To reduce hypotensive effect, go from lying to standing slowly.
• Limit alcohol intake.
• Report vomiting, diarrhea, diaphoresis, swelling of face/lips/tongue, difficulty in breathing, persistent cough.
• Limit salt intake.
• Maintain adequate hydration.
• Report decreased urinary output, dark-colored urine, swelling of the hands and feet.
• Immediately report allergic reactions, esp. life-threatening swelling of the face or tongue.

---

**lithium**

**lith-ee-um**

**Apo-Lithium**

**Lithobid**

**CLASSIFICATION**

**PHARMACOTHERAPEUTIC**: Mood-stabilizing agent.

**CLINICAL**: Antimanic.

■ **BLACK BOX ALERT** ■ Lithium toxicity is closely related to serum lithium levels and can occur at therapeutic doses. Routine determination of serum lithium levels is essential during therapy.

**Do not confuse Lithobid with Levbid or Lithostat.**

---

**Uses**
Management of bipolar disorder. Treatment of mania in pts with bipolar disorder. **OFF-LABEL:** Augmenting agent for depression.

**Precautions**

**Contraindications:** Hypersensitivity to lithium. Severely debilitated pts, severe cardiovascular disease, concurrent use with diuretics, severe dehydration, severe renal disease, severe sodium depletion or dehydration. **Cautions:** Mild to moderate cardiovascular disease, thyroid disease, elderly, mild to moderate renal impairment, medications altering sodium excretion, pregnancy, pts at risk for suicide, pts with significant fluid loss, pts receiving neuromuscular blocking agents.

**Action**

Changes cation transport across cell membrane in nerve/muscle cells; influences reuptake of serotonin/norepinephrine. **Therapeutic Effect:** Stabilizes mood, reducing episodes of mania.

**Pharmacokinetics**

Rapidly, completely absorbed from GI tract. Protein binding: None. Primarily excreted unchanged in urine. Removed by hemodialysis. **Half-life:** 18–24 hrs (increased in elderly).

**Lifespan considerations**

**Pregnancy/Lactation:** Freely crosses placenta. Distributed in breast milk. **Children:** May increase bone formation or density (alter parathyroid hormone concentrations). **Elderly:** More susceptible to develop lithium-induced goiter or clinical hypothyroidism, CNS toxicity. Increased thirst, urination noted more frequently; lower dosage recommended.

**Interactions**

**DRUG:** Diuretics (e.g., furosemide), NSAIDs, metroNIDAZOLE, ACE inhibitors (e.g., enalapril, lisinopril), angiotensin II antagonists, SSRIs (e.g., escitalopram, paroxetine, sertraline), calcium channel blockers (e.g.,
losartan, valsartan) may increase lithium concentration, risk of toxicity. HERBAL: None significant. FOOD: None known. LAB VALUES: May increase serum glucose, immunoreactive parathyroid hormone, calcium. Therapeutic serum level: 0.6–1.2 mEq/L; toxic serum level: greater than 1.5 mEq/L.

Availability (Rx)

Capsules: 150 mg, 300 mg, 600 mg. Oral Solution: 300 mg/5 mL. Tablets: 300 mg. Tablets (Extended-Release): 300 mg, 450 mg.

Administration/handling

PO

• Administer with meals, milk to decrease GI upset.
• Do not break, crush, dissolve, or divide extended-release tablets.

Indications/routes/dosage

During acute phase, a therapeutic serum lithium concentration of 0.6–1.2 mEq/L is required. For long-term control, desired level is 0.8–1 mEq/L. Monitor serum drug concentration, clinical response to determine proper dosage.

Usual Dosage

Dosage in Renal Impairment

<table>
<thead>
<tr>
<th>Creatinine Clearance</th>
<th>Dosage</th>
</tr>
</thead>
</table>

Dosage in Hepatic Impairment

No dose adjustment.

Side effects

Side effects are dose related and seldom occur at lithium serum levels less than 1.5 mEq/L. **Occasional:** Fine hand tremor, polydipsia, polyuria, mild nausea. **Rare:** Weight gain, bradycardia, tachycardia, acne, rash, muscle twitching, peripheral cyanosis, pseudotumor cerebri (eye pain, headache, tinnitus, vision disturbances).

Adverse effects/toxic reactions

Lithium serum concentration of 1.5–2.0 mEq/L may produce vomiting, diarrhea, drowsiness, confusion, incoordination, coarse hand tremor, muscle twitching, T-wave depression on EKG. Lithium serum concentration of 2.0–2.5 mEq/L may result in ataxia, giddiness, tinnitus, blurred vision, clonic movements, severe hypotension. Acute toxicity may be characterized by seizures, oliguria, circulatory failure, coma, death.

Nursing considerations

Baseline assessment

Question history of cardiac/thyroid disease, renal impairment. Assess hydration status. Assess mental status (e.g., mood, behavior). Serum lithium levels should be tested q3–4days during initial phase of therapy, q1–2mos thereafter, and wkly if there is no improvement of disorder or adverse effects occur.

Intervention/evaluation

Clinical assessment of therapeutic effect, tolerance to drug effect is necessary for correct dosing-level management. Assess behavior, appearance, emotional status, response to environment, speech pattern, thought content. Monitor serum
lithium concentrations, CBC with differential, urinalysis, creatinine clearance. Monitor renal, hepatic, thyroid, cardiovascular function; serum electrolytes. Assess for increased urinary output, persistent thirst. Report polyuria, prolonged vomiting, diarrhea, fever to physician (may need to temporarily reduce or discontinue dosage). Monitor for signs of lithium toxicity. Assess for therapeutic response (interest in surroundings, improvement in self-care, increased ability to concentrate, relaxed facial expression). Monitor lithium levels q3–4days at initiation of therapy (then q1–2mos). Obtain lithium levels 8–12 hrs postdose. **Therapeutic serum level:** 0.6–1.2 mEq/L; **toxic serum level:** greater than 1.5 mEq/L.

**Patient/ family teaching**

- Limit alcohol, caffeine intake.
- Avoid tasks requiring coordination until CNS effects of drug are known.
- May cause dry mouth.
- Maintain adequate salt, fluid intake (avoid dehydration).
- Report vomiting, diarrhea, muscle weakness, tremors, drowsiness, ataxia.
- Monitoring of serum level is necessary to determine proper dose.

---

**lixisenatide**

*lix-i-sen-a-tide*

**Adlyxin**

**Fixed-Combination(s)**

**Soliqua:** lixisenatide 33 mcg/mL and insulin glargine 100 units/mL.

**CLASSIFICATION**

**PHARMACOTHERAPEUTIC:** Antihyperglycemic (glucagon-like peptide-1 [GLP-1]) receptor agonist.

**CLINICAL:** Antidiabetic agent.

*Do not confuse lixisenatide with exenatide, liraglutide.*

**Uses**

Adjunct to diet and exercise to improve glycemic controls in pts with type 2 diabetes mellitus.
Precautions

**Contraindications:** Hypersensitivity to lixisenatide. **Cautions:** Renal impairment, severe gastroparesis, history of pancreatitis. Not recommended in pts with diabetic ketoacidosis, type 1 diabetes mellitus. Not a substitute for insulin. Medications with narrow therapeutic index or requiring rapid GI absorption.

Action

Increases glucose-dependent insulin secretion; decreases glucagon secretion. Slows gastric emptying. **Therapeutic Effect:** Improves glycemic control by lowering fasting glucose and postprandial blood glucose.

Pharmacokinetics

Widely distributed. Protein binding: not specified. Peak plasma concentration: 1–3.5 hrs. Eliminated through glomerulus filtration and proteolytic degradation. **Half-life:** 3 hrs.

Lifespan considerations

**Pregnancy/Lactation:** Unknown if distributed in breast milk. **Children:** Safety and efficacy not established in pts younger than 18 yrs. **Elderly:** No age-related precautions noted.

Interactions

**DRUG:** May increase hypoglycemic effect when added to insulin or sulfonylureas. May decrease the rate of absorption of oral medications due to delayed gastric emptying. **Oral contraceptive** should be taken 1 hr before or 11 hrs after lixisenatide. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** Expected to decrease serum glucose, Hgb A1c.

Availability (Rx)

**Prefilled Injector Pens:** 50 mcg/mL in 3 mL (for 14 preset doses of 10 mcg/dose), 100 mcg/mL in 3 mL (for 14 preset doses of 20 mcg/dose).
Administration/handling

**Subcutaneous**

**Preparation**
- Follow instructions for preparation according to manufacturer guidelines.
- Visually inspect for particulate matter or discoloration. Solution should appear clear and colorless.
- Do not use if solution is cloudy or discolored or if visible particles are observed.

**Administrations**
- Administer within 1 hr before the first meal of the day, preferably the same time each day. If a dose is missed, administer within 1 hr prior to next meal.
- Insert needle subcutaneously into upper arms, outer thigh, or abdomen, and inject solution.
- Do not inject into areas of active skin disease or injury such as sunburns, skin rashes, inflammation, skin infections, or active psoriasis.
- Rotate injection sites.

**Storage**
- Refrigerate unused injector pens.
- Once injector pen is activated, store at room temperature for up to 14 days.
- Do not freeze.
- Protect from light.

**Indications/routes/dosage**

**Type 2 Diabetes Mellitus**

**SQ: ADULTS, ELDERLY:** 10 mcg once daily for 14 days. **Maintenance:** Increase to 20 mcg once daily on day 15.

**Dosage in Renal Impairment**
Use caution.

**Dosage in Hepatic Impairment**
No dose adjustment.
Side effects

**Frequent (25%–10%):** Nausea, vomiting.

**Occasional (9%–1%):** Headache, diarrhea, dizziness, dyspepsia, constipation, abdominal distention, abdominal pain.

Adverse effects/toxic reactions

May increase risk of acute renal failure or worsening of chronic renal impairment (esp. in pts with vomiting, dehydration). May increase risk of hypoglycemia when used with other hypoglycemic agents or insulin. Anaphylaxis reported in less than 1% of pts. Other hypersensitivity reactions including angioedema, bronchospasm, laryngeal edema occur rarely. Acute pancreatitis, hemorrhagic or necrotizing pancreatitis were reported. Immunogenicity (auto-lixisenatide antibodies) occurred in 70% of pts.

Nursing considerations

**Baseline assessment**

**Intervention/evaluation**

Monitor capillary blood glucose levels, Hgb A1c; renal function test (esp. in pts with renal impairment who report diarrhea, gastroparesis, vomiting). Assess for hypoglycemia (anxiety, confusion, diaphoresis, diplopia, dizziness, headache, hunger, perioral numbness, tachycardia, tremors), hyperglycemia (confusion, fatigue, Kussmaul breathing, nausea, polyuria, vomiting). Screen for glucose-altering conditions: fever, stress, surgical procedures, trauma. Monitor for hypersensitivity reactions; abdominal pain that radiates to the back. Encourage fluid intake. Monitor I&O.

**Patient/family teaching**
• Diabetes requires lifelong control. Diet and exercise are principal parts of treatment; do not skip or delay meals.
• Test blood sugar regularly.
• Monitor daily calorie intake.
• When taking additional medications to lower blood sugar or when glucose demands are altered (fever, infection, stress trauma), have low blood sugar treatment available (glucagon, oral dextrose).
• Persistent, severe abdominal pain that radiates to the back (with or without vomiting) may indicate acute pancreatitis.
• Report allergic reactions of any kind, esp. difficulty breathing, itching, rash, swelling of the face or throat.
• Oral contraceptives should be taken at least 1 hr before or 11 hrs after dose.
• Therapy may cause acute kidney injury or kidney failure; report decreased urine output, amber-colored urine, flank pain.

lomitapide
lom-i-ta-pide
Juxtapid

CLASSIFICATION
PHARMACOTHERAPEUTIC: Microsomal triglyceride transfer protein inhibitor.
CLINICAL: Antihyperlipidemic.

■ BLACK BOX ALERT ■ May cause hepatotoxicity. May cause hepatic steatosis (increase in hepatic fat) regardless of serum ALT, AST elevation; may be risk factor for progressive hepatic disease, including steatohepatitis and cirrhosis.

Do not confuse lomitapide with loperamide.

Uses

Treatment of homozygous familial hypercholesterolemia (HoFH) in combination with low-fat diet and other lipid-lowering therapies, including LDL-C apheresis, to reduce LDL, total cholesterol, apoprotein B, non–HDL-C.
**Precautions**

**Contraindications:** Hypersensitivity to lomitapide. Pregnancy, breastfeeding, moderate to severe hepatic impairment, active hepatic disease including unexplained persistent elevation of serum transaminases, concomitant use of strong CYP3A4 inhibitors (e.g., ketoconazole, protease inhibitors). **Cautions:** Mild to moderate renal impairment, end-stage renal disease, mild hepatic impairment, alcohol consumption. Avoid use in pts with history of glucose-galactose malabsorption, other agents having hepatotoxic potential (e.g., acetaminophen).

**Action**

Inhibits microsomal triglyceride transfer protein in lumen of endoplasmic reticulum. Prevents assembly of apo-B-containing lipoproteins in enterocytes, hepatocytes; inhibits synthesis of chylomicrons, very low density lipoprotein (VLDL). **Therapeutic Effect:** Decreases plasma low-density lipoprotein cholesterol (LDL-C).

**Pharmacokinetics**

**Lifespan considerations**

**Pregnancy/Lactation:** Contraindicated in pregnancy. May cause fetal harm. Must use effective contraception in addition to barrier methods. Unknown if distributed in breast milk. Must either discontinue breastfeeding or discontinue therapy. **Children:** Safety and efficacy not established. **Elderly:** Increased risk for side effects, adverse reactions.

**Interactions**

**DRUG:** Acetaminophen, amiodarone, ISOtretinoin, methotrexate, tamoxifen, tetracycline may increase risk for hepatotoxicity. Strong CYP3A4 inhibitors (e.g., ketoconazole, protease inhibitors) contraindicated due to increased risk for myopathy, rhabdomyolysis. Moderate CYP3A4 inhibitors
(e.g., atorvastatin, oral contraceptives) may increase concentration. May increase concentration of warfarin. May increase effects of P-glycoprotein substrates (e.g., digoxin, SITagliptin). HERBAL: None known. FOOD: Grapefruit products may increase absorption, toxicity. LAB VALUES: May increase serum alkaline phosphatase, bilirubin, ALT, AST.

Availability (Rx)

Capsules: 5 mg, 10 mg, 20 mg, 30 mg, 40 mg, 60 mg.

Administration/handling

PO

• Give with water only.
• Administer without food (at least 2 hrs after evening meal).
• Administer whole; do not break, crush, or open capsules.

Indications/routes/dosage

To reduce risk for fat-soluble nutrient deficiency, recommend supplemental coadministration: vitamin E 400 international units PO daily, linolenic acid 200 mg PO daily, alpha-linolenic acid (ALA) 210 mg PO daily, eicosapentaenoic acid (EPA) 110 mg PO daily, docosahexaenoic acid (DHA) 80 mg PO daily. Because of risk for myopathy, concurrent use of simvastatin should not exceed 20–40 mg/day.

Homozygous Familial Hypercholesterolemia

PO: ADULTS, ELDERLY: Initially, 5 mg once daily for minimum of 2 wks. Gradually increase dose at 4-wk (minimum) intervals to 10 mg once daily, then 20 mg once daily, then 40 mg once daily, then 60 mg once daily based on tolerability. Maximum: 60 mg/day.

Dose Modification

Elevated Hepatic Enzymes

If ALT, AST is between 3–5 times upper limit of normal (ULN), reduce dose until ALT, AST less than 3 times ULN. If ALT, AST is greater than 5 times
ULN, withhold dose until less than 3 times ULN, then restart at reduced dose. If hepatotoxicity occurs or bilirubin level rises greater than 2 times ULN, discontinue treatment.

**End-Stage Renal Disease Receiving Dialysis, Mild Hepatic Impairment**
Do not exceed 40 mg/day.

**Concurrent Use of Weak CYP3A4 Inhibitors**
Do not exceed 30 mg/day.

**Concurrent Use of Oral Contraception**
Do not exceed 40 mg/day.

**Dosage in Renal Impairment**
No dose adjustment. **End-stage renal disease:** Maximum: 40 mg/day.

**Dosage in Hepatic Impairment**
**Mild impairment:** Maximum: 40 mg/day. **Moderate to severe impairment:** Contraindicated.

**Side effects**

**Frequent (79%–65%):** Diarrhea, nausea. **Occasional (38%–10%):** Dyspepsia, vomiting, abdominal pain, weight loss, abdominal distention, constipation, flatulence, fatigue, back pain, gastric reflux, headache, dizziness.

**Adverse effects/toxic reactions**
Progressive hepatic disease including steatohepatitis, cirrhosis has been reported in 6% of pts due to increased hepatic fat. May reduce absorption of fat-soluble nutrients; recommend daily supplemental replacement. Increased risk for myopathy including rhabdomyolysis (muscle pain/tenderness, weakness, dark or decreased urine output, elevated serum creatinine, CPK) when used with other antihyperlipidemics. May increase risk for supratherapeutic INR with warfarin. Infections including influenza, nasopharyngitis, gastroenteritis reported in 5% of pts. Palpitations, angina pectoris reported in 3% of pts. Increased risk for dehydration/malabsorption with galactose intolerance hereditary disorder, pancreatic disease, diarrhea.
Nursing considerations

**Baseline assessment**
Obtain detailed dietary history, esp. fat consumption. Confirm negative pregnancy test before initiating treatment. Obtain baseline laboratory studies: ALT, AST, alkaline phosphatase, bilirubin, serum cholesterol, triglycerides, PT/INR (if pt is on warfarin). Confirm positive history of homozygous familial hypercholesterolemia (HoFH). Receive full medication history including vitamins, minerals, herbal products. Screen for medical history as listed in Precautions.

**Intervention/evaluation**
Maintain hydration; offer fluids frequently. Monitor INR routinely (with anticoagulants). Monitor LFT with any dosage change, then every month for first year when maintenance goal reached, then every 3 mos. Obtain EKG for palpitations, shortness of breath, dizziness. Monitor for bruising, hematuria, jaundice, right upper abdominal pain, fever, lethargy, melena.

**Patient/family teaching**
• Avoid pregnancy.
• Use appropriate contraception measures, including barrier precautions.
• If pregnancy occurs, inform physician immediately.
• Diarrhea may decrease effectiveness of oral contraception.
• Do not breastfeed.
• Maintain low-fat diet.
• Report yellowing of skin, bruising, black/tarry stool, right upper quadrant pain, fever, lethargy, chest pain, palpitations.
• Avoid alcohol.
• Avoid grapefruit products.
• Do not chew, crush, or open capsules.
• Report any newly prescribed medications.

loperamide
loe-per-a-myde
Apo-Loperamide
Diamode

Diarr-Eze

Imodium A-D

Loperacap

Novo-Loperamide

### Fixed-Combination(s)

**Imodium Advanced:** loperamide/simethicone (an antiflatulent): 2 mg/125 mg.

**CLASSIFICATION**

**PHARMACOTHERAPEUTIC:** Antidiarrheal agent.

**CLINICAL:** Antidiarrheal.

**Do not confuse Imodium with Indocin, or loperamide with furosemide.**

### Uses

Controls, provides symptomatic relief of acute nonspecific diarrhea, chronic diarrhea associated with inflammatory bowel disease; reduces volume of ileostomy discharge. **OTC:** Control symptoms of diarrhea, including traveler’s diarrhea. **OFF-LABEL:** Chemotherapy-induced diarrhea, irinotecan-induced delayed diarrhea.

### Precautions

**Contraindications:** Hypersensitivity to loperamide. Abdominal pain without diarrhea, children younger than 2 yrs; acute dysentery, acute ulcerative colitis, bacterial enterocolitis caused by invasive organisms, including *Salmonella*, *Shigella*, *Campylobacter*. **Cautions:** Hepatic impairment, use in young children. Avoid use when inhibition of peristalsis is undesirable (e.g., potential for ileus, megacolon). Avoid use in pts with risk factors for QT prolongation.

### Action

Directly affects intestinal wall muscles through opioid receptor. **Therapeutic**
**Effect:** Slows intestinal motility, prolongs transit time of intestinal contents by reducing fecal volume, diminishing loss of fluid, electrolytes, increasing viscosity, bulk of stool. Increases tone of anal sphincter.

**Pharmacokinetics**

Poorly absorbed from GI tract. Protein binding: 97%. Metabolized in liver. Excreted in feces (30%), urine (less than 2%). Not removed by hemodialysis. **Half-life:** 7–14 hrs.

**Lifespan considerations**

**Pregnancy/Lactation:** Unknown if drug crosses placenta or is distributed in breast milk. **Children:** Not recommended for pts younger than 2 yrs (infants younger than 3 mos more susceptible to CNS effects). **Elderly:** May mask dehydration, electrolyte depletion.

**Interactions**

**DRUG:** May increase levels/effects of QT-prolonging agents. **Ranolazine** may increase levels/effects. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** None significant.

**Availability (Rx)**

**Capsules:** 2 mg. **Liquid:** 1 mg/5 mL, 1 mg/7.5 mL. **Suspension, Oral:** 1 mg/7.5 mL. **Tablet:** 2 mg. **Tablet, Chewable:** 2 mg.

**Administration/handling**

**Liquid**

• When administering to children, use accompanying plastic dropper to measure the liquid.

**Indications/routes/dosage**
Acute Diarrhea

PO (Capsules): ADULTS, ELDERLY: Initially, 4 mg, then 2 mg after each unformed stool. Maximum: 16 mg/day.
CHILDREN 9–12 YRS, WEIGHING MORE THAN 30 KG: Initially, 2 mg 3 times/day for 24 hrs, then 0.1 mg/kg/dose after each loose stool. Maximum: 6 mg/day.
CHILDREN 6–8 YRS, WEIGHING 20–30 KG: Initially, 2 mg twice daily for 24 hrs, then 0.1 mg/kg/dose after each loose stool. Maximum: 4 mg/day.
CHILDREN 2–5 YRS, WEIGHING 13–20 KG: Initially, 1 mg 3 times/day for 24 hrs, then 0.1 mg/kg/dose after each loose stool. Maximum: 3 mg/day.

Maintenance: 1 mg/10 kg only after loose stool but not exceeding initial dose.

Chronic Diarrhea

PO: ADULTS, ELDERLY: Initially, 4 mg, then 2 mg after each unformed stool until diarrhea is controlled. Average maintenance dose: 4–8 mg/day. Maximum: 16 mg/day.

Traveler’s Diarrhea

PO: ADULTS, ELDERLY: Initially, 4 mg, then 2 mg after each loose bowel movement (LBM). Maximum: 8 mg/day.
CHILDREN 9–11 YRS: Initially, 2 mg, then 1 mg after each LBM. Maximum: 6 mg/day.
CHILDREN 6–8 YRS: Initially, 2 mg, then 1 mg after each LBM. Maximum: 4 mg/day.

Dosage in Renal/Hepatic Impairment

No dose adjustment.

Side effects

Rare: Dry mouth, drowsiness, abdominal discomfort, allergic reaction (rash, pruritus).

Adverse effects/toxic reactions

Toxicity results in constipation, GI irritation (nausea, vomiting), CNS depression. Activated charcoal is used to treat loperamide toxicity.
Nursing considerations

**Baseline assessment**
Do not administer if GI bleeding, mechanical obstruction is suspected. Investigate cause of diarrhea (infectious vs. noninfectious). The use of antidiarrheals in the presence of *C. difficile*–associated diarrhea or other diarrhea caused by bacteria is controversial (drug may inhibit expulsion of toxic bacteria while elderly and debilitated pts are at an increased risk of mortality due to dehydration).

**Intervention/evaluation**

**Patient/family teaching**
- Do not exceed prescribed dose.
- May cause dry mouth.
- Avoid alcohol.
- Avoid tasks that require alertness, motor skills until response to drug is established.
- Report diarrhea lasting more than 3 days, abdominal pain with distention, new-onset fever.

**lopinavir/ritonavir**

*loe-pin-a-veer/rit-oh-na-veer*

**Kaletra**

*CLASSIFICATION*
PHARMACOTHERAPEUTIC: Protease inhibitor combination.
CLINICAL: Antiretroviral.

*Do not confuse Kaletra with Keppra.*

**Uses**
In combination with other antiretroviral agents for treatment of HIV infection.
Precautions

Contraindications: Hypersensitivity to lopinavir, ritonavir. Concomitant use of potent CYP3A inducers: alfuzosin, colchicine (pts with renal and/or hepatic impairment), dronedarone, elbasvir/grazoprevir, ergot derivatives (causes vasospasm, peripheral ischemia of extremities), lovastatin, lurasidone, midazolam (oral), pimozide, rifAMPin, sildenafil (for treatment of pulmonary arterial hypertension), simvastatin, St. John’s wort, triazolam (increased sedation, respiratory depression); coadministration of medications highly dependent on CYP3A for clearance (increased concentrations are associated with serious adverse reactions). Cautions: Hepatic impairment, hepatitis B or C virus infection, cardiac disease with underlying conduction abnormalities or structural heart defects, ischemic heart disease, cardiomyopathies, congenital long QT syndrome or medications that prolong QT interval, hypokalemia, history of pancreatitis, diabetes.

Action

Lopinavir inhibits activity of protease, an enzyme, late in HIV replication process; ritonavir increases plasma levels of lopinavir by inhibiting CYP3A metabolism of lopinavir. Therapeutic Effect: Formation of immature, noninfectious viral particles.

Pharmacokinetics

Lifespan considerations

Interactions
DRUG: May increase concentration/toxicity of amiodarone, atorvastatin, bepridil, clarithromycin, cycloSPORINE, felodipine, fluticasone, ketoconazole, lidocaine, lovastatin, midazolam, nelfinavir, niCARdipine, NIFEdipine, sildenafil, simvastatin, tacrolimus, traZODone, triazolam, warfarin. May decrease concentration/effects of oral contraceptives. CYP3A4 inducers (e.g., carBAMazepine, phenytoin, rifAMPin) may decrease concentration/effects. May cause disulfiram-like reaction with metroNIDAZOLE. HERBAL: St. John’s wort may decrease concentration/effects. FOOD: None known. LAB VALUES: May increase serum glucose, GGT, amylase, bilirubin, total cholesterol, triglycerides, uric acid, ALT, AST. May decrease platelets, serum sodium.

Availability (Rx)

**Oral Solution**: 80 mg/mL lopinavir/20 mg/mL ritonavir.  
**Tablets**: 100 mg lopinavir/25 mg ritonavir, 200 mg lopinavir/50 mg ritonavir.

Administration/handling

**PO**

- Give tablets whole; do not break, crush, dissolve, or divide.  
- Does not require refrigeration.  
- Give tablets without regard to food.  
- Solution should be given with food.  
- Administer solution using calibrated oral syringe.

Indications/routes/dosage

**HIV Infection**

Doses based on lopinavir component.  
**PO**: **ADULTS**: 800 mg once daily or 400 mg twice daily. **Pregnant Women**: 400 mg twice daily. **CHILDREN 6 MOS–18 YRS, WEIGHING GREATER THAN 40 KG**: **(Oral Solution)**: 400 mg twice daily. **WEIGHING 15–40 KG**: 10 mg/kg twice daily. **WEIGHING LESS THAN 15 KG**: 12 mg/kg twice
daily. CHILDREN 14 DAYS–6 MOS: 16 mg/kg twice daily. (Tablets):
WEIGHING GREATER THAN 35 KG: 400 mg twice daily. WEIGHING
26–35 KG: 300 mg twice daily. WEIGHING 15–25 KG: 200 mg twice daily.
WEIGHING LESS THAN 15 KG: Not recommended.

Dosage Adjustment for Combination Therapy
Efavirenz, Nelfinavir, Nevirapine: ADULTS, CHILDREN 6 MOS–18 YRS,
WEIGHING GREATER THAN 45 KG: 500 mg (520-mg solution) twice
daily. (Solution): 15–45 KG: 11 mg/kg twice daily. LESS THAN 15 KG: 13
mg/kg twice daily. (Tablet): 31–45 KG: 400 mg twice daily. 21–30 KG: 300 mg
twice daily. 15–20 KG: 200 mg twice daily. LESS THAN 15 KG: Not
recommended.

Dosage in Renal Impairment
No dose adjustment. Avoid once-daily dosing in HD pts.

Dosage in Hepatic Impairment
Use caution.

Side effects
Frequent (14%): Mild to moderate diarrhea. Occasional (6%–2%): Nausea,
asthenia. Abdominal pain, headache, vomiting. Rare (less than 2%): Insomnia,
rash.

Adverse effects/toxic reactions
Anemia, leukopenia, lymphadenopathy, deep vein thrombosis (DVT), Cushing’s
syndrome, pancreatitis, hemorrhagic colitis occur rarely.

Nursing considerations
Baseline assessment
Obtain baseline CBC, renal function, LFT viral load, CD4 count, cell count.
Obtain baseline weight. Question medical history as listed in Precautions.
Receive full medication history and screen for contraindications/interactions.
**Intervention/evaluation**

**Patient/ family teaching**

- Eat small, frequent meals to offset nausea, vomiting.
- Lopinavir/ritonavir is not a cure for HIV infection, nor does it reduce risk of transmission to others.
- Pt must continue practices to prevent HIV transmission.
- Illnesses, including opportunistic infections, may still occur.
- Due to high risk for drug interactions, do not take newly prescribed medication unless approved by prescriber who originally started treatment.

**Fixed-Combination(s)**

**Alavert Allergy and Sinus, Claritin-D:** loratadine/pseudoephedrine (a sympathomimetic): 5 mg/120 mg, 10 mg/240 mg.

**CLASSIFICATION**

**PHARMACOTHERAPEUTIC:** $H_1$ antagonist, second generation.

**CLINICAL:** Antihistamine.

*Do not confuse loratadine with clonidine, or Claritin with clarithromycin.*
Uses

Relief of nasal, non-nasal symptoms of seasonal allergic rhinitis (hay fever). Treatment of itching due to hives (urticaria).

Precautions

Contraindications: Hypersensitivity to loratadine. Cautions: Renal/hepatic impairment.

Action

Competes with histamine for H₁ receptor sites on effector cells. Therapeutic Effect: Prevents allergic responses mediated by histamine (e.g., rhinitis, urticaria, pruritus).

Pharmacokinetics

Rapidly, almost completely absorbed from GI tract. Protein binding: 97%; metabolite, 73%–77%. Distributed mainly to liver, lungs, GI tract, bile. Metabolized in liver. Excreted in urine (40%) and feces (40%). Not removed by hemodialysis. Half-life: 8.4 hrs; metabolite, 28 hrs (increased in elderly, hepatic impairment).

Lifespan considerations

Pregnancy/Lactation: Distributed in breast milk. Children: Safety and efficacy not established in pts younger than 2 yrs. Elderly: More sensitive to anticholinergic effects (e.g., dry mouth, nose, throat).

Interactions

DRUG: Clarithromycin, erythromycin, fluconazole, ketoconazole may increase concentration. HERBAL: St. John’s wort may decrease concentration/effects. FOOD: All foods delay absorption. LAB VALUES: May
suppress wheal, flare reactions to antigen skin testing unless drug is discontinued 4 days before testing.

**Availability (Rx)**

**Capsule:** 5 mg. **Solution, Oral:** 5 mg/5 mL. **Syrup:** 5 mg/5 mL. **Tablets (Alavert, Claritin, Loradamed):** 10 mg. **Tablets, Chewable (Claritin):** 5 mg. **Tablets (Orally Disintegrating [Alavert]):** 5 mg, 10 mg.

**Administration/handling**

**PO**
- May take without regard for food.

**Orally Disintegrating Tablets**
- Place under tongue.
- Disintegration occurs within seconds, after which tablet contents may be swallowed with or without water.

**Indications/routes/dosage**

**Allergic Rhinitis, Urticaria**

**PO:** **ADULTS, ELDERLY, CHILDREN 6 YRS AND OLDER:** 10 mg once daily or 5 mg twice daily (Claritin Reditabs). **CHILDREN 2–5 YRS:** 5 mg once daily.

**Dosage in Renal Impairment (CrCl less than 30 mL/min)**

**PO:** **ADULTS, ELDERLY, CHILDREN 6 YRS AND OLDER:** 10 mg every other day. **CHILDREN 2–5 YRS:** No dose adjustment.

**Dosage in Hepatic Impairment**

No dose adjustment.

**Side effects**
**Frequent (12%-8%):** Headache, fatigue, drowsiness. **Occasional (3%):** Dry mouth, nose, throat. **Rare:** Photosensitivity.

**Adverse effects/toxic reactions**
None significant.

**Nursing considerations**

**Baseline assessment**
Assess lung sounds for wheezing, skin for urticaria, other allergy symptoms.

**Intervention/evaluation**
For upper respiratory allergies, increase fluids to decrease viscosity of secretions, offset thirst, replenish loss of fluids from increased diaphoresis. Monitor symptoms for therapeutic response.

**Patient/family teaching**
- Drink plenty of water (may cause dry mouth).
- Avoid alcohol.
- Avoid tasks that require alertness, motor skills until response to drug is established (may cause drowsiness).
- May cause photosensitivity reactions (avoid direct exposure to sunlight).

---

**CLASSIFICATION**
**PHARMACOTHERAPEUTIC:** Benzodiazepine (Schedule IV).
**CLINICAL:** Antianxiety, sedative-hypnotic, antiemetic, skeletal muscle relaxant, amnesiac, anticonvulsant, antitremor.
Uses

**PO:** Management of anxiety disorders, short-term relief of symptoms of anxiety, anxiety associated with depressive symptoms. Insomnia due to anxiety or transient stress. **IV:** Status epilepticus, preanesthesia for amnesia, sedation. **OFF-LABEL:** Treatment of alcohol withdrawal, psychogenic catatonia, partial complex seizures, agitation (IV administration only), antiemetic for chemotherapy; rapid tranquilization of agitated pt, status epilepticus in children.

Precautions

**Contraindications:** Hypersensitivity to LORazepam, other benzodiazepines. Acute narrow-angle glaucoma, IV administration in pts with sleep apnea, severe respiratory depression (except during mechanical ventilation). **Cautions:** Neonates, renal/hepatic impairment, compromised pulmonary function, concomitant CNS depressant use, depression, history of drug dependence, alcohol abuse, or significant personality disorder, pts at risk for suicide.

Action

Enhances action of inhibitory neurotransmitter gamma-aminobutyric acid (GABA) in CNS, affecting memory, motor, sensory, cognitive function. **Therapeutic Effect:** Produces anxiolytic, anticonvulsant, sedative, muscle relaxant, antiemetic effects.

Lifespan considerations

Pregnancy/Lactation: May cross placenta. May be distributed in breast milk. May increase risk of fetal abnormalities if administered during first trimester of pregnancy. Chronic ingestion during pregnancy may produce fetal toxicity, withdrawal symptoms, CNS depression in neonates. Children: Safety and efficacy not established in pts younger than 12 yrs. Elderly: Use small initial doses with gradual increases to avoid ataxia, excessive sedation, or paradoxical CNS restlessness, excitement. May be more susceptible to cognitive impairment, delirium, falls, fractures.

Interactions

DRUG: Valproic acid may increase concentration/effects. Alcohol, other CNS depressants (e.g., morphine, PHENobarbital, zolpidem) may increase CNS depression. HERBAL: Gotu kola, kava kava, St. John’s wort, valerian may increase CNS depression. FOOD: None known. LAB VALUES: None significant. Therapeutic serum level: 50–240 ng/mL; toxic serum level: unknown.

Availability (Rx)

Injection Solution: 2 mg/mL, 4 mg/mL. Oral Solution (LORazepam Intensol): 2 mg/mL. Tablets: 0.5 mg, 1 mg, 2 mg.

Administration/handling

IV

Reconstitution
• Dilute with equal volume of Sterile Water for Injection, D₅W, or 0.9% NaCl.

Rate of Administration
• Give by IV push into tubing of free-flowing IV infusion (0.9% NaCl, D₅W) at a rate not to exceed 2 mg/min.

Storage
• Refrigerate parenteral form.
• Do not use if discolored or precipitate forms.
• Avoid freezing.
IM
• Give deep IM into large muscle mass.

PO
• Give with food.
• Tablets may be crushed.
• Dilute oral solution in water, juice, soda, or semisolid food.

IV incompatibilities
Aztreonam (Azactam), ondansetron (Zofran).

IV Compatibilities
Bumetanide (Bumex), cefepime (Maxipime), dexmedetomidine (Precedex), diltiazEM (Cardizem), DOBUTamine (Dobutrex), DOPamine (Intropin), heparin, labetalol (Normodyne, Trandate), milrinone (Primacor), norepinephrine (Levophed), piperacillin and tazobactam (Zosyn), potassium, propofol (Diprivan).

Indications/routes/dosage

Anxiety
PO: ADULTS: Initially, 2–3 mg/day in 2–3 divided doses. Usual dose: 2–6 mg/day in divided doses. Range: 1–10 mg/day. ELDERLY: Initially, 1–2 mg/day in divided doses. Titrate cautiously. Maximum: 3 mg/day in divided doses.

Insomnia Due to Anxiety
PO: ADULTS: (less than 65 yrs): 0.5–2 mg at bedtime. (65 yrs and older): 0.5–1 mg at bedtime.

Status Epilepticus
IV: ADULTS, ELDERLY, CHILDREN: 0.1 mg/kg. Maximum: 4 mg over 2–5 min. May repeat in 5–10 min. NEONATES: 0.05–0.1 mg/kg over 2–5 min.
May repeat in 10–15 min.

**Dosage in Renal/Hepatic Impairment**

**PO:** No dose adjustment. **IM/IV:** Mild to moderate impairment: Use caution. Not recommended in severe impairment.

**Side effects**

**Frequent (16%–7%):** Drowsiness, dizziness. **Rare (less than 4%):** Weakness, ataxia, headache, hypotension, nausea, vomiting, confusion, injection site reaction.

**Adverse effects/toxic reactions**

Abrupt or too-rapid withdrawal may result in pronounced restlessness, irritability, insomnia, hand tremor, abdominal cramping, muscle cramps, diaphoresis, vomiting, seizures. Overdose results in drowsiness, confusion, diminished reflexes, coma. **Antidote:** Flumazenil (see Appendix J for dosage).

**Nursing considerations**

**Baseline assessment**

Offer emotional support to anxious pt. Pt must remain recumbent following parenteral administration to reduce hypotensive effect. Assess motor responses (agitation, trembling, tension), autonomic responses (cold or clammy hands, diaphoresis).

**Intervention/evaluation**

Monitor B/P, respiratory rate, heart rate. For those on long-term therapy, hepatic/renal function tests, CBC should be performed periodically. Assess for paradoxical reaction, particularly during early therapy. Evaluate for therapeutic response: calm facial expression, decreased restlessness, insomnia, decrease in seizure-related symptoms. **Therapeutic serum level:** 50–240 ng/mL; **toxic serum level:** N/A.

**Patient/ family teaching**
• Drowsiness usually subsides during continued therapy.
• Avoid tasks that require alertness, motor skills until response to drug is established.
• Smoking reduces drug effectiveness.
• Do not abruptly discontinue medication after long-term therapy.
• Do not use alcohol, CNS depressants.
• Contraception recommended for long-term therapy.
• Immediately report suspected pregnancy.

<table>
<thead>
<tr>
<th>losartan</th>
</tr>
</thead>
<tbody>
<tr>
<td>loe-sar-tan</td>
</tr>
<tr>
<td>Apo-Losartan</td>
</tr>
<tr>
<td>Cozaar</td>
</tr>
</tbody>
</table>

**Fixed-Combination(s)**

**Hyzaar:** losartan/hydroCHLORothiazide (a diuretic): 50 mg/12.5 mg, 100 mg/12.5 mg, 100 mg/25 mg.

**CLASSIFICATION**

**PHARMACOTHERAPEUTIC:** Angiotensin II receptor antagonist.

**CLINICAL:** Antihypertensive.

- **BLACK BOX ALERT** - May cause fetal injury, mortality. Discontinue as soon as possible once pregnancy is detected.

Do not confuse Cozaar with Colace, Coreg, Hyzaar, or Zocor, or losartan with lorcaserin, valsartan.

**Uses**

Treatment of hypertension. Used alone or in combination with other antihypertensives. Treatment of diabetic nephropathy with an elevated creatinine and proteinuria (in pts with type 2 diabetes and history of hypertension), prevention of stroke in pts with hypertension and left ventricular hypertrophy.

**OFF-LABEL:** Slow rate of progression of aortic root dilation in children with Marfan’s syndrome. HF in pts intolerant of ACE inhibitors.
Precautions

**Contraindications:** Hypersensitivity to losartan. Concomitant use of aliskiren in pts with diabetes. **Cautions:** Renal/hepatic impairment, unstented renal arterial stenosis, significant aortic/mitral stenosis. Concurrent use of potassium supplements. Pts with history of angioedema.

Action

Blocks vasoconstrictor, aldosterone-secreting effects of angiotensin II, inhibiting binding of angiotensin II to AT\(_1\) receptors. **Therapeutic Effect:** Causes vasodilation, decreases peripheral resistance, decreases B/P.

Pharmacokinetics

<table>
<thead>
<tr>

</tbody>
</table>
Well absorbed after PO administration. Protein binding: 98%. Metabolized in liver. Excreted in urine (35%), feces (60%). Not removed by hemodialysis. **Half-life:** 2 hrs; metabolite, 6–9 hrs.

Lifespan considerations

**Pregnancy/Lactation:** Has caused fetal/neonatal morbidity, mortality. Potential for adverse effects on breastfed infant. Breastfeeding not recommended. **Children:** Safety and efficacy not established. **Elderly:** May be more sensitive to hypotensive effects.

Interactions

**DRUG:** NSAIDs (e.g., ibuprofen, ketorolac, naproxen) may decrease effects. Potassium-sparing diuretics (e.g., spironolactone, triamterene), potassium supplements may increase serum potassium. **Diuretics** (e.g., furosemide, HCTZ), antihypertensive medications (e.g., amLODIPine, lisinopril, valsartan) may produce additive hypotension. May increase levels/effects of lithium. **HERBAL:** Ephedra, ginseng, licorice, yohimbe may worsen hypertension. **Black cohosh, periwinkle** may increase antihypertensive effect.
Garlic, ginger, ginseng may increase hypoglycemic effect. **FOOD:** None known. **LAB VALUES:** May increase serum bilirubin, ALT, AST, Hgb, Hct. May decrease serum glucose.

**Availability (Rx)**

**Tablets:** 25 mg, 50 mg, 100 mg.

**Administration/handling**

**PO**

• May give without regard to food.

**Indications/routes/dosage**

**Hypertension**

**PO:** **ADULTS, ELDERLY:** Initially, 50 mg once daily. **Maximum:** May be given once or twice daily, with total daily doses ranging from 25–100 mg. **CHILDREN 6–16 YRS:** 0.7 mg/kg once daily. Adjust dose to BP response. **Maximum:** 100 mg/day.

**Diabetic Nephropathy**

**PO:** **ADULTS, ELDERLY:** Initially, 50 mg/day. May increase to 100 mg/day based on B/P response.

**Stroke Prevention (Hypertension with Left Ventricular Hypertrophy)**

**PO:** **ADULTS, ELDERLY:** 50 mg/day. **Maximum:** 100 mg/day based on BP response. Should be used in combination with a thiazide diuretic.

**Renal Impairment**

Not recommended if glomerular filtration rate (GFR) less than 30 mL/min.

**Hepatic Impairment**
PO: ADULTS, ELDERLY: Initially, 25 mg/day. May increase up to 100 mg/day.

Side effects

**Frequent (8%):** Upper respiratory tract infection. **Occasional (4%–2%):** Dizziness, diarrhea, cough. **Rare (1% or less):** Insomnia, dyspepsia, heartburn, back/leg pain, muscle cramps, myalgia, nasal congestion, sinusitis, depression.

Adverse effects/toxic reactions

Overdosage may manifest as hypotension and tachycardia. Bradycardia occurs less often. Institute supportive measures.

Nursing considerations

**Baseline assessment**

Obtain B/P, apical pulse immediately before each dose, in addition to regular monitoring (be alert to fluctuations). Question for possibility of pregnancy. Assess medication history (esp. diuretics).

**Intervention/evaluation**

**Patient/family teaching**

- Female pts of childbearing age should take measures to avoid pregnancy.
- Report pregnancy as soon as possible.
- Avoid tasks that require alertness, motor skills until response to drug is established (possible dizziness effect).
- Report any sign of infection (sore throat, fever), chest pain.
- Do not take OTC cold preparations, nasal decongestants.
- Do not stop taking medication.
- Limit salt intake.
Lovastatin

**PHARMACOTHERAPEUTIC:** HMG-CoA reductase inhibitor.

**CLINICAL:** Antihyperlipidemic.

Do not confuse lovastatin with atorvastatin, Leustatin, Lotensin, nystatin, pitavastatin, or pravastatin, or Mevacor with Benicar or Lipitor.

**Uses**

Adjunct to diet to decrease elevated serum total and LDL cholesterol in primary hypercholesterolemia; primary prevention of coronary artery disease; reduction of risk of MI, unstable angina, and in coronary revascularization procedures. Slows progression of coronary atherosclerosis in pts with coronary heart disease. Adjunct to diet in adolescent pts (10–17 yrs) with heterozygous familial hypercholesterolemia having LDL greater than 189 mg/dL or LDL greater than 160 mg/dL with positive family history of premature CV disease or LDL greater than 160 mg/dL with presence of at least 2 other CVD risk factors.

**Precautions**

**Contraindications:** Hypersensitivity to lovastatin. Active hepatic disease, unexplained persistent elevations of serum transaminases. Pregnancy, breastfeeding. Concomitant use of strong CYP3A4 inhibitors. **Cautions:** History of heavy/chronic alcohol use, renal impairment, hepatic disease; concomitant use of amiodarone, cycloSPORINE, fibrates, gemfibrozil, niacin, verapamil (increased risk of myopathy), elderly.
**Action**
Inhibits HMG-CoA reductase, the enzyme that catalyzes the early step in cholesterol synthesis. **Therapeutic Effect:** Decreases LDL, VLDL, triglycerides; increases HDL.

**Pharmacokinetics**

<table>
<thead>
<tr>
<th>Route (LDL, cholesterol reduction)</th>
<th>Onset</th>
<th>Peak</th>
<th>Duration</th>
</tr>
</thead>

</tbody>
</table>

Incompletely absorbed from GI tract (increased on empty stomach). Protein binding: 95%. Hydrolyzed in liver. Primarily excreted in feces. Not removed by hemodialysis. **Half-life:** 1.1–1.7 hrs.

**Lifespan considerations**

**Pregnancy/Lactation:** Contraindicated in pregnancy (suppression of cholesterol biosynthesis may cause fetal toxicity) and lactation. Unknown if drug is distributed in breast milk. **Children:** Safety and efficacy not established. **Elderly:** No age-related precautions noted.

**Interactions**

**DRUG:** CYP3A4 inhibitors (e.g., ketoconazole, clarithromycin) may increase concentration, risk of myopathy, rhabdomyolysis. **CycloSPORINE, fibrates, gemfibrozil, niacin, amiodarone, verapamil** may increase risk of rhabdomyolysis, acute renal failure. **HERBAL:** St. John’s wort may decrease concentration/effects. **FOOD:** Large quantities of grapefruit juice may increase risk of side effects (e.g., myalgia, weakness). **Red yeast rice** may increase concentration (2.4 mg lovastatin/600 mg rice). **LAB VALUES:** May increase serum creatine kinase (CK), transaminase.

**Availability (Rx)**

**Tablets:** 10 mg, 20 mg, 40 mg.

**Tablets (Extended-Release [Altoprev]):** 20 mg, 40 mg, 60 mg.
Administration/handling

PO
• Immediate-release tablet given with evening meal; extended-release at bedtime.
• Avoid intake of large quantities of grapefruit juice (greater than 1 quart).
• Do not break, crush, dissolve, or divide extended-release tablets.

Indications/routes/dosage

Hypercholesterolemia

PO (Extended-Release): ADULTS, ELDERLY: Initially, 20–60 mg once daily at bedtime. Adjust at 4-wk intervals. Maximum: 60 mg once daily at bedtime.

Heterozygous Familial Hypercholesterolemia

PO (Immediate-Release): CHILDREN 10–17 YRS: (LDL reduction 20% or greater): Initially, 20 mg/day; (LDL reduction less than 20%): Initially, 10 mg/day. Adjust at 4-wk intervals. Range: 10–40 mg daily.

Dosage with Concurrent Medication

Dosage in Renal Impairment

Use caution.

Dosage in Hepatic Impairment

No dose adjustment.

Side effects
Generally well tolerated. Side effects usually mild and transient. **Frequent (9%–5%)**: Headache, flatulence, diarrhea, abdominal pain, abdominal cramping, rash, pruritus. **Occasional (4%–3%)**: Nausea, vomiting, constipation, dyspepsia. **Rare (2%–1%)**: Dizziness, heartburn, myalgia, blurred vision, eye irritation.

**Adverse effects/toxic reactions**

Potential for cataract development. Occasionally produces myopathy manifested as muscle pain, tenderness, weakness with elevated creatine kinase (CK). Severe myopathy may lead to rhabdomyolysis.

**Nursing considerations**

**Baseline assessment**

Obtain dietary history. Question for possibility of pregnancy before initiating therapy. Obtain LFT, serum cholesterol, triglycerides.

**Intervention/evaluation**

**Patient/family teaching**

- Follow special diet (important part of treatment).
- Periodic lab tests are essential part of therapy.
- Maintain appropriate birth control measures.
- Avoid grapefruit juice, alcohol.
- Report severe gastric upset, vision changes, myalgia, weakness, changes in color of urine/stool, yellowing of eyes/skin, unusual bruising.

**lurasidone**

*loo-ras-i-done*

Latuda

CLASSIFICATION
**PHARMACOTHERAPEUTIC:** DOPamine, serotonin receptor antagonist.  
**CLINICAL:** Antipsychotic.

- **BLACK BOX ALERT** - Elderly pts with dementia-related psychosis are at increased risk for mortality due to cardiovascular events, infectious diseases. Increased risk of suicidal thinking/behavior in children, adolescents, young adults.

**Uses**

Treatment of schizophrenia in adults and adolescents (13–17 yrs). Depression associated with bipolar I disorder as monotherapy and as adjunctive therapy with lithium or valproate.

**Precautions**

**Contraindications:** Hypersensitivity to lurasidone. Concurrent use with strong CYP3A4 inhibitors (e.g., ketoconazole) and inducers (e.g., rifAMPin).  
**Cautions:** Cardiovascular disease (HF, history of MI, ischemia, conduction abnormalities), cerebrovascular disease (history of CVA in pts with dementia, seizure disorders), diabetes, Parkinson’s disease, renal/hepatic impairment, pts at risk for aspiration pneumonia, pts at risk for suicide, disorders where CNS depression is a feature, pts at risk for hypotension, elderly, head trauma, alcoholism, medications that lower seizure threshold.

**Action**

Antagonizes central DOPamine type 2 and serotonin type 2 receptors.  
**Therapeutic Effect:** Diminishes symptoms of schizophrenia. Reduces incidence of extrapyramidal side effects.

**Pharmacokinetics**

Absorbed in 1–3 hrs. Steady-state concentration occurs in 7 days. Well absorbed from GI tract (unaffected by food). Protein binding: 99%. Metabolized in liver. Excreted in feces (80%), urine (9%). **Half-life:** 18 hrs.
Lifespan considerations

**Pregnancy/Lactation:** Unknown if distributed in breast milk. Breastfeeding not recommended. **Children:** Safety and efficacy not established. **Elderly:** More susceptible to postural hypotension. Increased risk of cerebrovascular events (including stroke), mortality, in elderly pts with psychosis.

Interactions

**DRUG:** Alcohol, CNS depressants (e.g., LORazepam, morphine, zolpidem) may increase CNS depression. **RifAMPin** decreases concentration/effects. **DiltiaZEM, ketoconazole, ritonavir** may increase concentration/effects. **HERBAL:** Gotu kola, kava kava, St. John’s wort, valerian may increase CNS depression. **FOOD:** Grapefruit products may increase risk of torsades, orthostatic hypotension. **LAB VALUES:** May increase prolactin levels.

Availability (Rx)

**Tablets:** 20 mg, 40 mg, 60 mg, 80 mg, 120 mg.

Administration/handling

**PO**

- Give with food.
- Tablets may be crushed.

Indications/routes/dosage

**Schizophrenia**

**PO:** **ADULTS, ELDERLY:** Initially, 40 mg once daily with food. Increase dose based on response and tolerability. **Maximum:** 160 mg once daily with food. **Adolescents:** Initially, 40 mg once daily with food. **Maximum:** 80 mg once daily with food.

**Depressive Episode Associated with Bipolar Disorder**

**PO:** **ADULTS, ELDERLY:** Initially, 20 mg once daily, alone or in combination
with lithium or divalproex. **Maximum:** 120 mg/day. Titration not required.

**Concomitant Use of Moderate CYP3A4 Inhibitors**

**PO: ADULTS, ELDERLY:** Initially, 20 mg/day. **Maximum:** 80 mg/day.

**Moderate to Severe Renal Impairment**

**CrCl less than 50 mL/min:** Initially, 20 mg/day. **Maximum:** 80 mg/day.

**Hepatic Impairment**

**Mild impairment:** No dose adjustment. **Moderate impairment:** Initially, 20 mg/day. **Maximum:** 80 mg/day. **Severe impairment:** Initially, 20 mg/day. **Maximum:** 40 mg/day.

**Side effects**

**Frequent (15%–7%):** Drowsiness, sedation, insomnia (paradoxical reaction). **Occasional (6%–3%):** Nausea, vomiting, dyspepsia, fatigue, back pain, akathisia, dizziness, agitation, anxiety. **Rare (2%–1%):** Restlessness, salivary hypersecretion, tongue spasm, torticollis, trismus.

**Adverse effects/toxic reactions**

Extrapyramidal disorder (including cogwheel rigidity, drooling, bradykinesia, tardive dyskinesia, tremors) occurs in 5% of pts. Neuroleptic malignant syndrome (fever, muscle rigidity, irregular B/P or pulse, altered mental status, visual changes, dyspnea) occurs rarely.

**Nursing considerations**

**Baseline assessment**

Question history as listed in Precautions. Assess behavior, appearance, emotional status, response to environment, speech pattern, thought content. Renal function, LFT should be obtained before therapy as dose adjustment is required when initiating therapy.
**Intervention/evaluation**

Supervise suicidal risk pt closely during early therapy (as depression lessens, energy level improves, increasing suicide potential). Monitor for potential neuroleptic malignant syndrome. Assess for therapeutic response (greater interest in surroundings, improved self-care, increased ability to concentrate, relaxed facial expression).

**Patient/family teaching**

- Avoid tasks that may require alertness, motor skills until response to drug is established (may cause drowsiness, dizziness).
- Avoid alcohol.
- Report trembling in fingers, altered gait, unusual muscle/skeletal movements, palpitations, severe dizziness, fainting, visual changes, rash, difficulty breathing.
- Report suicidal ideation, unusual changes in behavior.

</tbody>
</table>
Fixed-Combination(s)
With aluminum and simethicone, an antiflatulent (Mylanta).

CLASSIFICATION
CLINICAL: Antacid, anticonvulsant, electrolyte, laxative.
Do not confuse magnesium sulfate with morphine sulfate.

Uses

Precautions

Action
Antacid: Acts in stomach to neutralize gastric acid. Therapeutic Effect: Increases pH. Laxative: Osmotic effect primarily in small intestine, draws water
into intestinal lumen. **Therapeutic Effect:** Promotes peristalsis, bowel evacuation. **Systemic (dietary supplement replacement):** Found primarily in intracellular fluids. **Therapeutic Effect:** Essential for enzyme activity, nerve conduction, muscle contraction. Maintains and restores magnesium levels. **Anticonvulsant:** Blocks neuromuscular transmission, amount of acetylcholine released at motor end plate. **Therapeutic Effect:** Produces seizure control.

**Pharmacokinetics**

**Antacid, laxative:** Minimal absorption through intestine. Absorbed dose primarily excreted in urine. **Systemic:** Widely distributed. Primarily excreted in urine.

**Lifespan considerations**

**Pregnancy/Lactation:** **Antacid:** Unknown if distributed in breast milk. **Parenteral:** Readily crosses placenta. Distributed in breast milk for 24 hrs after magnesium therapy is discontinued. Continuous IV infusion increases risk of magnesium toxicity in neonate. IV administration should not be used 2 hrs preceding delivery. **Children:** No age-related precautions noted. **Elderly:** Increased risk of developing magnesium deficiency (e.g., poor diet, decreased absorption, medications).

**Interactions**

**DRUG:** May decrease absorption of quinolones (e.g., ciprofloxacin, levoFLOXacin), tetracycline, bisphosphonates. May increase effects of antihypertensives (e.g., amLODIPine, lisinopril). **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** **Antacid:** May increase gastrin production, pH. **Laxative:** May decrease serum potassium. **Systemic:** None significant.

**Availability (Rx)**

**MAGNESIUM CHLORIDE**
**Tablets (Mag-Delay, Slow-Mag):** 64 mg.

**MAGNESIUM CITRATE**
**Oral Solution (Citroma):** 290 mg/5 mL. **Tablets:** 100 mg.
MAGNESIUM HYDROXIDE
Suspension, Oral (Milk of Magnesia): 400 mg/5 mL, 1,200 mg/15 mL. Tablets: 400 mg.
MAGNESIUM OXIDE
Capsules (Uro-Mag): 140 mg. Tablets (Mag-Ox 400): 400 mg.
MAGNESIUM SULFATE
Infusion Solution: 10 mg/mL, 20 mg/mL, 40 mg/mL, 80 mg/mL. Injection Solution: 125 mg/mL, 500 mg/mL.

Administration/handling

جاً IV
Reconstitution
• Must dilute to maximum concentration of 20% for IV infusion. May give IV push, IV piggyback, or continuous infusion.
Rate of Administration
• For IV push (diluted): Give no faster than 150 mg/min. For IV infusion, maximum rate of infusion is 2 g/hr.
Storage
• Store at room temperature.

جاً IM
• For adults, elderly, use 250 mg/mL (25%) or 500 mg/mL (50%) magnesium sulfate concentration.
• For infants, children, do not exceed 200 mg/mL (20% diluted solution).

جاً PO (Antacid)
• Shake suspension well before use.
• Chewable tablets should be chewed thoroughly before swallowing, followed by full glass of water.

جاً PO (Laxative)
• Drink full glass of liquid (8 oz) with each dose (prevents dehydration).
• Flavor may be improved by following with fruit juice, citrus carbonated beverage.
• Refrigerate citrate of magnesia (retains potency, palatability).
IV incompatibilities
Amphotericin B complex (Abelcet, AmBisome, Amphotec), cefepime (Maxipime), lansoprazole (Prevacid), pantoprazole (Protonix).

IV Compatibilities
Amikacin (Amikin), ceFAZolin (Ancef), ciprofloxacin (Cipro), dexmedetomidine (Precedex), DOBUTamine (Dobutrex), enalapril (Vasotec), gentamicin, heparin, HYDROmorphe (Dilaudid), insulin, linezolid (Zyvox), metoclopramide (Reglan), milrinone (Primacor), morphine, piperacillin/tazobactam (Zosyn), potassium chloride, propofol (Diprivan), tobramycin (Nebcin), vancomycin (Vancocin).

Indications/routes/dosage

MAGNESIUM SULFATE

Hypomagnesemia
Mild to Moderate
IV: ADULTS, ELDERLY: 1–4 g as 1 g/hr. Maximum: 12 g/12 hrs.

Severe Deficiency
IV: ADULTS, ELDERLY: 4–8 g as 1 g/hr.
IV: CHILDREN: 25–50 mg/kg/dose over 10–20 min. Maximum single dose: 2 g.

Usual Dose for Neonates
IM/IV: 25–50 mg/kg/dose q8–12h for 2–3 doses.

Eclampsia/Preeclampsia
IV: ADULTS: 4–5 g infusion, then 1–2 g/hr continuous infusion. Maximum: 40 g/24 hrs.

MAGNESIUM CHLORIDE
Dietary Supplement
PO: ADULTS, ELDERLY: 2 tablets once daily.

Hypomagnesemia
PO: ADULTS, ELDERLY: 8–20 mEq/day.

MAGNESIUM CITRATE

Laxative
PO: ADULTS, ELDERLY, CHILDREN 12 YRS AND OLDER: 195–300 mL once or in divided doses. 6–12 YRS: 90–210 mL once or in divided doses. 2–5 YRS: 60–90 mL once or in divided doses.

MAGNESIUM HYDROXIDE

Antacid
PO: ADULTS, ELDERLY, CHILDREN 12 YRS AND OLDER: (400 mg/5 mL): 5–15 mL as needed up to 4 times/day.

Laxative
PO: ADULTS, ELDERLY, CHILDREN 12 YRS AND OLDER: (400 mg/5 mL): 30–60 mL at HS or in divided doses. (Tablet): 8 tabs/day in divided doses. CHILDREN 6–11 YRS: (400 mg/5 mL): 15–30 mL at HS. CHILDREN 2–5 YRS: 5–15 mL at HS.

MAGNESIUM OXIDE

Antacid/Dietary Supplement
PO: ADULTS, ELDERLY: 1–2 tablets daily.

Laxative
PO: ADULTS, ELDERLY: 2–4 tablets at bedtime or in divided doses.

Dosage in Renal Impairment
Use caution.

Dosage in Hepatic Impairment
No dose adjustment.

Side effects

Adverse effects/toxic reactions
Magnesium as antacid, laxative has no known adverse reactions. Systemic use may produce prolonged PR interval, widening of QRS interval. Magnesium toxicity may cause loss of deep tendon reflexes, heart block, respiratory paralysis, cardiac arrest. Antidote: 10–20 mL 10% calcium gluconate (5–10 mEq of calcium).

Nursing considerations
Baseline assessment

Intervention/evaluation
reflexes before giving repeated, rapid parenteral doses (used as indication of CNS depression; suppressed reflexes may be sign of impending respiratory arrest). Patellar reflex must be present, respiratory rate should be 16/min or over before each parenteral dose. Initiate seizure precautions.

Patient/family teaching
• **Antacid**: Take at least 2 hrs apart from other medication.
• Do not take longer than 2 wks unless directed by physician.
• For peptic ulcer, take 1 and 3 hrs after meals and at bedtime for 4–6 wks.
• Chew tablets thoroughly, followed by 8 oz of water; shake suspensions well.
• Repeat dosing or large doses may have laxative effect.
• **Laxative**: Drink full glass (8 oz) liquid to aid stool softening.
• Use only for short term. Do not use if abdominal pain, nausea, vomiting is present.
• **Systemic**: Report symptoms of hypermagnesemia (altered mental status, difficulty breathing, dizziness, fatigue, palpitations, weakness).

<th>mannitol</th>
<th>man-it-ol</th>
</tr>
</thead>
<tbody>
<tr>
<td>Aridol</td>
<td></td>
</tr>
<tr>
<td>Osmitrol</td>
<td></td>
</tr>
</tbody>
</table>

**CLASSIFICATION**
**PHARMACOTHERAPEUTIC**: Polyol (sugar alcohol).
**CLINICAL**: Osmotic diuretic.

Do not confuse Osmitrol with esmolol.

**Uses**
Reduces increased ICP due to cerebral edema, IOP due to acute glaucoma. Promotes urinary excretion of toxic substances. **OFF-LABEL**: Improves renal transplant function. Severe, traumatic brain injury.

**Precautions**
**Contraindications**: Hypersensitivity to mannitol. Severe dehydration, active
intracranial bleeding (except during craniotomy), severe pulmonary edema, congestion, severe renal disease (anuria), progressive HF. **Cautions:** Concurrent nephrotoxic agents, conditions increasing sensitivity to bronchoconstriction (e.g., recent abdominal, thoracic surgery), sepsis, preexisting renal disease, hypernatremia.

**Action**

Elevates osmotic pressure of glomerular filtrate, inhibiting tubular reabsorption of water and electrolytes, resulting in increased urine output. Reduces intracranial pressure by decreasing blood viscosity, thereby increasing cerebral blood flow/oxygen transport. **Therapeutic Effect:** Produces diuresis; reduces intraocular pressure (IOP), intracranial pressure (ICP), cerebral edema.

**Pharmacokinetics**

<table>

</tbody>
</table>

**Lifespan considerations**

**Pregnancy/Lactation:** Unknown if drug crosses placenta or is distributed in breast milk. **Children:** Safety and efficacy not established in pts younger than 12 yrs. **Elderly:** Age-related renal impairment may require dosage adjustment.

**Interactions**

**DRUG:** None significant. **HERBAL:** Yohimbe may decrease effects. **FOOD:** None known. **LAB VALUES:** May decrease serum phosphate, potassium. May increase serum sodium, serum osmolality.

**Availability (Rx)**

**Injection Solution (Osmitrol):** 5%, 10%, 15%, 20%, 25%.
Administration/handling

**Alert** Assess IV site for patency before each dose. Pain, thrombosis noted with extravasation. In-line filter (less than 5 microns) used for concentrations over 20%.

**IV**

**Rate of Administration**
- Administer test dose for pts with oliguria.
- Give IV push over 3–5 min; over 30–60 min for cerebral edema, elevated ICP. Maximum concentration: 25%.
- Do not add KCl or NaCl to mannitol 20% or greater. Do not add to whole blood for transfusion.

**Storage**
- Store at room temperature.
- If crystals are noted in solution, warm bottle in hot water, shake vigorously at intervals. Cool to body temperature before administration. Do not use if crystals remain after warming procedure.

**IV incompatibilities**
Cefepime (Maxipime), filgrastim (Neupogen), imipenem-cilastatin (Primaxin).

**IV Compatibilities**
CISplatin (Platinol), furosemide (Lasix), linezolid (Zyvox), ondansetron (Zofran), propofol (Diprivan).

**Indications/routes/dosage**

**Usual Dosage**

**Elevated Intracranial Pressure**

**IV: ADULTS, ELDERLY:** 0.25–1 g/kg/dose. May repeat q6–8h as needed to maintain serum osmolality <300–325 mOsm/kg. **CHILDREN:** 0.25–1 g/kg/dose; repeat to maintain serum osmolality <300–320 mOsm/kg.
IOP Reduction

**IV: ADULTS, ELDERLY:** 1.5–2 g/kg over 30–60 min 1–1.5 hrs prior to surgery. **CHILDREN:** 1–2 g/kg over 30–60 min 1–1.5 hrs prior to surgery.

**Dosage in Renal Impairment**
Contraindicated with severe impairment; caution with underlying renal disease.

**Dosage in Hepatic Impairment**
No dose adjustment.

**Side effects**

**Frequent:** Dry mouth, thirst. **Occasional:** Blurred vision, increased urinary frequency/volume, headache, arm pain, backache, nausea, vomiting, urticaria, dizziness, hypotension, hypertension, tachycardia, fever, angina-like chest pain.

**Adverse effects/toxic reactions**
Fluid, electrolyte imbalance may occur due to rapid administration of large doses or inadequate urine output resulting in overexpansion of extracellular fluid. Circulatory overload may produce pulmonary edema, HF. Excessive diuresis may produce hypokalemia. Fluid loss in excess of electrolyte excretion may produce hypernatremia, hyperkalemia.

**Nursing considerations**

**Baseline assessment**
Obtain baseline B/P, pulse. Assess skin turgor, mucous membranes, mental status, muscle strength. Obtain baseline weight, chemistry studies. Assess I&O.

**Intervention/evaluation**
Monitor urinary output to ascertain therapeutic response. Monitor serum electrolytes, serum osmolarity, ICP, renal function, LFT. Assess vital signs, skin turgor, mucous membranes. Weigh daily. Monitor for signs of hypernatremia (confusion, drowsiness, thirst, dry mouth, cold/clammy skin); signs of
hypokalemia (changes in muscle strength, tremors, muscle cramps, altered mental status, cardiac arrhythmias). Signs of hyperkalemia include colic, diarrhea, muscle twitching followed by weakness, paralysis, arrhythmias.

**Patient/family teaching**

- Expect increased urinary frequency/volume.
- May cause dry mouth.

---

**medroxyPROGESTERone**

me-dro-ee-proe-je-ser-one

Apo-Medroxy

Depo-Provera

Depo-SubQ Provera 104

Novo-Medrone

Provera

**CLASSIFICATION**

**PHARMACOTHERAPEUTIC**: Hormone.

**CLINICAL**: Progestin, antineoplastic, contraceptive hormone.

■ **BLACK BOX ALERT** ■ Prolonged use (over 2 yrs) of contraceptive injection form may result in loss of bone mineral density. Limit long-term use (more than 2 yrs). May increase risk of dementia in postmenopausal women. Increased risk of invasive breast cancer in postmenopausal women in combination with conjugated estrogens.

**Do not confuse medroxyPROGESTERone with HYDROXYprogesterone, methylPREDNISolone, or methylTESTOSTERone, or Provera with Covera, Femara, Parlodel, or Premarin.**

---

**Uses**

**PO**: Reduction of endometrial hyperplasia in nonhysterectomized postmenopausal women (concurrently given with estrogen to women with intact uterus), treatment of secondary amenorrhea, abnormal uterine bleeding due to
hormonal imbalance. **IM:** Adjunctive therapy, palliative treatment of inoperable, recurrent, metastatic endometrial carcinoma; prevention of pregnancy, endometriosis-associated pain. **OFF-LABEL:** Treatment of paraphilia/hypersexuality.

## Precautions

**Contraindications:** Hypersensitivity to medroxyPROGESTERone. Carcinoma of breast or other progesterone-dependent or estrogen-dependent neoplasm, history of or active thrombotic disorders (cerebral apoplexy, thrombophlebitis, thromboembolic disorders), known or suspected pregnancy, missed abortion, severe hepatic impairment, undiagnosed abnormal vaginal bleeding, cerebrovascular disease, use as pregnancy test. **Caution:** Pts with conditions aggravated by fluid retention (asthma, seizures, migraine, cardiac/renal dysfunction), diabetes, history of mental depression, preexisting hypercholesterolemia, hypertriglyceridemia.

## Action

Inhibits secretion of pituitary gonadotropins. **Therapeutic Effect:** Prevents follicular maturation, ovulation. Causes endometrial thinning.

## Pharmacokinetics

Well absorbed after PO administration. Slowly absorbed after IM administration. Protein binding: 90%. Metabolized in liver. Primarily excreted in urine. **Half-life:** PO: 12–17 hrs. **IM:** 40–50 days.

## Lifespan considerations

**Pregnancy/Lactation:** Avoid use during pregnancy, esp. first 4 mos (congenital heart, limb reduction defects may occur). Distributed in breast milk. **Children:** Safety and efficacy not established. **Elderly:** No age-related precautions noted.

## Interactions

**DRUG:** CYP3A inducers (e.g., carBAMazepine, phenytoin, rifAMPin) may decrease effects. **HERBAL:** St. John’s wort may decrease effect of progestin
contraceptive. **FOOD:** None known. **LAB VALUES:** May alter serum thyroid, LFT, PT, HDL, total cholesterol, triglycerides; metapyrone test. May increase LDL.

### Availability (Rx)

**Injection Suspension:** 104 mg/0.65 mL prefilled syringe (Depo-SubQ Provera 104), 150 mg/mL (Depo-Provera), 400 mg/mL (Depo-Provera). **Tablets (Provera):** 2.5 mg, 5 mg, 10 mg.

### Administration/handling

**IM**
- Shake vial immediately before administering (ensures complete suspension).
- Administer deep IM into gluteal or deltoid muscle.

**SQ**
- Shake vigorously prior to administration.
- Inject in upper thigh or abdomen (avoid bony areas and umbilicus).
- Give over 5–7 sec; do not rub injection area.

**PO**
- Give with food.

### Indications/routes/dosage

**Endometrial Hyperplasia**

**PO: ADULTS:** 5–10 mg/day for 12–14 consecutive days each month starting on day 1 or 16 of cycle.

**Secondary Amenorrhea**

**PO: ADULTS:** 5–10 mg/day for 5–10 days, beginning at any time during menstrual cycle.

**Abnormal Uterine Bleeding**
PO: ADULTS: 5–10 mg/day for 5–10 days, beginning on calculated day 16 or day 21 of menstrual cycle.

Endometrial Carcinoma
IM: ADULTS, ELDERLY: Initially, 400–1,000 mg; repeat at 1-wk intervals.

Pregnancy Prevention
IM: (Depo-Provera): ADULTS: 150 mg q3mos (q13 wks).
SQ: (Depo-Subq Provera 104): ADULTS: 104 mg q3mos (q12–14 wks).

Endometriosis-Associated Pain
SQ: (Depo-Subq Provera 104): ADULTS: 104 mg q3mos (q12–14 wks) for up to 2 yrs.

Dosage in Renal Impairment
No dose adjustment.

Dosage in Hepatic Impairment
Contraindicated with severe impairment.

Side effects
Frequent: Transient menstrual abnormalities (spotting, change in menstrual flow/cervical secretions, amenorrhea) at initiation of therapy. Occasional: Edema, weight change, breast tenderness, anxiety, insomnia, fatigue, dizziness. Rare: Alopecia, depression, dermatologic changes, headache, fever, nausea.

Adverse effects/toxic reactions
Thrombophlebitis, pulmonary/cerebral embolism, retinal thrombosis occur rarely.

Nursing considerations
Baseline assessment
Obtain usual menstrual history. Question for hypersensitivity to progestins, possibility of pregnancy before initiating therapy. Obtain baseline weight, serum glucose, B/P.

**Intervention/evaluation**

Check weight daily; report wkly gain of 5 lb or more. Assess B/P periodically. Assess skin for rash, urticaria. Report development of chest pain, sudden shortness of breath, sudden decrease in vision, migraine headache, pain (esp. with swelling, warmth, redness) in calves, numbness of arm/leg (thrombotic disorders) immediately.

**Patient/family teaching**

- Report sudden loss of vision, severe headache, chest pain, coughing up of blood (hemoptysis), numbness in arm/leg, severe pain/swelling in calf, unusually heavy vaginal bleeding, severe abdominal pain/tenderness.
- Depo-Provera Contraceptive injection should be used as long-term birth control method (e.g., longer than 2 yrs) only if other birth control methods are inadequate.

---

**megestrol**

meg-jes-trol

Megace

Megace ES

Megace OS

**CLASSIFICATION**

**PHARMACOTHERAPEUTIC:** Synthetic hormone.

**CLINICAL:** Antineoplastic, progestin.

Do not confuse megestrol with mesalamine.

---

**Uses**

Palliative treatment of advanced endometrial or breast carcinoma; treatment of anorexia, cachexia, unexplained significant weight loss in pts with AIDS.

---

**Precautions**
**Contraindications:** Hypersensitivity to megestrol. **Suspension:** Known or suspected pregnancy. **Cautions:** History of thrombophlebitis, elderly.

**Action**

Antiestrogenic; interferes with normal estrogen cycle by decreasing release of luteinizing hormone (LH) from anterior pituitary gland by inhibiting pituitary function. May increase appetite by antagonizing metabolic effects of catabolic cytokines. **Therapeutic Effect:** Reduces tumor size. Increases appetite.

**Pharmacokinetics**

Well absorbed from GI tract. Metabolized in liver. Excreted in urine. **Half-life:** 13–105 hrs (mean 34 hrs).

**Lifespan considerations**

**Pregnancy/Lactation:** If possible, avoid use during pregnancy, esp. first 4 mos. Breastfeeding not recommended. **Children:** Safety and efficacy not established. **Elderly:** Use caution.

**Interactions**

**DRUG:** None significant. **HERBAL:** Avoid black cohosh, dong quai in estrogen-dependent tumors. Avoid herbs with progestogenic properties (e.g., chasteberry); may increase adverse effects. **FOOD:** None known. **LAB VALUES:** May alter serum thyroid, LFT, PT, HDL, total cholesterol, triglycerides. May increase LDL.

**Availability (Rx)**

**Oral Suspension:** 40 mg/mL (Megace), 625 mg/5 mL (Megace ES). **Tablets (Megace):** 20 mg, 40 mg.

**Administration/handling**

**PO**

• Store tablets, oral suspension at room temperature.
• Shake suspension well before use.
• Oral suspension compatible with water, orange juice, apple juice.
• Administer without regard to food.

**Indications/routes/dosage**

**Palliative Treatment of Advanced Breast Cancer**

**PO: ADULTS, ELDERLY:** 40 mg 4 times/day for at least 2 mos.

**Palliative Treatment of Advanced Endometrial Carcinoma**

**PO: ADULTS, ELDERLY:** 40–320 mg/day in divided doses for at least 2 mos.

**Anorexia, Cachexia, Weight Loss**

**PO: (Megace): ADULTS, ELDERLY:** 160–800 mg/day (10–20 mL/day) or (40 mg/mL suspension).

**Dosage in Renal Impairment**

Use caution.

**Dosage in Hepatic Impairment**

No dose adjustment.

**Side effects**

**Frequent:** Weight gain secondary to increased appetite. **Occasional:** Nausea, breakthrough menstrual bleeding, backache, headache, breast tenderness, carpal tunnel syndrome. **Rare:** Feeling of coldness.

**Adverse effects/toxic reactions**

Thrombophlebitis, pulmonary embolism occur rarely.

**Nursing considerations**

**Baseline assessment**
Question for possibility of pregnancy. Provide support to pt, family, recognizing that this drug is palliative, not curative.

**Intervention/evaluation**

**Patient/family teaching**
- Contraception is imperative.
- Report lower leg (calf) pain, difficulty breathing, vaginal bleeding.
- May cause headache, nausea, vomiting, breast tenderness, backache.

| meloxicam |
| mel-ox-i-kam |
| Apo-Meloxicam |
| Mobic |
| Vivlodex |

**CLASSIFICATION**
**PHARMACOTHERAPEUTIC:** NSAID.  
**CLINICAL:** Anti-inflammatory, analgesic.

- **BLACK BOX ALERT** Increased risk of serious cardiovascular thrombotic events, including myocardial infarction, CVA. Increased risk of severe GI reactions, including ulceration, bleeding, GI perforation.

**Uses**
Relief of signs/symptoms of osteoarthritis, rheumatoid arthritis (RA). Treatment of juvenile idiopathic arthritis (JIA) in pts 2 yrs of age and older (suspension) and weighing 60 kg or more (tablets).

**Precautions**
**Contraindications:** Hypersensitivity to meloxicam. Pts with aspirin triad
(asthma, rhinitis, aspirin intolerance). History of asthma, urticaria with NSAIDs, perioperative pain in setting of CABG surgery. **Cautions:** Renal/hepatic impairment, asthma, coagulation disorders, hypertension, history of GI disease (bleeding or ulcers), concurrent use of anticoagulants, fluid retention, HF, dehydration, smoking, alcohol use, elderly, debilitated.

**Action**

Produces analgesic, antipyretic, anti-inflammatory effects by inhibiting prostaglandin synthesis. **Therapeutic Effect:** Reduces inflammatory response, intensity of pain.

**Pharmacokinetics**

<table>
<thead>
<tr>
<th>Route</th>
<th>Onset</th>
<th>Peak</th>
<th>Duration</th>
</tr>
</thead>
<tbody>
<tr>
<td>PO (Analgesic)</td>
<td>30 min</td>
<td>4–5 hrs</td>
<td>N/A</td>
</tr>
</tbody>
</table>

**Lifespan considerations**

**Pregnancy/Lactation:** Avoid use at 30 wks gestation or more (may cause premature closure of ductus arteriosus). Distributed in breast milk. **Children:** Safety and efficacy not established in children younger than 2 yrs. **Elderly:** Age-related renal impairment may require dosage adjustment. More susceptible to GI toxicity; lower dosage recommended.

**Interactions**

**DRUG:** May decrease antihypertensive effects of ACE inhibitors (e.g., enalapril, lisinopril). May increase risk of nephrotoxicity with cycloSPORINE. **Aspirin** may increase risk of epigastric distress (heartburn, indigestion). **Anticoagulants** (e.g., heparin, warfarin), antiplatelets (e.g., aspirin, clopidogrel), NSAIDs (e.g., ibuprofen, naproxen), SNRIs (e.g., duloxetine, venlafaxine), SSRIs (e.g., escitalopram, paroxetine), thrombolytic therapy (e.g., TPA) may increase risk of bleeding. May increase concentration, risk of
toxicity of lithium. HERBAL: Cat’s claw, dong quai, evening primrose, feverfew, garlic, ginger, ginkgo, green tea, red clover may increase antiplatelet activity, risk of bleeding. FOOD: None known. LAB VALUES: May increase serum creatinine, ALT, AST.

Availability (Rx)

Oral Suspension: (Mobic): 7.5 mg/5 mL. Tablets: (Mobic): 7.5 mg, 15 mg. (Vivlodex): 5 mg, 10 mg.

Administration/handling

PO

• Give with food or milk to minimize GI irritation.
• Shake oral suspension gently before administering.

Indications/routes/dosage

Osteoarthritis, Rheumatoid Arthritis (RA)

PO: (Mobic): ADULTS, ELDERLY: Initially, 7.5 mg/day. Maximum: 15 mg/day (7.5 mg for pts on dialysis).

Osteoarthritis

PO: (Vivlodex): ADULTS, ELDERLY: Initially, 5 mg once daily. May increase to 10 mg once daily.

JIA

PO: (Suspension): CHILDREN, 2 YRS AND OLDER: 0.125 mg/kg once daily. Maximum: 7.5 mg. (Tablets): CHILDREN WEIGHING 60 KG OR MORE: 7.5 mg once daily.

Dosage in Renal Impairment

Not recommended with severe impairment.

Dosage in Hepatic Impairment
No dose adjustment.

**Side effects**

**Frequent (9%–7%):** Dyspepsia, headache, diarrhea, nausea. **Occasional (4%–3%):** Dizziness, insomnia, rash, pruritus, flatulence, constipation, vomiting. **Rare (less than 2%):** Drowsiness, urticaria, photosensitivity, tinnitus.

**Adverse effects/toxic reactions**

In pts treated chronically, peptic ulcer, GI bleeding, gastritis, severe hepatic toxicity (jaundice), nephrotoxicity (hematuria, dysuria, proteinuria), severe hypersensitivity reaction (bronchospasm, angioedema) occur rarely.

**Nursing considerations**

**Baseline assessment**

Assess onset, type, location, duration of pain/inflammation. Inspect appearance of affected joints for immobility, deformities, skin condition. Question history of GI bleeding, gastric or duodenal ulcers, hepatic/renal impairment, asthma.

**Intervention/evaluation**

Monitor CBC, BMP, LFT. Assess skin for petechiae. Assess for therapeutic response: relief of pain, stiffness, swelling; increased joint mobility; reduced joint tenderness; improved grip strength. Monitor for abdominal pain, hematemesis.

**Patient/family teaching**

- Take with food, milk to reduce GI upset.
- Report tinnitus, persistent abdominal pain/cramping, severe nausea, vomiting, difficulty breathing, unusual bruising or bleeding, rash, peripheral edema, chest pain, palpitations.
- Avoid use after 30 wks gestation.
Alkeran
Evomela

CLASSIFICATION
PHARMACOTHERAPEUTIC: Alkylating agent.
CLINICAL: Antineoplastic.

■ BLACK BOX ALERT ■ Myelosuppression is common. Potentially mutagenic, leukemogenic. Hypersensitivity noted with IV administration. Must be administered by certified chemotherapy personnel.

Do not confuse Alkeran with Leukeran or Myleran, or melphalan with Mephyton or Myleran.

Uses

Precautions
Contraindications: Hypersensitivity to melphalan. Resistance to prior melphalan therapy. Cautions: Preexisting bone marrow suppression, renal impairment, pregnancy, prior chemotherapy or irradiation.

Action
Inhibits protein synthesis primarily by cross-linking strands of DNA, RNA. Cell cycle–phase nonspecific. Therapeutic Effect: Disrupts nucleic acid function, producing tumor cell death.

Pharmacokinetics
Oral administration is highly variable. Incomplete intestinal absorption, variable first-pass metabolism, rapid hydrolysis may result. Protein binding: 60%–90%. Extensively metabolized in blood. Eliminated from plasma primarily by
chemical hydrolysis. Partially excreted in feces; minimal elimination in urine. **Half-life:** **PO:** 1–1.25 hrs. **IV:** 1.5 hrs.

**Lifespan considerations**

**Pregnancy/Lactation:** May cause fetal harm. Unknown if distributed in breast milk. **Children:** Safety and efficacy not established. **Elderly:** Age-related renal impairment may require dosage adjustment.

**Interactions**

**DRUG:** Bone marrow depressants may increase myelosuppression. Live virus vaccines may potentiate virus replication, increase vaccine side effects, decrease pt’s antibody response to vaccine. **HERBAL:** Echinacea may decrease effects. **FOOD:** None known. **LAB VALUES:** May increase serum uric acid.

**Availability (Rx)**

**Injection, Powder for Reconstitution:** 50 mg. **Tablets (Alkeran):** 2 mg.

**Administration/handling**

**IV**

**Reconstitution**
• Reconstitute 50-mg vial with diluent supplied by manufacturer to yield 5 mg/mL solution.
• Further dilute with 0.9% NaCl to final concentration not exceeding 0.45 mg/mL.

**Rate of Administration**
• Infuse over 15–30 min at rate not to exceed 10 mg/min (total infusion should be administered within 1 hr).

**Storage**
• Store at room temperature; protect from light.
• Once reconstituted, complete administration within 60 min.

**PO**
• Store tablets in refrigerator; protect from light.
• Give on empty stomach (1 hr before or 2 hrs after meals).

**IV incompatibilities**
Amphotericin B complex (Abelcet, AmBisome, Amphotec).

**IV Compatibilities**
Acyclovir, dexamethasone (Decadron), famotidine (Pepcid), furosemide (Lasix), lorazepam (Ativan), morphine.

**Indications/routes/dosage**

*Note:* WBC less than 3,000 cells/mm$^3$, platelets less than 100,000 cells/mm$^3$:
Withhold treatment until recovery.

**Ovarian Carcinoma**
**PO:** **ADULTS, ELDERLY:** 0.2 mg/kg/day for 5 successive days. Repeat at 4- to 5-wk intervals.

**Multiple Myeloma**
**PO:** **ADULTS:** Initially, 6 mg once daily for 2–3 wks, followed by up to 4 wks rest, then maintenance dose of 2 mg daily; or 0.15 mg/kg/day for 7 days with 2–6 wks rest, then maintenance dose of 0.05 mg/kg/day; or 0.25 mg/kg/day for 4 days, repeat at 4- to 6-wk intervals.
**IV:** **ADULTS:** 16 mg/m$^2$/dose every 2 wks for 4 doses, then repeat monthly after hematologic recovery.

**Dosage in Renal Impairment**
**IV:** **BUN LEVEL GREATER THAN 30 MG/DL:** Decrease dosage by 50%.

**Dosage in Hepatic Impairment**
No dose adjustment.

**Side effects**
Frequent: Nausea, vomiting (may be severe with large dose). Occasional: Diarrhea, stomatitis, rash, pruritus, alopecia.

Adverse effects/toxic reactions
Myelosuppression manifested as hematologic toxicity (principally leukopenia, thrombocytopenia, and, to lesser extent, anemia, pancytopenia, agranulocytosis). Leukopenia may occur as early as 5 days after drug initiation. WBC, platelet counts return to normal during 5th wk after therapy, but leukopenia, thrombocytopenia may last more than 6 wks after discontinuing drug. Hyperuricemia noted by hematuria, crystalluria, flank pain.

Nursing considerations

Baseline assessment
Obtain CBC, then wkly thereafter. Dosage may be decreased or discontinued if WBC falls below 3,000 cells/mm³ or platelet count falls below 100,000 cells/mm³. Antiemetics may be effective in preventing/treating nausea, vomiting.

Intervention/evaluation
Monitor CBC with differential, serum electrolytes. Monitor for stomatitis. Monitor for hematologic toxicity (fever, sore throat, signs of local infection, unusual bruising/bleeding from any site), symptoms of anemia (excessive fatigue, weakness), signs of hyperuricemia (hematuria, flank pain). Avoid IM injections, rectal temperatures, other traumas that may induce bleeding.

Patient/family teaching
• Increase fluid intake (may protect against hyperuricemia).
• Maintain strict oral hygiene.
• Hair loss is reversible, but new hair growth may have different color, texture.
• Avoid crowds, those with infections.
• Report fever, shortness of breath, cough, sore throat, bleeding, unusual bruising.
• May suppress ovarian function, leading to amenorrhea.
Apo-Memantine
Ebixa
Namenda
Namenda XR

Fixed-Combination(s)
Namzaric: memantine/donepezil (a cholinesterase inhibitor): 7 mg/10 mg; 14 mg/10 mg; 21 mg/10 mg; 28 mg/10 mg.

CLASSIFICATION
PHARMACOTHERAPEUTIC: NMDA receptor antagonist.
CLINICAL: Anti-Alzheimer’s agent.

Uses
Treatment of moderate to severe dementia of Alzheimer’s type. OFF-LABEL: Treatment of mild to moderate vascular dementia.

Precautions
Contraindications: Hypersensitivity to memantine. Cautions: Moderate to severe renal impairment, severe hepatic impairment, cardiovascular disease, seizure disorder, GU conditions that raise urine pH level.

Action
Decreases effects of glutamate, the principal excitatory neurotransmitter in the brain. Persistent CNS excitation by glutamate is thought to cause symptoms of Alzheimer’s disease. Therapeutic Effect: May inhibit clinical deterioration in moderate to severe Alzheimer’s disease.

Pharmacokinetics
Rapidly, completely absorbed after PO administration. Protein binding: 45%. Undergoes little metabolism; most of dose is excreted unchanged in urine. Half-
life: 60–80 hrs.

ęd Lifespan considerations

Pregnancy/Lactation: Unknown if drug crosses placenta or is distributed in breast milk. Children: Not prescribed for this pt population. Elderly: No age-related precautions noted, but use is not recommended in pts with severe renal impairment (CrCl less than 9 mL/min).

Interactions

DRUG: Urine alkalinizers (e.g., carbonic anhydrase inhibitors, sodium bicarbonate) may decrease renal elimination. HERBAL: None significant. FOOD: None known. LAB VALUES: None significant.

Availability (Rx)

Oral Solution: 2 mg/mL. Tablets: 5 mg, 10 mg. Capsules (Extended-Release [Namenda XR]): 7 mg, 14 mg, 21 mg, 28 mg.

Administration/handling

PO

• Give without regard to food.
• Administer oral solution using syringe provided. Do not dilute or mix with other fluids.
• Give extended-release capsules whole. Do not crush. May open capsule and sprinkle on applesauce; give immediately.

Indications/routes/dosage

Alzheimer’s Disease

PO: ADULTS, ELDERLY (Immediate-Release): Initially, 5 mg once daily. May increase dosage at intervals of at least 1 wk in 5-mg increments to 10 mg/day (5 mg twice daily), then 15 mg/day (5 mg and 10 mg as separate doses),
and finally 20 mg/day (10 mg twice daily). Target dose: 20 mg/day. *(Extended-Release)*: Initially, 7 mg once daily. May increase at intervals of at least 7 days in increments of 7 mg. **Maximum:** 28 mg once daily. Switching from immediate-release to extended-release: Begin the day following last dose of immediate release.

10 mg twice daily: 28 mg once daily.
5 mg twice daily: 14 mg once daily.

**Dosage in Renal Impairment**

<table>

**Dosage in Hepatic Impairment**

**Mild to moderate impairment:** No dose adjustment. **Severe impairment:** Use caution.

**Side effects**

**Occasional** (7%–4%): Dizziness, headache, confusion, constipation, hypertension, cough. **Rare** (3%–2%): Back pain, nausea, fatigue, anxiety, peripheral edema, arthralgia, insomnia.

**Adverse effects/toxic reactions**

None known.

**Nursing considerations**

**Baseline assessment**

Intervention/evaluation
Monitor cognitive, behavioral, functional status of pt. Monitor urine pH (alterations of urine pH toward the alkaline condition may lead to accumulation of the drug with possible increase in side effects). Monitor BUN, CrCl, serum creatinine lab values.

Patient/family teaching
- Do not reduce or stop medication; do not increase dosage without physician direction.
- Ensure adequate fluid intake.
- If therapy is interrupted for several days, restart at lowest dose, titrate to current dose at minimum of 1-wk intervals.
- Local chapter of Alzheimer’s Disease Association can provide a guide to services.

**meropenem**
mer-oh-pen-em
**Merrem**

CLASSIFICATION
PHARMACOTHERAPEUTIC: Carbapenem.
CLINICAL: Antibiotic.

Do not confuse meropenem with doripenem, ertapenem, or imipenem.

Uses

Precautions
Contraindications: Hypersensitivity to meropenem, pts who experienced
anaphylactic reactions to other beta-lactams. **Cautions:** Renal impairment, CNS disorders (particularly with history of seizures, concurrent use with valproic acid).

**Action**

Binds to penicillin-binding proteins. Inhibits bacterial cell wall synthesis. **Therapeutic Effect:** Bactericidal.

**Pharmacokinetics**

After IV administration, widely distributed into tissues and body fluids, including CSF. Protein binding: 2%. Primarily excreted unchanged in urine. Removed by hemodialysis. **Half-life:** 1 hr.

**Lifespan considerations**

**Pregnancy/Lactation:** Unknown if distributed in breast milk. **Children:** Safety and efficacy not established in pts younger than 3 mos. **Elderly:** Age-related renal impairment may require dosage adjustment.

**Interactions**

**DRUG:** May decrease effects of **valproic acid.** **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** May increase serum BUN, alkaline phosphatase, LDH, ALT, AST, bilirubin. May decrease Hgb, Hct, WBC.

**Availability (Rx)**

**Injection, Powder for Reconstitution:** 500 mg, 1 g.

**Administration/handling**

**IV**

**Reconstitution**

- Reconstitute each 500 mg with 10 mL Sterile Water for Injection, 0.9% NaCl, or D5W to provide concentration of 50 mg/mL.
- Shake to dissolve until clear.
• May further dilute with 0.9% NaCl or D₅W to a concentration of 1–20 mg/mL.

**Rate of Administration**
• May give by IV push or IV intermittent infusion (piggyback).
• If administering as IV intermittent infusion (piggyback), give over 15–30 min (may also give over 3 hrs); if administered by IV push, give over 3–5 min (at a concentration not greater than 50 mg/mL).

**Storage**
• Store vials at room temperature.
• After reconstitution of vials with 0.9% NaCl, stable for 2 hrs at room temperature or 18 hrs if refrigerated (with D₅W, stable for 1 hr at room temperature, 8 hrs if refrigerated). IV infusion with 0.9% NaCl stable for 4 hrs at room temperature or 24 hrs if refrigerated (with D₅W, 1 hr at room temperature or 4 hrs if refrigerated).

**IV incompatibilities**
Acyclovir (Zovirax), amphotericin B (Fungizone), diazepam (Valium), doxycycline (Vibramycin), metroNIDAZOLE (Flagyl), ondansetron (Zofran).

**IV Compatibilities**
Dexamethasone (Decadron), DOBUTamine (Dobutrex), DOPamine (Intropin), furosemide (Lasix), heparin, magnesium, morphine.

**Indications/routes/dosage**

**Usual Dosage**

**IV: ADULTS, ELDERLY:** 1.5–6 g/day in divided doses q8h. **(Extended-Infusion):** 0.5–2 g over 3 hrs q8h. **CHILDREN, ADOLESCENTS WEIGHING MORE THAN 50 KG:** 1.5–6 g/day in divided doses q8h. **CHILDREN 3 MOS AND OLDER WEIGHING 50 KG OR LESS:** 30–120 mg/kg/day in divided doses q8h. **Maximum:** 6 g/day. **NEONATES:** 20 mg/kg/dose q8–12h.

**Meningitis**

**IV: ADULTS, ELDERLY, CHILDREN WEIGHING 50 KG OR MORE:** 2 g
q8h. **CHILDREN 3 MOS AND OLDER WEIGHING LESS THAN 50 KG:** 40 mg/kg q8h. **Maximum:** 2 g/dose.

### Dosage in Hepatic Impairment
No dose adjustment.

### Side effects

**Frequent (5%–3%):** Diarrhea, nausea, vomiting, headache, inflammation at injection site. **Occasional (2%):** Oral candidiasis, rash, pruritus. **Rare (less than 2%):** Constipation, glossitis.

### Adverse effects/toxic reactions
Antibiotic-associated colitis, other superinfections (abdominal cramps, severe watery diarrhea, fever) may result from altered bacterial balance in GI tract. Anaphylactic reactions have been reported. Seizures may occur in pts with CNS disorders (e.g., brain lesions, history of seizures), bacterial meningitis, renal impairment.

### Nursing considerations
Baseline assessment
Question history of hypersensitivity, allergic reaction to penicillins, cephalosporins. Inquire about history of seizures.

Intervention/evaluation
Monitor daily pattern of bowel activity, stool consistency. Monitor for nausea, vomiting. Evaluate for inflammation at IV injection site. Assess skin for rash. Evaluate hydration status. Monitor I&O, renal function, LFT. Check mental status; be alert to tremors, possible seizures. Assess temperature, B/P twice daily, more often if necessary. Monitor serum electrolytes, esp. potassium.

Patient/family teaching
• Report persistent diarrhea, abdominal cramps, fever.

mesalamine
me-sal-a-meen
Apriso
Asacol HD
Canasa
Delzicol
Lialda
Mesasal
Pentasa
Rowasa
Salofalk
sfRowasa

CLASSIFICATION
PHARMACOTHERAPEUTIC: Salicylic acid derivative.
CLINICAL: Anti-inflammatory agent.
Do not confuse Asacol with Os-Cal, Lialda with Aldara, or mesalamine with megestrol, memantine, or methenamine.
**Uses**

**PO:** Treatment, maintenance of remission of mild to moderate active ulcerative colitis. **Rectal:** Treatment of active mild to moderate distal ulcerative colitis, proctosigmoiditis or proctitis. **OFF-LABEL:** Crohn’s disease.

**Precautions**

**Contraindications:** Hypersensitivity to mesalamine, salicylates. **Cautions:** Sulfasalazine, active peptic ulcer, pyloric stenosis, pericarditis, myocarditis, renal/hepatic impairment, elderly.

**Action**

Mechanism unknown. May modulate local mediators of inflammation, may inhibit tumor necrosis factor. **Therapeutic Effect:** Diminishes inflammation in colon.

**Pharmacokinetics**

Poorly absorbed from colon. Moderately absorbed from GI tract. Metabolized in liver. Unabsorbed portion excreted in feces; absorbed portion excreted in urine. Unknown if removed by hemodialysis. **Half-life:** 0.5–1.5 hrs; metabolite, 5–10 hrs.

**Lifespan considerations**

**Pregnancy/Lactation:** Unknown if drug crosses placenta or is distributed in breast milk. **Children:** Safety and efficacy not established. **Elderly:** Age-related renal impairment may require dosage adjustment.

**Interactions**

**DRUG:** None known. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** May increase serum alkaline phosphatase, ALT, AST, bilirubin.

**Availability (Rx)**

**Rectal Suspension (Rowasa, sfRowasa):** 4 g/60 mL. **Suppositories (Canasa):**
1 g.

Capsules (Controlled-Release [Pentasa]): 250 mg, 500 mg.
Capsules (Delayed-Release [Delzicol]): 400 mg.
Capsules(Extended-Release [Apriso]): 375 mg.
Tablets (Delayed-Release): (Asacol HD): 800 mg. (Lialda): 1.2 g.

Administration/handling

Store rectal suspension, suppository, oral forms at room temperature.

PO

• Have pt swallow whole; do not break outer coating of tablet.
• Give without regard to food.
• Apriso: Do not administer with antacids.
• Lialda: Administer once daily with meal.

Rectal

• Shake bottle well.
• Instruct pt to lie on left side with lower leg extended, upper leg flexed forward.
• Knee-chest position may also be used.
• Insert applicator tip into rectum, pointing toward umbilicus.
• Squeeze bottle steadily until contents are emptied.
• Store suppositories at room temperature. Do not refrigerate.

Indications/routes/dosage

Treatment of Ulcerative Colitis

PO (Capsule [Pentasa]): ADULTS, ELDERLY: 1 g 4 times daily.
PO (Capsule [Delzicol]): ADULTS, ELDERLY: 800 mg 3 times daily.
CHILDREN 5 YRS AND OLDER, WEIGHING 54–90 KG: 1,200 mg in morning and evening. Maximum: 2,400 mg/day. 33–53 KG: 1,200 mg in morning and 800 mg in evening. Maximum: 2,000 mg/day. 17–32 KG: 800 mg in morning and 400 mg in evening. Maximum: 1,200 mg/day.
PO (Tablet [Asacol HD]): ADULTS, ELDERLY: 1.6 g 3 times daily.
PO (Tablet [Lialda]): ADULTS, ELDERLY: 2.4–4.8 g once daily.
Maintenance of Remission in Ulcerative Colitis

PO (Capsule [Pentasa]): ADULTS, ELDERLY: 1 g 4 times daily.
PO (Capsule [Delzicol]): ADULTS, ELDERLY: 1.6 g/day in 2–4 divided doses.
PO (Capsule, Extended-Release [Apriso]): ADULTS, ELDERLY: 1.5 g once daily in the morning.
PO (Tablet [Lialda]): 2.4 g once daily with food.

Distal Ulcerative Colitis, Proctosigmoiditis, Proctitis

Rectal (Retention Enema): ADULTS, ELDERLY: 60 mL (4 g) at bedtime; retained overnight for approximately 8 hrs for 3–6 wks.

Suppository should be retained for 1–3 hrs for maximum benefit.

Dosage of Renal/Hepatic Impairment

Use caution.

Side effects

Mesalamine is generally well tolerated, with only mild, transient effects. Frequent (greater than 6%): PO: Abdominal cramps/pain, diarrhea, dizziness, headache, nausea, vomiting, rhinitis, unusual fatigue. Rectal: Abdominal/stomach cramps, flatulence, headache, nausea. Occasional (6%–2%): PO: Hair loss, decreased appetite, back/joint pain, flatulence, acne. Rectal: Alopecia. Rare (less than 2%): Rectal: Anal irritation.

Adverse effects/toxic reactions

Sulfite sensitivity may occur in susceptible pts, manifested as cramping, headache, diarrhea, fever, rash, urticaria, pruritus, wheezing. Discontinue drug immediately. Hepatitis, pancreatitis, pericarditis occur rarely with oral forms.

Nursing considerations

Baseline assessment
Obtain BUN, serum creatinine, LFT. Assess for abdominal pain, discomfort.

**Intervention/evaluation**

**Patient/family teaching**
- Report rash, fever, abdominal pain, significant diarrhea.
- Avoid tasks that require alertness, motor skills until response to drug is established.
- May discolor urine yellow-brown.
- Suppositories stain fabrics.

<table>
<thead>
<tr>
<th>mesna</th>
<th>mess-na</th>
</tr>
</thead>
<tbody>
<tr>
<td>Mesnex</td>
<td>Uromitexanuran</td>
</tr>
</tbody>
</table>

**CLASSIFICATION**
- **PHARMACOTHERAPEUTIC**: Cytoprotective agent.
- **CLINICAL**: Antineoplastic adjunct, antidote.

**Uses**
Detoxifying agent used as protectant against hemorrhagic cystitis induced by ifosfamide. **OFF-LABEL**: Reduce incidence of cyclophosphamide-induced hemorrhagic cystitis with high-dose cyclophosphamide.

**Precautions**
- **Contraindications**: Hypersensitivity to mesna. **Cautions**: Preexisting autoimmune disorders.
**Action**

Binds with, detoxifies urotoxic metabolites of ifosfamide/cyclophosphamide.  
**Therapeutic Effect:** Inhibits ifosfamide/cyclophosphamide-induced hemorrhagic cystitis.

**Pharmacokinetics**

Rapidly metabolized after IV administration to mesna disulfide, which is reduced to mesna in kidneys. Protein binding: 69%–75%. Excreted in urine.  
**Half-life:** 24 min; metabolite: 72 min.

**Lifespan considerations**

**Pregnancy/Lactation:** Unknown if drug crosses placenta or is distributed in breast milk. **Children:** Safety and efficacy not established. **Elderly:** Information not available.

**Interactions**

**DRUG:** None significant. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** May produce false-positive test result for urinary ketones.

**Availability (Rx)**

**Injection Solution:** 100 mg/mL.  
**Tablets:** 400 mg.

**Administration/handling**

**IV**

**Reconstitution**

• Dilute with D₅W or 0.9% NaCl to concentration of 20 mg/mL.  
• May add to solutions containing ifosfamide or cyclophosphamide.

**Rate of Administration**

• Administer by IV infusion over 15–30 min or by continuous infusion.

**Storage**

• Store parenteral form at room temperature.  
• After dilution, in 0.9% NaCl or D₅W, stable for 48 hrs at room temperature
(solutions of mesna and cyclophosphamide in D5W stable for 48 hrs if refrigerated or 6 hrs at room temperature). Discard unused medication.

**PO**
- Administer orally in either tablet formulation or parenteral solution.
- Dilute mesna solution before PO administration to decrease sulfur odor. Can be diluted (1:1 to 1:10) in carbonated cola drinks, fruit juices, milk.

**IV incompatibilities**
Amphotericin B complex (Abelcet, AmBisome, Amphotec), CISplatin (Platinol).

**IV Compatibilities**
Allopurinol (Aloprim), DOCEtaxel (Taxotere), DOXOrubicin (Adriamycin), etoposide (VePesid), gemcitabine (Gemzar), granisetron (Kytril), methotrexate, ondansetron (Zofran), PACLitaxel (Taxol), vinorelbine (Navelbine).

**Indications/routes/dosage**

**Prevention of Hemorrhagic Cystitis in Pts Receiving Ifosfamide**

**IV: ADULTS, ELDERLY:** 20% of ifosfamide dose at time of ifosfamide administration and 4 and 8 hrs after each dose of ifosfamide. **Total dose:** 60% of ifosfamide dosage.

**IV/PO:** 100% of ifosfamide dose, given as 20% at start time followed by 40% given orally 2 and 6 hrs after start of ifosfamide.

**Dosage in Renal/Hepatic Impairment**
No dose adjustment.

**Side effects**
- **Frequent (greater than 17%):** Altered taste, soft stools. **Large doses:** Diarrhea, myalgia, headache, fatigue, nausea, hypotension, allergic reaction.
Adverse effects/toxic reactions
Hematuria occurs rarely.

Nursing considerations

Baseline assessment
Each dose must be administered with ifosfamide therapy.

Intervention/evaluation
Assess morning urine specimen for hematuria. If such occurs, dosage reduction or discontinuation may be necessary. Monitor daily pattern of bowel activity, stool consistency; record time of evacuation. Monitor B/P for hypotension.

Patient/family teaching
• Report headache, myalgia, nausea.

Fixed-Combination(s)
**Actoplus Met:** metFORMIN/pioglitazone (an antidiabetic): 500 mg/15 mg, 850 mg/15 mg. **Avandamet:** metFORMIN/rosiglitazone (an antidiabetic): 500 mg/1 mg, 500 mg/2 mg, 500 mg/4 mg, 1,000 mg/2 mg, 1,000 mg/4 mg. **Glucovance:** metFORMIN/glyBURIDE (an antidiabetic): 250 mg/1.25 mg, 500 mg/2.5 mg, 500 mg/5 mg. **Invokamet:** metFORMIN/canagliflozin (an
antidiabetic): 500 mg/50 mg, 500 mg/150 mg, 1,000 mg/50 mg, 1,000 mg/150 mg. **Janumet, Janumet XR:** metFORMIN/SITagliptin (an antidiabetic): 500 mg/50 mg, 1,000 mg/50 mg. **Jentadueto, Jentadueto XR:** metFORMIN/linagliptin (an antidiabetic): 500 mg/2.5 mg; 1,000 mg/2.5 mg; 1,000 mg extended-release/2.5 mg; 1,000 mg extended-release/5 mg. **Kazano:** metFORMIN/alogliptin (an antidiabetic): 500 mg/12.5 mg; 1,000 mg/12.5 mg. **Kombiglyze XR:** metFORMIN/SAXagliptin (an antidiabetic): 500 mg/5 mg, 1,000 mg/5 mg, 1,000 mg/2.5 mg. **Metaglip:** metFORMIN/glipiZIDE (an antidiabetic): 250 mg/2.5 mg, 500 mg/2.5 mg, 500 mg/5 mg. **PrandiMet:** metFORMIN/repaglinide (an antidiabetic): 500 mg/1 mg, 500 mg/2 mg. **Synjardy:** metFORMIN/empagliflozin (an antidiabetic): 500 mg/5 mg, 1,000 mg/5 mg, 500 mg/12.5 mg, 1,000 mg/12.5 mg.

**CLASSIFICATION**

**PHARMACOTHERAPEUTIC:** Biguanide antihyperglycemic. **CLINICAL:** Antidiabetic agent.

■ **BLACK BOX ALERT** ■ Lactic acidosis occurs very rarely, but mortality rate is 50%. Risk increases with degree of renal impairment, pt’s age, those with diabetes, unstable or acute HF.

Do not confuse Glucophage with Glucotrol, or metFORMIN with metroNIDAZOLE.

**Uses**

Management of type 2 diabetes mellitus as monotherapy or concomitantly with oral sulfonylurea or insulin. **OFF-LABEL:** Polycystic ovarian syndrome, gestational diabetes mellitus. Prevention of type 2 diabetes.

**Precautions**

■ **ALERT** ■ Lactic acidosis is a rare but potentially severe consequence of metformin therapy. Withhold in pts with conditions that may predispose to lactic acidosis (e.g., hypoxemia, dehydration, hypoperfusion, sepsis).

**Contraindications:** Hypersensitivity to metformin. Renal disease/dysfunction; abnormal CrCl from any cause including MI, septicemia, or shock; acute or chronic metabolic acidosis (with or without coma). **Cautions:** HF, hepatic
impairment, excessive acute/chronic alcohol intake, elderly. Recommend temporary discontinuation at time of or before iodinated contrast imaging procedures in pts with CrCl of 30–60 mL/min, or with history of hepatic disease, alcoholism, HF.

**Action**

Decreases hepatic production of glucose. Decreases intestinal absorption of glucose, improves insulin sensitivity. **Therapeutic Effect:** Improves glycemic control, stabilizes/decreases body weight, improves lipid profile.

**Pharmacokinetics**

확장

**Lifespan considerations**

**Pregnancy/Lactation:** Insulin is drug of choice during pregnancy. Distributed in breast milk in animals. **Children:** Safety and efficacy not established in children younger than 10 yrs. **Elderly:** Age-related renal impairment or peripheral vascular disease may require dosage adjustment or discontinuation.

**Interactions**

**DRUG:** Furosemide may increase concentration. **Cationic medications (e.g., digoxin, morphine, quiNINE, raNITIdine, vancomycin)** may increase concentration/effects. **IV contrast dye** may increase risk of metformin-induced lactic acidosis, acute renal failure (discontinue metFORMIN 24–48 hrs prior to and up to 72 hrs after contrast exposure). **HERBAL:** Garlic may cause hypoglycemia. **FOOD:** None known. **LAB VALUES:** May alter cholesterol, LDL, triglycerides, HDL.

**Availability (Rx)**

**Oral Solution (Riomet):** 100 mg/mL. **Tablets (Glucophage):** 500 mg, 850 mg,
1,000 mg.

Tablets (Extended-Release): 500 mg (Fortamet, Glucophage XR, Glumetza), 750 mg (Glucophage XR), 1,000 mg (Fortamet, Glumetza).

Administration/handling

PO

• Give extended-release tablets whole. Do not break, crush, dissolve, or divide extended-release tablets.
• Give with meals (to decrease GI upset). Give Fortamet with glass of water.

Indications/routes/dosage

Allow 1–2 wks between dose titrations.

Diabetes Mellitus

PO (Immediate-Release Tablets, Solution): ADULTS, ELDERLY: Initially, 500 mg twice daily or 850 mg once daily. Titrate in increments of 500 mg wkly or 850 mg every other wk. May also titrate from 500 mg twice daily to 850 mg twice daily after 2 wks. Maintenance: 1,000–2,550 mg/day in 2–3 divided doses. Maximum: 2,550 mg/day. CHILDREN 10–16 YRS: Initially, 500 mg twice daily. Maintenance: Titrate in 500-mg increments wkly. Maximum: 2,000 mg/day.

PO (Extended-Release Tablets [Glucophage XR]): ADULTS, ELDERLY: Initially, 500 mg once daily. May increase by 500 mg at 1-wk intervals. Maintenance: 1,000–2,000 mg daily. Maximum: 2,000 mg/day.

PO (Extended-Release Tablets [Glumetza]): ADULTS, ELDERLY: Initially, 1,000 mg once daily. May increase by 500 mg at 1-wk intervals. Maximum: 2,000 mg/day. [Fortamet]: Initially, 500–1,000 mg once daily. May increase by 500 mg at 1-wk intervals. Maximum: 2,500 mg/day.

Dosage in Renal Impairment

Contraindicated in pts with serum creatinine greater than 1.5 mg/dL (males) or greater than 1.4 mg/dL (females). Alternative Recommendation: CrCl 45–60 mL/min: Continue use; monitor renal function q3–6 mos. CrCl 30–44 mL/min:
Use caution. Consider dose reduction; monitor renal function q3mos. **CrCl less than 30 mL/min:** Discontinue use.

**Dosage in Hepatic Impairment**
Avoid use (risk factor for lactic acidosis).

**Side effects**

**Occasional (greater than 3%):** GI disturbances (diarrhea, nausea, vomiting, abdominal bloating, flatulence, anorexia) that are transient and resolve spontaneously during therapy. **Rare (3%–1%):** Unpleasant/metallic taste that resolves spontaneously during therapy.

**Adverse effects/toxic reactions**

Lactic acidosis occurs rarely (0.03 cases/1,000 pts) but is a serious and often fatal (50%) complication. Lactic acidosis is characterized by increase in blood lactate levels (greater than 5 mmol/L), decrease in blood pH, electrolyte disturbances. Symptoms include unexplained hyperventilation, myalgia, malaise, drowsiness. May advance to cardiovascular collapse (shock), acute HF, acute MI, prerenal azotemia.

**Nursing considerations**

**Baseline assessment**
Verify pt has not received IV contrast dye within last 48 hrs. Obtain CBC, renal function test, fasting serum glucose, Hgb A1c.

**Intervention/evaluation**
Monitor fasting serum glucose, Hgb A1c, renal function, CBC. Monitor folic acid, renal function tests for evidence of early lactic acidosis. If pt is on concurrent oral sulfonylureas, assess for hypoglycemia (cool/wet skin, tremors, dizziness, anxiety, headache, tachycardia, numbness in mouth, hunger, diplopia). Be alert to conditions that alter glucose requirements: fever, increased activity, stress, surgical procedure.
Patient/family teaching

- Discontinue metFORMIN, report immediately if evidence of lactic acidosis appears (unexplained hyperventilation, muscle aches, extreme fatigue, unusual drowsiness).
- Prescribed diet is principal part of treatment; do not skip, delay meals.
- Diabetes requires lifelong control.
- Avoid alcohol.
- Report persistent headache, nausea, vomiting, diarrhea or if skin rash, unusual bruising/bleeding, change in color of urine or stool occurs.
- Do not take dose for at least 48 hrs after receiving IV contrast dye with radiologic testing.

methadone
meth-a-done
Dolophine
Metadol
Methadone Disket
Methadone Intensol
Methadose

CLASSIFICATION
PHARMACOTHERAPEUTIC: Opioid agonist (Schedule II).
CLINICAL: Opioid analgesic. Opioid dependency management.

BLACK BOX ALERT ■ May prolong QT interval, which may cause serious arrhythmias. May cause serious, life-threatening, or fatal respiratory depression. Monitor for signs of misuse, abuse, addiction. Prolonged maternal use may cause neonatal withdrawal syndrome.

Do not confuse methadone with Mephyton, Metadate CD, Metadate ER, methylphenidate, or morphine.

Uses

Moderate to severe pain when a continuous around-the-clock analgesic is
needed. Detoxification/maintenance treatment of opioid addiction in conjunction with social/medical services.

**Precautions**

**Contraindications:** Hypersensitivity to methadone. Severe respiratory depression, acute or severe asthma (in absence of resuscitative equipment or unmonitored setting), hypercarbia, known or suspected paralytic ileus, concurrent use of selegiline. **Caution:** Renal/hepatic impairment, elderly/debilitated pts, risk for QT prolongation, medications that prolong QT interval, conduction abnormalities, severe volume depletion, hypokalemia, hypomagnesemia, cardiovascular disease, depression, suicidal tendencies, history of drug abuse, respiratory disease, biliary tract dysfunction, acute pancreatitis, hypothyroidism, Addison’s disease, head injury, increased intracranial pressure.

**Action**

Binds with opioid receptors within CNS, causing inhibition of ascending pain pathways. **Therapeutic Effect:** Alters processes affecting analgesia, emotional response to pain; reduces withdrawal symptoms from other opioid drugs.

**Pharmacokinetics**

<table>

</tr>
<tr>
<td>IV</td>
<td>N/A</td>
<td>15–30 min</td>
<td>3–4 hrs</td>
</tr>
</tbody>
</table>

**Lifespan considerations**

**Pregnancy/Lactation:** Crosses placenta. Distributed in breast milk. Respiratory depression may occur in neonate if mother received opiates during labor. Regular use of opiates during pregnancy may produce withdrawal symptoms in
neonate (irritability, excessive crying, tremors, hyperactive reflexes, fever, vomiting, diarrhea, yawning, sneezing, seizures). **Children:** Paradoxical excitement may occur. Pts younger than 2 yrs more susceptible to respiratory depressant effects. **Elderly:** More susceptible to respiratory depressant effects. Age-related renal impairment may increase risk of urinary retention.

**Interactions**

**DRUG:** Alcohol, other CNS depressants (e.g., LORazepam, morphine, zolpidem) may increase CNS effects, respiratory depression, hypotension. **CYP3A4 inducers** (e.g., carBAMazepine, PHENobarbital) may decrease concentration/effects. **CYP3A4 inhibitors** (e.g., rifAMPin, clarithromycin) may increase methadone level. **Amiodarone, erythromycin** may prolong QT interval. **MAOIs** (e.g., phenelzine, selegiline) may produce serotonin syndrome (reduce dose to 1/4 of usual methadone dose). **HERBAL:** Gotu kola, kava kava, St. John’s wort, valerian may increase CNS depression. St. John’s wort may decrease concentration/effects. **FOOD:** Grapefruit products may alter concentration/effects. **LAB VALUES:** May increase serum amylase, lipase.

**Availability (Rx)**

**Injection Solution:** 10 mg/mL. **Oral Concentrate:** 10 mg/mL. **Oral Solution:** 5 mg/5 mL, 10 mg/5 mL. **Tablets (Dispersible):** 40 mg. **Tablets:** 5 mg, 10 mg.

**Administration/handling**

**IM, SQ**

- **IM preferred over SQ route** (SQ produces pain, local irritation, induration).
- Do not use if solution appears cloudy or contains a precipitate.
- Administer slowly.
- Those with circulatory impairment experience higher risk of overdosage due to delayed absorption of repeated administration.

**PO**

- Give without regard to meals.
- Oral dose for detoxification and maintenance may be given in fruit juice or
water.
• Dispersible tablet should not be chewed or swallowed; add to liquid, allow to dissolve before swallowing.

Indications/routes/dosage

Analgesia

PO: ADULTS, ELDERLY: Initially, 2.5 mg q8–12 hrs. May increase by 2.5 mg/dose or 5 mg/day q5–7 days. CHILDREN: 0.1 mg/kg/dose q4h for 2–3 doses then q6–12h as needed. Maximum dose: 10 mg.
IV, IM, SQ: ADULTS, ELDERLY: Initially, 2.5 mg q8–12h, then titrate slowly to desired effect. CHILDREN: 0.1 mg/kg q4h for 2–3 doses, then q6–12h. Maximum: 10 mg/dose.

Dosage in Renal Impairment
CrCl less than 10 mL/min: 50–75% normal dose. Avoid in severe hepatic disease.

Dosage in Hepatic Impairment
Mild to moderate impairment: No dose adjustment. Severe Impairment: Avoid use.

Detoxification

PO: ADULTS, ELDERLY: Initially, dose of 20–30 mg. An additional 5–10 mg may be provided if withdrawal symptoms have not been suppressed or if symptoms reappear after 2–4 hrs. Day 1 dose not to exceed 40 mg. Maintenance range: Titrate to a dose that prevents withdrawal symptoms for 24 hrs, reduces craving, reduces euphoria effect of self-administered opioids, while ensuring tolerance to sedative effects of methadone. Usual range: 80–120 mg/day. Dose reduction should be in increments of less than 10% of the maintenance dose every 10–14 days. Short-term: Initially, titrate to 40 mg/day in 2 divided doses. Continue 40-mg dose for 2–3 days. After 2–3 days of stabilization at 40 mg, gradually decrease dose to level keeping withdrawal symptoms tolerable.
Side effects

**Frequent:** Sedation, orthostatic hypotension, diaphoresis, facial flushing, constipation, dizziness, nausea, vomiting. **Occasional:** Confusion, urinary retention, palpitations, abdominal cramps, visual changes, dry mouth, headache, decreased appetite, anxiety, insomnia. **Rare:** Allergic reaction (rash, pruritus).

Adverse effects/toxic reactions

Overdose results in respiratory depression, skeletal muscle flaccidity, cold/clammy skin, cyanosis, extreme drowsiness progressing to seizures, stupor, coma. Early sign of toxicity presents as increased sedation after being on a stable dose. Cardiac toxicity manifested as QT prolongation, torsades de pointes. Tolerance to analgesic effect, physical dependence may occur with repeated use. **Antidote:** Naloxone (see Appendix J for dosage).

Nursing considerations

**Baseline assessment**

Obtain baseline EKG. Assess type, location, intensity of pain. **Detoxification:** Assess pt for opioid withdrawal. Pt should be in recumbent position before drug administration by parenteral route. Obtain vital signs before giving medication. If respirations are 12/min or less (20/min or less in children), withhold medication, contact physician.

**Intervention/evaluation**

Monitor vital signs 15–30 min after SQ/IM dose, 5–10 min following IV dose. Oral medication is 50% as potent as parenteral. Assess for adequate voiding. Monitor daily pattern of bowel activity, stool consistency. Assess for clinical improvement, record onset of relief of pain. Provide support to pt in detoxification program; monitor for withdrawal symptoms.

**Patient/family teaching**

- Methadone may produce drug dependence, has potential for being abused.
- Avoid alcohol.
- Do not stop taking abruptly after prolonged use.
• May cause dry mouth, drowsiness.
• Avoid tasks that require alertness, motor skills until response to drug is established.
• Report severe drowsiness, respiratory depression.

<table>
<thead>
<tr>
<th>methocarbamol</th>
<th>meth-oh-kar-ba-mal</th>
</tr>
</thead>
<tbody>
<tr>
<td>Robaxin</td>
<td></td>
</tr>
<tr>
<td>Robaxin-750</td>
<td></td>
</tr>
</tbody>
</table>

**CLASSIFICATION**

**PHARMACOTHERAPEUTIC:** Autonomic agent, carbamate derivative of guaifenesin.

**CLINICAL:** Skeletal muscle relaxant.

Do not confuse Robaxin with Skelaxin.

**Uses**

Adjunct to rest and physical therapy for relief of discomfort associated with acute, painful musculoskeletal conditions (e.g., tetanus).

**Precautions**

**Contraindications:** Hypersensitivity to methocarbamol. Renal impairment (injectable formulation). **Cautions:** Elderly, hepatic impairment, seizure disorders (injectable formulation).

**Action**

Skeletal muscle relaxant action may be related to its CNS depressant effects. Does not directly relax skeletal muscle, motor end plate, or nerve fiber. **Therapeutic Effect:** Relieves musculoskeletal pain.

**Pharmacokinetics**

Extensively distributed in tissues. Protein binding: 46%–50%. Converts to metabolites. Metabolized by dealkylation, hydroxylation; excreted in urine.
Half-life: 1–2 hrs.

Lifespan considerations

**Pregnancy/Lactation:** Unknown if distributed in breast milk. **Children:** Safety and efficacy not established in pts 16 yrs and younger. **Elderly:** May be more susceptible to CNS effects, anticholinergic effects. May have increased risk for falls, fractures.

Interactions

**DRUG:** Alcohol, CNS depressants (e.g., LORazepam, morphine, zolpidem), tricyclic antidepressants (e.g., amitriptyline, doxepin) may increase sedative effects. May inhibit effect of pyridostigmine. **HERBAL:** St. John’s wort, valerian, kava kava, gotu kola may increase CNS depression. **FOOD:** High-fat meals may increase absorption. **LAB VALUES:** May decrease WBC count.

Availability (Rx)

**Injection, Solution:** 100 mg/mL.

**Tablets, Film-Coated:** 500 mg, 750 mg.

Administration/handling

**IM/IV**

**(IM)**

- Maximum of 5 mL can be given into each gluteal region.

**(IV)**

- May give undiluted at maximum rate of 3 mL/min.
- May dilute with D₅W or 0.9% NaCl to concentration of 4 mg/mL.
- Administer in recumbent position and remain in position for 10–15 min after IV administration.

**PO**

- Give without regard to food.
- May crush or break tablets and mix with food or liquid.
Indications/routes/dosage

Muscle Spasm
PO: ADULTS, ELDERLY, CHILDREN 16 YRS AND OLDER: 1.5 g 4 times/day for 2–3 days, then 4–4.5 g/day in 3–6 divided doses.

Usual Parenteral Dose (Muscle Spasms)
IM/IV: ADULTS, ELDERLY: 1 g q8h for up to 3 days. Maximum: 3 g/day.

Tetanus
Do not use for longer than 72 hrs.
IV: ADULTS, ELDERLY: Initially, 1–2 g by direct IV injection, then 1–2 g by IV infusion q6h until oral therapy possible. Maximum: 24 g/day. CHILDREN: 15 mg/kg/dose. May repeat q6h if needed. Maximum: 1.8 g/m²/day.

Dosage in Renal/Hepatic Impairment
No dose adjustment. Injection contraindicated in severe renal impairment; use caution in pts with cirrhosis.

Side effects
Occasional: Dizziness, drowsiness, confusion, double vision, insomnia, headache, irritability, nausea, nervousness, dyspepsia, vomiting, metallic taste.

Adverse effects/toxic reactions
Anaphylactic reaction (rash, pruritus, urticaria, angioneurotic edema, fever, bradycardia, hypotension, syncope) has occurred. Leukopenia, cholestatic jaundice, seizure occur rarely.

Nursing considerations

Baseline assessment
Record onset, type, location, duration of musculoskeletal pain, inflammation. Inspect appearance of affected joints for immobility, stiffness, swelling.
Intervention/evaluation
Assist with ambulation at all times. Evaluate for therapeutic response: relief of pain, stiffness, swelling; improved mobility; reduced joint tenderness; improved grip strength.

Patient/family teaching
• Avoid tasks that require alertness, motor skills until response to drug is established.
• Avoid alcohol.
• May color urine brown, black, or green.
• Medication intended for short-term use (3 wks).
• Report severe sedation.

methotrexate
meth-o-trex-ate
Apo-Methotrexate
Otrexup
Rasuvo
Trexall

♦ CLASSIFICATION
PHARMACOTHERAPEUTIC: Antimetabolite.
CLINICAL: Antineoplastic, antiarthritic, antipsoriatic, antirheumatic, immunosuppressant.

■ BLACK BOX ALERT ■ May cause fetal abnormalities, death. May produce potentially fatal chronic hepatotoxicity, dermatologic reactions, acute renal failure, pneumonitis, myelosuppression, malignant lymphoma, aplastic anemia, GI toxicity. Do not use for psoriasis or rheumatoid arthritis treatment in pregnant women.

Do not confuse methotrexate with metOLazine, methylPREDNISolone, or mitoXANTRONE. MTX is an error-prone abbreviation; do not use as an abbreviation.
Uses

**Oncology-related:** Treatment of breast, head/neck, non–small-cell lung, small-cell lung carcinomas; trophoblastic tumors, acute lymphocytic, meningeal leukemias; non-Hodgkin’s lymphomas (lymphosarcoma, Burkitt’s lymphoma), carcinoma of gastrointestinal tract, mycosis fungoides, osteosarcoma. **Non-oncology uses:** Psoriasis, rheumatoid arthritis (including juvenile idiopathic arthritis). **OFF-LABEL:** Treatment of acute myelocytic leukemia, bladder carcinoma, ectopic pregnancy, management of abortion, systemic lupus erythematosus, treatment of and maintenance of remission in Crohn’s disease.

Precautions

**Contraindications:** Hypersensitivity to methotrexate. Breastfeeding. **Additional:** For pts with psoriasis or rheumatoid arthritis: Pregnancy, hepatic disease, alcoholism, immunodeficiency syndrome, preexisting blood dyscrasias. **Cautions:** Peptic ulcer, ulcerative colitis, preexisting myelosuppression, history of chronic hepatic disease, alcohol consumption, obesity, diabetes, hyperlipidemia, use with other hepatotoxic medications, concomitant use of proton pump inhibitors. Use of NSAIDs or aspirin with lower methotrexate doses for rheumatoid arthritis.

Action

Competes with enzymes necessary to reduce folic acid to tetrahydrofolic acid, a component essential to DNA synthesis, repair, and cellular replication. **Therapeutic Effect:** Inhibits DNA, RNA, protein synthesis. Possesses anti-inflammatory and immune-modulating activity.

Pharmacokinetics

Variably absorbed from GI tract. Completely absorbed after IM administration. Protein binding: 50%–60%. Widely distributed. Metabolized in liver. Primarily excreted in urine. Removed by hemodialysis but not by peritoneal dialysis. **Half-life:** 3–10 hrs (large doses, 8–15 hrs).

Ｌifespan considerations
**Pregnancy/Lactation:** Avoid pregnancy during methotrexate therapy and minimum 3 mos after therapy in males or at least one ovulatory cycle after therapy in females. May cause fetal death, congenital anomalies. Distributed in breast milk. Breastfeeding not recommended. **Children/Elderly:** Renal/hepatic impairment may require dosage adjustment.

**Interactions**

**DRUG:** Alcohol, hepatotoxic medications (e.g., acetaminophen, isoniazid, ketoconazole, simvastatin) may increase risk of hepatotoxicity. **Bone marrow depressants** may increase myelosuppression. **Live virus vaccines** may potentiate virus replication, increase vaccine side effects, decrease pt’s antibody response to vaccine. **NSAIDs** (e.g., ibuprofen, ketorolac, naproxen) may increase risk of toxicity. **Probenecid, salicylates** (e.g., aspirin) may increase concentration, risk of toxicity. **HERBAL:** Cat’s claw, echinacea possess immunostimulant properties. **FOOD:** None known. **LAB VALUES:** May increase serum uric acid, AST.

**Availability (Rx)**

**Injection, Powder for Reconstitution:** 1 g.  
**Injection, Autoinjector (Rasuvo):** 7.5 mg, 10 mg, 12.5 mg, 15 mg, 17.5 mg, 20 mg, 22.5 mg, 25 mg, 27.5 mg, 30 mg. **Injection Solution:** 25 mg/mL. **Injection Syringe (Otrexup):** 7.5 mg/0.4 mL, 10 mg/0.4 mL, 15 mg/0.4 mL, 20 mg/0.4 mL, 25 mg/0.4 mL. **Tablets (Trexall):** 2.5 mg, 5 mg, 7.5 mg, 10 mg, 15 mg.

**Administration/handling**

**Alert** May be carcinogenic, mutagenic, teratogenic. Handle with extreme care during preparation/administration. Wear gloves when preparing solution. If powder or solution comes in contact with skin, wash immediately, thoroughly with soap, water. May give IM, IV, intra-arterially, intrathecally.

**IV**

**Reconstitution**

- Reconstitute powder with D<sub>5</sub>W or 0.9% NaCl to provide concentration of 25 mg/mL or less.
- For intrathecal use, dilute with preservative-free 0.9% NaCl to provide a
concentration not greater than 2–4 mg/mL.

**Rate of Administration**
- Give IV push at rate of 10 mg/min.
- Give IV infusion at rate of 4–20 mg/hr (refer to specific protocol).

**Storage**
- Store vials at room temperature. Diluted solutions stable for 24 hrs at room temperature.

**IV incompatibilities**
- Droperidol (Inapsine), gemcitabine (Gemzar), idarubicin (Idamycin), midazolam (Versed), nalbuphine (Nubain).

**IV Compatibility**
- CISplatin (Platinol AQ), cyclophosphamide (Cytoxan), DAUNOrubicin (DaunoXome), DOXOrubicin (Adriamycin), etoposide (VePesid), 5-fluorouracil, granisetron (Kytril), leucovorin, mitoMYcin (Mutamycin), ondansetron (Zofran), PACLitaxel (Taxol), vinBLASTine (Velban), vinCRIStine (Oncovin), vinorelbine (Navelbine).

**Indications/routes/dosage**

**Oncology Uses**
- Refer to individual specific protocols for optimum dosage, sequence of administration.

**Head/Neck Cancer**

PO, IV, IM: **ADULTS, ELDERLY**: 40 mg/m² once weekly. Continue until disease progression or unacceptable toxicity.

**Breast Cancer**

IV: **ADULTS, ELDERLY**: 40 mg/m² days 1 and 8 q4wks in combination with cyclophosphamide and fluorouracil.

**Mycosis Fungoides**
IM, PO: ADULTS, ELDERLY: 5–50 mg once weekly or 15–37.5 mg twice weekly.

Rheumatoid Arthritis (RA)

PO: ADULTS: Initially, 7.5 mg once wkly or 2.5 mg q12h for 3 doses once wkly. Adjust dose gradually to optimal response. SQ/IM: Initially, 7.5 mg/wk. Adjust dose gradually to optimal response. ELDERLY: Initially, 5–7.5 mg/wk. Maximum: 20 mg/wk.

Juvenile Rheumatoid Arthritis (JRA)

PO, IM, SQ: CHILDREN: Initially, 10 mg/m$^2$ once wkly, then 20–30 mg/m$^2$/wk as a single dose.

Psoriasis

PO: ADULTS, ELDERLY: Initially, 10–25 mg once wkly or 2.5–5 mg q12h for 3 doses once wkly. IM/SQ: 10–25 mg once wkly. Adjust dose gradually to optimal response. Titrate to lowest effective dose.

Dosage in Renal Impairment

<table>
<thead>
<tr>
<th>Creatinine Clearance</th>
<th>Reduce Dose to</th>
</tr>
</thead>
<tbody>
<tr>
<td>61–80 mL/min</td>
<td>75% of normal</td>
</tr>
<tr>
<td>51–60 mL/min</td>
<td>70% of normal</td>
</tr>
<tr>
<td>10–50 mL/min</td>
<td>30–50% of normal</td>
</tr>
<tr>
<td>Less than 10 mL/min</td>
<td>Avoid use</td>
</tr>
</tbody>
</table>

Dosage in Hepatic Impairment

Use caution.

Side effects

Frequent (10%–3%): Nausea, vomiting, stomatitis, burning/erythema at psoriatic site (in pts with psoriasis). Occasional (3%–1%): Diarrhea, rash, dermatitis, pruritus, alopecia, dizziness, anorexia, malaise, headache, drowsiness, blurred vision.
Adverse effects/toxic reactions

High potential for various severe toxicities. GI toxicity may produce gingivitis, glossitis, pharyngitis, stomatitis, enteritis, hematemesis. Hepatotoxicity more likely to occur with frequent small doses than with large intermittent doses. Pulmonary toxicity characterized by interstitial pneumonitis. Hematologic toxicity, resulting from marked myelosuppression, may manifest as leukopenia, thrombocytopenia, anemia, hemorrhage. Dermatologic toxicity may produce rash, pruritus, urticaria, pigmentation, photosensitivity, petechiae, ecchymosis, pustules. Severe nephrotoxicity produces azotemia, hematuria, renal failure.

Nursing considerations

Baseline assessment

**Rheumatoid arthritis:** Assess pain, range of motion. Obtain baseline CBC, BMP, LFT, rheumatoid factor. **Psoriasis:** Assess skin lesions. Question for possibility of pregnancy in pts with psoriasis, rheumatoid arthritis (RA). Obtain all functional tests before therapy, repeat throughout therapy. Antiemetics may prevent nausea, vomiting.

Intervention/evaluation

Monitor CBC, BMP, LFT, urinalysis, chest X-rays, serum uric acid. Monitor for hematologic toxicity (fever, sore throat, signs of local infection, unusual bruising/bleeding from any site), symptoms of anemia (excessive fatigue, weakness). Assess skin for evidence of dermatologic toxicity. Keep pt well hydrated, urine alkaline. Avoid rectal temperatures, traumas that induce bleeding. Apply 5 full min of pressure to IV sites.

Patient/family teaching

- Maintain strict oral hygiene.
- Do not have immunizations without physician’s approval (drug lowers resistance).
- Avoid crowds, those with infection.
- Avoid alcohol, aspirin.
- Avoid ultraviolet sunlight exposure.
- Use contraceptive measures during therapy and for 3 mos (males) or 1
ovulatory cycle (females) after therapy.
• Promptly report fever, sore throat, signs of local infection, unusual bruising/bleeding from any site, diarrhea.
• Hair loss is reversible, but new hair growth may have different color, texture.
• Report persistent nausea/vomiting.

methylergonovine
meth-il-er-goe-noe-veen
Methergine

CLASSIFICATION
PHARMACOTHERAPEUTIC: Ergot alkaloid.
CLINICAL: Oxytocic agent, uterine stimulant.

Uses
Management of uterine atony, hemorrhage and subinvolution of uterus following delivery of placenta. Control uterine hemorrhage following delivery of anterior shoulder in second stage of labor.

Precautions
Contraindications: Hypersensitivity to methylergonovine. Hypertension, pregnancy, toxemia. Cautions: Renal/hepatic impairment, coronary artery disease, pts at risk for coronary artery disease (diabetes, obesity, smoking, hypercholesterolemia), concurrent use with CYP3A4 inhibitors (e.g., protease inhibitors), occlusive peripheral vascular disease, sepsis, second stage of labor.

Action
Increases tone, rate, amplitude of contraction of uterine smooth muscle. Therapeutic Effect: Shortens third stage of labor, reduces blood loss.

Pharmacokinetics

<table>

Rapidly absorbed from GI tract after IM administration. Distributed rapidly to plasma, extracellular fluid, tissues. Metabolized in liver. Primarily excreted in urine. **Half-life:** 0.5–2 hrs.

 hann

**Lifespan considerations**

**Pregnancy/Lactation:** Contraindicated during pregnancy. Small amounts distributed in breast milk. **Children/Elderly:** No information available.

**Interactions**

**DRUG:** DOPamime, norepinephrine, phenylephrine, vasopressin may increase effects. Strong CYP3A4 inhibitors (e.g., ketoconazole, ritonavir) may increase concentration/effect. Beta blockers (e.g., carvedilol, labetalol, metoprolol) may increase vasoconstrictive effect of ergot alkaloids. Anesthetics (e.g., halothane, methoxyflurane) may increase oxytocic effects.

**HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** May decrease serum prolactin.

**Availability (Rx)**

**Injection Solution:** 0.2 mg/mL. **Tablets:** 0.2 mg.

**Administration/handling**

**Note:** Initial dose may be given parenterally, followed by oral regimen. **IV use in life-threatening emergencies only.**

**Reconstitution**

- Dilute with 0.9% NaCl to volume of 5 mL.

**Rate of Administration**

- Give over at least 1 min, carefully monitoring B/P.

**Storage**

- Refrigerate ampules.

**IV incompatibilities**

None known.
**IV Compatibilities**

Heparin, potassium.

**Indications/routes/dosage**

**Prevention/Treatment of Postpartum, Postabortion Hemorrhage**

**PO:** **ADULTS:** 0.2 mg 3–4 times daily. Continue for up to 7 days.

**IV, IM:** **ADULTS:** Initially, 0.2 mg after delivery of anterior shoulder, after delivery of placenta, or during puerperium. May repeat q2–4h as needed.

**Dosage in Renal/Hepatic Impairment**

Use caution.

**Side effects**

**Frequent:** Nausea, uterine cramping, vomiting. **Occasional:** Abdominal pain, diarrhea, dizziness, diaphoresis, tinnitus, bradycardia, chest pain. **Rare:** Allergic reaction (rash, pruritus), dyspnea, severe or sudden hypertension.

**Adverse effects/toxic reactions**

Severe hypertensive episodes may result in CVA, serious arrhythmias, seizures. Hypertensive effects are more frequent with pt susceptibility, rapid IV administration, concurrent use of regional anesthesia, vasoconstrictors. Peripheral ischemia may lead to gangrene.

**Nursing considerations**

**Baseline assessment**

Determine baseline serum calcium level, B/P, pulse. Assess for any evidence of bleeding before administration.

**Intervention/evaluation**

Monitor uterine tone, bleeding, B/P, pulse q15min until stable (about 1–2 hrs).

**Patient/family teaching**
- Avoid smoking: causes increased vasoconstriction.
- Report increased cramping, bleeding, foul-smelling lochia.
- Report pale, cold hands/feet (possibility of diminished circulation).

<table>
<thead>
<tr>
<th>methylnaltrexone</th>
<th>meth-il-nal-trex-own</th>
</tr>
</thead>
<tbody>
<tr>
<td>Relistor</td>
<td></td>
</tr>
</tbody>
</table>

**CLASSIFICATION**

PHARMACOTHERAPEUTIC: Opioid receptor antagonist.
CLINICAL: Laxative.

Do not confuse methylnaltrexone with naltrexone.

**Uses**

**Injection:** Treatment of opioid-induced constipation in pts with advanced illness who are receiving palliative care when response to laxative therapy is insufficient. **Injection/Tablets:** Treatment of opioid-induced constipation for chronic pain unrelated to cancer.

**Precautions**

**Contraindications:** Hypersensitivity to methylnaltrexone. Known or suspected GI obstruction. Pts at increased risk of recurrent obstruction due to potential of GI perforation. **Cautions:** Renal impairment, history of GI tract lesions (e.g., peptic ulcer disease, GI tract malignancies).

**Action**

Blocks binding of opioids to peripheral opioid receptors within GI tract. **Therapeutic Effect:** Decreases constipating effect of opioids without reducing analgesic effect.
Pharmacokinetics

Absorbed rapidly. Undergoes moderate tissue distribution. Protein binding: 11%–15%. Excreted in urine (50%), feces (35%). **Half-life:** 8 hrs.

Lifespan considerations

**Pregnancy/Lactation:** Unknown if distributed in breast milk (not recommended). **Children:** Safety and efficacy not established. **Elderly:** No age-related precautions noted.

Interactions

**DRUG:** None significant. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** None significant.

Availability (Rx)

**Injection, Solution:** 8 mg/0.4 mL, 12 mg/0.6 mL. **Tablets:** 150 mg.

Administration/handling

**PO**

- Administer with water on an empty stomach at least 30 min before first meal of day.

**Subcutaneous**

**Preparation**

- Visually inspect for particulate matter or discoloration. Solution should appear colorless to pale yellow in color. Do not use if solution is cloudy, discolored, or if large particles are observed.

**Administration**

- Insert needle subcutaneously into upper arms, outer thigh, or abdomen, and inject solution.
- Do not inject into areas of active skin disease or injury such as sunburns, skin rashes, inflammation, skin infections, or active psoriasis.
- Rotate injection sites.

Storage
• Once solution is drawn into syringe, may be stored at room temperature.
• Administer within 24 hrs.

**Indications/routes/dosage**

[**Alert**] Usual schedule is once every other day, as needed, but no more frequently than once every 24 hrs.

**Constipation (Chronic Non-Cancer Pain)**

**PO:** **ADULTS, ELDERLY:** 450 mg once daily in the morning. **SQ:** **ADULTS, ELDERLY:** 12 mg/day. **Note:** Discontinue all laxatives prior to use.

**Constipation (Advanced Illness)**

**SQ:** **ADULTS, ELDERLY WEIGHING 38 KG TO LESS THAN 62 KG:** 8 mg. **ADULTS, ELDERLY WEIGHING 62–114 KG:** 12 mg. **ADULTS, ELDERLY WHOSE WEIGHT FALLS OUTSIDE THESE RANGES:** Dose at 0.15 mg/kg (round dose up to nearest 0.1 mL of volume).

**Dosage in Severe Renal Impairment (CrCl Less Than 60 mL/min)**

**SQ:** **ADULTS, ELDERLY:** Administer 50% of recommended dose.

**Dosage in Hepatic Impairment**

No dose adjustment.

**Side effects**

**Frequent (29%–12%):** Abdominal pain, flatulence, nausea. **Occasional (7%–5%):** Diarrhea, dizziness.

**Adverse effects/toxic reactions**

None known.

**Nursing considerations**

**Baseline assessment**
Question characteristics of constipation, frequency of bowel movements. Assess bowel sounds. Question history of GI obstruction, perforation, baseline GI disease; renal impairment. Receive full medication history, including herbal products, and screen for interactions. Assess hydration status.

**Intervention/evaluation**

30% of pts report defecation within 30 min after drug administration. Encourage fluid intake. Assess bowel sounds for peristalsis. Monitor daily pattern of bowel activity, stool consistency. If opioid medication is stopped, drug should be discontinued. Assess for abdominal disturbances.

**Patient/family teaching**

- Laxative effect usually occurs within 30 min but may take up to 24 hrs after medication administration.
- Common side effects include transient abdominal pain, nausea, vomiting.
- Report persistent or worsening symptoms, or if severe or persistent diarrhea occurs.

Ritalin LA

**CLASSIFICATION**

**PHARMACOTHERAPEUTIC:** CNS stimulant (*Schedule II*).

**CLINICAL:** CNS stimulant.

- **BLACK BOX ALERT** - Chronic abuse can lead to marked tolerance, psychological dependence. Abrupt withdrawal from prolonged use may lead to severe depression, psychosis.

Do not confuse Metadate ER with Metadate CD, methylphenidate with methadone, or Ritalin with Rifadin.

**Uses**

Treatment of attention-deficit hyperactivity disorder (ADHD). Management of narcolepsy. **OFF-LABEL:** Secondary mental depression (especially elderly pts, medically ill).

**Precautions**

**Contraindications:** Hypersensitivity to methylphenidate. Use during or within 14 days following MAOI therapy; marked anxiety, tension, agitation, motor tics; family history or diagnosis of Tourette’s syndrome, glaucoma. Metadate (additional): Severe hypertension, HF, arrhythmia, hyperthyroidism, recent MI or angina. Caution: Hypertension, seizures, acute stress reaction, emotional instability, history of drug dependence, HF, recent MI, hyperthyroidism or thyrotoxicosis, known structural cardiac abnormality, bipolar disorder, cardiomyopathy, arrhythmias, alcohol abuse.

**Action**

Blocks reuptake of norepinephrine, dopamine into presynaptic neurons. **Therapeutic Effect:** Decreases motor restlessness, fatigue. Increases motor activity, attention span, mental alertness. Produces mild euphoria.

**Pharmacokinetics**
<table>

</tbody>
</table>

Slowly, incompletely absorbed from GI tract. Protein binding: 15%. Metabolized in liver. Primarily excreted in urine. Unknown if removed by hemodialysis. **Half-life:** 2–4 hrs.
Lifespan considerations

Pregnancy/Lactation: Unknown if drug crosses placenta or is distributed in breast milk. **Children:** May be more susceptible to developing anorexia, insomnia, stomach pain, decreased weight. Chronic use may inhibit growth. Not approved for children younger than 6 yrs. **Elderly:** No age-related precautions noted.

Interactions

**DRUG:** MAOIs (e.g., phenelzine, selegiline) may increase effects. Other CNS stimulants (e.g., caffeine, dextroamphetamine, phentermine) may have additive effect. May inhibit metabolism of warfarin, anticonvulsants (e.g., carBAzepine, phenytoin), antidepressants. **HERBAL:** Ephedra may cause hypertension, arrhythmias. Yohimbe may increase CNS stimulation. **FOOD:** None known. **LAB VALUES:** None significant.

Availability (Rx)

**Oral Solution (Methylin):** 5 mg/5 mL, 10 mg/5 mL, 10 mg/1 mL. **Tablets (Chewable [Methylin]):** 2.5 mg, 5 mg, 10 mg. **Tablets (Methylin, Ritalin):** 5 mg, 10 mg, 20 mg. **Topical Patch (Daytrana):** 10 mg/9 hrs, 15 mg/9 hrs, 20 mg/9 hrs, 30 mg/9 hrs. **Powder for Suspension, Extended-Release (Quillivant XR):** 25 mg/5 mL. **Capsules (Extended-Release [Aptensio XR]):** 10 mg, 15 mg, 20 mg, 30 mg, 40 mg, 50 mg, 60 mg. **Capsules (Extended-Release [Metadate CD]):** 10 mg, 20 mg, 30 mg, 40 mg, 50 mg, 60 mg. **Capsules (Extended-Release [Ritalin LA]):** 10 mg, 20 mg, 30 mg, 40 mg. **Tablets (Extended-Release [Concerta]):** 18 mg, 27 mg, 36 mg, 54 mg, 72 mg. **Tablets (Extended-Release [Metadate ER, Methylin ER]):** 10 mg, 20 mg. **Tablets (Extended-Release [Quillichew ER]):** 20 mg, 30 mg, 40 mg. **Capsules (Extended-Release [Aptensio XR]):** 10 mg, 15 mg, 20 mg, 30 mg, 40 mg, 50 mg, 60 mg. **Capsules (Extended-Release [Metadate CD]):** 10 mg, 20 mg, 30 mg, 40 mg, 50 mg, 60 mg. **Capsules (Extended-Release [Ritalin LA]):** 10 mg, 20 mg, 30 mg, 40 mg. **Tablets (Extended-Release [Concerta]):** 18 mg, 27 mg, 36 mg, 54 mg, 72 mg.
**Methylin ER**: 10 mg, 20 mg. **Tablets, Extended Release ODT (Cotempla XR)**: 8.6 mg, 17.3 mg, 25.9 mg. **Tablets Chewable (Extended-Release [Quillichew ER])**: 20 mg, 30 mg, 40 mg. **Tablets (Sustained-Release [Ritalin SR])**: 20 mg.

**Administration/handling**

- Sustained-release, extended-release tablets may be given in place of regular tablets once the daily dose is titrated using regular tablets and the titrated dosage corresponds to sustained-release or extended-release tablet strength.

**PO**

- Do not give in afternoon or evening (may cause insomnia).
- Do not crush, break extended-release capsules, extended- or sustained-release tablets.
- Immediate-release tablets may be crushed.
- Give dose 30–45 min before meals.
- **Concerta**: Administer once daily in morning. May take without regard to food but must be taken with water, milk, or juice.
- **Methylin Chewable**: Give with at least 8 oz of water or other fluid.
- **Metadate CD, Ritalin LA**: 
  - May be opened, sprinkled on applesauce.
  - Instruct pt to swallow applesauce without chewing. Do not crush or chew capsule contents.
- **Quillivant XR**: Administer in morning with or without food. Shake bottle more than 10 sec prior to administration.

**Patch**

- To be worn daily for 9 hrs.
- Replace daily in morning.
- Apply to dry, clean area of hip.
- Avoid applying to waistline (clothing may cause patch to rub off).
- Alternate application site daily.
- Press firmly in place for 30 sec to ensure patch is in good contact with skin.
- Do not cut patch.
Indications/routes/dosage

ADHD

PO: ADULTS: (Immediate-Release): 5 mg twice daily, before breakfast and lunch. May increase by 5–10 mg/day at wkly intervals. **Maximum:** 60 mg/day in 2–3 divided doses. CHILDREN 6 YRS AND OLDER: Initially, 5 mg before breakfast and lunch. May increase by 5–10 mg/day at wkly intervals. **Usual dose:** 20–30 mg/day in 2–3 divided doses. **Maximum:** 60 mg/day.

PO (Concerta): CHILDREN 6 YRS AND OLDER, ADULTS UP TO 65 YRS OF AGE: Initially, 18 mg once daily; may increase by 18 mg/day at wkly intervals. **Maximum:** 54 mg/day in children 6–12 yrs of age (up to 72 mg/day in adolescents younger than 18 yrs).

PO (Metadate CD): CHILDREN 6 YRS AND OLDER: Initially, 20 mg/day. May increase by 10–20 mg/day at wkly intervals. **Maximum:** 60 mg/day.

PO: (Quillichew ER): CHILDREN 6 YRS AND OLDER: Initially, 20 mg/day. May increase by 10 mg/15 mg or 20 mg/day at wkly intervals. **Maximum:** 60 mg/day.

PO (Quillivant XR): CHILDREN 6 YRS AND OLDER: Initially, 20 mg once daily in the morning. May increase in increments of 10–20 mg/day at wkly increments. **Maximum:** 60 mg/day.

PO (Ritalin LA): CHILDREN 6 YRS AND OLDER: Initially, 20 mg/day. May increase by 10 mg/day at wkly intervals. **Maximum:** 60 mg/day.

PO (Metadate ER, Methylin ER): CHILDREN 6 YRS AND OLDER: May replace regular tablets after daily dose is titrated and 8-hr dosage corresponds to sustained-release or extended-release tablet strength. **Maximum:** 60 mg/day.

PO (Cotempla XR): CHILDREN, 6–18 YRS: Initially, 17.3 mg once daily. May increase in weekly intervals in 8.6 to 17.3 mg increments. **Maximum:** 51.8 mg/day.

PATCH (Daytrana): CHILDREN 6–12 YRS, ADOLESCENTS: Initially, 10 mg daily (applied and worn for 9 hrs). Dosage is titrated to desired effect. May increase dose no more frequently than every wk.

Narcolepsy

PO: ADULTS, ELDERLY: (Immediate-Release): Initially, 5 mg twice daily, before breakfast and lunch. May increase by 5–10 mg/day at wkly intervals. **Maximum:** 60 mg/day in 2–3 divided doses. **(Extended Release):** May give
once immediate-release is titrated. **Maximum:** 60 mg/day.

**Dosage in Renal/Hepatic Impairment**
No dose adjustment.

**Side effects**

**Frequent:** Anxiety, insomnia, anorexia. **Occasional:** Dizziness, drowsiness, headache, nausea, abdominal pain, fever, rash, arthralgia, vomiting. **Rare:** Blurred vision, Tourette’s syndrome (uncontrolled vocal outbursts, repetitive body movements, tics), palpitations, priapism.

**Adverse effects/toxic reactions**
Prolonged administration to children with ADHD may delay normal weight gain pattern. Overdose may produce tachycardia, palpitations, arrhythmias, chest pain, psychotic episode, seizures, coma. Hypersensitivity reactions, blood dyscrasias occur rarely.

**Nursing considerations**

**Baseline assessment**

**ADHD:** Assess attention span, impulsivity, interaction with others, distractibility. **Narcolepsy:** Observe/assess frequency of episodes. Question history of seizures.

**Intervention/evaluation**
Monitor B/P, pulse, changes in ADHD symptoms. CBC with differential should be performed routinely during therapy. If paradoxical return of attention-deficit occurs, dosage should be reduced or discontinued. Monitor growth.

**Patient/family teaching**
- Avoid tasks that require alertness, motor skills until response to drug is established.
- Sugarless gum, sips of water may relieve dry mouth.
- Report any increase in seizures.
• Take daily dose early in morning to avoid insomnia.
• Report anxiety, palpitations, fever, vomiting, skin rash.
• Report new or worsened symptoms (e.g., behavior, hostility, concentration ability).
• Avoid caffeine.
• Do not stop taking abruptly after prolonged use.

<td>Solu-Medrol</td>
</tr>
</tbody>
</table>

◆ CLASSIFICATION
PHARMACOTHERAPEUTIC: Adrenal corticosteroid.
CLINICAL: Anti-inflammatory.
Do not confuse DepoMedrol with Solu-Medrol, Medrol with Mebaral, or methylPREDNISolone with medroxyPROGESTERone or prednisolone.

**Uses**

Anti-inflammatory or immunosuppressant in treatment of hematologic, allergic, inflammatory, autoimmune, or neoplastic disorders. **OFF-LABEL:** Acute spinal cord injury.

**Precautions**

Contraindications: Hypersensitivity to methylprednisolone. Administration of live or attenuated virus vaccines, systemic fungal infection. **IM (additional):** Idiopathic thrombocytopenia purpura. **Cautions:** Respiratory tuberculosis,
untreated systemic infections, hypertension, HF, diabetes, GI disease (e.g., peptic ulcer), myasthenia gravis, renal/hepatic impairment, seizures, cataracts, glaucoma, following acute MI, thyroid disorder, thromboembolic tendencies, cardiovascular disease, elderly pts, psychiatric conditions, pts at risk for osteoporosis.

**Action**

Suppresses migration of polymorphonuclear leukocytes, reverses increased capillary permeability. **Therapeutic Effect:** Decreases inflammation.

**Pharmacokinetics**

</table>

Well absorbed from GI tract after IM administration. Widely distributed. Metabolized in liver. Excreted in urine. Removed by hemodialysis. **Half-life:** 3.5 hrs.

**Lifespan considerations**

**Pregnancy/Lactation:** Crosses placenta. Distributed in breast milk. May cause cleft palate (chronic use in first trimester). Breastfeeding not recommended. **Children:** Prolonged treatment or high dosages may decrease short-term growth rate, cortisol secretion. **Elderly:** No age-related precautions noted.

**Interactions**

**DRUG:** May alter effects of warfarin. CYP3A inducers (e.g., phenytoin, rifAMPin) may decrease effects. **Live virus vaccines** may decrease pt’s antibody response to vaccine, increase vaccine side effects, potentiate virus replication. **HERBAL:** Cat’s claw, echinacea possess immunostimulant properties. St. John’s wort may decrease concentration. **FOOD:** None known. **LAB VALUES:** May increase serum glucose, cholesterol, lipids, amylase, sodium. May decrease serum calcium, potassium, thyroxine, hypothalamic-
pituitary-adrenal (HPA) axis.

**Availability (Rx)**

**Injection, Powder for Reconstitution (SOLU):** 40 mg, 125 mg, 500 mg, 1 g.  
**Injection Suspension (DEPO):** 40 mg/mL, 80 mg/mL.  
**Tablets (Medrol):** 2 mg, 4 mg, 8 mg, 16 mg, 32 mg.  
**(Medrol Dosepak):** 4 mg (21 tablets).

**Administration/handling**

⚠️ Do not give methylPREDNIsolone acetate IV.

⚔️ **IV**

**Reconstitution**

- For infusion, add to D$_5$W, 0.9% NaCl.

**Rate of Administration**

- Give IV push over 3–15 min.
- Give IV piggyback. Dose of 250 mg over 15–30 min; dose of 500–999 mg over at least 30 min; dose of 1g or greater over 1 hr.

**Storage**

- Store vials at room temperature. Diluted solution is stable for 48 hrs at room temperature or refrigerated.

**IM**

- Methylprednisolone acetate should not be further diluted.
- MethylPREDNISolone sodium succinate should be reconstituted with Bacteriostatic Water for Injection.
- Give deep IM in gluteus maximus (avoid injection into deltoid muscle).

**PO**

- Give with food, milk.

⚠️ **IV incompatibilities**

Ciprofloxacin (Cipro), diltiaZEM (Cardizem), potassium chloride, propofol (Diprivan).
IV Compatibilities
Dexmedetomidine (Precedex), DOPamine (Intropin), heparin, midazolam (Versed), theophylline.

Indications/routes/dosage

Anti-Inflammatory, Immunosuppressive

IV: ADULTS, ELDERLY: 10–40 mg. May repeat q4–6h as needed. CHILDREN: 0.5–1.7 mg/kg/day or 5–25 mg/m²/day in 2–4 divided doses.

PO: ADULTS, ELDERLY: 4–48 mg/day in 1–4 divided doses. CHILDREN: 0.5–1.7 mg/kg/day or 5–25 mg/m²/day in 2–4 divided doses.

IM (MethylPREDNISolone Succinate): ADULTS, ELDERLY: 10–40 mg/day.

IM (Methylprednisolone Acetate): ADULTS, ELDERLY: 4–120 mg single dose.

Intra-Articular, Intralesional: ADULTS, ELDERLY: 4–80 mg q1–5wks.

Dosage in Renal/Hepatic Impairment
No dose adjustment.

Side effects

Frequent: Insomnia, heartburn, anxiety, abdominal distention, diaphoresis, acne, mood swings, increased appetite, facial flushing, GI distress, delayed wound healing, increased susceptibility to infection, diarrhea, constipation. Occasional: Headache, edema, tachycardia, change in skin color, frequent urination, depression. Rare: Psychosis, increased blood coagulability, hallucinations.

Adverse effects/toxic reactions

Long-term therapy: Hypocalcemia, hypokalemia, muscle wasting (esp. in arms, legs), osteoporosis, spontaneous fractures, amenorrhea, cataracts, glaucoma, peptic ulcer, HF. Abrupt withdrawal after long-term therapy: Anorexia, nausea, fever, headache, severe arthralgia, rebound inflammation, fatigue, weakness, lethargy, dizziness, orthostatic hypotension.
Nursing considerations

Baseline assessment
Question for hypersensitivity to any of the corticosteroids, components. Obtain baselines for height, weight, B/P, serum glucose, electrolytes. Check results of initial tests (tuberculosis [TB] skin test, X-rays, EKG). Question history as listed in Precautions.

Intervention/evaluation
Monitor I&O, daily weight; assess for edema. Monitor daily pattern of bowel activity, stool consistency. Check vital signs at least twice daily. Be alert for infection (sore throat, fever, vague symptoms). Monitor serum electrolytes, including B/P, glucose. Monitor for hypocalcemia (muscle twitching, cramps, positive Trousseau’s or Chvostek’s signs), hypokalemia (weakness, muscle cramps, numbness, tingling [esp. lower extremities], nausea/vomiting, irritability, EKG changes). Assess emotional status, ability to sleep. Check lab results for blood coagulability, clinical evidence of thromboembolism.

Patient/family teaching
• Take oral dose with food, milk.
• Do not change dose/schedule or stop taking drug; must taper off gradually under medical supervision.
• Report fever, sore throat, muscle aches, sudden weight gain or loss, edema, loss of appetite, fatigue.
• Maintain strict personal hygiene; avoid exposure to disease, trauma.
• Severe stress (serious infection, surgery, trauma) may require increased dosage.
• Follow-up visits, lab tests are necessary.
• Children must be assessed for growth retardation.
• Inform dentist, other physicians of methylprednisolone therapy now or within past 12 mos.

metoclopramide
met-oh-kloe-pra-myde
Apo-Metoclop
Reglan
**Uses**

**ORAL:** Symptomatic treatment of diabetic gastroparesis, gastroesophageal reflux.

**IV/IM:** Symptomatic treatment of diabetic gastroparesis, placement of enteral feeding tubes, prevent/treat nausea/vomiting with chemotherapy or after surgery. To stimulate gastric emptying and intestinal transit of barium when delayed emptying interferes with the radiological examination of the stomach and/or small intestine. To facilitate small bowel intubation in adults and children.

**Precautions**

**Contraindications:** Hypersensitivity to metoclopramide. Concurrent use of medications likely to produce extrapyramidal reactions. Situations in which GI motility may be dangerous (e.g., GI hemorrhage, GI perforation/obstruction), history of seizure disorder, pheochromocytoma. **Cautions:** Renal impairment, HF, cirrhosis, hypertension, depression, Parkinson’s disease, elderly.

**Action**

Stimulates motility of upper GI tract. Blocks dopamine-serotonin receptors in chemoreceptor trigger zone. Enhances acetylcholine response in upper GI tract; increases lower esophageal sphincter tone. **Therapeutic Effect:** Accelerates intestinal transit, promotes gastric emptying. Relieves nausea, vomiting.

**Pharmacokinetics**

<table>
<thead>
<tr>
<th>Route</th>
<th>Onset</th>
<th>Peak</th>
<th>Duration</th>
</tr>
</thead>
</table>

Well absorbed from GI tract. Metabolized in liver. Protein binding: 30%. Primarily excreted in urine. Not removed by hemodialysis. **Half-life:** 4–6 hrs.

**Lifespan considerations**

**Pregnancy/Lactation:** Crosses placenta. Distributed in breast milk. **Children:** More susceptible to having dystonic reactions. **Elderly:** More likely to have parkinsonian dyskinesias after long-term therapy.

**Interactions**

**DRUG:** Alcohol, other CNS depressants (e.g., lorazepam, morphine, zolpidem) may increase CNS depressant effect. **Anticholinergics** (e.g., scopolamine), opioid analgesics (e.g., morphine, HYDROMorphone) may decrease effects on GI motility. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** May increase serum aldosterone, prolactin.

**Availability (Rx)**

**Injection Solution:** 5 mg/mL. **Solution, Oral:** 5 mg/5 mL. **Tablets:** 5 mg, 10 mg.

**Tablets, Orally Disintegrating:** 5 mg, 10 mg.

**Administration/handling**

**IV**

**Reconstitution**

- Dilute doses greater than 10 mg in 50 mL D₅W or 0.9% NaCl.

**Rate of Administration**

- Infuse over 15–30 min.
- May give undiluted slow IV push at rate of 10 mg over 1–2 min.
- Too-rapid IV injection may produce intense feeling of anxiety, restlessness, followed by drowsiness.

**Storage**
• Store vials at room temperature.
• After dilution, IV infusion (piggyback) is stable for 24 hrs.

PO
• Give 30 min before meals and at bedtime.
• Tablets may be crushed.
• Do not cut, divide, break orally disintegrating tablets. Place on tongue, swallow with saliva.

IV incompatibilities
Allopurinol (Aloprim), cefepime (Maxipime), furosemide (Lasix), propofol (Diprivan).

IV Compatibilities
Dexamethasone, dexmedetomidine (Precedex), diltiazem (Cardizem), diphenhydrAMINE (Benadryl), fentaNYL (Sublimaze), heparin, HYDROmophone (Dilaudid), morphine, potassium chloride.

Indications/routes/dosage

Prevention of Chemotherapy-Induced Nausea/Vomiting
IV: ADULTS, ELDERLY, CHILDREN: 1–2 mg/kg 30 min before chemotherapy; repeat q2h for 2 doses, then q3h for 3 doses.

Postop Nausea/Vomiting
IV: ADULTS, ELDERLY: 10–20 mg near end of surgery.

Gastroparesis
PO, IV: ADULTS: 10 mg 30 min before meals and at bedtime for 2–8 wks.
PO, IV: ELDERLY: Initially, 5 mg 30 min before meals and at bedtime. May increase to 10 mg.

Gastroesophageal Reflux Disease (GERD)
PO: ADULTS: 10–15 mg up to 4 times/day, or single doses up to 20 mg as needed. ELDERLY: Initially, 5 mg 4 times/day. May increase to 10 mg.

Facilitate Small Bowel Intubation (Single Dose)

IV: ADULTS, ELDERLY: 10 mg as a single dose. CHILDREN 6–14 YRS: 2.5–5 mg as a single dose. CHILDREN YOUNGER THAN 6 YRS: 0.1 mg/kg as a single dose.

Dosage in Renal Impairment
Dosage is modified based on creatinine clearance.

<table>
<thead>
<tr>
<th>Creatinine Clearance</th>
<th>Dosage</th>
</tr>
</thead>
<tbody>
<tr>
<td>Less than 40 mL/min</td>
<td>50% of normal dose</td>
</tr>
</tbody>
</table>

Dosage in Hepatic Impairment
No dose adjustment.

Side effects

**Alert:** Doses of 2 mg/kg or greater, or increased length of therapy, may result in a greater incidence of side effects.

**Frequent (10%):** Drowsiness, restlessness, fatigue, lethargy. **Occasional (3%):** Dizziness, anxiety, headache, insomnia, breast tenderness, altered menstruation, constipation, rash, dry mouth, galactorrhea, gynecomastia. **Rare (less than 3%):** Hypotension, hypertension, tachycardia.

Adverse effects/toxic reactions
Extrapyramidal reactions occur most frequently in children, young adults (18–30 yrs) receiving large doses (2 mg/kg) during chemotherapy and usually are limited to akathisia (involuntary limb movement, facial grimacing, motor restlessness). Neuroleptic malignant syndrome (diaphoresis, fever, unstable B/P, muscular rigidity) has been reported.

Nursing considerations
Baseline assessment

**Antiemetic:** Assess for dehydration (poor skin turgor, dry mucous membranes, longitudinal furrows in tongue). Assess for nausea, vomiting, abdominal distention, bowel sounds.

Intervention/evaluation

Patient/family teaching

- Avoid tasks that require alertness, motor skills until response to drug is established.
- Report involuntary eye, facial, limb movement (extrapyramidal reaction).
- Avoid alcohol.

---

### metOLazone

meh-toe-la-zone

### Zaroxolyn

CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Thiazide diuretic.

**CLINICAL:** Diuretic, antihypertensive.

Do not confuse metOLazone with metaxalone, methotrexate, metoclopramide, or metoprolol, or Zaroxolyn with Zarontin.

---

Uses

Treatment of mild to moderate hypertension, edema due to HF, nephrotic syndrome, or impaired renal function.

Precautions

**Contraindications:** Hypersensitivity to metolazone. Anuria, hepatic coma/precoma. **Cautions:** History of hypersensitivity to sulfonamides, thiazide
diuretics. Severe renal disease, severe hepatic impairment, gout, prediabetes or diabetes, elevated serum cholesterol, triglycerides.

**Action**
 Blocks reabsorption of sodium, potassium, chloride at distal convoluted tubule, increasing excretion of sodium, potassium, water. **Therapeutic Effect:** Reduces B/P, promotes diuresis.

**Pharmacokinetics**

<table>
<thead>
<tr>
<th>Route</th>
<th>Onset</th>
<th>Peak</th>
<th>Duration</th>
</tr>
</thead>
<tbody>
<tr>
<td>PO (diuretic)</td>
<td>1 hr</td>
<td>—</td>
<td>24 hrs</td>
</tr>
</tbody>
</table>

Incompletely absorbed from GI tract. Protein binding: 95%. Primarily excreted unchanged in urine. Not removed by hemodialysis. **Half-life:** 20 hrs.

**Lifespan considerations**

**Pregnancy/Lactation:** Crosses placenta. Small amount distributed in breast milk. Breastfeeding not recommended. **Children:** No age-related precautions noted. **Elderly:** May be more sensitive to hypotensive or electrolyte effects. Age-related renal impairment may require dosage adjustment.

**Interactions**

**DRUG:** May increase risk of *digoxin* toxicity associated with metolazone-induced hypokalemia. May increase risk of *lithium* toxicity. **HERBAL:** *Ephedra, ginseng, licorice* may decrease effect. *Black cohosh, periwinkle* may enhance effect. **FOOD:** None known. **LAB VALUES:** May increase serum glucose, cholesterol, LDL, bilirubin, calcium, creatinine, uric acid, triglycerides. May decrease urinary calcium, serum magnesium, potassium, sodium.

**Availability (Rx)**

**Tablets:** 2.5 mg, 5 mg, 10 mg.

**Administration/handling**
PO
• May give with food, milk if GI upset occurs, preferably with breakfast (may prevent nocturia).

Indications/routes/dosage

Edema
PO: ADULTS: 2.5–10 mg/day. May increase to 20 mg/day.

Hypertension
PO: ADULTS, ELDERLY: Initially, 2.5–5 mg/day. Adjust dose to achieve maximum therapeutic effect.

Usual Pediatric Dosage (Edema, Refractory)
PO: 0.2–0.4 mg/kg/day in 1–2 divided doses.

Dosage in Renal Impairment
Mild to moderate impairment: No dose adjustment. Severe impairment: Use caution.

Dosage in Hepatic Impairment
No dose adjustment. Contraindicated with hepatic coma or precoma.

Side effects
Expected: Increased urinary frequency/volume. Frequent (10%–9%): Dizziness, light-headedness, headache. Occasional (6%–4%): Muscle cramps/spasm, drowsiness, fatigue, lethargy. Rare (less than 2%): Asthenia, palpitations, depression, nausea, vomiting, abdominal bloating, constipation, diarrhea, urticaria.

Adverse effects/toxic reactions
Vigorous diuresis may lead to profound water loss and electrolyte depletion, resulting in hypokalemia, hyponatremia, dehydration. Acute hypotensive
episodes may occur. Hyperglycemia may occur during prolonged therapy. Pancreatitis, paresthesia, blood dyscrasias, pulmonary edema, allergic pneumonitis, dermatologic reactions occur rarely. Overdose can lead to lethargy, coma without changes in electrolytes, hydration.

Nursing considerations

Baseline assessment

Intervention/evaluation
Continue to monitor B/P, vital signs, serum electrolytes, I&O, weight. Note extent of diuresis. Monitor for electrolyte disturbances (hypokalemia may result in weakness, tremors, muscle cramps, nausea, vomiting, altered mental status, tachycardia; hyponatremia may result in confusion, thirst, cold/clammy skin).

Patient/family teaching
• Expect increased urinary frequency/volume.
• Slowly go from lying to standing to reduce hypotensive effect.
• Avoid tasks requiring motor skills, mental alertness until response to drug is established.
• Eat foods high in potassium, such as whole grains (cereals), legumes, meat, bananas, apricots, orange juice, potatoes (white, sweet), raisins.

metoprolol
me-toe-pro-lol
Apo-Metoprolol
Lopressor
Toprol XL
Fixed-Combination(s)

**Dutoprol:** metoprolol/hydroCHLORothiazide (a diuretic): 25 mg/12.5 mg, 50 mg/12.5 mg, 100 mg/12.5 mg. **Lopressor HCT:** metoprolol/hydrochlorothiazide (a diuretic): 50 mg/25 mg, 100 mg/25 mg, 100 mg/50 mg.

**CLASSIFICATION**

**PHARMACOTHERAPEUTIC:** Beta₁-adrenergic blocker.

**CLINICAL:** Antianginal, antihypertensive, MI adjunct.

- **BLACK BOX ALERT** - Abrupt withdrawal can produce acute tachycardia, hypertension, ischemia. Drug should be gradually tapered over 1–2 wks.

Do not confuse metoprolol with atenolol, labetalol, nadolol, or stanozolol, or Toprol XL with TEGretol, TEGretol XR, or Topamax.

Uses

**Lopressor:** Treatment of hemodynamically stable acute myocardial infarction (AMI) to reduce CV mortality, angina pectoris, hypertension. **Toprol XL:** Treatment of angina pectoris, to reduce mortality or hospitalizations in pts with HF already receiving ACE inhibitors, diuretics, and/or digoxin; hypertension.  

**OFF-LABEL:** Treatment of ventricular arrhythmias, migraine prophylaxis, essential tremor, aggressive behavior, prevent reinfarction post MI, prevent/treat atrial fibrillation/atrial flutter, hypertrophic cardiomyopathy, thyrotoxicosis.

Precautions

**Contraindications:** Hypersensitivity to metoprolol.  

**(Immediate-Release): MI:** Severe sinus bradycardia, MI with heart rate less than 45 beats/min or systolic B/P less than 100 mm Hg, moderate to severe HF, significant first-degree heart block, second- or third-degree heart block.  

**(Immediate-Release): HTN/Angina:** Sinus bradycardia, second- or third-degree heart block, cardiogenic shock, overt HF, sick sinus syndrome (except with pacemaker), severe peripheral arterial disease, pheochromocytoma.  

**(Extended-Release):** Severe bradycardia, second- or third-degree heart block, cardiogenic shock, decompensated HF, sick sinus syndrome (except with functioning pacemaker).  

**Cautions:** Arterial obstruction,
bronchospastic disease, hepatic impairment, peripheral vascular disease, hyperthyroidism, diabetes mellitus, myasthenia gravis, psychiatric disease, history of severe anaphylaxis to allergens. *(Extended-Release):* Compensated HF.

**Action**

Selectively blocks beta$_1$-adrenergic receptors. **Therapeutic Effect:** Slows heart rate, decreases cardiac output, reduces B/P. Decreases myocardial ischemia severity.

**Pharmacokinetics**

<table>

**Lifespan considerations**

**Pregnancy/Lactation:** Crosses placenta; distributed in breast milk. Avoid use during first trimester. May produce bradycardia, apnea, hypoglycemia, hypothermia during delivery, low-birth-weight infants. **Children:** Safety and efficacy not established. **Elderly:** Age-related peripheral vascular disease may increase susceptibility to decreased peripheral circulation.

**Interactions**

**DRUG:** Diuretics (e.g., furosemide, HCTZ), other antihypertensives (e.g., amLODIPine, lisinopril, valsartan) may increase hypotensive effect. May mask symptoms of hypoglycemia, prolong hypoglycemic effect of insulin, oral hypoglycemics. NSAIDs (e.g., ibuprofen, ketorolac, naproxen) may decrease antihypertensive effect. Sympathomimetics (e.g., dopamine, norepinephrine), xanthines may mutually inhibit effects. Potent **CYP2D6 inhibitors** (e.g.,
FLUoxetine, cimetidine) may increase concentration. Digoxin, verapamil, diltiaZEM may increase risk of bradycardia/heart block. HERBAL: Ephedra, ginseng, yohimbe may worsen hypertension. Garlic may increase antihypertensive effect. FOOD: None known. LAB VALUES: May increase serum antinuclear antibody titer (ANA), serum BUN, lipoprotein, LDH, alkaline phosphatase, bilirubin, creatinine, potassium, uric acid, ALT, AST, triglycerides.

Availability (Rx)

Injection Solution: 1 mg/mL. Tablets (Immediate-Release): 25 mg, 50 mg, 100 mg. Tablets (Extended-Release): 25 mg, 50 mg, 100 mg, 200 mg.

Administration/handling

IV

Rate of Administration
• May give undiluted.
• Administer IV injection over 1 min.
• May give by IV piggyback (in 50 mL D$_5$W or 0.9% NaCl) over 30–60 min.
• Monitor EKG, B/P during administration.

Storage
• Store at room temperature.

PO
• Tablets may be crushed; do not crush extended-release tablets.
• Extended-release tablets may be divided in half.
• Give at same time each day.
• May be given with or immediately after meals (enhances absorption).

IV incompatibility

Amphotericin B complex (Abelcet, AmBisome, Amphotec), lidocaine, nitroglycerin.

IV Compatibilities
Amiodarone, diltiazEM, furosemide, heparin, morphine.

**Indications/routes/dosage**

**Hypertension**

**PO (Immediate-Release):** **ADULTS, ELDERLY:** Initially, 50 mg twice daily. Increase at wkly (or longer) intervals. **Maintenance:** 100–450 mg/day in 2–3 divided doses. **CHILDREN:** Initially, 0.5–1 mg/kg/dose. **Maximum Initial Dose:** 25 mg. **Maximum Daily Dose:** 6 mg/kg/day or 200 mg/day, whichever is less.

**PO (Extended-Release):** **ADULTS, ELDERLY:** Initially, 25–100 mg/day as single dose. May increase at least at wkly intervals until optimum B/P attained. **Maximum:** 400 mg/day. **CHILDREN 6 YRS OR OLDER:** Initially, 1 mg/kg once daily. **Maximum:** 50 mg. May increase to 2 mg/kg/day or 200 mg/day, whichever is less.

**Angina Pectoris**

**PO (Immediate-Release):** **ADULTS:** Initially, 50 mg twice daily. Increase at wkly (or longer) intervals. Usual range: 50–200 mg twice daily. **Maximum:** 400 mg/day.

**PO (Extended-Release):** **ADULTS:** Initially, 100 mg/day as single dose. May increase by at least at wkly intervals until optimum clinical response achieved. **Maximum:** 400 mg/day.

**HF**

**PO (Extended-Release):** **ADULTS:** Initially, 12.5–25 mg/day. May double dose q2wks up to target dose of 200 mg/day.

**Early Treatment of MI**

**IV:** **ADULTS:** 5 mg q5min for up to 3 doses, followed by 25–50 mg orally q6–12h for 48–72 hrs. Transition over 2–3 days to twice daily Lopressor or once daily Toprol XL. May increase up to a maximum of 200 mg/day.

**Dosage in Renal/Hepatic Impairment**

No dose adjustment.
Side effects
Metoprolol is generally well tolerated, with transient and mild side effects. **Frequent:** Diminished sexual function, drowsiness, insomnia, unusual fatigue/weakness. **Occasional:** Anxiety, diarrhea, constipation, nausea, vomiting, nasal congestion, abdominal discomfort, dizziness, difficulty breathing, cold hands/feet. **Rare:** Altered taste, dry eyes, nightmares, paresthesia, allergic reaction (rash, pruritus).

Adverse effects/toxic reactions
Overdose may produce profound bradycardia, hypotension, bronchospasm. Abrupt withdrawal may result in diaphoresis, palpitations, headache, tremulousness, exacerbation of angina, MI, ventricular arrhythmias. May precipitate HF, MI in pts with heart disease, thyroid storm in those with thyrotoxicosis, peripheral ischemia in those with existing peripheral vascular disease. Hypoglycemia may occur in pts with previously controlled diabetes (may mask signs of hypoglycemia). **Antidote:** Glucagon (see Appendix J for dosage).

Nursing considerations

**Baseline assessment**
Assess baseline renal function, LFT. Assess B/P, apical pulse immediately before drug administration (if pulse is 60/min or less or systolic B/P is less than 90 mm Hg, withhold medication, contact physician). **Antianginal:** Record onset, type (sharp, dull, squeezing), radiation, location, intensity, duration of anginal pain, precipitating factors (exertion, emotional stress).

**Intervention/evaluation**
Measure B/P near end of dosing interval (determines whether B/P is controlled throughout day). Monitor B/P for hypotension, respiration for shortness of breath. Assess pulse for quality, rate, rhythm. Assess for evidence of HF: dyspnea (esp. on exertion, lying down), night cough, peripheral edema, distended neck veins. Monitor I&O (increased weight, decreased urinary output may indicate HF). Therapeutic response to hypertension noted in 1–2 wks.
Patient/family teaching

- Do not abruptly discontinue medication.
- Compliance with therapy regimen is essential to control hypertension, arrhythmias.
- If dose is missed, take next scheduled dose (do not double dose).
- Go from lying to standing slowly.
- Report excessive fatigue, dizziness.
- Avoid tasks that require alertness, motor skills until response to drug is established.
- Do not use nasal decongestants, OTC cold preparations (stimulants) without physician approval.
- Monitor B/P, pulse before taking medication.
- Restrict salt, alcohol intake.

metroNIDAZOLE
me-troe-nye-da-azole
Flagyl
Metro
MetroCream
MetroGel
MetroGel-Vaginal
NidaGel
Noritate
Vandazole

Fixed-Combination(s)

Helidac: metronidazole/bismuth/tetracycline (an anti-infective): 250 mg/262 mg/500 mg. Pylera: metroNIDAZOLE/bismuth/tetracycline (an anti-infective): 125 mg/140 mg/125 mg.

CLASSIFICATION
PHARMACOTHERAPEUTIC: Nitroimidazole derivative.
CLINICAL: Antibacterial, antiprotozoal.
Do not confuse metroNIDAZOLE with meropenem, metFORMIN, methotrexate, or miconazole.

**Uses**

Treatment of anaerobic infections (skin/skin structure, CNS, lower respiratory tract, bone/joints, intra-abdominal, gynecologic, endocarditis, septicemia). Treatment of *H. pylori* (part of multidrug regimen); surgical prophylaxis (colorectal), trichomoniasis, amebiasis. Topical treatment of acne rosacea or inflammatory lesions. **Vaginal gel:** Treatment of bacterial vaginosis. **OFF-LABEL:** Crohn’s disease, urethritis. Antibiotic-associated pseudomembranous colitis (AAPC) caused by *C. difficile*.

**Precautions**

**Contraindications:** Hypersensitivity to metronidazole. Pregnancy (first trimester with trichomoniasis), use of disulfiram within 2 wks, use of alcohol during therapy or within 3 days of discontinuing metroNIDAZOLE. **Cautions:** Blood dyscrasias, severe hepatic dysfunction, end-stage renal disease, seizure disorder, HF, other sodium-retaining states, elderly.

**Action**

Disrupts DNA, inhibiting nucleic acid synthesis. **Therapeutic Effect:** Produces bactericidal, antiprotozoal, amebicidal, trichomonacidal effects. Produces anti-inflammatory, immunosuppressive effects when applied topically.

**Pharmacokinetics**

Well absorbed from GI tract; minimally absorbed after topical application. Protein binding: less than 20%. Widely distributed; crosses blood-brain barrier. Metabolized in liver. Excreted in urine (80%), feces (15%). Removed by hemodialysis. **Half-life:** 8 hrs (increased in cirrhosis, neonates). Active metabolite prolonged in renal failure.

**Lifespan considerations**

**Pregnancy/Lactation:** Readily crosses placenta. Distributed in breast milk.
Contraindicated during first trimester in those with trichomoniasis. Topical use during pregnancy, lactation discouraged. **Children:** Safety and efficacy of topical administration not established in pts younger than 21 yrs. **Elderly:** Age-related hepatic impairment may require dosage adjustment.

**Interactions**

**DRUG:** Alcohol may cause disulfiram-type reaction (e.g., abdominal cramps, nausea, vomiting, headache, psychotic reactions). **Disulfiram** may increase risk of toxicity. May increase effects of oral anticoagulants (e.g., warfarin). **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** May increase serum LDH, ALT, AST.

**Availability (Rx)**

**Capsules:** 375 mg. **Injection (Infusion):** 500 mg/100 mL. **Suspension, Oral:** 50 mg/mL, 100 mg/mL. **Tablets (Flagyl):** 250 mg, 500 mg. **Topical Cream:** 0.75% (MetroCream), 1% (Noritate). **Topical Gel (MetroGel):** 0.75%, 1%. **Vaginal Gel (MetroGel-Vaginal, Vandazole):** 0.75%.

**Tablets (Extended-Release):** 750 mg.

**Administration/handling**

**IV**

**Rate of Administration**

- Infuse IV over 30–60 min. Do not give by IV bolus.

**Storage**

- Store at room temperature (ready-to-use infusion bags).

**PO**

- Give without regard to meals. Give with food to decrease GI irritation.
- Extended-release tablet should be given on an empty stomach (1 hr before or 2 hrs after meals).
- Do not crush extended-release tablets.

**IV incompatibilities**
Amphotericin B complex (Abelcet, AmBisome, Amphotec).

**IV Compatibilities**
Dexmedetomidine (Precedex), diltiazem (Cardizem), DOPamine (Intropin), heparin, HYDROmorphine (Dilaudid), LORazepam (Ativan), magnesium sulfate, midazolam (Versed), morphine.

**Indications/routes/dosage**

**Amebiasis**
**PO:** ADULTS, ELDERLY: 750 mg q8h for 5–10 days. **CHILDREN:** 35–50 mg/kg/day in divided doses q8h for 7–10 days.

**Anaerobic Infections**
**PO, IV:** ADULTS, ELDERLY: 500 mg q6–8h. **Maximum:** 4 g/day.
**PO:** CHILDREN, INFANTS: 30–50 mg/kg/day in divided doses q8h. **Maximum:** 2,250 mg/day.
**IV:** CHILDREN, INFANTS: 22.5–40 mg/kg/day in 3 divided doses. **Maximum:** 1,500 mg/day.

**Intra-Abdominal Infections**
**IV:** ADULTS, ELDERLY: 500 mg q6h. **Maximum:** 4 g/day.

**Pseudomembranous Colitis**
**PO:** ADULTS, ELDERLY: 250–500 mg 3–4 times/day. **CHILDREN:** 30 mg/kg/day in divided doses q6h for 7–10 days. **Maximum:** 2 g/day.

**Bacterial Vaginosis**
**Intravaginal:** ADULTS: 0.75% apply 1–2 times/day for 5 days. 1.3% apply once as a single dose.

**Centers for Disease Control and Prevention (CDC) does not recommend the use of topical agents during pregnancy.**

**Rosacea**
Topical: ADULTS, ELDERLY: (1%): Apply to affected area once daily. (0.75%): Apply to affected area twice daily.

Dosage in Renal Impairment
No dose adjustment.

Dosage in Hepatic Impairment
Mild to moderate impairment: Use caution. No dose adjustment. Severe impairment: Reduce dose by 50% for immediate-release; not recommended for extended-release.

Side effects
Frequent: Systemic: Anorexia, nausea, dry mouth, metallic taste. Vaginal: Symptomatic cervicitis/vaginitis, abdominal cramps, uterine pain. Occasional: Systemic: Diarrhea, constipation, vomiting, dizziness, erythematous rash, urticaria, reddish-brown urine. Topical: Transient erythema, mild dryness, burning, irritation, stinging, tearing when applied too close to eyes. Vaginal: Vaginal, perineal, vulvar itching; vulvar swelling. Rare: Mild, transient leukopenia; thrombophlebitis with IV therapy.

Adverse effects/toxic reactions
Oral therapy may result in furry tongue, glossitis, cystitis, dysuria, pancreatitis. Peripheral neuropathy (manifested as numbness, tingling of hands/feet) usually is reversible if treatment is stopped immediately upon appearance of neurologic symptoms. Seizures occur occasionally.

Nursing considerations
Baseline assessment
Obtain baseline CBC, LFT. Question for history of hypersensitivity to metronidazole, other nitroimidazole derivatives (and parabens with topical). Obtain specimens for diagnostic tests, cultures before giving first dose (therapy may begin before results are known).
**Intervention/evaluation**

**Patient/family teaching**

- Urine may be red-brown or dark.
- Avoid alcohol, alcohol-containing preparations (cough syrups, elixirs) for at least 48 hrs after last dose.
- Avoid tasks that require alertness, motor skills until response to drug is established.
- If taking metronIDAZOLE for trichomoniasis, refrain from sexual intercourse until full treatment is completed.
- For amebiasis, frequent stool specimen checks will be necessary.
- **Topical:** Avoid contact with eyes.
- May apply cosmetics after application.
- Metronidazole acts on erythema, papules, pustules but has no effect on rhinophyma (hypertrophy of nose), telangiectasia, ocular problems (conjunctivitis, keratitis, blepharitis).
- Other recommendations for rosacea include avoidance of hot/spicy foods, alcohol, extremes of hot/cold temperatures, excessive sunlight.

**micafungin**

mye-ka-fun-jin

Mycamine

**CLASSIFICATION**

PHARMACOTHERAPEUTIC: Echinocandin antifungal.

CLINICAL: Antifungal.

**Uses**

Treatment of esophageal candidiasis, candidemia, candida peritonitis, abscesses, acute disseminated candidiasis, prophylaxis of *Candida* infection in pts
undergoing hematopoietic stem cell transplant. **OFF-LABEL:** Treatment of infections due to *Aspergillus* spp.

**Precautions**

**Contraindications:** Hypersensitivity to micafungin. **Cautions:** Hepatic/renal impairment, concomitant hepatotoxic medications.

**Action**

Inhibits synthesis of glucan (vital component of fungal cell formation), damaging fungal cell membrane. **Therapeutic Effect:** Decreased glucan content leads to cellular lysis.

**Pharmacokinetics**

Slowly metabolized in liver. Protein binding: greater than 99%. Primarily excreted in feces. Not removed by hemodialysis. **Half-life:** 11–21 hrs.

**Lifespan considerations**

**Pregnancy/Lactation:** May reduce sperm count. May be embryotoxic. Unknown if distributed in breast milk. **Children:** Safety and efficacy not established. **Elderly:** No age-related precautions noted.

**Interactions**

**DRUG:** Hepatotoxic drugs (e.g., acetaminophen, ketoconazole, methotrexate, simvastatin) may increase risk of hepatic injury. May increase concentration of NIFEdipine, sirolimus, itraconazole. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** May increase serum creatinine, alkaline phosphatase, LDH, ALT, AST.

**Availability (Rx)**

**Injection, Powder for Reconstitution:** 50 mg, 100 mg.

**Administration/handling**
Reconstitution
• Add 5 mL 0.9% NaCl (without bacteriostatic agent) to each 50-mg vial (10 mL to 100-mg vial) to yield micafungin 10 mg/mL.
• Gently swirl to dissolve; do not shake.
• Further dilute in 0.9% NaCl or D₅W to final concentration of 0.5–1.5 mg/mL.
• Alternatively, D₅W may be used for reconstitution and dilution.
• Flush existing IV line with 0.9% NaCl or D₅W before infusion.

Rate of Administration
• Infuse over 60 min.

Storage
• Reconstituted solution is stable for 24 hrs at room temperature.
• Discard if precipitate is present.

IV incompatibilities
Amiodarone, nicardipine.

IV Compatibilities
Bumetanide (Bumex), calcium gluconate, heparin.

Indications/routes/dosage

Esophageal Candidiasis
IV: ADULTS, ELDERLY: 150 mg/day for 10–30 days. CHILDREN 4 MOS OR OLDER: (GREATER THAN 30 KG): 2.5 mg/kg/day. (Maximum: 150 mg daily.) (30 KG OR LESS): 3 mg/kg/day.

Candida Prophylaxis in Stem Cell Pts
IV: ADULTS, ELDERLY: 50 mg/day. CHILDREN 4 MOS OR OLDER: 1 mg/kg/day. Maximum: 50 mg/day.

Candidemia, Disseminated Candidiasis, Peritonitis, Abscesses
IV: ADULTS, ELDERLY: 100 mg/day for 15 days. CHILDREN 4 MOS OR...
OLDER: 2 mg/kg/day. Maximum: 100 mg daily.

Dosage in Renal/Hepatic Impairment
No dose adjustment.

Side effects
Occasional (3%–2%): Nausea, headache, diarrhea, vomiting, fever. Rare (1%): Dizziness, drowsiness, pruritus, abdominal pain, dyspepsia.

Adverse effects/toxic reactions
Hypersensitivity reaction characterized by rash, pruritus, facial edema occurs rarely. Anaphylaxis, hemoglobinuria, hemolytic anemia have been reported.

Nursing considerations

Baseline assessment
Determine baseline renal function, LFT and periodically thereafter.

Intervention/evaluation
Monitor BUN, serum creatinine, CrCl, LFT. Monitor for hepatotoxicity.

Patient/Family Teaching
• Report liver problems such as bruising, confusion; dark amber or orange-colored urine; right upper abdominal pain; yellowing of the skin or eyes.
• Report decreased urine output; dark, amber urine; swelling of the hands or feet.
• Do not take OTC medications that are toxic to the liver (e.g., acetaminophen).

midazolam
mye-da-zoe-lam
Apo-Midazolam
CLASSIFICATION: Benzodiazepine (Schedule IV).
CLINICAL: Sedative, anxiolytic.
Uses
Sedation, anxiolytic, amnesia before procedure or induction of anesthesia, conscious sedation before diagnostic/radiographic procedure, continuous IV sedation of intubated or mechanically ventilated pts. **OFF-LABEL:** Anxiety, status epilepticus, conscious sedation (intranasal route).

Precautions
**Contraindications:** Hypersensitivity to midazolam. Acute narrow-angle glaucoma, concurrent use of potent CYP3A4 inhibitors. **Cautions:** Renal/hepatic/pulmonary impairment, impaired gag reflex, HF, treated open-angle glaucoma, obese pts, concurrent CNS depressants, alcohol dependency, elderly pts, debilitated pts.

Action
Enhances action of gamma-aminobutyric acid (GABA), one of the major inhibitory neurotransmitters in the brain. **Therapeutic Effect:** Produces anxiolytic, hypnotic, anticonvulsant, muscle relaxant, amnestic effects.

Pharmacokinetics

Well absorbed after IM administration. Protein binding: 97%. Metabolized in liver. Primarily excreted in urine. Not removed by hemodialysis. **Half-life:** 1–5
Lifespan considerations

Pregnancy/Lactation: Crosses placenta. Unknown if drug is distributed in breast milk. Children: Neonates more likely to have respiratory depression. Elderly: Age-related renal impairment may require dosage adjustment.

Interactions

DRUG: Alcohol, other CNS depressants (e.g., LORazepam, morphine, zolpidem) may increase CNS effects, respiratory depression, hypotensive effect. CYP3A4 inhibitors (e.g., erythromycin, ketoconazole, ritonavir) may increase concentration/sedative effect. HERBAL: Gotu kola, kava kava, St. John’s wort, valerian may increase CNS depression. St. John’s wort may decrease concentration. FOOD: Grapefruit products increase oral absorption, systemic availability. LAB VALUES: None significant.

Availability (Rx)

Injection Solution: 1 mg/mL, 5 mg/mL. Syrup: 2 mg/mL.

Administration/handling

IV

Rate of Administration
• May give undiluted or as infusion.
• Resuscitative equipment, O₂ must be readily available before IV administration.
• Administer by slow IV injection over at least 2–5 min at concentration of 1–5 mg/mL.
• Reduce IV rate in those older than 60 yrs, debilitated pts with chronic disease states, pulmonary impairment.
• Too-rapid IV rate, excessive doses, or single large dose increases risk of respiratory depression/arrest.

Storage
• Store vials at room temperature.
IM

- Give deep IM into large muscle mass. **Maximum concentration:** 1 mg/mL.

PO

- Do not mix with grapefruit juice.

**IV incompatibilities**

Albumin, amphotericin B complex (Abelcet, AmBisome, Amphotec), ampicillin (Polycillin), ampicillin and sulbactam (Unasyn), bumetanide (Bumex), co-trimoxazole (Bactrim), dexamethasone (Decadron), fosphenytoin (Cerebyx), furosemide (Lasix), hydrocortisone (Solu-Cortef), methotrexate, nafcillin (Nafcil), sodium bicarbonate.

**IV Compatibility**

Amiodarone (Cordarone), atropine, calcium gluconate, dexmedetomidine (Precedex), diltiazem (Cardizem), diphenhydramine (Benadryl), DOBUTamine (Dobutrex), DOPamine (Intropin), etomidate (Amidate), fentany (Sublimaze), glycopyrrolate (Robinul), heparin, HYDROMorphine (Dilaudid), hydROMorphone (Vistaril), insulin, LORazepam (Ativan), milrinone (Primacor), morphine, nitroglycerin, norepinephrine (Levophed), potassium chloride, propofol (Diprivan).

**Indications/routes/dosage**

**Preop Sedation**

**PO:** CHILDREN: 0.25–0.5 mg/kg. **Maximum:** 20 mg.

**IV:** ADULTS, ELDERLY: 0.02–0.04 mg/kg. Usual dose: 1–2.5 mg.

CHILDREN 6–12 YRS: 0.025–0.05 mg/kg. **Maximum:** 10 mg. CHILDREN 6 MOS–5 YRS: 0.05–0.1 mg/kg. **Maximum:** 6 mg.

**IM:** ADULTS, ELDERLY: 0.07–0.08 mg/kg 30–60 min before surgery. Usual dose: 5 mg. CHILDREN: 0.1–0.15 mg/kg 30–60 min before surgery. **Maximum:** 10 mg.

**Continuous Sedation During Mechanical Ventilation**
**IV: ADULTS, ELDERLY:** Initially, 0.01–0.05 mg/kg (1–5 mg in 70-kg adult). May repeat at 5- to 15-min intervals until adequate sedation achieved or continuous infusion rate of 0.02–0.1 mg/kg/hr and titrated to desired effect. **CHILDREN:** Initially, 0.05–0.2 mg/kg followed by continuous infusion of 0.06–0.12 mg/kg/hr (1–2 mcg/kg/min) titrated to desired effect. Usual range: 0.4–9.4 mcg/kg/min.

**Dosage in Renal Impairment**
No dose adjustment.

**Dosage in Hepatic Impairment**
Use caution.

**Side effects**
**Frequent (10%–4%):** Decreased respiratory rate, tenderness at IM or IV injection site, pain during injection, oxygen desaturation, hiccups. **Occasional (3%–2%):** Hypotension, paradoxical CNS reaction. **Rare (less than 2%):** Nausea, vomiting, headache, coughing.

**Adverse effects/toxic reactions**
Inadequate or excessive dosage, improper administration may result in cerebral hypoxia, agitation, involuntary movements, hyperactivity, combativeness. Too-rapid IV rate, excessive doses, or single large dose increases risk of respiratory depression/arrest. Respiratory depression/apnea may produce hypoxia, cardiac arrest.

**Nursing considerations**

**Baseline assessment**
Resuscitative equipment, oxygen must be available. Obtain vital signs before administration. Assess level of consciousness.

**Intervention/evaluation**
Monitor respiratory rate, oxygen saturation continuously during parenteral
administration for underventilation, apnea. Monitor vital signs, level of sedation q3–5min during recovery period. Assess level of consciousness for effectiveness.

**midodrine**

mye-doe-dreen

Amatine

Apo-Midodrine

**CLASSIFICATION**

PHARMACOTHERAPEUTIC: Alpha₁ agonist.

CLINICAL: Vasopressor.

■ **BLACK BOX ALERT** ■ Can cause marked rise in supine blood pressure; use in pts for whom orthostatic hypotension significantly impairs daily life.

Do not confuse Amatine with amantadine or protamine, or midodrine with Midrin.

**Uses**

Treatment of symptomatic orthostatic hypotension. **OFF-LABEL:** Vasovagal syncope, prevention of dialysis-induced hypotension.

**Precautions**

**Contraindications:** Hypersensitivity to midodrine. Acute renal failure, persistent supine hypertension, pheochromocytoma, severe cardiac disease, thyrotoxicosis, urinary retention. **Cautions:** Renal/hepatic impairment, history of visual problems, diabetes, immobility, pts who are unable to stand. Concurrent administration with digoxin, beta blockers (e.g., metoprolol), vasoconstrictors (e.g., norepinephrine).

**Action**

Forms active metabolite desglymidodrine, an alpha₁ agonist, increasing arteriolar and venous tone. **Therapeutic Effect:** Increases standing, sitting, and supine
systolic B/P in pts with orthostatic hypotension.

**Pharmacokinetics**

<table>
<thead>
<tr>
<th>Route</th>
<th>Onset</th>

</table>

Rapid absorption from GI tract following PO administration. Protein binding: Low. Undergoes enzymatic hydrolysis in systemic circulation. Excreted in urine. **Half-life:** 0.5 hr.

**Lifespan considerations**

**Pregnancy/Lactation:** Unknown if drug crosses placenta or is distributed in breast milk. **Children:** Safety and efficacy not established. **Elderly:** Age-related renal impairment may require dosage adjustment.

**Interactions**

**DRUG:** Digoxin may have additive bradycardic effects. **Sodium-retaining steroids** (e.g., fludrocortisone) may increase sodium retention. **Vasoconstrictors** (e.g., DOPamine, norepinephrine) may have additive effects. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** None significant.

**Availability (Rx)**

**Tablets:** 2.5 mg, 5 mg, 10 mg.

**Administration/handling**

- Give without regard to food.
- Last dose of day should be given 3–4 hrs before bedtime.

**Indications/routes/dosage**

**Orthostatic Hypotension**

**PO:** **ADULTS, ELDERLY:** 10 mg 3 times/day (q3–4hrs). Give during the day
when pt is upright, such as upon arising, midday, and late afternoon. Do not give later than 6 PM. **Maximum:** 30 mg/day.

**Dosage in Renal Impairment**
2.5 mg 3 times/day; increase gradually, as tolerated. **Hemodialysis:** Dose after HD unless used to prevent HD-induced hypotension.

**Dosage in Hepatic Impairment**
Use caution.

**Side effects**

**Frequent (20%–7%):** Paresthesia, piloerection, pruritus, dysuria, supine hypertension. **Occasional (6%–1%):** Pain, rash, chills, headache, facial flushing, confusion, dry mouth, anxiety.

**Adverse effects/toxic reactions**

May cause marked increase of supine systolic BP (supine hypertension).

**Nursing considerations**

**Baseline assessment**
Assess sensitivity to midodrine, other medications (esp. digoxin, sodium-retaining vasoconstrictors). Assess medical history, esp. for renal impairment, severe hypertension, cardiac disease.

**Intervention/evaluation**
Monitor B/P, renal, hepatic, cardiac function.

**Patient/family teaching**
- Do not take last dose of the day after evening meal or less than 4 hrs before bedtime.
- Do not give if pt will be supine.
- Use caution with OTC medications that may affect B/P (e.g., cough and cold,
midostaurin
mye-doe-staw-rim
Rydapt

CLASSIFICATION
PHARMACOTHERAPEUTIC: Tyrosine kinase inhibitor.
CLINICAL: Antineoplastic.
Do not confuse midostaurin with midodrine.

Uses
Treatment of adult pts with newly diagnosed acute myeloid leukemia (AML) who are FLT3 mutation–positive, as detected by an FDA-approved test (in combination with standard cytarabine and daunorubicin induction and cytarabine consolidation chemotherapy). Treatment of adult pts with aggressive systemic mastocytosis (ASM), systemic mastocytosis with associated hematologic neoplasm (SM-AHN), or mast cell leukemia (MCL).

Precautions
Contraindications: Hypersensitivity to midostaurin. Cautions: Baseline anemia, leukopenia, neutropenia, thrombocytopenia; concomitant use of strong CYP3A inhibitors, strong CYP3A inducers; pts at risk for hemorrhage (e.g., history of GI bleeding, coagulation disorders, recent trauma; concomitant use of anticoagulants, NSAIDs, antiplatelet medication).

Action
Inhibits multiple receptors including FLT3 receptor signaling, and cell proliferation. Therapeutic Effect: Induces apoptosis in ITD and ITD mutant expressing leukemic cells.

Pharmacokinetics
Widely distributed. Metabolized in liver. Protein binding: 99.8%. Peak plasma
concentration: 1–3 hrs. Steady state reached in 28 days. Excreted in feces (95%), urine (5%). **Half-life:** 21 hrs.

**Lifespan considerations**

**Pregnancy/Lactation:** Avoid pregnancy; may cause fetal harm. Females of reproductive potential and males with female partners of reproductive potential should use effective contraception during treatment and for at least 4 mos after discontinuation. Unknown if distributed in breast milk. Breastfeeding not recommended. May impair fertility in both females and males. **Children:** Safety and efficacy not established. **Elderly:** No age-related precautions noted.

**Interactions**

**DRUG:** Moderate CYP3A4 inhibitors (e.g., ciprofloxacin, fluconazole, verapamil), strong CYP3A4 inhibitors (e.g., erythromycin, ketoconazole, ritonavir) may increase concentration/effect. Strong CYP3A4 inducers (e.g., carbAMazepine, phenytoin, rifAMPin) may decrease concentration/effect. QT-prolonging agents may enhance QT-prolonging effect. May decrease therapeutic effect of BCG. **HERBAL:** St. John’s wort may decrease concentration/effect. **FOOD:** Grapefruit products may increase concentration/effect. **LAB VALUES:** May increase serum alkaline phosphatase, ALT, AST, bilirubin, creatinine, GGT, glucose, lipase, sodium, uric acid. May decrease Hgb, Hct, lymphocytes, leukocytes, neutrophils, platelets, RBCs; serum albumin, magnesium, phosphate, potassium. May increase or decrease serum calcium or sodium. May prolong aPTT.

**Availability (Rx)**

- **Capsules:** 25 mg.

**Administration/handling**

**PO**

- Give with food.
- Administer whole; do not cut, crush, open capsules.
Indications/Routes/Dosage

Acute Myeloid Leukemia
PO: ADULTS, ELDERLY: 50 mg twice daily (at 12-hr intervals) on days 8–21 of each induction with cytarabine and daunorubicin, and on days 8–21 of each cycle of consolidation with high-dose cytarabine.

Systemic Mastocytosis, Mast Cell Leukemia
PO: ADULTS, ELDERLY: 100 mg twice daily. Continue until disease progression or unacceptable toxicity.

Dose Modification for Systemic Mastocytosis

Neutropenia
Treatment-induced ANC less than 1000 cells/mm³ in pts without MCL; treatment-induced ANC less than 500 cells/mm³ in pts with baseline ANC 500–1500 cells/mm³: Withhold treatment until ANC greater than or equal to 1000 cells/mm³, then resume at 50 mg twice daily. May increase to 100 mg twice daily if 50 mg dose is tolerated. If treatment-induced neutropenia persists for more than 21 days, permanently discontinue.

Thrombocytopenia
Platelet count less than 50,000 cells/mm³ (treatment-induced) in pts without MCL; platelet count less than 25,000 cells/mm³ (treatment-induced) in pts with baseline platelet count 25,000–75,000 cells/mm³: Withhold treatment until platelet count greater than or equal to 50,000 cells/mm³, then resume at 50 mg twice daily. May increase to 100 mg twice daily if 50-mg dose is tolerated. If treatment-induced thrombocytopenia persists for more than 21 days, permanently discontinue.

Anemia
Hgb less than 8 g/dL (treatment-induced) in pts without MCL; life-threatening anemia with baseline Hgb 8–10 g/dL (treatment-induced): Withhold treatment until Hgb greater than or equal to 8 g/dL, then resume at 50 mg twice daily. May increase to 100 mg twice daily if 50-mg dose is tolerated. If
treatment-induced anemia persists for more than 21 days, permanently discontinue.

**Nausea, Vomiting**

*CTCAE Grade 3 or 4 nausea, vomiting despite antiemetic therapy:* Withhold treatment for 3 days (6 doses), then resume at 50 mg twice daily. May increase to 100 mg twice daily if 50-mg dose is tolerated.

**Nonhematologic Toxicities**

*Any other grade toxicities:* Withhold treatment until resolved to CTCAE Grade 2 or less, then resume at 50 mg twice daily. May increase to 100 mg twice daily if 50-mg dose is tolerated.

**Dosage in Renal/Hepatic Impairment**

Not specified; use caution.

**Side Effects**

*(AML) Frequent (83%–24%):* Nausea, mucositis, stomatitis, laryngeal pain, vomiting, headache, petechiae, musculoskeletal pain. *Occasional (20%–7%):* Hyperglycemia, hemorrhoids, arthralgia, hyperhidrosis, insomnia, hypertension, dry skin, increased weight. *Rare (4%–3%):* Tremor, eyelid edema. *(Systemic Mastocytosis) Frequent (82%–23%):* Nausea, vomiting, diarrhea, edema, peripheral edema, fatigue, asthenia, musculoskeletal pain, back pain, extremity pain, abdominal pain, constipation, pyrexia, headache, dyspnea, bronchospasm. *Occasional (19%–6%):* Arthralgia, cough, rash, dizziness, insomnia, hypotension, dyspepsia. *Rare (5%–4%):* Vertigo, chills, mental status change.

**Adverse Effects/Toxic Reactions**

Anemia, leukopenia, lymphopenia, neutropenia, thrombocytopenia are expected responses to therapy. Hypersensitivity reactions including anaphylaxis, angioedema, dyspnea, itching, flushing may occur. Infections including bronchitis, bronchopulmonary aspergillosis, colitis, cellulitis, device-related infection, erysipelas, fungal pneumonia, gastroenteritis, hepatic candidiasis, herpes zoster, nasopharyngitis, oral herpes, pneumonia, sepsis, sinusitis, splenic
fungal infection, upper respiratory tract infection, urinary tract infection have occurred. Renal failure, acute kidney injury may occur. Other adverse effects including angina pectoris, cardiac failure, contusion, duodenal ulcer hemorrhage, epistaxis, gastritis, febrile neutropenia, GI bleeding, hematoma, interstitial lung disease, myocardial infarction, myocardial ischemia, pericardial effusion, pneumonitis, pulmonary congestion, pulmonary edema, thrombosis were reported. May prolong QT interval.

Nursing Considerations

Baseline Assessment
Obtain ANC, CBC, BMP, LFT; serum magnesium; vital signs. Ensure electrolytes are corrected prior to initiation. In females of reproductive potential, obtain pregnancy test within 7 days of initiation. Screen for active infection. To reduce risk of nausea/vomiting, administer antiemetic before treatment. Obtain EKG in pts taking QT interval–prolonging medications. Receive full medication history and screen for interactions. Question history as listed in Precautions. Question plans of breastfeeding. Confirm compliance of effective contraception. Offer emotional support.

Intervention/Evaluation
Monitor ANC, CBC for anemia, leukopenia, neutropenia, lymphopenia, thrombocytopenia. Monitor BMP for renal insufficiency, electrolyte imbalance (esp. in pts with diarrhea, vomiting, malnutrition); LFT for transaminitis, hepatotoxicity. Diligently screen for infections, sepsis; provide appropriate antimicrobial therapy if indicated. Obtain ABG, radiologic test if interstitial lung disease or pneumonitis suspected. Monitor for toxicities at least wkly for 4 wks, then every other wk for 8 wks, then monthly thereafter. If treatment-related toxicities occur, consider referral to specialist. Monitor for hemorrhage, melena, hematuria; hypersensitivity reactions; myocardial infarction, pulmonary disease, thrombosis. Monitor I&O.

Patient/Family Teaching
• Blood levels will be routinely monitored.
• Treatment may depress your immune system and reduce your ability to fight infection. Report symptoms of infection such as body aches, burning with
urination, chills, cough, fatigue, fever. Avoid those with active infection.

- Report symptoms of kidney failure (decreased urination, amber-colored urine, flank pain, fatigue, swelling of the hands or feet); liver problems (bruising, confusion; amber, dark, orange-colored urine; right upper abdominal pain, yellowing of the skin or eyes); lung problems (severe cough, difficulty breathing, lung pain, shortness of breath).

- Avoid pregnancy. Females and males of childbearing potential should use effective contraception during treatment and for at least 4 mos after last dose. Do not breastfeed.

- Treatment may impair fertility.

- Avoid grapefruit products, Seville oranges, starfruit, herbal supplements.

- Do not take newly prescribed medications unless approved by the prescriber who originally started treatment.

- Heart attacks have occurred; immediately report chest pain, sweating, fainting, palpitations, jaw pain, pain that radiates to the left arm.

- Antinausea medication will be given before treatment to reduce the risk of nausea or vomiting.

- Report bleeding of any kind, esp. nosebleeds, blood in stool or urine.

- Allergic reactions such as anaphylaxis, difficulty breathing, itching, flushing, rash may occur.

---

**milnacipran**
mil-nay-sip-ran

**Savella**

- **CLASSIFICATION**
  - PHARMACOTHERAPEUTIC: Serotonin, norepinephrine reuptake inhibitor.
  - CLINICAL: Fibromyalgia agent.

- **BLACK BOX ALERT**
  - Increased risk of suicidal ideation and behavior in children, adolescents, and young adults 18–24 yrs with major depressive disorder, other psychiatric disorders. Not approved for use in children.

Do not confuse Savella with cevimeline or sevelamer.
Uses
Management of fibromyalgia.

Precautions

Contraindications: Hypersensitivity to milnacipran. Concomitant use of MAOIs to treat psychiatric disorders (concurrently or within 5 days of discontinuing milnacipran or within 2 wks of discontinuing MAOI), initiation of milnacipran in pts receiving linezolid or IV methylene blue. Caution: Pts with depression, pts at increased risk of suicide, other psychiatric disorders; elevated blood pressure or heart rate, seizure disorder, pts with substantial alcohol use or chronic hepatic disease, pts with history of dysuria (e.g., prostatic hypertrophy, prostatitis), controlled narrow-angle glaucoma, renal impairment, cardiovascular disease, elderly.

Action
Appears to inhibit serotonin and norepinephrine reuptake at CNS neuronal presynaptic membranes. Therapeutic Effect: Reduces chronic pain, fatigue, depression, sleep disorders associated with fibromyalgia syndrome; improves physical function.

Pharmacokinetics

Lifespan Considerations

Pregnancy/Lactation: Increased risk of fetal complications, including need for respiratory support, if given during third trimester. Unknown if distributed in breast milk. Children: Safety and efficacy not established in pts younger than 18 yrs. Elderly: Severe renal impairment requires dosage adjustment.

Interactions

Drug: Lithium, MAOIs (e.g., phenelzine, selegiline) may increase risk of serotonin syndrome. EPIEPRINE, norepinephrine may produce paroxysmal
hypertension, arrhythmias. **Intravenous digoxin** may produce tachycardia, hypotension. May inhibit antihypertensive effect of **cloNIDine.** **HERBAL:** Gotu kola, kava kava, St. John’s wort, valerian may increase CNS depression, increase risk of serotonin syndrome. **FOOD:** None known. **LAB VALUES:** May decrease serum sodium.

**Availability (Rx)**

![Tablets, Film-Coated: 12.5 mg, 25 mg, 50 mg, 100 mg.](image)

**Administration/handling**

- Give without regard to food.
- Do not break, crush, dissolve, or divide film-coated tablets.

**Indications/routes/dosage**

**Fibromyalgia**

**PO: ADULTS, ELDERLY:** Day 1: 12.5 mg once. Days 2–3: 25 mg/day (12.5 mg twice daily). Days 4–7: 50 mg/day (25 mg twice daily). After Day 7: 100 mg/day (50 mg twice daily thereafter). Dose may be increased to 200 mg/day (100 mg twice daily).

**Dosage in Renal Impairment**

- **Mild impairment:** No dose adjustment. **Moderate impairment:** Use caution. **Severe impairment:** Reduce maintenance dose by 50% to 50 mg/day (25 mg twice daily). Based on pt response, dose may be increased to 100 mg/day (50 mg twice daily). Not recommended in end-stage renal disease.

**Dosage in Hepatic Impairment**

- **Mild to moderate impairment:** No dose adjustment. **Severe impairment:** Use caution.

**Side effects**

- **Frequent (37%–18%):** Nausea, headache. **Occasional (16%–5%):**
Constipation, insomnia, hot flashes, dizziness, hyperhidrosis, palpitations, vomiting, URI. **Rare (Less Than 5%):** Dry mouth, increased B/P, anxiety, skin flushing, rash, blurred vision, abdominal pain, chest pain, chills, pruritus, paresthesia, tachycardia.

### Adverse effects/toxic reactions

Abrupt discontinuation may present withdrawal symptoms (dysphoria, irritability, agitation, dizziness, paresthesia, anxiety, confusion, headache, lethargy, emotional lability, tinnitus, seizures). Serotonin syndrome symptoms may include mental status changes (agitation, hallucinations), hyperreflexia, incoordination. May increase risk of bleeding events (e.g., ecchymoses, hematomas, epistaxis).

### Nursing considerations

#### Baseline assessment

Obtain baseline pain intensity scale, location(s) of pain, tenderness. Obtain baseline B/P, heart rate. Question for history of changes in day-to-day pain intensity.

#### Intervention/evaluation

Control nausea with antiemetics. Treat complaint of headache, migraine with appropriate analgesics. Monitor for increase in B/P, pulse. Question for changes in visual acuity. Assess for clinical improvement and record onset of pain control, decreased fatigue, lessening of depressive symptoms, improvement in sleep pattern. Monitor for suicidal ideation.

#### Patient/family teaching

- Avoid tasks that require alertness, motor skills until response to drug is established.
- Do not abruptly discontinue medication.
- Increase fluids, bulk to prevent constipation.
- Report unusual changes in behavior, suicidal ideation; hot flushing that becomes intolerant, excessive sweating.
- Caution about risk of bleeding associated with concomitant use of NSAIDs,
milrinone
mil-ri-none

CLASSIFICATION
PHARMACOTHERAPEUTIC: Cardiac inotropic agent.
CLINICAL: Vasodilator.

Uses

Short-term management of decompensated HF. OFF-LABEL: Inotropic therapy for pts unresponsive to other therapy, outpatient inotropic therapy for heart transplant candidates, palliation of symptoms in end-stage HF.

Precautions

Contraindications: Hypersensitivity to milrinone. Cautions: Severe obstructive aortic or pulmonic valvular disease, history of ventricular arrhythmias, atrial fibrillation/flutter, renal impairment. Not recommended in pts with acute MI.

Action

Inhibits phosphodiesterase, which increases cyclic adenosine monophosphate (cAMP), potentiating delivery of calcium to myocardial contractile systems. Therapeutic Effect: Relaxes vascular muscle, causing vasodilation. Increases cardiac output, decreases pulmonary capillary wedge pressure, vascular resistance.

Pharmacokinetics

Protein binding: 70%. Metabolized in liver. Primarily excreted in urine. Half-life: 1.7–2.7 hrs.

Lifespan considerations

Pregnancy/Lactation: Unknown if drug crosses placenta or is distributed in
breast milk. **Children:** Safety and efficacy not established. **Elderly:** Age-related renal impairment may require dosage adjustment.

**Interactions**

**DRUG:** None significant. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** None significant.

**Availability (Rx)**

**Injection Solution (Primacor):** 1 mg/mL, 10-mL vial. **Injection Solution (Premix [Primacor]):** 200 mcg/mL (100 mL, 200 mL).

**Administration/handling**

**IV**

**Reconstitution**

- For IV infusion, dilute 20-mg (20-mL) vial with 80 mL 0.9% NaCl or D$_5$W to provide concentration of 0.2 mg/mL (200 mcg/mL).

**Rate of Administration**

- For IV injection (loading dose), administer undiluted slowly over 10 min.
- Monitor for arrhythmias, hypotension during IV therapy; reduce or temporarily discontinue infusion until condition stabilizes. Infuse via infusion pump.

**Storage**

- Diluted solutions stable for 72 hrs at room temperature.

**IV incompatibilities**

Furosemide (Lasix), imipenem-cilastatin (Primaxin), procainamide (Pronestyl).

**IV Compatibilities**

Calcium gluconate, dexamethasone (Decadron), dexmedetomidine (Precedex), digoxin (Lanoxin), diltiazem (Cardizem), DOBUTamine (Dobutrex), DOPamine (Intropin), heparin, HYDROmorphe (Dilaudid), lidocaine, magnesium, midazolam (Versed), morphine, nitroglycerin, potassium, propofol (Diprivan).
Indications/routes/dosage

Management of HF

IV: ADULTS: Initially, 50 mcg/kg over 10 min. Continue with maintenance infusion rate of 0.125–0.75 mcg/kg/min based on hemodynamic and clinical response.

Dosage in Renal Impairment

</tbody>
</table>

Dosage in Hepatic Impairment

No dose adjustment.

Side effects

Occasional (3%–1%): Headache, hypotension. Rare (less than 1%): Angina, chest pain.

Adverse effects/toxic reactions

Supraventricular/ventricular arrhythmias (12%), nonsustained ventricular tachycardia (2%), sustained ventricular tachycardia (1%) may occur. Ventricular fibrillation (0.2%) has been documented.

Nursing considerations

Baseline assessment

Obtain baseline lab studies, esp. BN peptide. Offer emotional support (difficulty breathing may produce anxiety). Assess B/P, apical pulse rate before treatment
begins and during IV therapy. Assess lung sounds; observe for edema.

**Intervention/evaluation**

Monitor B/P, heart rate, cardiac output, EKG, serum potassium, renal function, signs/symptoms of HF.

</table>

**CLASSIFICATION**

**PHARMACOTHERAPEUTIC:** Tetracycline.

**CLINICAL:** Antibiotic.

***Do not confuse Dynacin with Dyazide, DynaCirc, or Dynapen, or Minocin with Indocin, Mithracin, or niacin.***

**Uses**

Treatment of susceptible infections due to *Rickettsiae, M. pneumoniae, C. trachomatis, C. psittaci, H. ducreyi, Yersinia pestis, Francisella tularensis, Vibrio cholerae, Brucella* spp.; gram-negative organisms, including acute intestinal amebiasis, gram-negative respiratory and skin/skin structure infections. **Solodyn:** Treatment of inflammatory lesions of moderate to severe non-nodular acne. **OFF-LABEL:** Treatment of nocardiosis, community-acquired MRSA infection, rheumatoid arthritis (RA), prosthetic joint infection.

**Precautions**

**Contraindications:** Hypersensitivity to minocycline, other tetracyclines.

**Cautions:** Children younger than 8 yrs, renal impairment, hepatic impairment, sun/ultraviolet exposure (severe photosensitivity reaction). Avoid use in pregnancy.
**Action**
Inhibits bacterial protein synthesis by binding to ribosomes. **Therapeutic Effect:** Bacteriostatic.

**Pharmacokinetics**
Well absorbed from GI tract. Protein binding: 70%–75%. Partially excreted in feces; minimal excretion in urine. Not removed by hemodialysis. **Half-life:** 11–23 hrs.

**Lifespan considerations**

- **Pregnancy/Lactation:** Readily crosses placenta; distributed in breast milk. May inhibit fetal skeletal growth. **Children:** May cause permanent discoloration of teeth, enamel hypoplasia. Not recommended in pts younger than 8 yrs. **Elderly:** No age-related precautions noted.

**Interactions**

- **DRUG:** Aluminum-, calcium-, magnesium-containing antacids may decrease absorption, effect. **Ergot** may increase risk of ergotism. May decrease the effects of **estrogen-containing oral contraceptives.**
- **HERBAL:** Dong quai, St. John’s wort may increase risk of photosensitivity.
- **FOOD:** None known.
- **LAB VALUES:** May increase serum alkaline phosphatase, amylase, bilirubin, ALT, AST, BUN.

**Availability (Rx)**

- **Capsules:** 50 mg, 75 mg, 100 mg.
- **Tablets:** 50 mg, 75 mg, 100 mg.
- **Tablets (Extended-Release [Solodyn]):** 45 mg, 55 mg, 65 mg, 80 mg, 90 mg, 105 mg, 115 mg, 135 mg.

**Administration/handling**

- **PO**
  - Take without regard to food.
  - Give with adequate fluid (reduces risk of esophageal irritation and ulceration).
Give pellet-filled capsules, extended-release tablets whole; do not cut, crush, dissolve, or divide.

**Indications/routes/dosage**

**Usual Dosage**

**PO: ADULTS, ELDERLY:** Initially, 100–200 mg once, then 100 mg q12h or 50 mg 4 times/day. **CHILDREN OLDER THAN 8 YRS:** Initially, 4 mg/kg once, then 2 mg/kg q12h. **Maximum:** 100 mg/dose, 200 mg/day.

**Acne**

**PO (Solodyn):** **CHILDREN 12 YRS AND OLDER, WEIGHING 126–136 KG:** 135 mg once daily; **WEIGHING 111–125 KG:** 115 mg once daily; **WEIGHING 97–110 KG:** 105 mg once daily; **WEIGHING 85–96 KG:** 90 mg once daily; **WEIGHING 72–84 KG:** 80 mg once daily; **WEIGHING 60–71 KG:** 65 mg once daily; **WEIGHING 50–59 KG:** 55 mg once daily; **WEIGHING 45–49 KG:** 45 mg once daily.

**(Capsule or Immediate-Release Tablet):** **ADULTS, ELDERLY:** 50–100 mg/twice daily.

**Dosage in Renal/Hepatic Impairment**

Use caution.

**Side effects**

**Frequent:** Dizziness, light-headedness, diarrhea, nausea, vomiting, abdominal cramps, possibly severe photosensitivity, drowsiness, vertigo. **Occasional:** Altered pigmentation of skin, mucous membranes, rectal/genital pruritus, stomatitis.

**Adverse effects/toxic reactions**

Superinfection (esp. fungal), anaphylaxis, increased ICP may occur. Bulging fontanelles occur rarely in infants.
Nursing considerations

Baseline assessment
Question for history of allergies, esp. tetracyclines, sulfite.

Intervention/evaluation

Patient/family teaching
• Continue antibiotic for full length of treatment.
• Space doses evenly.
• Drink full glass of water with capsules or tablets.
• Avoid tasks that require alertness, motor skills until response to drug is established.
• Report diarrhea, rash, other new symptoms.
• Protect skin from sun exposure.
• Advise female pts to use additional form of birth control (may decrease effectiveness of oral contraceptives).

mirabegron  
*mir-a-beg-ron*
Myrbetriq

CLASSIFICATION
PHARMACOTHERAPEUTIC: Beta₃-adrenergic agonist.
CLINICAL: Smooth muscle relaxant.

Uses
Treatment of overactive bladder with symptoms of urinary incontinence,
urgency, frequency.

Precautions

**Contraindications:** Hypersensitivity to mirabegron. **Cautions:** Bladder outlet obstruction, pts taking antimuscarinic medications (increases urinary retention), mild to moderate hepatic/renal impairment, history of QT-interval prolongation, medications known to prolong QT interval. Not recommended for use in pts with severe uncontrolled hypertension (SBP equal to or greater than 180 mm Hg and/or DBP equal to or greater than 110 mm Hg).

Action

Relaxes detrusor smooth muscle of bladder through beta_3 stimulation during storage phase of urinary bladder fill–void cycle. **Therapeutic Effect:** Increases bladder capacity, reduces symptoms of urinary urgency, increased voiding frequency, urge incontinence, nocturia.

Pharmacokinetics

Readily absorbed following PO administration; widely distributed. Protein binding: 71%. Eliminated in urine (55%), feces (35%). **Half-life:** 50 hrs.

Lifespan considerations

**Pregnancy/Lactation:** Unknown if distributed in breast milk. **Children:** Safety and efficacy not established. **Elderly:** No age-related precautions noted.

Interactions

**DRUG:** May increase concentration of desipramine, digoxin, metoprolol, thioridazine, flecainide, propafenone. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** May increase GGT, LDH; temporarily increase ALT, AST.

Availability (Rx)

**Tablets, Extended-Release:** 25 mg, 50 mg.
Administration/handling

PO
• Give without regard to meals.
• Administer with water; instruct pt to swallow whole.
• Do not break, crush, dissolve, or divide film-coated tablets.

Indications/routes/dosage

Overactive Bladder
PO: ADULTS, ELDERLY: Initially, 25 mg once daily. Efficacy seen within 8 wks for 25-mg dose. May increase to 50 mg once daily.

Dosage in Renal Impairment
Mild to moderate impairment: No dosage adjustment. Severe impairment: Do not exceed 25 mg once daily.

Dosage in Hepatic Impairment
Mild impairment: No dosage adjustment. Moderate impairment: Do not exceed 25 mg once daily. Severe impairment: Not recommended.

Side effects
Occasional (9%–4%): Hypertension, headache, nasopharyngitis. Rare (2%–1%): Constipation, arthralgia, diarrhea, tachycardia, fatigue.

Adverse effects/toxic reactions
Worsening of preexisting hypertension reported infrequently. Urinary tract infection occurred in 6% of pts, influenza in 3%, and upper respiratory infection in 1.5%.

Nursing considerations
Baseline assessment
Check B/P; assess for hypertension. Monitor EKG. Receive full medication history, and screen for possible drug interactions. Monitor I&O (particularly in pts with history of urinary retention).

**Intervention/evaluation**

Monitor ALT, AST, LDH, GGT periodically. Palpate bladder for urinary retention. Measure B/P near end of dosing interval (determines whether B/P is controlled throughout day). Periodic B/P determinations are recommended, especially in hypertensive pts. For pts taking digoxin, monitor digoxin serum level for therapeutic effect (very narrow line between therapeutic and toxic level). Assess pulse for quality, irregular rate, bradycardia. Question for evidence of headache.

**Patient/family teaching**

- Report urinary retention.
- Do not use nasal decongestants, over-the-counter cold preparations without doctor approval. Restrict salt, alcohol intake.
- Take mirabegron with water; swallow tablet whole; do not chew, crush, dissolve, or divide tablet.
- May take with or without food.

---

**mirtazapine**

*mir-taz-a-peen*

Apo-Mirtazapine

Remeron

Remeron Soltab

CLASSIFICATION

PHARMACOTHERAPEUTIC: Alpha-2 antagonist.

CLINICAL: Antidepressant.

BLACK BOX ALERT ■ Increased risk of suicidal thinking and behavior in children, adolescents, young adults 18–24 yrs with major depressive disorder, other psychiatric disorders.

Do not confuse Remeron with Premarin, Rozerem, or Zemuron.
Uses
Treatment of major depressive disorder (MDD).

Precautions
Contraindications: Hypersensitivity to mirtazapine. Use of MAOIs to treat psychiatric disorders (concurrently or within 14 days of discontinuing either MAOI or mirtazapine), initiation of mirtazapine in pts receiving linezolid or IV methylene blue. Caution: Renal/hepatic impairment, elderly pts, seizure disorder, suicidal ideation or behavior, alcoholism, concurrent medications that lower seizure threshold, cardiovascular disease, pts at risk for QT prolongation, medications known to prolong QT interval.

Action
Acts as antagonist at presynaptic alpha_2-adrenergic receptors, increasing norepinephrine, serotonin neurotransmission. Has low anticholinergic activity. Therapeutic Effect: Relieves depression.

Pharmacokinetics
Rapidly, completely absorbed after PO administration; absorption not affected by food. Protein binding: 85%. Metabolized in liver. Primarily excreted in urine. Unknown if removed by hemodialysis. Half-life: 20–40 hrs (longer in males [37 hrs] than females [26 hrs]).

Lifespan considerations

Interactions
DRUG: Alcohol, CNS depressant medications (e.g., LORazepam, morphine, zolpidem) may increase impairment of cognition, motor skills. Serotonergic drugs (e.g., venlafaxine) may increase risk of serotonin syndrome. CYP3A4
inducers (e.g., carBAMazepine, phenytoin, rifAMPin) may decrease concentration/effects. CYP3A4 inhibitors (e.g., erythromycin, ketoconazole, ritonavir) may increase concentration/effects. MAOIs (e.g., phenelzine, selegiline) may increase risk of neuroleptic malignant syndrome, hypertensive crisis, severe seizures. HERBAL: Gotu kola, kava kava, St. John’s wort, valerian may increase CNS depression. St. John’s wort may decrease concentration/effects, may increase risk of serotonin syndrome. FOOD: None known. LAB VALUES: May increase serum cholesterol, triglycerides, ALT.

Availability (Rx)
Tablets: 7.5 mg, 15 mg, 30 mg, 45 mg. Tablets (Orally Disintegrating): 15 mg, 30 mg, 45 mg.

Administration/handling

PO
• Give without regard to food.
• May crush/break scored tablets.

Orally Disintegrating Tablets
• Give without regard to food.
• Do not split tablet.
• Place on tongue; dissolves without water.

Indications/routes/dosage

Depression
PO: ADULTS: Initially, 15 mg at bedtime. May increase by 15 mg/day q1–2wks. Maximum: 45 mg/day. ELDERLY: Initially, 7.5 mg at bedtime. May increase by 7.5–15 mg/day q1–2wks. Maximum: 45 mg/day.

Dosage in Renal/Hepatic Impairment
Use caution.
Side effects

**Frequent (54%–12%)**: Drowsiness, dry mouth, increased appetite, constipation, weight gain. **Occasional (89%–4%)**: Asthenia, dizziness, flu-like symptoms, abnormal dreams. **Rare**: Abdominal discomfort, vasodilation, paresthesia, acne, dry skin, thirst, arthralgia.

Adverse effects/toxic reactions

Higher incidence of seizures than with tricyclic antidepressants (esp. in pts with no history of seizures). Overdose may produce cardiovascular effects (severe orthostatic hypotension, dizziness, tachycardia, palpitations, arrhythmias). Abrupt discontinuation from prolonged therapy may produce headache, malaise, nausea, vomiting, vivid dreams. Agranulocytosis occurs rarely.

Nursing considerations

**Baseline assessment**

Assess mental status, appearance, behavior, speech pattern, level of interest, mood. Obtain baseline weight. For pts on long-term therapy, renal function, LFT, CBC should be performed periodically.

**Intervention/evaluation**

Supervise suicidal-risk pt closely during early therapy (as depression lessens, energy level improves, increasing suicide potential). Children, adolescents are at increased risk for suicidal thoughts/behavior and worsening of depression, esp. during first few mos of therapy. Assess appearance, behavior, speech pattern, level of interest, mood. Monitor for hypotension, arrhythmias.

**Patient/family teaching**

* Take as single bedtime dose.
* Avoid alcohol, depressant/sedating medications.
* Avoid tasks requiring alertness, motor skills until response to drug established.
* Report worsening depression, suicidal ideation, unusual changes in behavior.
Fixed-Combination(s)

**Arthrotec**: miSOPROStol/diclofenac (an NSAID): 200 mcg/50 mg, 200 mcg/75 mg.

**CLASSIFICATION**

**PHARMACOTHERAPEUTIC**: Prostaglandin.

**CLINICAL**: Antisecretory, gastric protectant.

- **BLACK BOX ALERT** - Use during pregnancy can cause abortion, premature birth, birth defects. Not recommended in women of childbearing potential unless pt is capable of complying with effective contraception.

Do not confuse Cytotec with Cytoxan, or miSOPROStol with metoprolol or miFEPRIStone.

**Uses**

Prevention of NSAID-induced gastric ulcers and in pts at high risk for developing gastric ulcer/gastric ulcer complications. Medical termination of intrauterine pregnancy through 70 days’ gestation (in conjunction with miFEPRIStone). **OFF-LABEL**: Cervical ripening, labor induction, treatment/prevention of postpartum hemorrhage, treatment of incomplete or missed abortion.

**Precautions**

**Contraindications**: Hypersensitivity to prostaglandins; pregnancy when used to reduce NSAID-induced ulcers (produces uterine contractions). **Cautions**: Renal impairment, cardiovascular disease, elderly.

**Action**

Replaces protective prostaglandins consumed with prostaglandin-inhibiting
therapies (e.g., NSAIDs). Induces uterine contractions. **Therapeutic Effect:** Reduces acid secretion from gastric parietal cells, stimulates bicarbonate production from gastric/duodenal mucosa.

### Pharmacokinetics

<table>
<thead>
<tr>
<th>Route</th>
<th>Onset</th>
<th>Peak</th>
<th>Duration</th>
</tr>
</thead>
<tbody>
<tr>
<td>PO</td>
<td>30 min</td>
<td>1–1.5 hrs</td>
<td>3–6 hrs</td>
</tr>
</tbody>
</table>

Rapidly absorbed from GI tract. Protein binding: 80%–90%. Primarily excreted in urine. Unknown if removed by hemodialysis. **Half-life:** 20–40 min.

### Lifespan considerations

**Pregnancy/Lactation:** Unknown if distributed in breast milk. Produces uterine contractions, uterine bleeding, expulsion of products of conception (abortifacient property). **Children:** Safety and efficacy not established. **Elderly:** No age-related precautions noted.

### Interactions

**DRUG:** Antacids may increase concentration. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** None significant.

### Availability (Rx)

**Tablets:** 100 mcg, 200 mcg.

### Administration/handling

**PO**

- Give with or after meals (minimizes diarrhea).

### Indications/routes/dosage

**Prevention of NSAID-Induced Gastric Ulcer**

**PO:** **ADULTS:** 200 mcg 4 times/day with food (last dose at bedtime). Continue
for duration of NSAID therapy. May reduce dosage to 100 mcg 4 times/day or 200 mcg 2 times/day with food. **ELDERLY:** 100–200 mcg 4 times/day with food.

**Termination of Intrauterine Pregnancy**
See manufacturer guidelines for miFEPRlstone.

**Early Pregnancy Loss**
**Intravaginal:** 800 mcg once; may repeat 3 or more hrs after first dose and within 7 days of no response to initial dose.

**Incomplete Abortion, Postpartum Hemorrhage**
**PO:** 600 mcg as a single dose.

**Labor Induction or Cervical Ripening**
**Intravaginal:** 25 mcg q3–6 hrs. Some pts may require 50 mcg q6 hrs. **Maximum:** 50 mcg/dose.

**Dosage in Renal/Hepatic Impairment**
No dose adjustment.

**Side effects**
**Frequent (40%–20%):** Abdominal pain, diarrhea. **Occasional (3%–2%):** Nausea, flatulence, dyspepsia, headache. **Rare (1%):** Vomiting, constipation.

**Adverse effects/toxic reactions**
Overdosage may produce sedation, tremor, seizures, dyspnea, palpitations, hypotension, bradycardia.

**Nursing considerations**

**Baseline assessment**
Question for possibility of pregnancy before initiating therapy.
Patient/family teaching

- Avoid magnesium-containing antacids (minimizes potential for diarrhea).
- Women of childbearing potential must not be pregnant before or during medication therapy (may result in hospitalization, surgery, infertility, fetal death).
- Incidence of diarrhea may be lessened by taking immediately following meals.

mitoMYcin
mye-toe-my-e-sin

Mutamycin

CLASSIFICATION
PHARMACOTHERAPEUTIC: Antibiotic.
CLINICAL: Antineoplastic.

BLACK BOX ALERT
Potent vesicant. Marked myelosuppression. Infiltration produces ulceration, necrosis, cellulitis, tissue sloughing. Hemolytic-uremic syndrome reported. Must be administered by certified chemotherapy personnel.

Do not confuse mitoMYcin with mithramycin or mitoXANTRONE.

Uses

Treatment of disseminated adenocarcinoma of stomach, pancreas (in combination with other chemotherapy agents and as palliative treatment when other modalities have failed). OFF-LABEL: Treatment of bladder cancer, anal carcinoma; cervical, esophageal, gastric, non–small-cell lung cancer.

Precautions

Contraindications: Hypersensitivity to mitomycin. Coagulation disorders, other increased bleeding tendencies, thrombocytopenia. Cautions: Myelosuppression, renal (serum creatinine greater than 1.7 mg/dL)/hepatic impairment, pregnancy, prior radiation treatment.

Action
Alkylating agent, cross-linking with strands of DNA.  **Therapeutic Effect:** Inhibits DNA, RNA synthesis.

**Pharmacokinetics**

Widely distributed. Does not cross blood-brain barrier. Metabolized in liver. Excreted in urine. **Half-life:** 50 min.

**Lifespan considerations**

**Pregnancy/Lactation:** If possible, avoid use during pregnancy, esp. first trimester. Breastfeeding not recommended. Safety in pregnancy not established. **Children:** Safety and efficacy not established. **Elderly:** Age-related renal impairment may require dosage adjustment.

**Interactions**

**DRUG:** Bone marrow depressants may increase myelosuppression. **Live virus vaccines** may potentiate virus replication, increase vaccine side effects, decrease pt’s antibody response to vaccine. **HERBAL:** Avoid black cohosh, dong quai in estrogen-dependent tumors. **FOOD:** None known. **LAB VALUES:** May increase serum BUN, creatinine.

**Availability (Rx)**

**Injection, Powder for Reconstitution:** 5 mg, 20 mg, 40 mg.

**Administration/handling**

**Alert** May be carcinogenic, mutagenic, teratogenic. Handle with extreme care during preparation/administration. Give via IV push, IV infusion. Extremely irritating to vein. Injection may produce pain with induration, thrombophlebitis, paresthesia.

**IV**

**Reconstitution**

- Reconstitute with Sterile Water for Injection to provide solution containing 0.5–1 mg/mL.
• Do not shake vial to dissolve.
• Allow vial to stand at room temperature until complete dissolution occurs.
• For IV infusion, further dilute with 50–100 mL D₅W or 0.9% NaCl (concentration 20–40 mcg/mL).

Rate of Administration
• Give slow IV push or by IV infusion over 15–30 min.
• Extravasation may produce cellulitis, ulceration, tissue sloughing. Terminate administration immediately, inject ordered antidote. Apply ice intermittently for up to 72 hrs; keep area elevated.

Storage
• Use only clear, blue-gray solutions.
• Concentration of 0.5 mg/mL (reconstituted vial or syringe) is stable for 7 days at room temperature or 2 wks if refrigerated. Further diluted solution with D₅W is stable for 3 hrs, 12 hrs if diluted with 0.9% NaCl at room temperature.

IV incompatibilities
Aztreonam (Azactam), bleomycin (Blenoxane), cefepime (Maxipime), filgrastim (Neupogen), heparin, piperacillin/tazobactam (Zosyn), sargramostim (Leukine), vinorelbine (Navelbine).

IV Compatibilities
Cisplatin (Platinol AQ), cyclophosphamide (Cytoxan), DOXOrubicin (Adriamycin), 5-fluorouracil, granisetron (Kytril), leucovorin, methotrexate, ondansetron (Zofran), vinBLASTine (Velban), vinCRIStine (Oncovin).

Indications/routes/dosage
Refer to individual protocols.

Stomach, Pancreatic Cancer
IV: ADULTS, ELDERLY, CHILDREN: 20 mg/m² as single dose. Repeat q6–8wks.

Bladder Cancer (Non–Muscle Invasive)
Intravesicular Instillation: ADULTS, ELDERLY: Low risk of recurrence: 40
mg as single dose postoperatively (retain in bladder for 1–2 hrs). High risk of recurrence: 20 mg/wk for 6 wks, then 20 mg qmo for 3 yrs (retain in bladder for 1–2 hrs).

### Dose Modification for Toxicity

| Leukocytes 2,000 to less than 3,000 cells/mm³ | Hold therapy until leukocytes 4,000 or more cells/mm³; reduce dose to 70% or more in subsequent cycles |
| Leukocytes less than 2,000 cells/mm³ | Hold therapy until leukocytes 4,000 or more cells/mm³; reduce dose to 50% in subsequent cycles |
| Platelets 25,000 to less than 75,000 cells/mm³ | Hold therapy until platelets 100,000 or more cells/mm³; reduce dose to 70% in subsequent cycles |
| Platelets less than 25,000 cells/mm³ | Hold therapy until platelets 100,000 or more cells/mm³; reduce dose to 50% in subsequent cycles |

### Dosage in Renal Impairment

**CrCl less than 10 mL/min:** Give 75% of normal dose.

### Dosage in Hepatic Impairment

No dose adjustment.

### Side effects

**Frequent (greater than 10%):** Fever, anorexia, nausea, vomiting. **Occasional (10%–2%):** Stomatitis, paresthesia, purple colored bands on nails, rash, alopecia, unusual fatigue. **Rare (less than 1%):** Thrombophlebitis, cellulitis with extravasation.

### Adverse effects/toxic reactions

Marked myelosuppression results in hematologic toxicity manifested as leukopenia, thrombocytopenia, and, to a lesser extent, anemia (generally occurs within 2–4 wks after initial therapy). Renal toxicity may be evidenced by increased serum BUN, creatinine levels. Pulmonary toxicity manifested as dyspnea, cough, hemoptysis, pneumonia. Long-term therapy may produce hemolytic uremic syndrome, characterized by hemolytic anemia, thrombocytopenia, renal failure, hypertension.
Nursing considerations

Baseline assessment
Obtain CBC with differential, PT, bleeding time, before and periodically during therapy. Antiemetics before and during therapy may alleviate nausea/vomiting. Offer emotional support.

Intervention/evaluation
Monitor hematologic status, renal function studies. Assess IV site for phlebitis, extravasation. Monitor for hematologic toxicity (fever, sore throat, signs of local infection, unusual bruising/bleeding from any site), symptoms of anemia (excessive fatigue, weakness). Assess for renal toxicity (foul odor from urine, elevated serum BUN, creatinine).

Patient/family teaching
• Maintain strict oral hygiene.
• Immediately report stinging, burning, pain at injection site.
• Do not have immunizations without physician’s approval (drug lowers resistance to infection).
• Avoid contact with those who have recently received live virus vaccine.
• Hair loss is reversible, but new hair growth may have different color, texture.
• Report nausea/vomiting, fever, sore throat, bruising, bleeding, shortness of breath, painful urination.

modafinil
moe-daf-i-nil
Alertec
Apo-Modafinil
Provigil
CLASSIFICATION
PHARMACOTHERAPEUTIC: Alpha₁-agonist, CNS stimulant (Schedule IV).
CLINICAL: Wakefulness-promoting agent, antinarcoleptic.
Uses

Treatment of excessive daytime sleepiness associated with narcolepsy, shift work sleep disorder, adjunct therapy for obstructive sleep apnea/hypopnea syndrome. **OFF-LABEL:** Treatment of ADHD, multiple sclerosis–related fatigue.

Precautions

**Contraindications:** Hypersensitivity to modafinil, armodafinil. **Cautions:** History of clinically significant mitral valve prolapse, left ventricular hypertrophy, renal/hepatic impairment, angina, cardiac disease, myocardial ischemia, recent MI, preexisting psychosis or bipolar disorder, Tourette’s syndrome.

Action

Increases alpha activity, decreasing delta, theta, brain wave activity. **Therapeutic Effect:** Reduces number of sleep episodes, total daytime sleep.

Pharmacokinetics

Well absorbed from GI tract. Protein binding: 60%. Widely distributed. Metabolized in liver. Excreted by kidneys. Unknown if removed by hemodialysis. **Half-life:** 15 hrs.

Lifespan considerations

**Pregnancy/Lactation:** Unknown if excreted in breast milk. Use caution if given to pregnant women. **Children:** Safety and efficacy not established in pts younger than 16 yrs. **Elderly:** Age-related renal/hepatic impairment may require decreased dosage.

Interactions

**DRUG:** May decrease concentrations of cycloSPORINE, oral contraceptives. May increase concentrations of tricyclic antidepressants (e.g., amitriptyline, doxepin), warfarin. **Other CNS stimulants (e.g., caffeine)** may increase CNS stimulation. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** None significant.
Availability (Rx)
Tablets (Provigil): 100 mg, 200 mg.

Administration/handling

PO
• Give without regard to meals.

Indications/routes/dosage

Narcolepsy, Obstructive Sleep Apnea/Hypopnea Syndrome
PO: ADULTS: 200 mg/day in the morning. ELDERLY: 100 mg/day in the morning.

Shift Work Sleep Disorder
PO: ADULTS: 200 mg about 1 hr prior to start of work shift.

Dosage in Renal Impairment
No dose adjustment.

Dosage in Hepatic Impairment
Mild to moderate impairment: No dose adjustment. Reduce dose 50% with severe impairment.

Side effects
Generally well tolerated. Occasional (5%): Headache, nausea, dizziness, insomnia, palpitations, diarrhea.

Adverse effects/toxic reactions
Agitation, excitation, increased B/P, insomnia may occur. Psychiatric disturbances (anxiety, hallucinations, suicidal ideation), serious allergic reactions (angioedema, Stevens-Johnson syndrome) have been noted.
Nursing considerations

Baseline assessment
Obtain baseline evidence of narcolepsy or other sleep disorders, including pattern, environmental situations, length of sleep episodes. Question for sudden loss of muscle tone (cataplexy) precipitated by strong emotional responses before sleep episode. Assess frequency/severity of sleep episodes before drug therapy.

Intervention/evaluation
Monitor sleep pattern, evidence of restlessness during sleep, length of insomnia episodes at night. Assess for dizziness, anxiety; initiate fall precautions.

Patient/family teaching
• Avoid alcohol.
• Sugarless gum, sips of water may relieve dry mouth.
• Do not increase dose without physician approval.
• Use alternative contraceptives during therapy and 1 mo after discontinuing modafinil (reduces effectiveness of oral contraceptives).

mometasone
moe-met-a-sone
Asmanex
Asmanex HFA
Elocon
Nasonex

Fixed-Combination(s)
Dulera: mometasone/formoterol (beta-adrenergic agonist): 100 mcg/5 mcg, 200 mcg/5 mcg.
♦CLASSIFICATION
PHARMACOTHERAPEUTIC: Adrenocorticosteroid.
CLINICAL: Anti-inflammatory.
**Uses**

**Nasal:** Treatment of nasal symptoms of seasonal/perennial allergic rhinitis in adults, children 2 yrs and older. Prophylaxis of nasal symptoms of seasonal allergic rhinitis in adults, adolescents 12 yrs and older. Treatment of nasal polyps in adults. **Inhalation:** Maintenance treatment of asthma as prophylactic therapy. **Topical:** Relief of inflammatory, pruritic manifestations of steroid-responsive dermatoses.

**Precautions**

**Contraindications:** Hypersensitivity to mometasone, milk proteins. Primary treatment of status asthmaticus or acute bronchospasm. **Cautions:** Thyroid/hepatic/renal impairment, elderly, diabetes, cardiovascular disease, glaucoma, cataracts, myasthenia gravis, pts at risk for osteoporosis, seizures, GI disease (e.g., ulcer, colitis); following MI. Untreated systemic fungal, viral, bacterial infections.

**Action**

Inhibits release of mediators of inflammation (e.g., histamine, kinins). **Therapeutic Effect:** Improves symptoms of asthma, rhinitis.

**Pharmacokinetics**

Undetectable in plasma. Protein binding: 98%–99%. Swallowed portion undergoes extensive metabolism. Excreted in bile (74%), urine (8%). **Half-life:** 5 hrs.

**Lifespan considerations**

**Pregnancy/Lactation:** Unknown if drug crosses placenta or is distributed in breast milk. **Children:** Prolonged treatment/high doses may decrease short-term growth rate, cortisol secretion. **Elderly:** No age-related precautions noted.

**Interactions**

**DRUG:** Ketoconazole may increase concentration (inhalation). **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** None significant.
Availability (Rx)

Administration/handling

Inhalation

• Do not shake or prime.
• Hold twisthaler straight up with pink portion (base) on bottom, remove cap.
• Exhale fully.
• Firmly close lips around mouthpiece and inhale a fast, deep breath.
• Hold breath for 10 sec.

Intranasal

• Instruct pt to clear nasal passages as much as possible before use.
• Tilt head slightly forward.
• Insert spray tip into nostril, pointing toward nasal passages, away from nasal septum.
• Spray into one nostril while pt holds other nostril closed, concurrently inspires through nose to permit medication as high into nasal passages as possible.

Topical

• Apply thin layer of cream, lotion, ointment to cover affected area. Rub in gently.
• Do not cover area with occlusive dressing.

Indications/routes/dosage

Allergic Rhinitis

Nasal Spray: ADULTS, ELDERLY, CHILDREN 12 YRS AND OLDER: 2 sprays in each nostril once daily. When used to prevent nasal rhinitis, begin 2–4 wks prior to start of pollen season. CHILDREN 2–11 YRS: 1 spray in each nostril once daily.
Asthma

Inhalation: ADULTS, ELDERLY, CHILDREN 12 YRS AND OLDER

Skin Disease

Topical: ADULTS, ELDERLY, CHILDREN 12 YRS AND OLDER: Apply cream, lotion, or ointment sparingly to affected area once daily.

Nasal Polyp

Nasal Spray: ADULTS, ELDERLY: 2 sprays (100 mcg) in each nostril twice daily. Total dose: 400 mcg.

Dosage in Renal/Hepatic Impairment

No dose adjustment.

Side effects

Adverse effects/toxic reactions

Acute hypersensitivity reaction (urticaria, angioedema, severe bronchospasm) occurs rarely. Transfer from systemic to local steroid therapy may unmask previously suppressed bronchial asthma condition.
Nursing considerations

Baseline assessment
Question for hypersensitivity to any corticosteroids.

Intervention/evaluation
Teach proper use of nasal spray, oral inhaler. Instruct pt to clear nasal passages before use. Report if no improvement in symptoms or if sneezing, nasal irritation occur. Assess lung sounds for wheezing, rales.

Patient/family teaching
• Do not change dose schedule or stop taking drug; must taper off gradually under medical supervision. **Nasal:** Report if symptoms do not improve; report if sneezing, nasal irritation occur.
• Clear nasal passages prior to use. **Inhalation:** Inhale rapidly, deeply; rinse mouth after inhalation.
• Not indicated for acute asthma attacks. **Topical:** Do not cover affected area with bandage, dressing.

</tr>
</tbody>
</table>

Uses
Prophylaxis, chronic treatment of asthma. Prevention of exercise-induced bronchoconstriction. Relief of symptoms of seasonal allergic rhinitis (hay fever), perennial allergic rhinitis. **OFF-LABEL:** Urticaria.
Precautions

**Contraindications:** Hypersensitivity to montelukast. **Cautions:** Systemic corticosteroid treatment reduction during montelukast therapy. Concomitant use of CYP3A4 inducers. Not for use in acute asthma attacks.

Action

Binds to cysteinyl leukotriene receptors, inhibiting effects of leukotrienes on bronchial smooth muscle. **Therapeutic Effect:** Decreases bronchoconstriction, vascular permeability, mucosal edema, mucus production.

Pharmacokinetics

Rapidly absorbed from GI tract. Protein binding: 99%. Extensively metabolized in liver. Excreted almost exclusively in feces. **Half-life:** 2.7–5.5 hrs (slightly longer in elderly).

Lifespan considerations

**Pregnancy/Lactation:** Unknown if distributed in breast milk. Use during pregnancy only if necessary. **Children/Elderly:** No age-related precautions noted in pts older than 6 yrs or the elderly.

Interactions

**DRUG:** CYP3A4 inducers (e.g., carBAMazepine, PHENObarbital, rifAMPin) may decrease concentration/effects. **HERBAL:** St. John’s wort may decrease concentration/effects. **FOOD:** None known. **LAB VALUES:** May increase serum ALT, AST, eosinophils.

Availability (Rx)

**Oral Granules:** 4 mg per packet. **Tablets:** 10 mg. **Tablets (Chewable):** 4 mg, 5 mg.
Administration/handling

PO

• May take without regard to food/meals. When treating asthma, administer in evening.
• When treating allergic rhinitis, may individualize administration times.
• Granules may be given directly in mouth or mixed with carrots, rice, applesauce, ice cream, baby formula, or breast milk (do not add to any other liquid or food).
• Give within 15 min of opening packet.

Indications/routes/dosage

Bronchial Asthma
PO: ADULTS, ELDERLY, CHILDREN 15 YRS AND OLDER: One 10-mg tablet daily, taken in the evening. CHILDREN 6–14 YRS: One 5-mg chewable tablet daily, taken in the evening. CHILDREN 2–5 YRS: One 4-mg chewable tablet daily, taken in the evening. CHILDREN 6–23 MOS: 4 mg (oral granules) once daily in the evening.

Seasonal Allergic Rhinitis
PO: ADULTS, ELDERLY, CHILDREN 15 YRS AND OLDER: One 10-mg tablet, taken in the evening. CHILDREN 6–14 YRS: One 5-mg chewable tablet, taken in the evening. CHILDREN 2–5 YRS: One 4-mg chewable tablet, or oral granules taken in the evening.

Perennial Allergic Rhinitis
PO: ADULTS, ELDERLY, CHILDREN 15 YRS AND OLDER: One 10-mg tablet, taken in the evening. CHILDREN 6–14 YRS: One 5-mg chewable tablet, taken in the evening. CHILDREN 2–5 YRS: One 4-mg chewable tablet or oral granules, taken in the evening. CHILDREN 6–23 MOS: 4 mg oral granules, taken in the evening.

Exercise-Induced Bronchoconstriction Prevention
PO: ADULTS, ELDERLY, CHILDREN 15 YRS AND OLDER: 10 mg 2 or
more hrs before exercise. No additional doses within 24 hrs. **CHILDREN 6–14 YRS:** 5 mg (chew tab) 2 or more hrs prior to exercise. No additional doses within 24 hrs.

**Dosage in Renal/Hepatic Impairment**
No dose adjustment.

**Side effects**

**ADULTS, CHILDREN 15 YRS AND OLDER:** Frequent (18%): Headache. Occasional (4%): Influenza. Rare (3%–2%): Abdominal pain, cough, dyspepsia, dizziness, fatigue, dental pain. **CHILDREN 6–14 YRS:** Rare (less than 2%): Diarrhea, laryngitis, pharyngitis, nausea, otitis media, sinusitis, viral infection.

**Adverse effects/toxic reactions**
Suicidal ideation and behavior, depression have been noted.

**Nursing considerations**

**Baseline assessment**
Chewable tablet contains phenylalanine (component of aspartame); parents of phenylketonuric pts should be informed. Assess lung sounds for wheezing. Assess for allergy symptoms. Question history of depression, suicidal ideation.

**Intervention/evaluation**
Monitor rate, depth, rhythm, type of respirations; quality/rate of pulse. Assess lung sounds for wheezing. Monitor for change in mood, behavior.

**Patient/family teaching**
- Increase fluid intake (decreases lung secretion viscosity).
- Take as prescribed, even during symptom-free periods as well as during exacerbations of asthma.
- Do not alter/stop other asthma medications.
- Drug is not for treatment of acute asthma attacks.
• Report increased use or frequency of short-acting bronchodilators, changes in behavior, suicidal ideation.

**morphine**

*mor*-feen

Duramorph

Infumorph

**Kadian**

M-Eslon

MS Cont in

MS-IR

**Fixed-Combination(s)**

**Embeda**: morphine/naloxone (an opioid antagonist): 20 mg/0.8 mg, 30 mg/1.2 mg, 50 mg/2 mg, 60 mg/2.4 mg, 80 mg/3.2 mg, 100 mg/4 mg.

**CLASSIFICATION**

**PHARMACOTHERAPEUTIC**: Opioid agonist (*Schedule II*).

**CLINICAL**: Opioid analgesic.

■ **BLACK BOX ALERT** ■ Be alert for signs of abuse, misuse, diversion.

**Epidural**: Monitor for delayed sedation. **Sustained-release**: Do not crush or chew. **MS Contin**: Use only in opioid-tolerant pts requiring over 400 mg/day. **Kadian**: Use only in opioid-tolerant pts. **Duramorph**: Risk of severe and/or sustained cardiopulmonary depression.

Do not confuse morphine with HYDROmorphine, or morphine sulfate with magnesium sulfate, MS Cont in with OxyCONTIN. MSO₄ and MS are error-prone abbreviations.

**Uses**

Relief of moderate to severe, acute, or chronic pain; analgesia during labor, pain due to MI, dyspnea from pulmonary edema not resulting from chemical respiratory irritant. **Infumorph**: Use in devices for managing intractable chronic
pain. **Extended-release:** Use only when repeated doses for extended periods of time are required around the clock.

## Precautions

**Contraindications:** All Formulations: Hypersensitivity to morphine. Acute or severe asthma, GI obstruction, known or suspected paralytic ileus, severe hepatic/renal impairment, severe respiratory depression. **Extended-Release:** GI obstruction, acute postoperative pain, hypercarbia. **Injection:** HF due to lung disease; arrhythmias, head injury, seizures, acute alcoholism. Labor when premature birth expected. Increased intracranial pressure. **Immediate-Release (Tablets, Oral Solution):** Hypercarbia. **Extreme Caution:** COPD, cor pulmonale, hypoxia, hypercapnia, preexisting respiratory depression, head injury, increased ICP, severe hypotension. **Cautions:** Biliary tract disease, pancreatitis, Addison’s disease, cardiovascular disease, morbid obesity, adrenal insufficiency, elderly, hypothyroidism, urethral stricture, prostatic hyperplasia, debilitated pts, pts with CNS depression, toxic psychosis, seizure disorders, alcoholism.

## Action

Binds with opioid receptors within CNS, inhibiting ascending pain pathways. **Therapeutic Effect:** Alters pain perception, emotional response to pain.

Variably absorbed from GI tract. Readily absorbed after IM, SQ administration. Protein binding: 20%–35%. Widely distributed. Metabolized in liver. Primarily
excreted in urine. Removed by hemodialysis. **Half-life:** 2–4 hrs (increased in hepatic disease).

**Lifespan considerations**

**Pregnancy/Lactation:** Crosses placenta. Distributed in breast milk. May prolong labor if administered in latent phase of first stage of labor or before cervical dilation of 4–5 cm has occurred. Respiratory depression may occur in neonate if mother received opiates during labor. Regular use of opiates during pregnancy may produce withdrawal symptoms in neonate (irritability, excessive crying, tremors, hyperactive reflexes, fever, vomiting, diarrhea, yawning, sneezing, seizures). **Children:** Paradoxical excitement may occur; those younger than 2 yrs are more susceptible to respiratory depressant effects. **Elderly:** Paradoxical excitement may occur. Age-related renal impairment may increase risk of urinary retention.

**Interactions**

**DRUG:** Alcohol, other CNS depressants (e.g., LORazepam, gabapentin, zolpidem) may increase CNS effects, respiratory depression, hypotension. **MAOIs** (e.g., phenelzine, selegiline) may produce serotonin syndrome. (Reduce dosage to 1/4 of usual morphine dose.) **HERBAL:** Gotu kola, kava kava, St. John’s wort, valerian may increase CNS depression. **FOOD:** None known. **LAB VALUES:** May increase serum amylase, lipase.

**Availability (Rx)**

**Injection, Solution:** 2 mg/mL, 4 mg/mL, 5 mg/mL, 10 mg/mL, 15 mg/mL. **Injection, Solution (Epidural, Intrathecal, IV Infusion) (Duramorph):** 0.5 mg/mL, 1 mg/mL. **Injection, Solution (Epidural or Intrathecal) (Infumorph):** 10 mg/mL, 25 mg/mL. **Injection, Solution Patient-Controlled Analgesia (PCA) Pump:** 1 mg/mL. **Solution Oral:** 10 mg/5 mL, 20 mg/5 mL. **Suppository:** 5 mg, 10 mg, 20 mg, 30 mg. **Tablets:** 15 mg, 30 mg. **Capsules, Extended-Release:** 30 mg, 45 mg, 60 mg, 75 mg, 90 mg, 120 mg. **Capsules, Sustained-Release:** 10 mg, 20 mg, 30 mg, 50 mg, 60 mg, 80 mg, 100 mg, 200 mg. **Tablets, Extended-Release:** 15 mg, 30 mg, 60 mg, 100 mg, 200 mg.
Administration/handling

IV

Reconstitution
• May give undiluted.
• For IV injection, may dilute in Sterile Water for Injection or 0.9% NaCl to final concentration of 1–2 mg/mL.
• For continuous IV infusion, dilute to concentration of 0.1–1 mg/mL in D₅W and give through controlled infusion device.

Rate of Administration
• Always administer very slowly. Rapid IV increases risk of severe adverse reactions (apnea, chest wall rigidity, peripheral circulatory collapse, cardiac arrest, anaphylactoid effects).

Storage
• Store at room temperature.

IM, SQ
• Administer slowly, rotating injection sites.
• Pts with circulatory impairment experience higher risk of overdosage due to delayed absorption of repeated administration.

PO
• May give without regard to food.
• Mix liquid form with fruit juice to improve taste.
• Do not break, crush, dissolve, or divide extended-release capsule, tablets.
• Avinza, Kadian: May mix with applesauce immediately prior to administration.

Rectal
• If suppository is too soft, chill for 30 min in refrigerator or run cold water over foil wrapper.
• Moisten suppository with cold water before inserting well into rectum.

IV incompatibilities

Amphotericin B complex (Abelcet, AmBisome, Amphotec), cefepime
(Maxipime), doxorubicin (Doxil), phenytoin (Dilantin).

**IV Compatibilities**

Amiodarone (Cordarone), atropine, bumetanide (Bumex), bupivacaine (Marcaine, Sensorcaine), dexametomidine (Precedex), diltiaZEM (Cardizem), diphenhydrAMINE (Benadryl), DOBUTamine (Dobutrex), DOPamine (Intropin), glycopyrrolate (Robinul), heparin, hydrOXYzine (Vistaril), lidocaine, LORazepam (Ativan), magnesium, midazolam (Versed), milrinone (Primacor), nitroglycerin, potassium, propofol (Diprivan).

**Indications/routes/dosage**

- Dosage should be titrated to desired effect.

**Analgesia**

**PO (Immediate-Release):** ADULTS, ELDERLY: 10–30 mg q4h as needed. 
**Solution:** 10–20 mg q4h as needed. 
**Tablet:** 15–30 mg q4h as needed.

**CHILDREN 6 MONTHS OF AGE AND OLDER WEIGHING 50 KG OR GREATER:** 15–20 mg q3–4h as needed. 
**CHILDREN 6 MONTHS OF AGE AND OLDER WEIGHING LESS THAN 50 KG:** 0.2–0.5 mg/kg q3–4h as needed. 
**CHILDREN YOUNGER THAN 6 MONTHS:** (Oral solution): 0.08–0.1 mg/kg q3–4h as needed.

- For the Avinza dosage below, be aware that this drug is to be administered once daily only.
- For the Kadian dosage information below, be aware that this drug is to be administered q12h or once daily.
- Be aware that pediatric dosages of extended-release preparations of Kadian and AVINza have not been established.
- For the MS Contin dosage information below, be aware that the daily dosage is divided and given q8h or q12h.

**PO (Extended-Release [AVINza]):** ADULTS, ELDERLY: Dosage requirement should be established using prompt-release formulations and is based on total daily dose. AVINza is given once daily only.

**PO (Extended-Release [Kadian]):** ADULTS, ELDERLY: Dosage requirement should be established using prompt-release formulations and is based on total daily dose. Dose is given once daily or divided and given q12h.
PO (Extended-Release [MS Contin]): ADULTS, ELDERLY: Dosage requirement should be established using prompt-release formulations and is based on total daily dose. Daily dose is divided and given q8h or q12h.

IV: ADULTS, ELDERLY: 2.5–5 mg q3–4h as needed. Note: Repeated doses (e.g., 1–2 mg) may be given more frequently (e.g., every hr) if needed.

CHILDREN 50 KG OR GREATER: Initially, 2–5 mg q2–4h as needed.

CHILDREN WEIGHING LESS THAN 50 KG: Initially, 0.05 mg/kg. Range: 0.1–0.2 mg/kg q2–4h as needed. NEONATES: Initially, 0.05–0.1 mg/kg/dose q4–6h as needed.

IV Continuous Infusion: ADULTS, ELDERLY: 0.8–10 mg/hr. Range: Titrate up to 80 mg/hr. CHILDREN WEIGHING 50 KG OR GREATER: 1.5 mg/hr.

CHILDREN WEIGHING LESS THAN 50 KG: Initially, 0.01–0.04 mg/kg/hr (10–40 mcg/kg/hr). NEONATES: Initially, 0.01 mg/kg/hr (10 mcg/kg/hr). Maximum: 0.015–0.02 mg/kg/hr.

Note: IM injection not recommended

IM: ADULTS, ELDERLY: 5–10 mg q3–4h as needed. CHILDREN: 0.1–0.2 mg/kg q3–4h as needed.

Patient-Controlled Analgesia (PCA)

IV: ADULTS, ELDERLY: Usual concentration: 1 mg/mL. Demand dose: 1 mg (range: 0.5–2.5 mg). Lockout interval: 5–10 min.

Dosage in Renal Impairment

<table>
<thead>
<tr>
<th>Creatinine Clearance</th>
<th>Dose</th>
</tr>
</thead>
<tbody>
<tr>
<td>10–50 mL/min, CRRT</td>
<td>75% of normal dose</td>
</tr>
<tr>
<td>Less than 10 mL/min, HD, PD</td>
<td>50% of normal dose</td>
</tr>
</tbody>
</table>

Dosage in Hepatic Impairment

No dose adjustment.

Side effects

Alert: Ambulatory pts, pts not in severe pain may experience nausea, vomiting more frequently than pts in supine position or who have severe pain. Frequent: Sedation, decreased B/P (including orthostatic hypotension), diaphoresis, facial flushing, constipation, dizziness, drowsiness, nausea, vomiting. Occasional:
Allergic reaction (rash, pruritus), dyspnea, confusion, palpitations, tremors, urinary retention, abdominal cramps, vision changes, dry mouth, headache, decreased appetite, pain/burning at injection site. **Rare:** Paralytic ileus.

**Adverse effects/toxic reactions**

Overdose results in respiratory depression, skeletal muscle flaccidity, cold/clammy skin, cyanosis, extreme drowsiness progressing to seizures, stupor, coma. Tolerance to analgesic effect, physical dependence may occur with repeated use. Prolonged duration of action, cumulative effect may occur in those with hepatic/renal impairment. **Antidote:** Naloxone (see Appendix J for dosage).

**Nursing considerations**

**Baseline assessment**

Pt should be in recumbent position before drug is given by parenteral route. Assess onset, type, location, duration of pain. Obtain vital signs before giving medication. If respirations are 12/min or less (20/min or less in children), withhold medication, contact physician. Effect of medication is reduced if full pain recurs before next dose.

**Intervention/evaluation**

Monitor vital signs 5–10 min after IV administration, 15–30 min after SQ, IM. Be alert for decreased respirations, B/P. Check for adequate voiding. Monitor daily pattern of bowel activity, stool consistency; avoid constipation. Initiate deep breathing, coughing exercises, particularly in those with pulmonary impairment. Assess for clinical improvement; record onset of pain relief. Consult physician if pain relief is not adequate.

**Patient/family teaching**

• Discomfort may occur with injection.
• Change positions slowly to avoid orthostatic hypotension.
• Avoid tasks that require alertness, motor skills until response to drug is established.
• Avoid alcohol, CNS depressants.
• Tolerance, dependence may occur with prolonged use of high doses.
• Report ineffective pain control, constipation, urinary retention.

### moxifloxacin

mox-i-flox-a-sin

**Avelox**

**Avelox IV**

**Moxeza**

**Vigamox**

CLASSIFICATION

PHARMACOTHERAPEUTIC: Fluoroquinolone.

CLINICAL: Antibacterial, antibiotic.

- **BLACK BOX ALERT** - May increase risk of tendonitis, tendon rupture (increased with concurrent corticosteroids, organ transplant recipients, those older than 60 yrs). May aggravate myasthenia gravis (avoid use).

Do not confuse Avelox with Avonex.

### Uses

Treatment of susceptible infections due to *S. pneumoniae*, *S. pyogenes*, *S. aureus*, *H. influenzae*, *M. catarrhalis*, *K. pneumoniae*, *M. pneumoniae*, *C. pneumoniae* including acute bacterial exacerbation of chronic bronchitis, acute bacterial sinusitis, intra-abdominal infection, community-acquired pneumonia, uncomplicated skin/skin structure infections. **Ophthalmic:** Topical treatment of bacterial conjunctivitis due to susceptible strains of bacteria.

### Precautions

**Contraindications:** Hypersensitivity to moxifloxacin, other quinolones. **Cautions:** Renal/hepatic impairment, bradycardia, acute myocardial ischemia, myasthenia gravis, diabetes, rheumatoid arthritis, seizures, pts with prolonged QT interval, medications known to prolong QT interval, hypokalemia, hypomagnesemia, elderly, pts with suspected CNS disorder, pts at risk for tendon rupture, tendonitis (e.g., renal failure, concomitant use of corticosteroids; solid
organ transplant recipient, elderly).

**Action**

Inhibits two enzymes, topoisomerase II and IV, in susceptible microorganisms. **Therapeutic Effect:** Interferes with bacterial DNA replication. Prevents/delays emergence of resistant organisms. Bactericidal.

**Pharmacokinetics**

Well absorbed from GI tract after PO administration. Protein binding: 50%. Widely distributed throughout body with tissue concentration often exceeding plasma concentration. Metabolized in liver. Excreted in urine (20%), feces (25%) unchanged. **Half-life:** **PO:** 12 hrs; **IV:** 15 hrs.

**Lifespan considerations**

**Pregnancy/Lactation:** May be distributed in breast milk. May produce teratogenic effects. **Children:** Safety and efficacy not established. **Elderly:** No age-related precautions noted.

**Interactions**

**DRUG:** Antacids, iron preparations, sucralfate may decrease absorption. **NSAIDs** (e.g., ibuprofen, ketorolac, naproxen) may increase risks of CNS stimulation/seizures. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** None significant.

**Availability (Rx)**

**Injection Infusion (Avelox IV):** 400 mg (250 mL). **Ophthalmic Solution (Moxeza, Vigamox):** 0.5%. **Tablets (Avelox):** 400 mg.

**Administration/handling**

**IV**

**Reconstitution**

- Available in ready-to-use containers.
Rate of Administration
• Give by IV infusion only.
• Avoid rapid or bolus IV infusion.
• Infuse over 60 min.

Storage
• Store at room temperature.
• Do not refrigerate.

PO
• Give without regard to meals.
• Oral moxifloxacin should be administered 4 hrs before or 8 hrs after antacids, multivitamins, iron preparations, sucralfate, didanosine chewable/buffered tablets, pediatric powder for oral solution.

Ophthalmic
• Place gloved finger on lower eyelid and pull out until a pocket is formed between eye and lower lid.
• Place prescribed number of drops into pocket.
• Instruct pt to close eye gently (so medication will not be squeezed out of the sac) and to apply digital pressure to lacrimal sac at inner canthus for 1 min to minimize systemic absorption.

IV incompatibilities
Do not add or infuse other drugs simultaneously through the same IV line. Flush line before and after use if same IV line is used with other medications.

Indications/routes/dosage

Usual Dose
PO, IV: ADULTS, ELDERLY: 400 mg q24h. Duration dependent on severity of infection.

Acute Bacterial Sinusitis
PO, IV: ADULTS, ELDERLY: 400 mg q24h for 10 days.
Acute Bacterial Exacerbation of Chronic Bronchitis
PO, IV: ADULTS, ELDERLY: 400 mg q24h for 5 days.

Community-Acquired Pneumonia
PO, IV: ADULTS, ELDERLY: 400 mg q24h for 7–14 days.

Intra-Abdominal Infection
PO, IV: ADULTS, ELDERLY: 400 mg q24h for 5–14 days.

Skin/Skin Structure Infection
PO, IV: ADULTS, ELDERLY: 400 mg once daily for 7–21 days.

Topical Treatment of Bacterial Conjunctivitis Due to Susceptible Strains of Bacteria
Ophthalmic: ADULTS, ELDERLY, CHILDREN 1 YR AND OLDER:
(Vigamox): 1 drop 3 times/day for 7 days. (Moxeza): 1 drop 2 times/day for 7 days.

Dosage in Renal Impairment
No dose adjustment.

Dosage in Hepatic Impairment
Mild to moderate impairment: No dose adjustment. Severe impairment: Use caution.

Side effects
Frequent (8%–6%): Nausea, diarrhea. Occasional: PO, IV (3%–2%): Dizziness, headache, abdominal pain, vomiting. Ophthalmic (6%–1%): Conjunctival irritation, reduced visual acuity, dry eye, keratitis, eye pain, ocular itching, swelling of tissue around cornea, eye discharge, fever, cough, pharyngitis, rash, rhinitis. Rare (1%): Altered taste, dyspepsia, photosensitivity.

Adverse effects/toxic reactions
Pseudomembranous colitis (severe abdominal cramps/pain, severe watery diarrhea, fever) may occur. Superinfection (anal/genital pruritus, moderate to severe diarrhea, stomatitis) may occur. May increase risk of tendonitis, tendon rupture, peripheral neuropathy.

**Nursing considerations**

**Baseline assessment**
Obtain serum BUN, creatinine; CrCl, GFR in pts with renal impairment; LFT in pts with hepatic impairment. Obtain bacterial culture and sensitivity prior to administration. Question pt’s usual stool characteristics (color, frequency, consistency). Question medical history as listed in Precautions, esp. cardiac conduction disorders, CNS disorders, hypersensitivity reaction.

**Intervention/evaluation**
Monitor for CNS reactions (agitation, anxiety, convulsions, depression, hallucinations, increased ICP, insomnia, nightmares, suicidal ideation and behavior), peripheral neuropathy; hypersensitivity reactions (throat and facial edema, dyspnea, urticaria, itching, hemodynamic instability); muscle weakness, voice dystonia in pts with myasthenia gravis; pain, swelling, bruising, popping of tendons. Be alert for superinfections. Obtain EKG if cardiac arrhythmia suspected or palpitations occur. Observe daily pattern of bowel activity, stool consistency (increased severity may indicate antibiotic-associated colitis). If frequent diarrhea occurs, obtain *C. difficile* toxin screen and initiate isolation precautions until test result confirmed. Antibacterial drugs that are not directed against *C. difficile* infection may need to be discontinued. Monitor I&O.

**Patient/family teaching**
- It is essential to complete drug therapy despite symptom improvement. Early discontinuation may result in antibacterial resistance or increase risk of recurrent infection.
- Report any episodes of diarrhea, esp. during the first few mos after final dose. Frequent diarrhea, fever, abdominal pain, blood-streaked stool may indicate infectious diarrhea, which may be contagious to others.
- Severe allergic reactions, such as hives, palpitations, rash, shortness of breath, swelling of tongue, may occur.
• Tendon inflammation/swelling, tendon rupture may occur; report bruising, pain, swelling in tendon areas or snapping, popping of tendons.
• Immediately report nervous system problems such as anxiety, confusion, dizziness, nervousness, nightmares, thoughts of suicide, seizures, tremors, trouble sleeping.
• Treatment may cause heart problems such as low heart rate, palpitations; permanent nerve damage such as burning, numbness, tingling, weakness.
• Do not take aluminum- or magnesium-containing antacids, multivitamins, zinc or iron products at least 2 hrs before or 6 hrs after dose.
• Drink plenty of fluids.

| mupirocin
| mue-peer-oh-sin
| Bactroban
| Bactroban Nasal

CLASSIFICATION
PHARMACOTHERAPEUTIC: Antibacterial.
CLINICAL: Topical antibiotic.
Do not confuse Bactroban or Bactroban Nasal with bacitracin, baclofen, or Bactrim.

Uses
Ointment: Topical treatment of impetigo caused by S. aureus, S. pyogenes.

Precautions
Contraindications: Hypersensitivity to mupirocin. Cautions: Renal impairment, burn pts.

Action

**Pharmacokinetics**

Following topical administration, penetrates outer layer of skin (minimal through intact skin). Protein binding: 95%. Metabolized in liver. Excreted in urine. **Half-life:** 17–36 min.

**Lifespan considerations**

**Pregnancy/Lactation:** Unknown if distributed in breast milk. Breastfeeding not recommended. **Children:** Safety and efficacy not established. **Elderly:** No age-related precautions noted.

**Interactions**

**DRUG:** None significant. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** None significant.

**Availability (Rx)**

**Cream, Topical (Bactroban):** 2%. **Ointment, Intranasal (1-g single-use tube) (Bactroban Nasal):** 2%. **Ointment, Topical (Bactroban):** 2%.

**Administration/handling**

**Topical**

**Cream, Ointment**

- For topical use only.
- May cover with gauze dressing.
- Avoid contact with eyes.

**Intranasal**

- Apply 1/2 of the ointment from single-use tube into each nostril.
Avoid contact with eyes.

**Indications/routes/dosage**

**Usual Topical Dosage**

**Topical Cream:** ADULTS, ELDERLY, CHILDREN 3 MOS AND OLDER: Apply small amount 3 times/day for 10 days. **Topical Ointment:** ADULTS, ELDERLY, CHILDREN 2 MOS AND OLDER: Apply small amount 3 times/day for 5–14 days.

**Usual Nasal Dosage**

**Intranasal:** ADULTS, ELDERLY, CHILDREN 12 YRS AND OLDER: Apply small amount 2 times/day for 5–10 days.

**Side effects**

**Frequent:** Nasal (9%–3%): Headache, rhinitis, upper respiratory congestion, pharyngitis, altered taste. **Occasional:** Nasal (2%): Burning, stinging, cough. **Topical (2%–1%):** Pain, burning, stinging, pruritus. **Rare:** Nasal (less than 1%): Pruritus, diarrhea, dry mouth, epistaxis, nausea, rash. **Topical (less than 1%):** Rash, nausea, dry skin, contact dermatitis.

**Adverse effects/toxic reactions**

Superinfection may result in bacterial, fungal infections, esp. with prolonged, repeated therapy.

**Nursing considerations**

**Baseline assessment**

Assess skin for type, extent of lesions.

**Intervention/evaluation**

Monitor healing of skin lesions. In event of skin reaction, stop applications, cleanse area gently, notify physician.
Patient/family teaching

• For external use only.
• Avoid contact with eyes.
• Explain precautions to avoid spread of infection; teach how to apply medication.
• Report skin reactions, irritation.
• Report if no improvement is noted in 3–5 days.

mycophenolate
mye-koe-fen-o-late
Apo-Mycophenolate
CellCept
Myfortic
Novo-Mycophenolate

CLASSIFICATION
PHARMACOTHERAPEUTIC: Immunologic agent.
CLINICAL: Immunosuppressant.

BLACK BOX ALERT
Increased risk of congenital malformation, spontaneous abortion. Increased risk for development of lymphoma, skin malignancy. Increased susceptibility to infections. Administer under supervision of physician experienced in immunosuppressive therapy.

Uses

Precautions

**Contraindications:** Hypersensitivity to mycophenolate, mycophenolic acid or polysorbate 80 (IV formulation). **Cautions:** Active severe GI disease, renal impairment, neutropenia, women of childbearing potential (use caution when handling).

Action

Suppresses immunologically mediated inflammatory response by inhibiting inosine monophosphate dehydrogenase, an enzyme that deprives lymphocytes of nucleotides necessary for DNA, RNA synthesis, thus inhibiting proliferation of T and B lymphocytes. **Therapeutic Effect:** Prevents transplant rejection.

Pharmacokinetics

Rapidly, extensively absorbed after PO administration (food decreases drug plasma concentration but does not affect absorption). Protein binding: 97%. Completely hydrolyzed to active metabolite mycophenolic acid. Primarily excreted in urine. Not removed by hemodialysis. **Half-life:** 17.9 hrs.

Lifespan considerations

**Pregnancy/Lactation:** Unknown if drug crosses placenta or is distributed in breast milk. Breastfeeding not recommended. Increased risk of miscarriage, birth defects. Effective contraception should be used during treatment and for 6 wks after discontinuation. **Children:** Safety and efficacy not established in children younger than 3 months. **Elderly:** Age-related renal impairment may require dosage adjustment.

Interactions

**DRUG:** May increase concentrations of *acyclovir, ganciclovir* in pts with renal impairment. **Antacids** (aluminum- and magnesium-containing), **cholestyramine** may decrease absorption. **Live virus vaccines** may potentiate virus replication, increase vaccine side effects, decrease pt’s antibody response to vaccine. **Other immunosuppressants** (e.g., *cyclophosphamide, cycloSPORINE, tacrolimus*) may increase risk of infection, lymphomas.
Probenecid may increase concentration. HERBAL: Cat’s claw, echinacea may decrease effects (have immunostimulant properties). FOOD: All foods may decrease concentration. LAB VALUES: May increase serum cholesterol, alkaline phosphatase, creatinine, ALT, AST. May alter serum glucose, lipids, calcium, potassium, phosphate, uric acid.

Availability (Rx)

Administration/handling

IV
Reconstitution
• Reconstitute each 500-mg vial with 14 mL D₅W. Gently agitate.
• For 1-g dose, further dilute with 140 mL D₅W; for 1.5-g dose, further dilute with 210 mL D₅W, providing a concentration of 6 mg/mL.

Rate of Administration
• Infuse over at least 2 hrs.
• Begin infusion within 4 hrs of reconstitution.

Storage
• Store at room temperature.

PO
• Give on empty stomach (1 hr before or 2 hrs after food).
• Do not break, crush, or open capsules or break, crush, dissolve, or divide delayed-release tablets. Avoid inhalation of powder in capsules, direct contact of powder on skin/mucous membranes. If contact occurs, wash thoroughly, with soap, water. Rinse eyes profusely with plain water.
• May store reconstituted suspension in refrigerator or at room temperature.
• Suspension is stable for 60 days after reconstitution.
• Suspension can be administered orally or via an NG tube (minimum size 8 French).
**IV incompatibilities**

Mycophenolate is compatible only with D5W. Do not infuse concurrently with other drugs or IV solutions.

**Indications/routes/dosage**

**Prevention of Renal Transplant Rejection**

PO, IV *(Cellcept)*: ADULTS, ELDERLY: 1 g twice daily. PO: CHILDREN 3 MONTHS AND OLDER: *(Cellcept Suspension)*: 600 mg/m²/dose twice daily. Maximum: 1 g twice daily.

PO *(Myfortic)*: ADULTS, ELDERLY: 720 mg twice daily. CHILDREN 5–16 YRS: 400 mg/m² twice daily. Maximum: 720 mg twice daily.

**Prevention of Heart Transplant Rejection**

PO, IV *(Cellcept)*: ADULTS, ELDERLY: 1.5 g twice daily.

**Prevention of Hepatic Transplant Rejection**

PO *(Cellcept)*: ADULTS, ELDERLY: 1.5 g twice daily.

IV *(Cellcept)*: ADULTS, ELDERLY: 1 g twice daily.

**Dosage in Renal/Hepatic Impairment**

No dose adjustment.

**Side effects**

Frequent (37%–20%): UTI, hypertension, peripheral edema, diarrhea, constipation, fever, headache, nausea. Occasional (18%–10%): Dyspepsia, dyspnea, cough, hematuria, asthenia, vomiting, edema, tremors, oral candidiasis, acne; abdominal, chest, back pain. Rare (9%–6%): Insomnia, respiratory tract infection, rash, dizziness.

**Adverse effects/toxic reactions**

Significant anemia, leukopenia, thrombocytopenia, neutropenia, leukocytosis may occur, particularly in pts undergoing renal transplant rejection. Sepsis,
infection occur occasionally. GI tract hemorrhage occurs rarely. There is an increased risk of developing neoplasms. Immunosuppression results in increased susceptibility to infection.

**Nursing considerations**

**Baseline assessment**

Women of childbearing potential should have a negative serum or urine pregnancy test within 1 wk before initiation. Assess medical history, esp. renal function, existence of active digestive system disease, drug history, esp. other immunosuppressants.

**Intervention/evaluation**

CBC should be performed wkly during first mo of therapy, twice monthly during second and third mos of treatment, then monthly throughout the first yr. If rapid fall in WBC occurs, dosage should be reduced or discontinued. Assess particularly for delayed bone marrow suppression. Report any major change in assessment of pt.

**Patient/family teaching**

- Effective contraception should be used before, during, and for 6 wks after discontinuing therapy, even if pt has a history of infertility, other than hysterectomy.
- Two forms of contraception must be used concurrently unless abstinence is absolute.
- Report unusual bleeding/bruising, sore throat, mouth sores, abdominal pain, fever.
- Laboratory follow-up while taking medication is important part of therapy.
- Malignancies may occur.

Canadian trade name
Non-Crushable Drug
High Alert drug

**underlined** underlined – top prescribed drug
nafillin
naf-sil-in

CLASSIFICATION
PHARMACOTHERAPEUTIC: Penicillinase-resistant penicillin.
CLINICAL: Antibiotic.

Uses
Treatment of respiratory tract, skin/skin structure infections, osteomyelitis, endocarditis, meningitis; perioperatively, esp. in cardiovascular, orthopedic procedures. Predominant treatment of infections caused by susceptible strains of staphylococci.

Precautions
Contraindications: Hypersensitivity to nafillin, other penicillins. Cautions: History of allergies, particularly cephalosporins; severe renal/hepatic impairment, asthma, pts with HF.

Action

Lifespan considerations
Pregnancy/Lactation: Readily crosses placenta; appears in cord blood, amniotic fluid. Distributed in breast milk. May lead to rash, diarrhea, candidiasis in neonate, infant. Children: Immature renal function in neonate may delay renal
excretion. **Elderly:** Age-related renal impairment may require dosage adjustment.

**Interactions**

**DRUG:** High doses (2 g q4h) may decrease effects of warfarin. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** May cause false-positive Coombs’ test.

**Availability (Rx)**

**Injection, Powder for Reconstitution:** 1 g, 2 g. **Infusion (Premix):** 1 g/50 mL, 2 g/100 mL.

**Administration/handling**

⚠️ **Space doses evenly around the clock.**

**IV**

**Reconstitution**
- Reconstitute each vial with 10 mL Sterile Water for Injection or 0.9% NaCl.
- For intermittent IV infusion (piggyback), further dilute with 50–100 mL 0.9% NaCl or D₅W.

**Rate of Administration**
- Infuse over 30–60 min.
- Because of potential for hypersensitivity/anaphylaxis, start initial dose at few drops per min, increase slowly to ordered rate; stay with pt first 10–15 min, then check q10min.
- Limit IV therapy to less than 48 hrs, if possible. Stop infusion if pt complains of pain at IV site.

**Storage**
- Refrigerate diluted solution for up to 7 days or store at room temperature for up to 24 hrs.
- Discard if precipitate forms.

**IM**
- Reconstitute each 500 mg with 1.7 mL Sterile Water for Injection or 0.9%
NaCl to provide concentration of 250 mg/mL.
• Inject IM into large muscle mass.

**IV incompatibilities**
Aztreonam (Azactam), diltiaZEM (Cardizem), droperidol (Inapsine), fentaNYL, gentamicin, insulin, labetalol (Normodyne, Trandate), methylPREDNISolone (Solu-Medrol), midazolam (Versed), nalbuphine (Nubain), vancomycin (Vancocin), verapamil (Isoptin).

**IV Compatibilities**
Acyclovir, famotidine (Pepcid), fluconazole (Diflucan), heparin, HYDROMorphone (Dilaudid), lidocaine, lipids, magnesium, morphine, potassium chloride, propofol (Diprivan).

**Indications/routes/dosage**

**Usual Dosage**
**IV: ADULTS, ELDERLY:** 0.5–2 g q4–6h. **CHILDREN:** Mild to Moderate Infections: 100–150 mg/kg/day in divided doses q6h. Maximum: 4 g/day. Severe Infections: 150–200 mg/kg/day in divided doses q4–6h. Maximum: 12 g/day. **NEONATES:** 25 mg/kg/dose in divided doses q6–12h. **IM: ADULTS, ELDERLY:** 500 mg q4–6h.

**Dosage in Renal/Hepatic Impairment**
No dose adjustment.

**Side effects**
**Frequent:** Mild hypersensitivity reaction (fever, rash, pruritus), GI effects (nausea, vomiting, diarrhea). **Occasional:** Hypokalemia with high IV dosages, phlebitis, thrombophlebitis (common in elderly). **Rare:** Extravasation with IV administration.

**Adverse effects/toxic reactions**
Potentially fatal antibiotic-associated colitis, superinfections (abdominal cramps, severe watery diarrhea, fever) may result from altered bacterial balance in GI tract. Hematologic effects (esp. involving platelets, WBCs), severe hypersensitivity reactions, anaphylaxis occur rarely.

Nursing considerations

Baseline assessment
Question for history of allergies, esp. penicillins, cephalosporins.

Intervention/evaluation
Hold medication, promptly report rash (possible hypersensitivity), diarrhea (fever, abdominal pain, mucus/blood in stool may indicate antibiotic-associated colitis). Evaluate IV site frequently for phlebitis (heat, pain, red streaking over vein), infiltration (potential extravasation). Monitor periodic CBC, urinalysis, BMP, LFT. Be alert for superinfection: fever, vomiting, diarrhea, anal/genital pruritus, oral mucosal changes (ulceration, pain, erythema).

Patient/family teaching
• Continue antibiotic for full length of treatment.
• Doses should be evenly spaced.
• Discomfort may occur with IM injection.
• Report IV discomfort immediately.
• Report diarrhea, rash, other new symptoms.

**nalbuphine**

*nal-bue-feen*

**Nubain**

◆ **CLASSIFICATION**
**PHARMACOTHERAPEUTIC**: Opioid agonist, antagonist.
**CLINICAL**: Opioid analgesic.

**Uses**
Relief of moderate to severe pain, preop analgesia, obstetric analgesia, adjunct to
anesthesia. **OFF-LABEL:** Opioid-induced pruritus.

### Precautions

**Contraindications:** Hypersensitivity to nalbuphine. **Cautions:** Hepatic/renal impairment, respiratory depression, recent MI, recent biliary tract impairment, pancreatitis, hypovolemia, head trauma, increased intracranial pressure (ICP), pregnancy, pts suspected of being opioid dependent, obesity, thyroid dysfunction, prostatic hyperplasia, urinary stricture, adrenal insufficiency, cardiovascular disease, elderly pts, debilitated pts.

### Action

Agonist of kappa opioid receptors and partial antagonist of mu opioid receptors within CNS, inhibiting ascending pain pathways. **Therapeutic Effect:** Alters pain perception, emotional response to pain.

### Pharmacokinetics

<table>
<thead>
<tr>
<th>Route</th>
<th>Onset</th>
<th>Peak</th>
<th>Duration</th>
</tr>
</thead>
<tbody>
<tr>
<td>IV</td>
<td>2–3 min</td>
<td>2–3 min</td>
<td>3–4 hrs</td>
</tr>
<tr>
<td>IM</td>
<td>Less than 15 min</td>
<td>30 min</td>
<td>3–6 hrs</td>
</tr>
<tr>
<td>SQ</td>
<td>Less than 15 min</td>
<td>N/A</td>
<td>3–6 hrs</td>
</tr>
</tbody>
</table>

Well absorbed after IM, SQ administration. Metabolized in liver. Primarily eliminated in feces by biliary secretion. **Half-life:** 3.5–5 hrs.

### Lifespan considerations

**Pregnancy/Lactation:** Readily crosses placenta. Distributed in breast milk. Breastfeeding not recommended. May cause fetal, neonatal adverse effects during labor/delivery (e.g., fetal bradycardia). **Children:** Paradoxical excitement may occur. Pts younger than 2 yrs more susceptible to respiratory depression. **Elderly:** More susceptible to respiratory depression. Age-related renal impairment may increase risk of urinary retention.

### Interactions
DRUG: Alcohol, other CNS depressants (e.g., LORazepam, morphine, zolpidem) may increase CNS effects, respiratory depression, hypotension. HERBAL: Gotu kola, kava kava, St. John’s wort, valerian may increase CNS depression. FOOD: None known. LAB VALUES: May increase serum amylase, lipase.

Availability (Rx)
Injection Solution: 10 mg/mL, 20 mg/mL.

Administration/handling

ivr
Reconstitution
• May give undiluted.
Rate of Administration
• For IV push, administer each 10 mg over 3–5 min.
Storage
• Store parenteral form at room temperature.

IM/Subcutaneous
• Rotate injection sites.
• Administer undiluted.

ivr incompatibilities
Amphotericin B complex (Abelcet, AmBisome, Amphotec), cefepime (Maxipime), ketorolac (Toradol), nafcillin (Nafcil), piperacillin and tazobactam (Zosyn).

ivr Compatibilities
Dexmedetomidine (Precedex), diphenhydrAMINE (Benadryl), droperidol (Inapsine), glycopyrrolate (Robinul), hydrOXYzine (Vistaril), lidocaine, midazolam (Versed), prochlorperazine (Compazine), propofol (Diprivan).
Indications/routes/dosage

Analgesia

**IV, IM, SQ: ADULTS, ELDERLY:** 10 mg q3–6h as needed. Do not exceed maximum single dose of 20 mg or daily dose of 160 mg. **CHILDREN 1 YR AND OLDER:** 0.1–0.2 mg/kg q3–4h as needed. **Maximum:** 20 mg/dose, 160 mg/day.

Dosage in Renal/Hepatic Impairment

Use caution.

Side effects

**Frequent (36%):** Sedation. **Occasional (9%–3%):** Diaphoresis, cold/clammy skin, nausea, vomiting, dizziness, vertigo, dry mouth, headache. **Rare (less than 1%):** Restlessness, emotional lability, paresthesia, flushing, paradoxical reaction.

Adverse effects/toxic reactions

Abrupt withdrawal after prolonged use may produce symptoms of narcotic withdrawal (abdominal cramping, rhinorrhea, lacrimation, anxiety, fever, piloerection [goose bumps]). Overdose results in severe respiratory depression, skeletal muscle flaccidity, cyanosis, extreme drowsiness progressing to seizures, stupor, coma. Tolerance to analgesic effect, physical dependence may occur with chronic use.

Nursing considerations

Baseline assessment

Question medical history as listed in Precautions. Obtain vital signs before giving medication. If respirations are 12/min or less (20/min or less in children), withhold medication, contact physician. Assess onset, type, location, duration of pain. Effect of medication is reduced if full pain recurs before next dose.
**Intervention/evaluation**

Monitor for change in respirations, B/P, rate/quality of pulse. Monitor daily pattern of bowel activity, stool consistency. Initiate deep breathing, coughing exercises, particularly in pts with pulmonary impairment. Assess for clinical improvement, record onset of relief of pain. Consult physician if pain relief is not adequate.

**Patient/family teaching**

- Avoid alcohol.
- Avoid tasks that require alertness, motor skills until response to drug is established.
- May cause dry mouth.
- May be habit forming.

---

**naldemedine**

*Symproic*

**CLASSIFICATION**

**PHARMACOTHERAPEUTIC:** Opioid receptor antagonist (peripheral acting) *(Schedule II).*

**CLINICAL:** GI agent.

---

**Uses**

Treatment of opioid-induced constipation (OIC) in adult pts with chronic non-cancer pain, including pts with chronic pain related to prior cancer or its treatment, who do not require frequent (e.g., weekly) opioid dosage escalation.

**Precautions**

**Contraindications:** Hypersensitivity to naldemedine. Known or suspected mechanical GI obstruction. Pts at risk of recurrent GI obstruction. **Cautions:** Severe hepatic impairment, pts with advanced illness associated with impaired structural integrity of the GI wall or conditions that may impair integrity of GI wall (e.g., Crohn’s disease, diverticulitis, GI tract malignancies, intestinal
adhesions, Ogilvie’s syndrome, peptic ulcers, peritoneal malignancies). Concomitant use of strong CYP3A inducers, other opioid antagonists. Pts with disruption to the blood-brain barrier (may precipitate symptoms of opioid withdrawal).

**Action**

Blocks opioid binding at the peripheral mu-opioid receptors in GI tract. Inhibits the delay in GI transit times. **Therapeutic Effect:** Decreases constipating effects of opioids.

**Pharmacokinetics**

Widely distributed. Metabolized in liver. Protein binding: 93%–94%. Peak plasma concentration: 45 mins (with food: 2.5 hrs). Excreted in urine (57%), feces (35%). Not removed by dialysis. **Half-life:** 11 hrs.

**Lifespan considerations**

**Pregnancy/Lactation:** May cross the placenta and cause fetal opiate withdrawal due to immature blood-brain barrier. Due to risk of opiate withdrawal in nursing infants, breastfeeding not recommended during treatment and for at least 3 days after discontinuation. **Children:** Safety and efficacy not established. **Elderly:** No age-related precautions noted.

**Interactions**

**DRUG:** P-gp inhibitors (e.g., amiodarone, azithromycin, carvedilol, cycloSPORINE), moderate CYP3A inhibitors (e.g., erythromycin, ciprofloxacin, diltiazem, dronedarone, fluconazole, verapamil), strong CYP3A inhibitors (e.g., ketoconazole, ritonavir) may increase concentration/effect; **Strong CYP3A inducers** (e.g., carBAMazepine, phenytoin, rifAMPin) may decrease concentration/effect. **Methylnaltrexone, opioid antagonists** may increase adverse/toxic effects. **HERBAL:** St. John’s wort may decrease concentration/effect. **FOOD:** None known. **LAB VALUES:** None known.
**Availability (Rx)**

*Tablets: 0.2 mg.*

**Administration/handling**

*PO*

- Give with or without food.

**Indications/Routes/Dosage**

**Opioid-Induced Constipation**

*PO: ADULTS, ELDERLY: 0.2 mg once daily. (Discontinue if opioid pain medication is discontinued.)*

**Dosage in Renal Impairment**

No dose adjustment.

**Dosage in Hepatic Impairment**

*Mild to moderate impairment: No dose adjustment. Severe impairment: Not recommended.*

**Side Effects**

**Frequent (21%-12%): Abdominal pain. Occasional (9%-3%):** Diarrhea, nausea, flatulence, vomiting, headache, hyperhidrosis.

**Adverse Effects/Toxic Reactions**

Severe abdominal pain, diarrhea requiring hospitalization have occurred. GI perforation was reported in pts with baseline GI disease (Crohn’s disease, diverticulitis, GI tract malignancies, peptic ulcers, Ogilvie’s syndrome, peritoneal malignancies). Symptoms of opiate withdrawal including abdominal pain, anxiety, chills, diarrhea, feeling cold, flushing, hyperhidrosis, increased lacrimation, irritability, nausea were reported, esp. in pts taking methadone or
with disruptions to the blood-brain barrier. May increase risk of adverse effects in pts with renal impairment.

**Nursing Considerations**

**Baseline Assessment**
Discontinue all maintenance laxative therapy prior to initiation. Laxatives may be restarted if therapy has been ineffective for 3 days. Changes to analgesic dosage prior to initiation is not required. Question characteristics of constipation, frequency of bowel movements. Assess bowel sounds. Question history of GI obstruction, GI perforation, or baseline GI disease. Receive full medication history, including herbal products, and screen for interactions. Assess hydration status.

**Intervention/Evaluation**
Pts may be less responsive to therapy if taking opioids for less than 4 wks. Monitor for opioid withdrawal symptoms, esp. in pts taking methadone or with disruptions to blood-brain barrier. Monitor for severe, persistent, or worsening of abdominal pain; may indicate GI tract obstruction or perforation. Encourage fluid intake. Monitor daily pattern of bowel activity, stool consistency. Discontinue treatment if opioid pain medication is also discontinued. If dose is increased to 25 mg/day in pts with renal impairment, monitor for adverse effects.

**Patient/Family Teaching**
- Take with or without food.
- Do not take laxatives unless approved by prescriber.
- Notify prescriber if opioid pain medication is discontinued.
- Immediately report severe, persistent abdominal pain; may indicate tear or blockage in GI tract.
- Do not ingest grapefruit products or take herbal supplements.
- Opioid withdrawal may occur in a fetus of pregnant females due to undeveloped fetal blood-brain barrier.
- Do not breastfeed during treatment and for at least 3 days after last dose.
- Do not take newly prescribed medication unless approved by prescriber who originally started treatment.
naloxegol
nal-ox-ee-gol
Movantik

CLASSIFICATION
PHARMACOTHERAPEUTIC: Mu-opioid receptor antagonist
(Peripherally acting).
CLINICAL: GI agent.
Do not confuse naloxegol with naloxone.

Uses

Treatment of opioid-induced constipation (OIC) in adult pts with chronic non-cancer pain, including pts with chronic pain related to prior cancer or its treatment who do not require frequent (e.g., weekly) opioid dosage escalation.

Precautions

Contraindications: Hypersensitivity to naloxegol. Known or suspected mechanical GI obstruction, pts at risk for recurrent GI obstruction. Concomitant use of strong CYP3A inhibitors. Cautions: Moderate to severe renal impairment, end-stage renal disease, severe hepatic impairment; pts with risk or reduction of structural wall integrity of GI tract (e.g., Crohn’s disease, diverticulitis, GI tract malignancies, peptic ulcers, Ogilvie’s syndrome, peritoneal metastases). Pts with disruptions to the blood-brain barrier. Concomitant use of moderate CYP3A inhibitors, P-glycoprotein (P-gp) inhibitors. Avoid concomitant use of strong CYP3A inducers, other opioid antagonists.

Action

Blocks opioid binding at peripheral mu-opioid receptors in GI tract. Therapeutic Effect: Decreases constipating effects of opioids.

Pharmacokinetics

Rapidly absorbed. Widely distributed. Metabolized in liver. Protein binding:
4.2%. Peak plasma concentration: less than 2 hrs. Excreted in feces (68%), urine (16%). **Half-life:** 6–11 hrs.

### Lifespan considerations

**Pregnancy/Lactation:** Known to cross the placenta. Use during pregnancy may induce fetal opiate withdrawal due to immature blood-brain barrier. Unknown if excreted in breast milk. Breastfeeding not recommended due to risk of opiate withdrawal in nursing infants. **Children:** Safety and efficacy not established. **Elderly:** No age-related precautions noted.

### Interactions

**DRUG:** P-gp inhibitors (e.g., amiodarone, azithromycin, carvedilol, cycloSPORINE), moderate CYP3A inhibitors (e.g., erythromycin, ciprofloxacin, diltiazem, dronedarone, fluconazole, verapamil), strong CYP3A inhibitors (e.g., ketoconazole, ritonavir) may increase concentration/effect; may increase risk of opiate withdrawal. **Strong CYP3A inducers** (e.g., carbAMazepine, phenytoin, rifAMPin) may decrease concentration/effect. **Methylnaltrexone, opioid antagonists** may increase adverse/toxic effects. **HERBAL:** St John’s wort may decrease concentration/effect. **FOOD:** Grapefruit products may increase concentration/effect. **LAB VALUES:** None known.

### Availability (Rx)

**Tablets:** 12.5 mg, 25 mg.

### Administration/handling

**PO**
- Give on empty stomach at least 1 hr prior to first meal or 2 hrs after first meal.
- Swallow whole; do not chew. For pts unable to swallow tablet whole, tablets may be crushed and mixed with 120 mL water for oral administration or mixed with 60 mL for NG tube administration. After administration of crushed tablet, refill container with 120 mL (oral) or 60 mL (NG tube) of water, stir well, and give remaining contents.
• Do not give with grapefruit products.

**Indications/Routes/Dosage**

**Note:** Discontinue all maintenance laxative therapy prior to use. May reintroduce laxatives if suboptimal response to naloxegol after 3 days.

**Opioid-Induced Constipation**

**PO:** **ADULTS, ELDERLY:** 25 mg once daily in am. May reduce dose to 12.5 mg once daily if 25-mg dose is not tolerated.

**Dose Modification**

Concomitant use of moderate CYP3A inhibitors: 12.5 mg daily in am. **Strong CYP3A inhibitors:** Contraindicated.

**Dosage in Renal Impairment**

**Mild impairment:** No dose adjustment. **Moderate to severe impairment** (CrCl less than 60 mL/min); **ESRD:** Reduce dose to 12.5 mg once daily in am. If tolerated, may increase to 25 mg once daily in am.

**Dosage in Hepatic Impairment**

**Mild to moderate impairment:** No dose adjustment. **Severe impairment:** Not recommended; avoid use.

**Side Effects**

**Frequent (21%-12%):** Abdominal pain. **Occasional (9%-3%):** Diarrhea, nausea, flatulence, vomiting, headache, hyperhidrosis.

**Adverse Effects/Toxic Reactions**

Severe abdominal pain, diarrhea requiring hospitalization have occurred. GI perforation was reported in pts with baseline GI disease (Crohn’s disease, diverticulitis, GI tract malignancies, peptic ulcers, Ogilvie’s syndrome, peritoneal malignancies). Symptoms of opiate withdrawal, including abdominal pain, anxiety, chills, diarrhea, hyperhidrosis, irritability, yawning, were reported,
esp. in pts taking methadone or with disruptions to the blood-brain barrier. May increase risk of adverse effects in pts with renal impairment who have increased dose to 25 mg/day.

**Nursing Considerations**

**Baseline Assessment**
Discontinue all maintenance laxative therapy prior to initiation. Laxatives may be restarted if therapy has been ineffective for 3 days. Changes to analgesic dosage prior to initiation are not required. Question characteristics of constipation, frequency of bowel movements. Assess bowel sounds. Question history of GI obstruction, perforation, baseline GI disease. Receive full medication history including herbal products and screen for interactions. Assess hydration status.

**Intervention/Evaluation**
Pts may be less responsive to therapy if taking opioids for less than 4 wks. Monitor for opioid withdrawal symptoms, esp. in pts taking methadone or with disruptions to blood-brain barrier. Monitor for severe, persistent, worsening of abdominal pain; may indicate GI tract obstruction, perforation. Encourage fluid intake. Monitor daily pattern of bowel activity, stool consistency. Discontinue treatment if opioid pain medication is also discontinued. If dose is increased to 25 mg/day in pts with renal impairment, monitor for increased adverse effects.

**Patient/Family Teaching**
• Take on an empty stomach in the am at least 1 hr before or 2 hrs after morning meal.
• Do not take laxatives unless approved by prescriber.
• Tablets may be taken whole or crushed and mixed in water.
• Notify prescriber if opioid pain medication is discontinued.
• Immediately report severe, persistent abdominal pain; may indicate tear or blockage in GI tract.
• Do not ingest grapefruit products or take herbal supplements.
• Opioid withdrawal may occur in a fetus of pregnant females due to undeveloped fetal blood-brain barrier.
• Do not breastfeed.
naloxone

nal-ox-own

Evzio

Narcan

Narcan Nasal Spray

Fixed-Combination(s)

Embeda: naloxone/morphine (an opioid agonist): 0.8 mg/20 mg, 1.2 mg/30 mg, 2 mg/50 mg, 2.4 mg/60 mg, 3.2 mg/80 mg, 4 mg/100 mg. Suboxone (sublingual film): naloxone/buprenorphine (an analgesic): 0.5 mg/2 mg, 1 mg/4 mg, 2 mg/8 mg, 3 mg/12 mg. Zubsolv: naloxone/buprenorphine: 0.36 mg/1.4 mg, 1.4 mg/ 5.7 mg.

CLASSIFICATION

PHARMACOTHERAPEUTIC: Opioid antagonist.

CLINICAL: Antidote.

Do not confuse naloxone with Lanoxin or naltrexone.

Uses

Narcan: Complete or partial reversal of opioid depression including respiratory depression. Diagnosis of suspected opioid tolerance or acute opioid overdose. Evzio, Narcan Nasal Spray: Emergency treatment of known or suspected opioid overdose. OFF-LABEL: Opioid-induced pruritus.

Precautions

Contraindications: Hypersensitivity to naloxone. Cautions: Cardiac/pulmonary disease. Medications with potential for adverse cardiovascular effects (e.g., hypotension, arrhythmias).

Action

Displaces opioids at opioid-occupied receptor sites in CNS. Therapeutic Effect: Reverses opioid-induced sleep/sedation, increases respiratory rate, raises B/P to
normal range.

**Pharmacokinetics**

<table>
<thead>
<tr>
<th>Route</th>

<td>N/A</td>
<td>20–60 min</td>
</tr>
<tr>
<td>SQ</td>
<td>2–5 min</td>
<td>N/A</td>
<td>20–60 min</td>
</tr>
</tbody>
</table>

Well absorbed after IM, SQ administration. Metabolized in liver. Primarily excreted in urine. **Half-life:** 60–100 min.

**Lifespan considerations**

**Pregnancy/Lactation:** Unknown if drug crosses placenta or is distributed in breast milk. **Children/Elderly:** No age-related precautions noted.

**Interactions**

**DRUG:** None significant. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** None significant.

**Availability (Rx)**

**Injection, Autoinjector (Evzio):** 0.4 mg/0.4 mL. **Injection Solution:** 0.4 mg/mL, 1 mg/mL. **Narcan Nasal Spray:** 4 mg/0.1 mL.

**Administration/handling**

**IV**

**Reconstitution**

- For IV push, may give undiluted (0.4 mg/mL or diluted with 9 mL 0.9% NaCl to concentration of 0.04 mg/mL).
- For continuous IV infusion, dilute each 2 mg of naloxone with 500 mL of D₅W or 0.9% NaCl, producing solution containing 0.004 mg/mL (4 mcg/mL).

**Rate of Administration**

- May give IV push over 30 sec.
Storage
• Store parenteral form at room temperature.
• Use mixture within 24 hrs; discard unused solution.
• Protect from light.
• Stable in D₅W or 0.9% NaCl at 4 mcg/mL for 24 hrs.

IM
• Give deep IM in large muscle mass.

IV incompatibilities
Amphotericin B complex (Abelcet, AmBisome, Amphotec).

IV Compatibility
Heparin, ondansetron (Zofran), propofol (Diprivan).

Indications/routes/dosage
Note: If no response seen after a total of 10 mg, consider other causes of respiratory depression.

Opioid Overdose
IV, IM, SQ: ADULTS, ELDERLY: 0.4–2 mg q2–3min as needed. May repeat doses q20–60min. CHILDREN 5 YRS AND OLDER, WEIGHING 20 KG OR MORE: 2 mg/dose; if no response, may repeat q2–3min. May need to repeat doses q20–60min. CHILDREN YOUNGER THAN 5 YRS, WEIGHING LESS THAN 20 KG: 0.1 mg/kg (Maximum: 2 mg); if no response, repeat q2–3min. May need to repeat doses q20–60min. NARCAN NASAL SPRAY: ADULTS, ELDERLY, CHILDREN: Single spray (4 mg) into one nostril. May give q2–3min until emergency medical assistance arrives. (Evzio): IM: ADULTS, ELDERLY, CHILDREN: 0.4 mg as a single dose; may repeat q2–3min until emergency medical assistance becomes available.

Reversal of Respiratory Depression with Therapeutic Opioid Dosing
**IV, IM, SQ: ADULTS, ELDERLY:** Initially, 0.02–0.2 mg. Titrate to avoid profound withdrawal, seizures, arrhythmias, or severe pain. **CHILDREN:** 0.001–0.015 mg/kg. Titrate to desired effect. If administered IM or SQ, dose is to be given in divided doses.

**Dosage in Renal/Hepatic Impairment**
No dose adjustment.

**Side effects**
None known; little or no pharmacologic effect in absence of narcotics.

**Adverse effects/toxic reactions**
Too-rapid reversal of narcotic-induced respiratory depression may result in agitation, nausea, vomiting, tremors, increased B/P, tachycardia, seizures. Excessive dosage in postoperative pts may produce significant reversal of analgesia, agitation, tremors. Hypotension or hypertension, ventricular tachycardia/fibrillation, pulmonary edema may occur in pts with cardiovascular disease.

**Nursing considerations**

**Baseline assessment**
Maintain patent airway. Obtain weight of children to calculate drug dosage.

**Intervention/evaluation**
Monitor vital signs, esp. rate, depth, rhythm of respiration, during and frequently following administration. Carefully observe pt after satisfactory response (duration of opiate may exceed duration of naloxone, resulting in recurrence of respiratory depression). Assess for increased pain with reversal of opiate.
fixed-combination(s)

**Contrave:** naltrexone/bupropion (a norepinephrine-dopamine reuptake inhibitor): 8 mg/90 mg.

**Troxycra ER:** naltrexone/oxyCODONE (an opioid analgesic): 1.2 mg/10 mg, 2.4 mg/20 mg, 3.6 mg/30 mg, 4.8 mg/40 mg, 7.2 mg/60 mg, 9.6 mg/80 mg.

**CLASSIFICATION**

**PHARMACOTHERAPEUTIC:** Opioid receptor antagonist.

**CLINICAL:** Narcotic antagonist, alcohol antagonist antidote.

*Do not confuse naltrexone with naloxone.*

**Uses**

Treatment of alcohol dependence. Blocks effects of exogenously administered opioids.

**Precautions**

**Contraindications:** Hypersensitivity to naltrexone. Opioid dependence or current use of opioid analgesics, acute opioid withdrawal, failed naloxone challenge, or positive urine screen for opioids. **Cautions:** Severe hepatic impairment, pts at high risk of suicide, thrombocytopenia, depression, history of bleeding disorders, concurrent anticoagulant therapy, moderate to severe renal impairment.

**Action**

Blocks effects of endogenous opioid peptides by competitively binding at opioid receptors. **Therapeutic Effect:** **Alcohol deterrent:** Decreases craving, drinking days, relapse rate. **Antidote:** Blocks physical dependence of morphine, heroin, other opioids.

**Pharmacokinetics**

<table>

</tbody>
</table>
Well absorbed following PO administration. Protein binding: 21%. Metabolized in liver. Reduction in first-pass hepatic metabolism when given by intramuscular route. Excreted primarily in urine. **Half-life:** **PO:** 4 hrs; **IM:** 5–10 days.

**Lifespan considerations**

**Pregnancy/Lactation:** Unknown if drug crosses placenta or is distributed in breast milk. **Children:** Safety and efficacy not established in pts younger than 18 yrs. **Elderly:** No age-related precautions noted.

**Interactions**

**DRUG:** May decrease effects of opioid analgesics (e.g., morphine, HYDROcodone, HYDROmorphine). **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** May increase serum transaminase, ALT, AST.

**Availability (Rx)**

**Injection Suspension, Extended-Release Kit (Vivitrol):** 380 mg/4 mL vial. **Tablets:** 50 mg.

**Administration/handling**

**Alert** In pts with narcotic dependence, do not attempt treatment until pt has remained opioid free for 7–10 days. Test urine for opioids for verification. Pt should not be experiencing withdrawal symptoms.

**IM**

• Give in deep muscle mass of gluteal region, alternating buttocks.
• Vivitrol must be suspended only in diluent supplied in kit.

**Storage**

• Store entire diluent supplied in the kit.
• All components (microspheres, diluent, preparation needle, administration needle with safety device) are required for preparation and administration. Spare administration needle is provided in case of clogging.

**PO**
• May take without regard to food. Administer with food or antacids or after meals to minimize adverse GI effects.

**Indications/routes/dosage**

**Alcohol Dependence**

**PO:** **ADULTS, ELDERLY:** 50 mg once daily. Alternative maintenance regimens may be used (e.g., 50 mg/day Monday through Friday and 100 mg on Saturday, or 100 mg every other day, or 150 mg q3days.)

**IM:** **ADULTS, ELDERLY:** *(Vivitrol):* 380 mg once q4wks.

**Opioid Dependence**

**PO:** **ADULTS, ELDERLY:** Initially, 25 mg. Observe for 1 hr. If no withdrawal signs appear, give 50 mg on day 2. Maintenance regimen is flexible, variable, and individualized. May be given as 50 mg daily, 50 mg/day Monday through Friday and 100 mg on Saturday, 100 mg every other day, or 150 mg q3days for 12 wks. **IM:** **ADULTS, ELDERLY:** 380 mg q4wks.

**Dosage in Renal Impairment**

**Mild impairment:** No dose adjustment. **Moderate to severe impairment:** Use caution.

**Dosage in Hepatic Impairment**

No dose adjustment. **Severe:** Use caution.

**Side effects**

**Common: IM:** *(69%):* Injection site reaction (induration, tenderness, pain, nodules, swelling, pruritus, ecchymosis). **Frequent: Alcohol Deterrent:** *(33%–10%):* Nausea, headache, depression. **Narcotic Addiction (10%–5%):** Insomnia, anxiety, headache, low energy, abdominal cramps, nausea, vomiting, joint/muscle pain. **Occasional: Alcohol Deterrent (4%–2%):** Dizziness, anxiety, fatigue, insomnia, vomiting, suicidal ideation. **Narcotic Addiction (5% or less):** Irritability, increased energy, dizziness, anorexia, diarrhea, constipation, rash, chills, increased thirst.
**Adverse effects/toxic reactions**

Signs/symptoms of opioid withdrawal include rhinorrhea, lacrimation, yawning, diaphoresis, tremor, vomiting, piloerection (goose bumps), feeling of temperature change, arthralgia, myalgia, abdominal cramps, formication (feeling of skin crawling). Accidental naltrexone overdosage produces withdrawal symptoms within 5 min of ingestion, lasts up to 48 hrs. Symptoms present as confusion, visual hallucinations, drowsiness, significant vomiting, diarrhea. Hepatotoxicity may occur with large doses.

**Nursing considerations**

**Baseline assessment**

Treatment should not be instituted unless pt is opioid free for 7–10 days, alcohol free for 3–5 days before therapy begins. Obtain medication history (esp. opioids), other medical conditions (esp. hepatitis, other hepatic disease). If opioid dependence suspected, a naloxone challenge test should be performed (naloxone administered to verify opioid dependence and eligibility for admission to opioid treatment program).

**Intervention/evaluation**

Monitor for evidence of hepatotoxicity (abdominal pain that lasts longer than a few days, white bowel movements, dark urine, jaundice). Monitor serum ALT, AST, bilirubin.

**Patient/family teaching**

• If heroin, other opiates are self-administered, there will be no effect. However, any attempt to overcome naltrexone’s prolonged 24- to 72-hr blockade of opioid effect by taking large amounts of opioids is dangerous and may result in coma, serious injury, fatal overdose.
• Naltrexone blocks effects of opioid-containing medicine (cough/cold preparations, antidiarrheal preparations, opioid analgesics).
• Report abdominal pain lasting longer than 3 days, white bowel movement, dark-colored urine, yellowing of skin or eyes.

naproxen
na-prox-en
Aleve
Anaprox DS
Apo-Naproxen
EC-Naprosyn
Naprelan
Naprosyn

Fixed-Combination(s)

**Prevacid NapraPac:** naproxen/lansoprazole (proton pump inhibitor): 375 mg/15 mg, 500 mg/15 mg.

**Treximet:** naproxen/SUMAtriptan (an antimigraine): 60 mg/10 mg; 500 mg/85 mg. **Vimovo:** naproxen/esomeprazole (proton pump inhibitor): 375 mg/20 mg, 500 mg/20 mg.

**CLASSIFICATION**

**PHARMACOTHERAPEUTIC:** NSAID.

**CLINICAL:** Analgesic, anti-inflammatory.

■ **BLACK BOX ALERT** ■ Increased risk of serious cardiovascular thrombotic events, including myocardial infarction, CVA. Increased risk of severe GI reactions, including ulceration, bleeding, perforation of stomach, intestines.

Do not confuse Aleve with Alesse, or Anaprox with Anaspaz or Avapro.

**Uses**

Treatment of acute or long-term mild to moderate pain, primary dysmenorrhea, rheumatoid arthritis (RA), juvenile rheumatoid arthritis (JRA), osteoarthritis, ankylosing spondylitis, acute gouty arthritis, bursitis, tendonitis, fever. **OFF-LABEL:** Migraine prophylaxis.

**Precautions**
Contraindications: History of asthma, urticaria; hypersensitivity to naproxen, other NSAIDs. Perioperative pain in setting of CABG surgery. Cautions: GI disease (bleeding, ulcers), fluid retention, renal/hepatic impairment, asthma, HF, concurrent use of anticoagulants, smoking, use of alcohol, elderly pts, debilitated pts.

Action
Reversibly inhibits COX-1 and COX-2 enzymes, resulting in decreased formation of prostaglandin precursors. Therapeutic Effect: Reduces inflammatory response, intensity of pain.

LifeSpan considerations

Pregnancy/Lactation: Crosses placenta. Distributed in breast milk. Avoid use during third trimester (may adversely affect fetal cardiovascular system: premature closing of ductus arteriosus). Children: Safety and efficacy not established in pts younger than 2 yrs. Children older than 2 yrs at increased risk for skin rash. Elderly: Age-related renal impairment may increase risk of hepatic/renal toxicity; reduced dosage recommended. More likely to have serious adverse effects with GI bleeding/ulceration.

Interactions

DRUG: May decrease effects of antihypertensives (e.g., amLODIPine, lisinopril, valsartan), diuretics (e.g., furosemide, HCTZ). Aspirin, other salicylates may increase risk of GI side effects, bleeding. Bone marrow depressants may increase risk of hematologic reactions. May increase risk of bleeding with heparin, oral anticoagulants (e.g., warfarin),
thrombolytics (e.g., alteplase). May increase concentration, risk of toxicity of lithium. May increase risk of methotrexate toxicity. HERBAL: Cat’s claw, dong quai, evening primrose, feverfew, garlic, ginger, ginkgo, ginseng, horse chestnut, red clover possess antiplatelet activity, may increase risk of bleeding. FOOD: None known. LAB VALUES: May prolong bleeding time. May increase serum BUN, creatinine, ALT, AST, alkaline phosphatase. May decrease Hgb, Hct, leukocytes, platelets, uric acid.

**Availability (Rx)**

Capsule: 220 mg. Oral Suspension: 125 mg/5 mL naproxen. Tablets: 220 mg, 250 mg, 275 mg, 375 mg, 500 mg, 550 mg. ![]( Tablets (Extended-Release): 375 mg, 500 mg, 750 mg. )

**Administration/handling**

PO

- Give controlled-release form whole. Do not break, crush, dissolve, or divide.
- Best taken with food or milk (decreases GI irritation).
- Shake suspension well.

**Indications/routes/dosage**

Note: Dosage expressed as naproxen base (200 mg naproxen base equivalent to 220 mg naproxen sodium).

**Rheumatoid Arthritis (RA), Osteoarthritis, Ankylosing Spondylitis**

PO: ADULTS, ELDERLY: *(Immediate-Release)*: 500–1,000 mg/day in 2 divided doses. May increase to 1,500 mg/day for limited time. *(Extended-Release)*: Initially, 750–1,000 mg once daily. May increase temporarily to 1,500 mg once daily.

**Acute Gouty Arthritis**

PO: ADULTS, ELDERLY: *(Immediate-Release)*: Initially, 750 mg naproxen, then 250 mg naproxen q8h until attack subsides. *(Extended-Release)*: Initially,
1,000–1,500 mg, then 1,000 mg once daily until attack subsides.

**Mild to Moderate Pain, Dysmenorrhea, Bursitis, Tendonitis**

**PO: ADULTS, ELDERLY (Immediate-Release):** Initially, 500 mg, then 500 mg q12h or 250 mg q6–8h as needed. **Maximum:** 1,250 mg on day 1, then 1,000 mg once daily. **(Extended-Release):** Initially, 1,000 mg once daily. May temporarily increase to 1,500 mg once daily, then reduce to 1,000 mg once daily.

**Juvenile Idiopathic Arthritis (JIA)**

**PO (Oral Suspension Recommended):** CHILDREN OLDER THAN 2 YRS: 10–15 mg/kg/day in 2 divided doses. **Maximum:** 1,000 mg/day.

**OTC Uses (Pain, Fever)**

**PO: ADULTS 65 YRS AND YOUNGER, CHILDREN 12 YRS AND OLDER:** Initially, 400 mg once, then 200 mg q8–12h. **ADULTS OLDER THAN 65 YRS:** 200 mg q12h. **Maximum:** 400 mg in any 8- to 12-hr period or 600 mg/day.

**Dosage in Renal Impairment**

Not recommended with CrCl less than 30 mL/min.

**Dosage in Hepatic Impairment**

Use caution.

**Side effects**

**Frequent (9%–4%):** Nausea, constipation, abdominal cramps/pain, heartburn, dizziness, headache, drowsiness. **Occasional (3%–1%):** Stomatitis, diarrhea, indigestion. **Rare (less than 1%):** Vomiting, confusion.

**Adverse effects/toxic reactions**

Rare reactions with long-term use include peptic ulcer, GI bleeding, gastritis, severe hepatic reactions (cholestasis, jaundice), nephrotoxicity (dysuria, hematuria, proteinuria, nephrotic syndrome), and severe hypersensitivity reaction (fever, chills, bronchospasm).
Nursing considerations

Baseline assessment
Assess onset, type, location, duration of pain/inflammation. Inspect appearance of affected joints for immobility, deformities, skin condition. Question history of GI bleeding, gastric or duodenal ulcers, hypertension.

Intervention/evaluation
Assist with ambulation if dizziness occurs. Periodically monitor renal function test during chronic use. Monitor daily pattern of bowel activity, stool consistency. Evaluate for therapeutic response: relief of pain, stiffness, swelling; increased joint mobility, reduced joint tenderness, improved grip strength.

Patient/family teaching
• Avoid tasks that require alertness, motor skills until response to drug is established.
• Take with food, milk.
• Avoid aspirin, alcohol during therapy (increases risk of GI bleeding).
• Report headache, rash, visual disturbances, weight gain, black or tarry stools, bleeding, persistent headache.

naratriptan
nar-a-trip-tan
Amerge

Classification
PHARMACOTHERAPEUTIC: Serotonin receptor agonist.
CLINICAL: Antimigraine.
Do not confuse naratriptan with eletriptan or almotriptan, or Amerge with Altace or Amaryl.

Uses
Treatment of acute migraine headache with or without aura in adults.
Precautions

Contraindications: Hypersensitivity to naratriptan. Basilar/hemiplegic migraine, cerebrovascular disease, peripheral vascular disease, coronary artery disease, ischemic heart disease (including angina pectoris, history of MI, silent ischemia, Prinzmetal’s angina), severe hepatic impairment (Child-Pugh grade C), severe renal impairment (CrCl less than 15 mL/min), uncontrolled hypertension, use within 24 hrs of ergotamine-containing preparations or another serotonin receptor agonist, 5-HT agonist (e.g., SUMatriptan), MAOI use within 14 days. Cautions: Mild to moderate renal/hepatic impairment, pt profile suggesting cardiovascular risks, elderly.

Action

Binds selectively to serotonin receptors, producing vasoconstrictive effect on cranial blood vessels. Therapeutic Effect: Relieves migraine headache.

Pharmacokinetics

Well absorbed after PO administration. Protein binding: 28%–31%. Metabolized in liver. Eliminated primarily in urine. Half-life: 6 hrs (increased in hepatic/renal impairment).

Lifespan considerations

Interactions

DRUG: Ergotamine-containing medications may produce vasospastic reaction. SSRIs (e.g., escitalopram, paroxetine, sertraline), SNRIs (e.g., duloxetine, venlafaxine) may produce serotonin syndrome. HERBAL: None significant. FOOD: None known. LAB VALUES: None significant.

Availability (Rx)
*Tablets:* 1 mg, 2.5 mg.

**Administration/handling**

**PO**
- Give without regard to food.
- Do not break, crush, dissolve, or divide tablets. Swallow whole with water.

**Indications/routes/dosage**

**Acute Migraine Attack**

**PO:** *ADULTS:* 1 or 2.5 mg. If headache improves but then returns, dose may be repeated after 4 hrs. **Maximum:** 5 mg/24 hrs.

**Dosage in Renal/Hepatic Impairment**

<table>
<thead>
<tr>
<th>Hepatic Failure</th>

</thead>
<tbody>
<tr>
<td>Mild to moderate</td>
<td>15–39 mL/min</td>
<td>Initial, 1 mg; Max: 2.5 mg/24 hrs</td>
</tr>
<tr>
<td>Severe</td>
<td>Less than 15 mL/min</td>
<td>Contraindicated</td>
</tr>
</tbody>
</table>

**Side effects**

*Occasional (5%):* Nausea. *Rare (2%):* Paresthesia, dizziness, fatigue, drowsiness, feeling of pressure in throat, neck, jaw.

**Adverse effects/toxic reactions**

Corneal opacities, other ocular defects may occur. Cardiac events (ischemia, coronary artery vasospasm, MI), noncardiac vasospasm-related reactions (hemorrhage, cerebrovascular accident [CVA]) occur rarely, particularly in pts with hypertension, diabetes, strong family history of coronary artery disease, obese pts, smokers, males older than 40 yrs, postmenopausal women.

**Nursing considerations**
Baseline assessment
Question medical history as listed in Precautions. Question pt regarding possible precipitating symptoms, onset, location, duration of migraine.

Intervention/evaluation
Assess for relief of migraine headache; potential for photophobia, phonophobia (sound sensitivity), nausea, vomiting.

Patient/family teaching
• Do not chew, crush, dissolve, or divide tablet; swallow whole with water.
• May repeat dose after 4 hrs (maximum of 5 mg/24 hrs).
• May cause dizziness, fatigue, drowsiness.
• Avoid tasks that require alertness, motor skills until response to drug is established.
• Report any chest pain, palpitations, tightness in throat, rash, hallucinations, anxiety, panic.

nateglinide
na-te-glye-nide
Starlix

CLASSIFICATION
PHARMACOTHERAPEUTIC: Meglitinide analogue.
CLINICAL: Antidiabetic agent.

Uses
Treatment of type 2 diabetes mellitus as an adjunct to diet and exercise.

Precautions
Contraindications: Hypersensitivity to nateglinide. Diabetic ketoacidosis, type 1 diabetes. Cautions: Moderate to severe hepatic impairment, severe renal impairment, elderly pts, malnourished, adrenal/pituitary dysfunction.

Action
Stimulates insulin release from beta cells of pancreas by depolarizing beta cells, leading to opening of calcium channels. Resulting calcium influx induces insulin secretion. **Therapeutic Effect:** Lowers serum glucose concentration.

### Pharmacokinetics

<table>
<thead>
<tr>
<th>Route</th>
<th>Onset</th>
<th>Peak</th>
<th>Duration</th>
</tr>
</thead>
<tbody>
<tr>
<td>PO</td>
<td>20 min</td>
<td>1 hr</td>
<td>4 hrs</td>
</tr>
</tbody>
</table>

Rapidly absorbed from GI tract. Protein binding: 98%. Extensive metabolism in liver. Excreted in urine (83%), feces (10%). **Half-life:** 1.5 hrs.

### Lifespan considerations

**Pregnancy/Lactation:** Unknown if drug crosses placenta or is distributed in breast milk. **Children:** Safety and efficacy not established. **Elderly:** Increased susceptibility to hypoglycemia.

### Interactions

**DRUG:** Beta blockers (e.g., carvedilol, metoprolol) may mask symptoms of hypoglycemia. Beta blockers (e.g., carvedilol, metoprolol), MAOIs (e.g., phenelzine, selegiline), NSAIDs (e.g., ibuprofen, ketorolac, naproxen), salicylates may increase hypoglycemic effect. Corticosteroids (e.g., predniSONE), sympathomimetics, thiazide diuretics (e.g., HCTZ), thyroid medications may decrease hypoglycemic effect. **HERBAL:** Bilberry, garlic, ginger, ginseng may increase hypoglycemic effect. **St. John’s wort** may decrease concentration/effects. **FOOD:** None known. **LAB VALUES:** Decrease in serum glucose expected.

### Availability (Rx)

**Tablets:** 60 mg, 120 mg.

### Administration/handling

**PO**
• Ideally, give within 15 min of a meal, but may be given immediately before a meal to as long as 30 min before a meal.

Indications/routes/dosage

Diabetes Mellitus

PO: ADULTS, ELDERLY: Initial/Maintenance: 120 mg 3 times/day before meals. 60 mg 3 times/day may be given in pts close to Hgb A1c goal.

Dosage in Renal Impairment

Mild to moderate impairment: No dose adjustment. Severe impairment: Use caution.

Dosage in Hepatic Impairment

Mild impairment: No dose adjustment. Moderate to severe impairment: Use caution.

Side effects

Frequent (10%): Upper respiratory tract infection. Occasional (4%–3%): Back pain, flu-like symptoms, dizziness, arthropathy, diarrhea. Rare (2% or less): Bronchitis, cough.

Adverse effects/toxic reactions

Hypoglycemia occurs in less than 2% of pts.

Nursing considerations

Baseline assessment

Check fasting serum glucose, Hgb A1c periodically to determine minimum effective dose. Discuss lifestyle to determine extent of learning, emotional needs. Ensure follow-up instruction if pt, family do not thoroughly understand diabetes management, glucose-testing technique. At least 1 wk should elapse to assess response to drug before new dose adjustment is made.
Intervention/evaluation

Monitor serum glucose, food intake. Assess for hypoglycemia (cool, wet skin, tremors, dizziness, anxiety, headache, tachycardia, numbness in mouth, hunger, diplopia), hyperglycemia (polyuria, polyphagia, polydipsia, nausea, vomiting, dim vision, fatigue, deep rapid breathing). Be alert to conditions that alter glucose requirements: fever, increased activity, stress, surgical procedures.

Patient/family teaching

• Diabetes requires lifelong control.
• Prescribed diet, exercise are principal parts of treatment; do not skip, delay meals.
• Continue to adhere to dietary instructions, regular exercise program, regular testing of serum glucose.

---

**necitumumab**

*ne-si-toom-oo-mab*

**Portrazza**

**CLASSIFICATION**

**PHARMACOTHERAPEUTIC**: Epidermal growth factor receptor (EGFR) inhibitor. Monoclonal antibody.

**CLINICAL**: Antineoplastic.

- **BLACK BOX ALERT** - Cardiopulmonary arrest and/or sudden death reported in 3% of pts (when treated in combination with gemcitabine and cisplatin). Closely monitor serum electrolytes, esp. serum calcium, magnesium, potassium, and aggressively replace as appropriate. Hypomagnesemia occurred in 83% of pts and was severe in 20%. Monitor pts for hypomagnesemia, hypocalcemia, hypokalemia prior to each dose, during treatment, and up to 8 wks after discontinuation. Withhold treatment for CTCAE grade 3 or 4 electrolyte abnormality.

Do not confuse necitumumab with adalimumab, belimumab, daratumumab, ipilimumab, nivolumab, ofatumumab, or panitumumab.
Uses
First-line treatment (in combination with gemcitabine and CISplatin) of metastatic squamous non–small-cell lung cancer (NSCLC).

Precautions

**Contraindications:** Severe hypersensitivity to necitumumab. **Cautions:** COPD, chronic arrhythmias, coronary artery disease, HF, recent MI (within 6 mos), pts at risk for electrolyte imbalance (e.g., adrenal insufficiency, alcoholism, renal failure, thyroid disorders, malnutrition, chronic diarrhea; concomitant use of medication known to cause electrolyte abnormalities); history of venous or arterial thrombosis (e.g., CVA, DVT, MI, pulmonary embolism). Not indicated for treatment of nonsquamous non–small-cell lung cancer.

Action
Binds to ligand-binding site of EGFR and prevents activation, expression, signaling of EGFR. **Therapeutic Effect:** Inhibits tumor cell growth and metastasis.

Pharmacokinetics
Widely distributed. Metabolism not specified. Elimination not specified. **Half-life:** 14 days.

Ｌifikspan considerations

**Pregnancy/Lactation:** Avoid pregnancy; may cause fetal harm. Female pts of reproductive potential should use effective contraception during treatment and for at least 3 mos after discontinuation. Unknown if distributed in breast milk. Breastfeeding not recommended during treatment and up to 3 mos after discontinuation. **Children:** Safety and efficacy not established. **Elderly:** May have increased risk of venous thromboembolism (including pulmonary embolism).

Interactions
Availability (Rx)

Injection Solution: 800 mg/50 mL (16 mg/mL).

Administration/handling

IV

Preparation
• Visually inspect for particulate matter or discoloration.
• Solution should appear clear to slightly opalescent, colorless to slightly yellow in color. Discard if solution is cloudy or particulate matter is observed.
• Dilute in 250 mL 0.9% NaCl bag.
• Do not use solutions containing dextrose.
• Gently invert to mix. Do not shake or agitate.

Infusion Guidelines
• For pts with prior grade 1 or 2 infusion reaction, premedicate with diphenhydrAMINE (or equivalent) before each subsequent infusion.
• For pts with recurrent grade 1 or 2 infusion reaction (despite administration of diphenhydrAMINE), premedicate with dexamethasone (or equivalent), acetaminophen, diphenhydrAMINE (or equivalent) before each subsequent infusion.
• Once infusion is complete, flush IV line with 0.9% NaCl only.

Rate of Administration
• Infuse over 60 mins using infusion pump via dedicated line.

Storage
• Refrigerate unused vials in original carton until time of use.
• Protect from light.
• May refrigerate diluted solution up to 24 hours or at room temperature up to 4 hrs.

IV incompatibilities

Do not mix with dextrose-containing solutions. Do not infuse with other
medications or electrolytes.

Indications/routes/dosage

Non–Small-Cell Lung Cancer

**IV: ADULTS, ELDERLY:** 800 mg on days 1 and 8 of each 3-wk cycle (in combination with gemcitabine and CISplatin). Continue until disease progression or unacceptable toxicity.

Dose Modification

Based on Common Terminology Criteria for Adverse Events (CTCAE).

Infusion Reactions

**Any grade 1 reaction:** Decrease rate by 50%. **Grade 2 reaction:** Interrupt infusion until resolved to grade 1 or 0, then resume with rate reduced by 50% for all subsequent infusions. **Grade 3 reaction:** Permanently discontinue.

Dermatological Toxicity

**Grade 3 rash or acneiform rash:** Withhold treatment until resolved to grade 2 or better, then reduce dose to 400 mg for at least 1 treatment cycle. If tolerated, may increase dose to 600 mg and 800 mg for subsequent cycles. **Permanent Discontinuation:** Grade 3 rash or acneiform rash that does not resolve to grade 2 or better within 6 wks; worsening of skin reaction or intolerance at 400 mg dose; grade 3 skin induration or fibrosis; grade 4 dermatologic toxicity.

Electrolyte Imbalance

Withhold treatment for any grade 3 or 4 electrolyte abnormalities. Resume once abnormalities resolve to grade 2 or better.

Venous/Arterial Thrombosis

**Any occurrence:** Permanently discontinue.

Dosage in Renal Impairment
No dose adjustment.

Dosage in Hepatic Impairment

Mild to moderate impairment: No dose adjustment. Severe impairment: Not specified; use caution.

Side effects

Frequent (44%–29%): Rash, vomiting. Occasional (16%–5%): Diarrhea, dermatitis acneiform, decreased weight, stomatitis, headache, acne, pruritus, dry skin, paronychia, conjunctivitis, blurry vision, dry eye, reduced visual acuity, blepharitis, eye pain, increased lacrimation, ocular hyperemia, visual impairment, eye pruritus, skin fissures. Rare (3%–1%): Dysphagia, muscle spasm, oropharyngeal pain.

Adverse effects/toxic reactions

All cases were reported in combination with gemcitabine and CISplatin. Pts with severe hypomagnesemia, hypokalemia, hypocalcemia are at an increased risk for cardiac arrhythmias or sudden death. Cardiopulmonary arrest and/or sudden death occurred in 3% of pts. Most cases of cardiopulmonary arrest occurred within 30 days of the last dose and involved co-morbidities including COPD, coronary artery disease, hypomagnesemia, hypertension. Hypomagnesemia reported in 83% of pts with median onset of approx. 6 wks. Severe hypomagnesemia (grade 3 or 4) reported in 20% of pts. Infusion reaction (any grade) reported in 1.5% of pts. Life-threatening venous and arterial thromboembolic events including pulmonary embolism (5% of pts), DVT (2% of pts), CVA (2% of pts), MI (1% of pts); thrombosis of mesenteric veins, pulmonary artery/vein, axillary vein, vena cava, subclavian vein; thrombophlebitis may occur. Hemoptysis reported in 10% of pts. Ocular toxicities including conjunctivitis, conjunctival hemorrhage, eye infections were reported. Severe skin toxicities occurred in 8% of pts. Immunogenicity (auto-necitumumab antibodies) occurred in 4% of pts.

Nursing considerations
Baseline assessment

Obtain baseline BMP, serum magnesium, ionized calcium; vital signs prior to each dose. Obtain pregnancy test in female pts of reproductive potential. Receive full medication history and screen for drugs known to cause electrolyte imbalance. Assess nutritional status. Question history of CVA, DVT, pulmonary embolism, cardiac disease, recent MI; conditions known to cause electrolyte imbalance; prior hypersensitivity reaction to any drug in treatment regimen; prior infusion reaction. Offer emotional support. Conduct full dermatological exam.

Intervention/evaluation

Diligently monitor serum electrolytes, esp. serum magnesium, potassium, calcium, ionized calcium, during therapy and up to 8 wks after discontinuation. Monitor for symptoms of hypocalcemia, hypokalemia, hypomagnesemia. Obtain EKG, vital signs if arrhythmia, chest pain, palpitations, syncope occurs. Aggressively replace electrolytes as appropriate. Pts with sudden chest pain, dyspnea, hypoxia, tachycardia should be evaluated for pulmonary embolism. Monitor for symptoms of DVT (leg or arm pain/swelling), CVA (aphasia, altered LOC, hemiplegia, vision loss, headache, homonymous hemianopsia [vision loss on the same side of both eyes]), MI (chest pain, dyspnea, syncope, diaphoresis, left arm pain, jaw pain). Monitor for hemoptysis. Assess skin for rash, hypersensitivity reaction; eyes for infection, subconjunctival hemorrhage.

Patient/family teaching

• Therapy may cause low levels of potassium, magnesium, calcium in the blood and may be life threatening. Replace electrolytes exactly as instructed.
• Report symptoms of electrolyte imbalance such as fainting, fatigue, muscle cramps, palpitations, paralysis, numbness or tingling, seizures, weakness.
• Avoid pregnancy; treatment may cause birth defects. Female pts of childbearing potential should use effective contraception during treatment and for at least 3 mos after last dose. Do not breastfeed during therapy and for at least 3 mos after last dose.
• Treatment may cause blood clots in the arms, legs, lungs, brain, heart, or abdomen. Immediately report symptoms of stroke (difficulty speaking, confusion, paralysis, vision loss), heart attack (chest pain, shortness of breath, fainting, dizziness, profuse sweating, left arm or jaw pain), lung embolism
(difficulty breathing, fast heart rate, chest pain), or blood clots in the arms or legs (pain/swelling).
• Report skin rashes, allergic reactions, coughing up blood; eye problems such as infection, vision impairment, collection of blood in the whites of the eyes.
• Avoid sunlight, tanning beds. Wear protective clothing, high SPF sunscreen, and lip balm when outdoors.

neratinib
ne-ra-ti-nib
Nerlynx

CLASSIFICATION
PHARMACOTHERAPEUTIC: Epidermal growth factor receptor (EGFR) inhibitor.
CLINICAL: Antineoplastic.
Do not confuse neratinib with afatinib, axitinib, bosutinib, cabozantinib, dasatinib, gefitinib, imatinib, ponatinib, tofacitinib.

Uses
Extended adjuvant treatment of adult pts with early stage HER2-overexpressed/amplified breast cancer, to follow adjuvant trastuzumab-based therapy.

Precautions
Contraindications: Hypersensitivity to neratinib. Cautions: Dehydration, electrolyte imbalance, hepatic impairment, irritable bowel syndrome with diarrhea. Avoid concomitant use of strong or moderate CYP3A inhibitors, CYP3A inducers; proton pump inhibitors, H₂ receptor antagonists, antacids.

Action
Irreversibly binds to epidermal growth factor receptor (EGFR), human epidermal growth factor receptor 2 (HER2), HER4, reducing autophosphorylation and signaling of EGFR and HER2. Therapeutic Effect: Exhibits antitumor activity in EGFR and/or HER2 expressing cancer cell lines.
**Pharmacokinetics**

Widely distributed. Metabolized in liver. Protein binding: 99%. Peak plasma concentration: 2–8 hrs. Excreted in feces (97%), urine (1%). **Half-life:** 7–17 hrs.

**Lifespan considerations**

**Pregnancy/Lactation:** Avoid pregnancy; may cause fetal harm/malformations. Unknown if distributed in breast milk. Breastfeeding not recommended during treatment and for at least 1 month after last dose. Females of reproductive potential should use effective contraception during treatment and for at least 1 mo after discontinuation. **Males:** Males with female partners of reproductive potential should use effective contraception during treatment and up to 3 mos after discontinuation. **Children:** Safety and efficacy not established. **Elderly:** May have increased risk of adverse reactions/toxic effects. Use caution.

**Interactions**

**DRUG:** Aluminum-, magnesium-, calcium-containing antacids, H₂ receptor antagonists (e.g., famotidine), proton pump inhibitors (e.g., omeprazole, pantoprazole) may decrease concentration/effect. **Strong CYP3A4 inhibitors** (e.g., ketoconazole, ritonavir), **moderate CYP3A inhibitors** (e.g., erythromycin, ciprofloxacin, diltiazem, dronedarone, fluconazole, verapamil) may increase concentration/effect. **CYP3A4 inducers** (e.g., carBAMazepine, phenytoin, rifAMPin) may decrease concentration/effect. May increase concentration of **pazopanib, topotecan.** **HERBAL:** None significant. **FOOD:** **Grapefruit products** may increase concentration/effect. **LAB VALUES:** May increase serum ALT, AST, bilirubin.

**Availability (Rx)**

**Tablets:** 40 mg.

**Administration/handling**

**PO**

• Give with food.
• Administer whole; do not break, cut, crush, or divide tablets.
• If a dose is missed or vomiting occurs after administration, do not give extra dose. Administer next dose at regularly scheduled time.
• Take 3 hours after aluminum-, magnesium-, or calcium-containing antacids are given.

**Indications/Routes/Dosage**

**Note:** Recommend antidiarrheal prophylaxis during first 2 cycles (56 days) of therapy.

**Breast Cancer**

**PO: ADULTS, ELDERLY:** 240 mg (6 tablets) once daily for 1 yr.

**Loperamide (Antidiarrheal) Prophylaxis**

**WKS 1–2 (DAYS 1–14):** 4 mg three times/day. **WKS 3–8 (DAYS 15–56):** 4 mg twice daily. **WKS 9–52 (DAYS 57–365):** 4 mg as needed (do not exceed 16 mg/day).

**Dose Reduction Schedule (Neratinib)**

**First dose reduction:** 200 mg daily. **Second dose reduction:** 160 mg daily. **Third dose reduction:** 120 mg daily.

**Dose Modification**

**Any CTCAE grade 3 toxicity:** Withhold treatment until improved to grade 1 or 0 (or baseline), then resume at the next reduced dose level. **Any CTCAE grade 4 toxicity:** Permanently discontinue.

**Diarrhea**

**CTCAE grade 1 diarrhea (increase of greater than 4 stools/day over baseline); CTCAE grade 2 diarrhea (increase of 4–6 stools/day over baseline) lasting more than 5 days, CTCAE grade 3 diarrhea (increase of greater than 7 stools/day over baseline, incontinence, hospitalization, self-limiting ADLs lasting more than 2 days):** Adjust antidiarrheal therapy, diet. Maintain fluid intake (approx. 2 L/day). Once improved to grade 1 or 0, start loperamide 4 mg with each administration. **Any CTCAE grade diarrhea with complications (fever, hypotension, renal failure, or grade 3 or 4**
neutropenia): Withhold treatment and adjust antidiarrheal therapy, diet. Maintain fluid intake (approx. 2 L/day). If diarrhea improves to grade 1 or 0 within 7 days, resume treatment at same dose level. If diarrhea improves to grade 1 or 0 for more than 7 days, resume treatment at the next reduced dose level. Once improved to grade 1 or 0, start loperamide 4 mg with each administration. CTCAE grade 4 diarrhea (life-threatening event, emergent intervention indicated); recurrent grade 2 diarrhea (or higher) at 120 mg dose: Permanently discontinue.

Hepatotoxicity
CTCAE grade 3 serum ALT elevation (greater than 5–20 times upper limit normal [ULN]) or CTCAE grade 3 serum bilirubin elevation (greater than 3–10 times ULN): Withhold treatment until improved to grade 1 or 0 and investigate cause. If serum ALT elevation improves to grade 1 or 0 within 3 wks, resume treatment at reduced dose level. CTCAE grade 4 serum ALT elevation (greater than 20 times ULN) or CTCAE grade 4 serum bilirubin elevation (greater than 10 times ULN): Permanently discontinue and investigate cause.

Dosage in Renal Impairment
Not specified; use caution.

Dosage in Hepatic Impairment
Mild to moderate impairment (Child-Pugh A or B): No dose adjustment. Severe impairment (Child-Pugh C): Reduce starting dose to 80 mg.

Side Effects
Frequent (95%–26%): Diarrhea, nausea, abdominal pain, vomiting. Occasional (18%–4%): Rash (erythematous, follicular, generalized, pruritic, pustular, maculo-papular, papular, dermatitis, dermatitis acniform, toxic skin eruption), stomatitis, mouth ulceration, oral mucosal blistering, mucosal inflammation, oropharyngeal pain, oral pain, glossodynia, glossitis, cheilitis, decreased appetite, muscle spasm, dyspepsia, nail disorder (paronychia, onychoclasis, nail discoloration, nail toxicity, abnormal nail growth, nail dystrophy), dry skin, abdominal distention, decreased weight, dehydration. Rare (3%): Dry mouth.
Adverse Effects/Toxic Reactions

Diarrhea reported in 95% of pts. CTCAE grade 3 diarrhea reported in 40% of pts. CTCAE grade 4 diarrhea reported in less than 1% of pts. Median time of onset of diarrhea was days to wks. Severe diarrhea, dehydration, hypotension, renal failure may occur. Hepatotoxicity reported in 5%–10% of pts.

Nursing Considerations

Baseline Assessment

Intervention/Evaluation

Monitor LFT monthly for the first 3 mos, then q3mos thereafter. Monitor for hepatotoxicity (abdominal pain, ascites, confusion, dark-colored urine, jaundice). Obtain BMP (note electrolytes) if severe diarrhea occurs. Ensure compliance of antidiarrheal therapy. Additional antidiarrheal medication may be needed to manage diarrhea despite treatment with loperamide. Monitor daily pattern of bowel activity, stool consistency. If treatment-related toxicities occur, consider referral to specialist. Monitor I&O. Assess skin, nails, oral mucosa for toxic reactions.

Patient/Family Teaching

• Treatment may cause severe diarrhea, which may lead to life-threatening dehydration or hospitalization. Take antidiarrheal medication exactly as prescribed (goal is 1–2 bowel movements/day). Report worsening of diarrhea or dehydration.
• Drink plenty of fluids (at least 2 L/day if severe diarrhea occurs).
• Report liver problems such as bruising; confusion; amber, dark, orange-colored urine; right upper abdominal pain; yellowing of the skin or eyes.
• Treatment may cause fetal harm; avoid pregnancy.
• Females of childbearing potential should use effective contraception during treatment and for at least 1 mo after last dose. Males with female partners of childbearing potential should use effective contraception during treatment and up to 3 mos after last dose.
• Do not breastfeed.
• Avoid grapefruit products, Seville oranges, starfruit, herbal supplements.
• Acid-reducing medications may interfere with absorption; avoid use. Do not take aluminum-, magnesium-, calcium-containing antacids 3 hrs before or 3 hrs after dose.
• Do not take newly prescribed medications unless approved by the prescriber who originally started treatment.

**niacin**
nye-a-sin

Niacor

Niaspan

Slo-Niacin

**Fixed-Combination(s)**

**Advicor**: niacin/lovastatin (HMG-CoA reductase inhibitor [statin]): 500 mg/20 mg, 750 mg/20 mg, 1,000 mg/20 mg. **Simcor**: niacin/simvastatin (HMG-CoA reductase inhibitor [statin]): 500 mg/20 mg, 500 mg/40 mg, 750 mg/20 mg, 1,000 mg/20 mg, 1,000 mg/40 mg.

**CLASSIFICATION**

**PHARMACOTHERAPEUTIC**: Water-soluble vitamin.
**CLINICAL**: Antihyperlipidemic.

*Do not confuse niacin, Niacor, or Niaspan with Minocin or Nitro-Bid.*

**Uses**

Treatment of dyslipidemias, lowers risk of recurrent MI (pts with history of MI/hyperlipidemia), slow progression of CAD, treatment of hypertriglyceridemia in pts at risk for pancreatitis, dietary supplement. **OFF-LABEL**: Treatment of pellagra.
Precautions

**Contraindications:** Hypersensitivity to niacin, nicotinic acid. Active peptic ulcer disease, arterial hemorrhage, significant or unexplained persistent elevations in hepatic transaminases, active hepatic disease. **Caution:** Diabetes, gallbladder disease, unstable angina, MI, renal impairment, heavy alcohol use, concomitant use of anticoagulants, gout, history of jaundice/hepatic disease, inadequately treated hypothyroidism, elderly pts.

Action

Component of two coenzymes needed for tissue respiration, lipid metabolism, glycogenolysis. May inhibit release of free fatty acids from adipose tissue, increase lipoprotein lipase activity. **Therapeutic Effect:** Reduces total LDL, VLDL cholesterol levels and triglyceride levels; increases HDL cholesterol concentration.

Pharmacokinetics

Readily absorbed from GI tract. Widely distributed. Protein binding: 20%. Metabolized in liver. Primarily excreted in urine. **Half-life:** 45 min.

Lifespan considerations

**Pregnancy/Lactation:** Not recommended for use during pregnancy/lactation. Distributed in breast milk. **Children:** No age-related precautions noted. Not recommended in pts younger than 2 yrs. **Elderly:** No age-related precautions noted.

Interactions

**DRUG:** Alcohol may increase risk of side effects. May increase effect of antihypertensives (e.g., amLODIPine, lisinopril, valsartan). Lovastatin, pravastatin, simvastatin may increase risk of acute renal failure, rhabdomyolysis. **Vasoactive drugs** (e.g., calcium channel blockers, nitrates) may increase hypotension. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** May increase serum uric acid, PT, amylase, bilirubin, fasting glucose, LDH, transaminase. May decrease platelets.
Availability (OTC)

Tablets (Immediate-Release): 50 mg, 100 mg, 250 mg, 500 mg.
Capsules (Extended-Release): 250 mg, 500 mg. Tablets (Extended-Release): 250 mg, 500 mg, 750 mg, 1,000 mg.

Administration/handling

PO

• For pts switching from immediate-release niacin to extended-release niacin, initiate extended-release form with low doses and titrate to therapeutic response.
• Give with food.
• Give aspirin 30 min before taking extended-release niacin to minimize flushing.
• Do not break, crush, dissolve, or divide long-acting forms.

Indications/routes/dosage

Hyperlipidemia

PO (Immediate-Release): ADULTS, ELDERLY: Initially, 250 mg once daily (with evening meal). May increase dose q4–7days up to 1.5–2 g/day in 2–3 divided doses. After 2 mos may increase at 2- to 4-wk intervals to 3 g/day in 3 divided doses. Maximum: 6 g/day in 3 divided doses. Usual daily dose: 1.5–3 g/day.

PO (Extended-Release): ADULTS, ELDERLY: Initially, 500 mg/day at bedtime for 4 wks, then 1 g at bedtime for 4 wks. May increase by no more than 500 mg q4wks up to maximum of 2 g/day. Usual daily dose: 1–2 g/day.

Dosage for Hepatic Toxicity

Transaminases more than 3 times ULN: Discontinue therapy.

Dosage in Renal/Hepatic Impairment

No dose adjustment.
Side effects

**Frequent:** Flushing (esp. face, neck) occurring within 20 min of drug administration and lasting for 30–60 min, GI upset, pruritus. **Occasional:** Dizziness, hypotension, headache, blurred vision, burning/tingling of skin, flatulence, nausea, vomiting, diarrhea. **Rare:** Hyperglycemia, glycosuria, rash, hyperpigmentation, dry skin.

Adverse effects/toxic reactions

Arrhythmias occur rarely.

Nursing considerations

Baseline assessment

Obtain diet history, especially fat consumption. Question for history of hypersensitivity to niacin, tartrazine, aspirin. Obtain baseline serum cholesterol, triglyceride, glucose, LFT.

Intervention/evaluation

Patient/family teaching

- Transient flushing of the skin, sensation of warmth, pruritus, tingling may occur.
- Report dizziness (avoid sudden changes in posture).
- Report nausea, vomiting, loss of appetite, yellowing of skin, dark urine, feeling of weakness.
- If medically approved, take aspirin 30 min before taking extended-release niacin to minimize flushing.
- Take at bedtime with low-fat snack.
- Limit alcohol consumption.
niCARdipine
nye-kar-di-peen

**Cardene IV**

**CLASSIFICATION**

PHARMACOTHERAPEUTIC: Calcium channel blocker.

CLINICAL: Antianginal, antihypertensive.

Do not confuse Cardene SR with Cardizem SR or codeine, or niCARdipine with NIFEdipine or niMODipine.

**Uses**

**Precautions**

**Action**

Inhibits calcium ion movement across cell membranes, depressing contraction of cardiac, vascular smooth muscle. Therapeutic Effect: Increases heart rate, cardiac output, myocardial oxygen delivery. Decreases systemic vascular resistance, B/P.

**Pharmacokinetics**

</table>
Rapidly, completely absorbed from GI tract. Protein binding: 95%. Metabolized in liver. Primarily excreted in urine. Not removed by hemodialysis. **Half-life:** 2–4 hrs.

### Lifespan considerations

**Pregnancy/Lactation:** Unknown if distributed in breast milk. **Children:** Safety and efficacy not established. **Elderly:** Age-related renal impairment may require dosage adjustment.

### Interactions

**DRUG:** May increase concentration of cycloSPORINE. **HERBAL:** Ephedra, ginger, ginseng, yohimbe may increase hypertension. **Licorice** may cause retention of sodium, water; may increase loss of potassium. **St. John’s wort** may decrease levels. **FOOD:** Grapefruit products may alter absorption. **LAB VALUES:** None significant.

### Availability (Rx)

**Capsules:** 20 mg, 30 mg. **Infusion, Ready to Use:** 20 mg/200 mL, 40 mg/200 mL. **Injection Solution:** 2.5 mg/mL (10-mL vial). **Capsules (Sustained-Release):** 30 mg, 60 mg.

### Administration/handling

#### IV

**Reconstitution**

- Dilute 25-mg vial with 240 mL D5W, 0.45% NaCl, or 0.9% NaCl to provide concentration of 0.1 mg/mL.

**Rate of Administration**

- Give by slow IV infusion.
- Change IV site q12h if administered peripherally.

**Storage**

- Store at room temperature.
- Diluted IV solution is stable for 24 hrs at room temperature.
PO
• Give without regard to food.
• Do not break, crush, or open capsules. Give whole.

**IV incompatibilities**
Ampicillin (Principen), ampicillin/sulbactam (Unasyn), cefepime (Maxipime), cefTAZidime (Fortaz), furosemide (Lasix), heparin, sodium bicarbonate.

**IV Compatibilities**
DiltiaZEM (Cardizem), DOBUTamine (Dobutrex), DOPamine (Intropin), EPINEPHrine, HYDROmorphe (Dilaudid), labetalol (Trandate), LORazepam (Ativan), midazolam (Versed), milrinone (Primacor), morphine, nitroglycerin, norepinephrine (Levophed), potassium chloride.

**Indications/routes/dosage**

**Chronic Stable Angina**
**PO: ADULTS, ELDERLY: (Immediate-Release):** Initially, 20 mg 3 times/day. Range: 20–40 mg 3 times/day (allow 3 days between dosage increases).

**Hypertension**
**PO: ADULTS, ELDERLY: (Immediate- Release):** Initially, 20 mg 3 times/day. Range: 20–40 mg 3 times/day (allow 3 days between dosage increases).
**PO: ADULTS, ELDERLY: (Extended-Release):** Initially, 30 mg twice daily. Range: 30–60 mg twice daily.

**Acute Hypertension**
**IV: ADULTS, ELDERLY (GRADUAL B/P DECREASE):** Initially, 5 mg/hr. May increase by 2.5 mg/hr q5–15min. **Maximum:** 15 mg/hr. After B/P goal is achieved, adjust dose to maintain desired BP.

**Dosage in Renal Impairment**
**ADULTS, ELDERLY: (PO):** Initially, give 20 mg q8h (30 mg twice daily
[sustained-release capsules]), then titrate. **(IV):** No dose adjustment.

**Dosage in Hepatic Impairment**

**ADULTS, ELDERLY: (PO):** Initially, give 20 mg twice daily, then titrate. **(IV):** No dose adjustment.

**Side effects**

**Frequent (10%–7%):** Headache, facial flushing, peripheral edema, light-headedness, dizziness. **Occasional (6%–3%):** Asthenia, palpitations, angina, tachycardia. **Rare (less than 2%):** Nausea, abdominal cramps, dyspepsia, dry mouth, rash.

**Adverse effects/toxic reactions**

Overdose produces confusion, slurred speech, drowsiness, marked hypotension, bradycardia.

**Nursing considerations**

**Baseline assessment**

Concurrent therapy with sublingual nitroglycerin may be used for relief of anginal pain. Record onset, type (sharp, dull, squeezing), radiation, location, intensity, duration of anginal pain, precipitating factors (exertion, emotional stress).

**Intervention/evaluation**

**Patient/family teaching**

- May take without regard to food.
- Sustained-release capsule taken whole; do not break, chew, crush, or open.
- Avoid alcohol, grapefruit products; limit caffeine.
- Report if anginal pain not relieved or if palpitations, shortness of breath,
swelling, dizziness, constipation, nausea, hypotension occurs.
• Avoid tasks requiring motor skills, alertness until response to drug is established.

CLASSIFICATION
PHARMACOTHERAPEUTIC: Cholinergic-receptor agonist.
CLINICAL: Smoking deterrent.
Do not confuse NicoDerm with Nitroderm.

Uses
Treatment to aid smoking cessation for relief of nicotine withdrawal symptoms.

Precautions
Contraindications: Hypersensitivity to nicotine. Cautions: Smoking post-MI period, severe or worsening angina, active temporomandibular joint disease (gum), pregnancy, hyperthyroidism, pheochromocytoma, insulin-dependent diabetes, severe renal impairment, eczematous dermatitis, oropharyngeal inflammation, esophagitis, peptic ulcer (delays healing in peptic ulcer disease), coronary artery disease, recent MI, serious cardiac arrhythmias, vasospastic
disease, angina, hypertension, hepatic impairment, use of oral inhaler/nasal spray with bronchospastic disease.

**Action**

Binds to nicotinic-cholinergic receptors at the autonomic ganglia, in the adrenal medulla, at neuromuscular junction, and in the brain, producing both stimulating, depressant effects on peripheral, central nervous systems. **Therapeutic Effect:** Provides source of nicotine during nicotine withdrawal, reduces withdrawal symptoms.

**Pharmacokinetics**

Absorbed slowly after transdermal administration. Protein binding: 5%. Metabolized in liver. Excreted primarily in urine. **Half-life:** 4 hrs.

**Lifespan considerations**

**Pregnancy/Lactation:** Distributed in breast milk. Use of cigarettes, nicotine gum associated with decrease in fetal breathing movements. **Children:** Not recommended in this pt population. **Elderly:** Age-related decrease in cardiac function may require dosage adjustment.

**Interactions**

**DRUG:** Smoking cessation, decreased dosage of nicotine may alter effects of tricyclic antidepressants (e.g., amitriptyline, doxepin), theophylline. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** None significant.

**Availability (OTC)**

**Chewing Gum:** 2 mg, 4 mg. **Inhalation (Nicotrol Inhaler):** 10-mg cartridge. **Lozenges:** 2 mg, 4 mg. **Nasal Spray (Nicotrol NS):** 0.5 mg/spray. **Transdermal Patch:** 7 mg/24 hrs, 14 mg/24 hrs, 21 mg/24 hrs.

**Administration/handling**
Gum
• Do not swallow.
• Chew 1 piece when urge to smoke present.
• Chew slowly and intermittently for 30 min.
• Chew until distinctive nicotine taste (peppery) or slight tingling in mouth perceived, then stop; when tingling almost gone (about 1 min), repeat chewing procedure (this allows constant slow buccal absorption).
• Too-rapid chewing may cause excessive release of nicotine, resulting in adverse effects similar to oversmoking (e.g., nausea, throat irritation).

Inhaler
• Insert cartridge into mouthpiece.
• Puff on nicotine cartridge mouthpiece for 20 min.

Lozenge
• Do not chew or swallow.
• Allow to dissolve slowly (20–30 min).

Transdermal
• Apply promptly upon removal from protective pouch (prevents evaporation, loss of nicotine).
• Use only intact pouch. Do not cut patch.
• Apply only once daily to hairless, clean, dry skin on upper body, outer arm.
• Replace daily; rotate sites; do not use same site within 7 days; do not use same patch longer than 24 hrs.
• Normal exposure to water (e.g., bathing, swimming) should not affect patch.
• Wash hands with water alone after applying patch (soap may increase nicotine absorption).
• Discard used patch by folding patch in half (sticky side together), placing in pouch of new patch, and throwing away in such a way as to prevent child or pet accessibility.
• Patch may contain conducting metal; remove prior to MRI.

Indications/routes/dosage
Smoking Cessation Aid to Relieve Nicotine Withdrawal Symptoms

**PO: (Chewing Gum):** ADULTS, ELDERLY: 2 mg. Use 4 mg in pts who smoke first cigarette within 30 min of waking. Chew 1 piece of gum when urge to smoke, up to 24/day. Use following schedule: wks 1–6: q1–2h (at least 9 pieces/day); wks 7–9: q2–4h; wks 10–12: q4–8h.

**PO: (Lozenge):**
- **Alert:** For pts who smoke the first cigarette within 30 min of waking, administer the 4-mg lozenge; otherwise, administer the 2-mg lozenge.
- **ADULTS, ELDERLY:** One 4-mg or 2-mg lozenge q1–2h for the first 6 wks (use at least 9 lozenges/day first 6 wks); 1 lozenge q2–4h for wks 7–9; and 1 lozenge q4–8h for wks 10–12. **Maximum:** 1 lozenge at a time, 5 lozenges/6 hrs, 20 lozenges/day.

**Transdermal: **
- **Alert:** Apply 1 new patch q24h. **ADULTS, ELDERLY WHO SMOKE 10 CIGARETTES OR MORE PER DAY:** Follow the guidelines below. **Step 1:** 21 mg/day for 6 wks. **Step 2:** 14 mg/day for 2 wks. **Step 3:** 7 mg/day for 2 wks. **ADULTS, ELDERLY WHO SMOKE LESS THAN 10 CIGARETTES PER DAY:** Follow the guidelines below. **Step 1:** 14 mg/day for 6 wks. **Step 2:** 7 mg/day for 2 wks.

**Nasal:** **ADULTS, ELDERLY:** Each dose (2 sprays, 1 spray in each nostril) = 1 mg nicotine. Initially, 1–2 doses/hr. **Maximum:** 5 doses/hr (10 sprays), 40 doses/day (80 sprays). For best results, take at least 8 doses/day (16 sprays).

**Inhaler (Nicotrol):** **ADULTS, ELDERLY:** Initially, 6–16 cartridges per day. Puff on nicotine cartridge mouthpiece for about 20 min as needed. **Maximum:** 16 cartridges/day.

**Dosage in Renal/Hepatic Impairment**
No dose adjustment.

**Side effects**

**Frequent:** All forms: Hiccups, nausea. Gum: Mouth/throat soreness. **Transdermal:** Erythema, pruritus, burning at application site. **Occasional:** All forms: Eructation, GI upset, dry mouth, insomnia, diaphoresis, irritability. Gum: Hoarseness. **Inhaler:** Mouth/throat irritation, cough. **Rare:** All forms: Dizziness, myalgia, arthralgia.
Adverse effects/toxic reactions

Overdose produces palpitations, tachyarrhythmias, seizures, depression, confusion, diaphoresis, hypotension, rapid/weak pulse, dyspnea. Lethal dose for adults is 40–60 mg. Death results from respiratory paralysis.

Nursing considerations

Baseline assessment
Screen, evaluate those with coronary heart disease (history of MI, angina pectoris), serious cardiac arrhythmias, Buerger’s disease, Prinzmetal’s variant angina.

Intervention/evaluation
Monitor smoking habits, B/P, pulse, sleep pattern, skin for erythema, pruritus, burning at application site if transdermal system used.

Patient/family teaching
• Follow guidelines for proper application of transdermal system.
• Chew gum slowly to avoid jaw ache, maximize benefit.
• Report persistent rash, pruritus that occurs with patch.
• Do not smoke while wearing patch.

Procardia XL

CLASSIFICATION

PHARMACOTHERAPEUTIC: Calcium channel blocker, dihydropyridine.

CLINICAL: Antianginal, antihypertensive.

Do not confuse NIFEdipine with niCARdipine or niMODipine, or Procardia XL with Cartia XT.

Uses

**Immediate-/extended-release:** Treatment of angina due to coronary artery spasm (Prinzmetal’s variant angina), chronic stable angina (effort-associated angina). **Extended-release:** Treatment of hypertension. **OFF-LABEL:** Treatment of Raynaud’s phenomenon, pulmonary hypertension, preterm labor, prevention/treatment of high-altitude pulmonary edema.

Precautions

Contraindications: Hypersensitivity to NIFEdipine. ST elevation myocardial infarction (STEMI). **Cautions:** Renal/hepatic impairment, obstructive coronary disease, HF, severe aortic stenosis, edema, severe left ventricular dysfunction, hypertrophic cardiomyopathy, before major surgery, bradycardia, concurrent use with beta blockers or digoxin, CYP3A4 inhibitors/inducers.

Action

Inhibits calcium ion movement across cell membranes, depressing contraction of cardiac, vascular smooth muscle. **Therapeutic Effect:** Increases heart rate, myocardial oxygen delivery, cardiac output. Decreases systemic vascular resistance, B/P.

Pharmacokinetics

Rapidly, completely absorbed from GI tract. Protein binding: 92%–98%. Metabolized in liver. Primarily excreted in urine. Not removed by hemodialysis. **Half-life:** 2–5 hrs.
Lifespan considerations

Pregnancy/Lactation: Insignificant amount distributed in breast milk. Children: Safety and efficacy not established. Elderly: Age-related renal impairment may require dosage adjustment. Use lower initial doses and titrate to response.

Interactions

DRUG: Strong CYP3A4 inducers (e.g., rifAMPin, PHENobarbital, phenytoin, carBAMazepine) may decrease concentration/effects. CYP3A4 inhibitors (e.g., clarithromycin, ketoconazole) may increase concentration. Beta blockers (e.g., carvedilol, metoprolol) may have additive effect. May increase digoxin concentration, risk of toxicity. Hypokalemia-producing agents (e.g., furosemide, other diuretics) may increase risk of arrhythmias. HERBAL: Ephedra, garlic, ginseng, yohimbe may increase hypertension. Licorice may cause retention of sodium, water; may increase loss of potassium. St. John’s wort decreases concentration/effects. FOOD: Grapefruit products may increase risk for flushing, headache, tachycardia, hypotension. LAB VALUES: May cause positive ANA, direct Coombs’ test.

Availability (Rx)

Capsules: 10 mg, 20 mg.
Tablets, Extended-Release: 30 mg, 60 mg, 90 mg.

Administration/handling

PO
• Do not break, crush, dissolve, or divide extended-release tablets.
• Give without regard to meals (Adalat CC, Nifediac CC should be taken on an empty stomach).
• Grapefruit products may alter absorption; avoid use.

Sublingual
• Capsules must be punctured, chewed, and/or squeezed to express liquid into
Indications/routes/dosage

Prinzmetal’s Variant Angina, Chronic Stable (Effort-Associated) Angina

**PO (Immediate-Release):** ADULTS, ELDERLY: Initially, 10 mg 3 times/day. Increase at 7- to 14-day intervals. **Maintenance:** 10 mg 3 times/day up to 30 mg 4 times/day. **Maximum:** 180 mg/day.

**PO (Extended-Release):** ADULTS, ELDERLY: Initially, 30–60 mg/day. May increase at 7- to 14-day intervals. **Maximum:** 120 mg/day.

Hypertension

**PO (Extended-Release):** ADULTS, ELDERLY: Initially, 30–60 mg/day. May increase at 7- to 14-day intervals. **Maximum:** 90–120 mg/day. **CHILDREN 1–17 YRS:** Initially, 0.2–0.5 mg/kg/day. **Maximum:** 3 mg/kg/day or 120 mg/day.

Dosage in Renal/Hepatic Impairment

No dose adjustment.

Side effects

**Frequent (30%–11%):** Peripheral edema, headache, flushed skin, dizziness.

**Occasional (12%–6%):** Nausea, shakiness, muscle cramps/pain, drowsiness, palpitations, nasal congestion, cough, dyspnea, wheezing.

**Rare (5%–3%):** Hypotension, rash, pruritus, urticaria, constipation, abdominal discomfort, flatulence, sexual dysfunction.

Adverse effects/toxic reactions

May precipitate HF, MI in pts with cardiac disease, peripheral ischemia. Overdose produces nausea, drowsiness, confusion, slurred speech. **Antidote:** Glucagon (see Appendix J for dosage).

Nursing considerations
Baseline assessment
Concurrent therapy with sublingual nitroglycerin may be used for relief of anginal pain. Record onset, type (sharp, dull, squeezing), radiation, location, intensity, duration of anginal pain; precipitating factors (exertion, emotional stress). Check B/P for hypotension immediately before giving medication.

Intervention/evaluation
Assist with ambulation if light-headedness, dizziness occurs. Assess for peripheral edema. Assess skin for flushing. Monitor LFT. Observe for signs/symptoms of HF.

Patient/family teaching
• Go from lying to standing slowly.
• Report palpitations, shortness of breath, pronounced dizziness, nausea, exacerbations of angina.
• Avoid alcohol; concomitant grapefruit product use.

niMODipine
naye-mode-i-peen
Nimotop
Nymalize

CLASSIFICATION
PHARMACOTHERAPEUTIC: Calcium channel blocker, dihydropyridine.
CLINICAL: Cerebral vasospasm agent.

BLACK BOX ALERT Severe cardiovascular events, including fatalities, have resulted when capsule contents have been withdrawn by syringe and administered by IV injection rather than orally or via nasogastric tube.

Do not confuse niMODipine with niCARdipine or NIFEdipine.

Uses
Improvement of neurologic deficits due to cerebral vasospasm following
subarachnoid hemorrhage from ruptured intracranial aneurysms.

**Precautions**

**Contraindications:** Hypersensitivity to nimodipine. Concurrent use with strong CYP3A4 inhibitors (e.g., clarithromycin, voriconazole). **Cautions:** Pts with cirrhosis, baseline hypotension, bradycardia.

**Lifespan considerations**

**Pregnancy/Lactation:** Unknown if drug crosses placenta or is distributed in breast milk. **Children:** Safety and efficacy not established. **Elderly:** Age-related renal impairment may require dosage adjustment. May experience greater hypotensive response, constipation.

**Action**

Inhibits movement of calcium ions across vascular smooth muscle cell membranes. Exerts greatest effect on cerebral arteries. **Therapeutic Effect:** Produces favorable effect on severity of neurologic deficits due to cerebral vasospasm. May prevent cerebral vasospasm.

**Pharmacokinetics**

Rapidly absorbed from GI tract. Protein binding: 95%. Metabolized in liver. Excreted in bile (80%), urine (20%). Not removed by hemodialysis. **Half-life:** 1–2 hrs.

**Interactions**

**DRUG:** Beta blockers (e.g., carvedilol, metoprolol) may have additive effect, increase depression of cardiac SA/AV conduction. May increase digoxin concentration. **Agents inducing hypokalemia (e.g., furosemide, HCTZ, high-dose or IV insulin)** may increase risk of arrhythmias. **CYP3A4 inhibitors (e.g., erythromycin, ketoconazole, protease inhibitors)** may inhibit metabolism. **CYP3A4 inducers (e.g., rifabutin, rifAMPin)** may increase metabolism. **HERBAL:** Ephedra, garlic, ginseng, yohimbe may increase hypertension. **Licorice** may cause retention of sodium, water; may increase loss of potassium.
St. John’s wort may decrease level/effects. **FOOD: Grapefruit products** may increase concentration, risk of toxicity. **LAB VALUES:** None significant.

**Availability (Rx)**

**Solution, Oral (Nymalize):** 60 mg/20 mL.  
**Capsules:** 30 mg.

**Administration/handling**

**PO**

- Administer 1 hr before or 2 hrs after meals.
- If pt unable to swallow, place hole in both ends of capsule with 18-gauge needle to extract contents into syringe. Empty into NG tube; flush tube with 30 mL water.

**Indications/routes/dosage**

**Subarachnoid Hemorrhage**

**PO:** **ADULTS, ELDERLY:** 60 mg q4h for 21 days. Begin within 96 hrs of subarachnoid hemorrhage.

**Dosage in Renal Impairment**

No dose adjustment.

**Dosage in Hepatic Impairment**

**PO:** **ADULTS, ELDERLY:** Reduce dose to 30 mg q4h in pts with cirrhosis.

**Side effects**

**Occasional (6%–2%):** Hypotension, peripheral edema, diarrhea, headache.  
**Rare (less than 2%):** Allergic reaction (rash, urticaria), tachycardia, flushing of skin.
**Adverse effects/toxic reactions**
Overdose produces nausea, weakness, dizziness, drowsiness, confusion, slurred speech.

**Nursing considerations**

**Baseline assessment**
Assess level of consciousness, neurologic response, initially and throughout therapy. Monitor baseline LFT. Assess B/P, apical pulse immediately before drug administration (if pulse is 60/min or less or systolic B/P is less than 90 mm Hg, withhold medication, contact physician).

**Intervention/evaluation**

**Patient/family teaching**
- Do not chew, crush, dissolve, or divide capsules.
- Report palpitations, shortness of breath, swelling, constipation, nausea, dizziness. Immediately report headache, blurry vision, confusion (may indicate vasospasm).

---

**niraparib**

nye-rap-a-rib

Zejula

**CLASSIFICATION**

**PHARMACOTHERAPEUTIC**: Poly(ADP-ribose) polymerase (PARP) inhibitor.

**CLINICAL**: Antineoplastic.

*Do not confuse niraparib with olaparib, neratinib, or rucaparib.*

---

**Uses**
Maintenance treatment of adult pts with recurrent epithelial ovarian, fallopian
tube, or primary peritoneal cancer who are in a complete or partial response to platinum-based chemotherapy.

**Precautions**

**Contraindications:** Hypersensitivity to niraparib. **Cautions:** Baseline anemia, leukopenia, neutropenia, thrombocytopenia; history of hypertension, cardiac disease; pts at risk for hemorrhage (e.g., history of GI bleeding, coagulation disorders, recent trauma; concomitant use of anticoagulants, antiplatelet medication, NSAIDs).

**Action**

Inhibits poly(ADP-ribose) polymerase enzymatic activity, resulting in DNA damage, apoptosis, and cellular death. **Therapeutic Effect:** Induces cytotoxicity in tumor cell lines with and without BRCA deficiencies.

**Pharmacokinetics**

Well absorbed. Widely distributed. Metabolized by carboxylesterase to inactive metabolite. Protein binding: 83%. Peak plasma concentration: 3 hrs. Excreted in urine (48%), feces (39%). **Half-life:** 36 hrs.

**Lifespan considerations**

**Pregnancy/Lactation:** Avoid pregnancy; may cause fetal harm/malformations. Unknown if distributed in breast milk. Breastfeeding not recommended during treatment and up to 1 mo after discontinuation. Females of reproductive potential should use effective contraception during treatment and for at least 6 mos after discontinuation. May impair fertility in males. **Children:** Safety and efficacy not established. **Elderly:** No age-related precautions noted.

**Interactions**

**DRUG:** May decrease therapeutic effect of BCG vaccine. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** May increase serum alkaline phosphatase, ALT, AST, creatinine, GGT. May decrease ANC, Hgb, Hct, leukocytes, neutrophils, RBCs; serum potassium.
Availability (Rx)
Capsules: 100 mg.

Administration/handling

PO
• Give with or without food.
• Administer whole; do not break, cut, crush, or open capsules.
• If a dose is missed or vomiting occurs after administration, do not give extra dose. Administer next dose at regularly scheduled time.
• Administration at bedtime may decrease occurrence of nausea.

Indications/Routes/Dosage

Recurrent Epithelial Ovarian, Fallopian Tube, Peritoneal Cancer
PO: ADULTS, ELDERLY: 300 mg once daily, initiated no later than 8 wks after most recent platinum-containing regimen. Continue until disease progression or unacceptable toxicity.

Dose Reduction Schedule
First dose reduction: 200 mg daily. Second dose reduction: 100 mg daily.

Dose Modification
Note: If acute myeloid leukemia or myelodysplastic syndrome is confirmed, permanently discontinue.

Anemia, Neutropenia
ANC less than 1,000 cells/mm³, Hgb level less than 8 g/dL: Withhold treatment for maximum of 28 days until ANC improves to greater than or equal to 1,500 cells/mm³ or Hgb level improves to 9 g/dL or greater, then resume at reduced dose level. If ANC or Hgb level does not improve to an acceptable level within 28 days or if dose is already reduced to 100 mg/day, permanently discontinue.
Hematologic Toxicity Requiring Transfusion
Platelet count less than or equal to 10,000 cells/mm$^3$: Consider transfusion, then resume at reduced dose level.

Nonhematologic Toxicity
Any nonhematologic CTCAE grade 3 or 4 toxicity when prophylactic treatment is not possible or toxicity persists despite treatment: Withhold treatment for maximum of 28 days until resolved, then resume at next lower dose level.
Any nonhematologic CTCAE grade 3 or 4 toxicity lasting more than 28 days with 100 mg/day regimen: Permanently discontinue.

Thrombocytopenia
Platelet count less than 100,000 cells/mm$^3$: First occurrence: Withhold treatment for maximum of 28 days until improved to greater than or equal to 100,000 cells/mm$^3$, then resume at same or reduced dose level. If platelet count is less than 75,000 cells/mm$^3$, resume at reduced dose level. Second occurrence: Withhold treatment for maximum of 28 days until improved to greater than or equal to 100,000 cells/mm$^3$, then resume at reduced dose level. If platelet count does not improve to an acceptable level within 28 days or if dose is already reduced to 100 mg/day, permanently discontinue.

Dosage in Renal Impairment
Mild to moderate impairment: No dose adjustment. Severe impairment, ESRD: Not specified; use caution.

Dosage in Hepatic Impairment
Mild impairment: No dose adjustment. Moderate to severe impairment: Not specified; use caution.

Side Effects
Frequent (74%–20%): Nausea, fatigue, asthenia, constipation, vomiting, abdominal pain/distention, insomnia, headache, decreased appetite, rash, mucositis, stomatitis, hypertension, dyspnea. Occasional (19%–10%): Myalgia, back pain, dizziness, dyspepsia, cough, arthralgia, anxiety, dysgeusia, dry mouth,
palpitations, tachycardia, peripheral edema, decreased weight, depression.

**Adverse Effects/Toxic Reactions**

Anemia, neutropenia, leukopenia, thrombocytopenia are expected responses to therapy, but more severe reactions including bone marrow failure may result in life-threatening event. Fatal cases of acute myeloid leukemia, myelodysplastic syndrome reported in 1% of pts. Hypertension, hypertensive crisis reported in 9% of pts. Infections including bronchitis, conjunctivitis, nasopharyngitis (23% of pts), urinary tract infection (13% of pts) may occur. Epistaxis may occur, esp. in pts with treatment-induced thrombocytopenia.

**Nursing Considerations**

**Baseline Assessment**

**Intervention/Evaluation**

Monitor ANC, CBC for anemia, leukopenia, neutropenia, thrombocytopenia wkly for first 4 wks, then monthly for 11 mos, then periodically thereafter. In pts with platelet count less than 10,000 cells/mm$^3$, consider withholding anticoagulant, antiplatelet drugs or proceed with transfusion (if applicable). Monitor for acute myeloid leukemia, myelodysplastic syndrome (bleeding or bruising easily, fatigue, frequent infections, pyrexia, hematuria, melena, weakness, weight loss, cytopenias, increased requirements for blood transfusion). Diligently screen for infections. Monitor vital signs for arrhythmia, hypertension, tachycardia. Offer antiemetic if nausea, vomiting occurs. Assess skin for rash, toxic reactions. Encourage nutritional intake.

**Patient/Family Teaching**

- Treatment may depress your immune system and reduce your ability to fight infection. Report symptoms of infection such as body aches, burning with urination, chills, cough, fatigue, fever. Avoid those with active infection.
• Treatment may cause severe bone marrow depression or new-onset myeloid leukemia; report bruising, fatigue, fever, frequent infections, shortness of breath, weight loss, bleeding easily, blood in urine or stool.
• Avoid pregnancy. Females and males of childbearing potential should use effective contraception during treatment and for at least 6 mos after last dose.
• Do not breastfeed during treatment and for at least 1 mo after final dose.
• Treatment may impair fertility in males.
• Dose administration at bedtime may decrease occurrence of nausea.

nitazoxanide
nye-ta-zox-a-nide
Alinia

◆CLASSIFICATION
PHARMACOTHERAPEUTIC: Antiparasitic.
CLINICAL: Antiprotozoal agent.

Uses
Treatment of diarrhea caused by Cryptosporidium parvum, Giardia lamblia in children 12 mos and older, adults. OFF-LABEL: C. difficile-associated diarrhea.

Precautions
Contraindications: Hypersensitivity to nitazoxanide. Cautions: Caution with use of suspension in diabetic pts (due to sucrose content), hepatic/biliary disease, renal impairment.

Action
Interferes with body’s reaction to pyruvate: ferredoxin oxidoreductase, an enzyme essential for anaerobic energy metabolism. Therapeutic Effect: Produces antiprotozoal activity, reducing/terminating diarrheal episodes.

Pharmacokinetics
Rapidly hydrolyzed to active metabolite. Protein binding: 99%. Excreted in urine, bile, feces. **Half-life:** 2–4 hrs.

### Lifespan considerations

**Pregnancy/Lactation:** Unknown if distributed in breast milk. **Children:** Safety and efficacy not established in pts younger than 1 yr (suspension) and younger than 12 yrs (tablet). **Elderly:** No age-related precautions noted.

### Interactions

**DRUG:** None significant. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** May increase serum creatinine, ALT.

### Availability (Rx)

**Powder for Oral Suspension:** 100 mg/5 mL. **Tablets:** 500 mg.

### Administration/handling

**PO (Oral Suspension)**

- Store unreconstituted powder at room temperature.
- Reconstitute oral suspension with 48 mL water to provide concentration of 100 mg/5 mL.
- Shake vigorously to suspend powder.
- Reconstituted solution is stable for 7 days at room temperature.
- Give with food.

**PO (Tablets)**

- Give with food.

### Indications/routes/dosage

**Diarrhea Caused by C. Parvum, G. Lamblia**

**PO:** **ADULTS, ELDERLY, CHILDREN 12 YRS AND OLDER:** 500 mg
q12h for 3 days. **CHILDREN 4–11 YRS:** 200 mg q12h for 3 days. **CHILDREN 1–3 YRS:** 100 mg q12h for 3 days.

**Dosage in Renal/Hepatic Impairment**
Use caution.

**Side effects**

**Occasional (8%):** Abdominal pain. **Rare (2%–1%):** Diarrhea, vomiting, headache.

**Adverse effects/toxic reactions**
None known.

**Nursing considerations**

**Baseline assessment**
Establish baseline B/P, weight, serum glucose, electrolytes. Assess for dehydration.

**Intervention/evaluation**

**Patient/family teaching**
- Parents of children with diabetes should be aware that the oral suspension contains 1.48 g of sucrose per 5 mL.
- Therapy should provide significant improvement of diarrhea.
**Furadantin**

**Macrobid**

**Macrodantin**

**Novo-Furantoin**

**CLASSIFICATION**

**PHARMACOTHERAPEUTIC:** Antibacterial.

**CLINICAL:** Antibiotic, UTI prophylaxis.

Do not confuse Macrobid with MicroK or Nitro-Bid, or nitrofurantoin with Neurontin or nitroglycerin.

---

**Uses**

Prevention/treatment of UTI caused by susceptible gram-negative, gram-positive organisms, including *E. coli*, *S. aureus*, *Enterococcus*, *Klebsiella*, *Enterobacter*.

**Precautions**

**Contraindications:** Hypersensitivity to nitrofurantoin. Anuria, oliguria, renal impairment (CrCl less than 60 mL/min), infants younger than 1 mo due to risk of hemolytic anemia. Pregnancy at term, during labor, or delivery, or when onset of labor is imminent. Pts with history of cholestatic jaundice or hepatic impairment with previous nitrofurantoin therapy. **Cautions:** Renal impairment, diabetes, electrolyte imbalance, anemia, vitamin B deficiency, debilitated pts (greater risk of peripheral neuropathy), G6PD deficiency (greater risk of hemolytic anemia), elderly pts, prolonged therapy (may cause pulmonary toxicity).

**Action**

Inhibits bacterial enzyme systems, interfering with metabolism and cell wall synthesis. **Therapeutic Effect:** Bacteriostatic (bactericidal at high concentrations).

**Pharmacokinetics**

Microcrystalline form rapidly, completely absorbed; macrocrystalline form more slowly absorbed. Food increases absorption. Protein binding: 60%. Primarily
concentrated in urine, kidneys. Metabolized in most body tissues. Primarily excreted in urine. Removed by hemodialysis. **Half-life:** 20–60 min.

**Lifespan considerations**

**Pregnancy/Lactation:** Readily crosses placenta. Distributed in breast milk. Contraindicated at term and during lactation when infant suspected of having G6PD deficiency. **Children:** No age-related precautions noted in pts older than 1 mo. **Elderly:** Avoid use. More likely to develop acute pneumonitis, peripheral neuropathy. Age-related renal impairment may require dosage adjustment.

**Interactions**

**DRUG:** Antacids containing magnesium trisilicate may decrease absorption. **Probenecid** may increase concentration, risk of toxicity. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** May increase serum ALT, AST, phosphorus. May decrease Hgb.

**Availability (Rx)**

Capsules (Macrocrystalline [Macrobid]): 100 mg. Capsules (Macrocrystalline [Macrodantin]): 25 mg, 50 mg, 100 mg. **Oral Suspension** (Microcrystalline [Furadantin]): 25 mg/5 mL.

**Administration/handling**

**PO**

- Give with food, milk to enhance absorption, reduce GI upset.
- May mix suspension with water, milk, fruit juice; shake well.

**Indications/routes/dosage**

**UTI**

**PO:** *(Furadantin, Macrodantin):** **ADULTS, ELDERLY:** 50–100 mg q6h for 7 days or at least 3 days after obtaining sterile urine. **Maximum:** 400 mg/day. **CHILDREN, ADOLESCENTS:** 5–7 mg/kg/day in divided doses q6h for 7
days or at least 3 days after obtaining sterile urine. **Maximum:** 400 mg/day.

**PO: (Macrobid):** **ADULTS, ELDERLY, ADOLESCENTS:** 100 mg twice daily for 7 days.

**Long-Term Prevention of UTI**
**PO: ADULTS, ELDERLY:** 50–100 mg at bedtime. **CHILDREN OLDER THAN 1 MONTH:** 1–2 mg/kg/day in 2 divided doses. **Maximum:** 100 mg/day.

**Dosage in Renal Impairment**
Contraindicated in pts with CrCl less than 60 mL/min.

**Dosage in Hepatic Impairment**
No dose adjustment.

**Side effects**
**Frequent:** Anorexia, nausea, vomiting, dark urine. **Occasional:** Abdominal pain, diarrhea, rash, pruritus, urticaria, hypertension, headache, dizziness, drowsiness. **Rare:** Photosensitivity, transient alopecia, asthmatic exacerbation in those with history of asthma.

**Adverse effects/toxic reactions**
Superinfection, hepatotoxicity, peripheral neuropathy (may be irreversible), Stevens-Johnson syndrome, permanent pulmonary impairment, anaphylaxis occur rarely.

**Nursing considerations**

**Baseline assessment**
Question for history of asthma. Evaluate baseline renal function, LFT. Question medical history as listed in Precautions, and screen for contraindications.

**Intervention/evaluation**
Monitor CBC, BMP, LFT; I&O. Monitor daily pattern of bowel activity, stool
consistency. Assess skin for rash, urticaria. Be alert for numbness/tingling, esp. of lower extremities (may signal onset of peripheral neuropathy). Observe for signs of hepatotoxicity (fever, rash, arthralgia, hepatomegaly). Monitor respiratory status, esp. in pts with asthma.

**Patient/ family teaching**

- Urine may become dark yellow/brown.
- Take with food, milk for best results, to reduce GI upset.
- Complete full course of therapy.
- Avoid sun, ultraviolet light; use sunscreen, wear protective clothing.
- Report cough, fever, chest pain, difficulty breathing, numbness/tingling of fingers, toes.
- Rare occurrence of alopecia is transient.

| Trinipatch

**CLASSIFICATION**

**PHARMACOTHERAPEUTIC**: Nitrate.

**CLINICAL**: Antianginal, antihypertensive, coronary vasodilator.

*Do not confuse Nitro-Bid with Macrobid or Nicobid, Nitro-Dur with Nicoderm, nitroglycerin with nitrofurantoin or nitroprusside, or Nitrostat with Nilstat or Nystatin.*
Uses

Treatment/prevention of angina pectoris. Extended-release, topical forms used for prophylaxis, long-term angina management. IV form used in treatment of HF, acute MI, perioperative hypertension, induction of intraoperative hypotension. **Rectiv:** Treatment of moderate to severe pain associated with chronic anal fissure. **OFF-LABEL:** Short-term management of pulmonary hypertension, esophageal spastic disorders, uterine relaxation, treatment of sympathomimetic vasopressor extravasation.

Precautions

**Contraindications:** Hypersensitivity to nitroglycerin. Allergy to adhesives (transdermal); increased ICP; severe anemia; concurrent use of sildenafil, tadalafil, vardenafil (PDE5 inhibitors). **(Additional)IV:** Restrictive cardiomyopathy, pericardial tamponade, constrictive pericarditis. **Sublingual, Rectal:** Increased intracranial pressure, severe anemia. **Cautions:** Blood volume depletion, severe hypotension (systolic B/P less than 90 mm Hg), bradycardia (less than 50 beats/min), inferior wall MI and suspected right ventricular involvement.

Action

Dilates coronary arteries, improves collateral blood flow to ischemic areas within myocardium. IV form produces peripheral vasodilation. **Therapeutic Effect:** Decreases myocardial oxygen demand. Reduces left ventricular preload, afterload.

Well absorbed after PO, sublingual, topical administration. Metabolized in liver, by enzymes in bloodstream. Protein binding: 60%. Excreted in urine. Not removed by hemodialysis. **Half-life:** 1–4 min.

### Lifespan considerations

**Pregnancy/Lactation:** Unknown if drug crosses placenta or is distributed in breast milk. **Children:** Safety and efficacy not established. **Elderly:** More susceptible to hypotensive effects. Age-related renal impairment may require dosage adjustment.

### Interactions

**DRUG:** Alcohol, other antihypertensives (e.g., amLODIPine, lisinopril, valsartan), vasodilators may increase risk of orthostatic hypotension. Concurrent use of **sildenafl, tadalafl, vardenafil** (PDE5 inhibitors) produces significant hypotension. **HERBAL:** Ephedra, ginger, ginseng, licorice may increase hypertension. **Black cohosh, goldenseal, hawthorne** may cause hypotension. **FOOD:** None known. **LAB VALUES:** May increase serum methemoglobin, urine catecholamine concentrations.

### Availability (Rx)

**Infusion, Pre-Mix:** 25 mg/250 mL, 50 mg/500 mL, 50 mg/250 mL, 100 mg/250 mL. **Injection, Solution:** 5 mg/mL. **Ointment (Nitro-Bid):** 2%. **Ointment, Rectal (Rectiv):** 0.4%. **Translingual Spray:** 0.4 mg/spray. **Transdermal Patch:** 0.1 mg/hr, 0.2 mg/hr, 0.4 mg/hr, 0.6 mg/hr. **Capsules, Extended-Release:** 2.5 mg, 6.5 mg, 9 mg. **Tablets, Sublingual:** 0.4 mg.

### Administration/handling

**Alert** Cardioverter/defibrillator must not be discharged through paddle electrode overlying nitroglycerin (transdermal, ointment) application. May cause burns to pt or damage to paddle via arcing.
IV

**Reconstitution**
- Available in ready-to-use injectable containers.
- Dilute vials in D$_5$W or 0.9% NaCl. **Maximum concentration:** 400 mcg/mL.
- Use glass bottles.

**Rate of Administration**
- Use micro-drop or infusion pump.

**Storage**
- Store at room temperature.
- Reconstituted solutions stable for 48 hrs at room temperature or 7 days if refrigerated.

PO
- Do not break, crush, or open extended-release capsules.
- Do not shake oral aerosol canister before lingual spraying.

**Sublingual**
- Instruct pt to not swallow.
- Dissolve under tongue.
- Administer while seated.
- Slight burning sensation under tongue may be lessened by placing tablet in buccal pouch.
- Keep sublingual tablets in original container.

**Topical**
- Spread thin layer on clean, dry, hairless skin of upper arm or body (not below knee or elbow), using applicator or dose-measuring papers. Do not use fingers; do not rub/massage into skin.

**Transdermal**
- Apply patch on clean, dry, hairless skin of upper arm or body (not below knee or elbow).
- May keep patch on when bathing/showering.
- Do not cut/trim to adjust dose.
IV incompatibilities
Alteplase (Activase), phenytoin (Dilantin).

IV Compatibilities
Amiodarone (Cordarone), dexmedetomidine (Precedex), diltiazEM (Cardizem), DOBUTamine (Dobutrex), DOPamine (Intropin), EPINEPHrine, famotidine (Pepcid), fentaNYL (Sublimaze), furosemide (Lasix), heparin, HYDROmorphine (Dilaudid), insulin, labetalol (Trandate), lidocaine, lipids, LORazepam (Ativan), midazolam (Versed), milrinone (Primacor), morphine, niCARdipine (Cardene), nitroprusside (Nipride), norepinephrine (Levophed), propofol (Diprivan).

Indications/routes/dosage

Angina, CAD
Translingual Spray: ADULTS, ELDERLY: 1–2 sprays onto or under tongue q3–5min until relief is noted (no more than 3 sprays in 15-min period).
Sublingual: ADULTS, ELDERLY: One tablet (0.3–0.4 mg) under tongue. If chest pain fails to improve or worsens in 3–5 min, call 911. After the call, may take additional tablet. A third tablet may be taken 5 min after second dose (maximum of 3 tablets).
PO (Extended-Release): ADULTS, ELDERLY: 2.5–6.5 mg 3–4 times/day. Maximum: 26 mg 4 times/day.
Topical: ADULTS, ELDERLY: Initially, 1/2 inch upon waking and 1/2 inch 6 hrs later. May double dose to 1 inch and double again to 2 inches. Maximum: 2 doses/day including nitrate-free interval of 10–12 hrs.
Transdermal Patch: ADULTS, ELDERLY: Initially, 0.2–0.4 mg/hr. Maintenance: 0.4–0.8 mg/hr. Consider patch on for 12–14 hrs, patch off for 10–12 hrs (prevents tolerance).

HF, Acute MI
IV: ADULTS, ELDERLY: Initially, 5 mcg/min via infusion pump. Increase in 5-mcg/min increments at 3- to 5-min intervals until B/P response is noted or until dosage reaches 20 mcg/min, then increase by 10–20 mcg/min q3–5min.
Dosage may be further titrated according to clinical, therapeutic response up to 400 mcg/min.

**Anal Fissure**

**RECTAL: ADULTS, ELDERLY:** One inch (1.5 mg) q12h for up to 3 wks.

**Dosage in Renal/Hepatic Impairment**

No dose adjustment.

**Side effects**

**Frequent:** Headache (possibly severe; occurs mostly in early therapy, diminishes rapidly in intensity, usually disappears during continued treatment), transient flushing of face/neck, dizziness (esp. if pt is standing immobile or is in a warm environment), weakness, orthostatic hypotension. **Sublingual:** Burning, tingling sensation at oral point of dissolution. **Ointment:** Erythema, pruritus. **Occasional:** GI upset. **Transdermal:** Contact dermatitis.

**Adverse effects/toxic reactions**

Discontinue drug if blurred vision, dry mouth occurs. Severe orthostatic hypotension may occur, manifested by syncope, pulselessness, cold/clammy skin, diaphoresis. Tolerance may occur with repeated, prolonged therapy; minor tolerance may occur with intermittent use of sublingual tablets. High doses tend to produce severe headache.

**Nursing considerations**

**Baseline assessment**

Record onset, type (sharp, dull, squeezing), radiation, location, intensity, duration of anginal pain; precipitating factors (exertion, emotional stress). Assess B/P, apical pulse before administration and periodically following dose. Pt must have continuous EKG monitoring for IV administration. Rule out right-sided MI, if applicable (may precipitate life-threatening hypotension). Receive full medication history, and screen for interactions, esp. use of PDE5 inhibitors. Question medical history and screen for contraindications.
**Intervention/evaluation**

Monitor B/P, heart rate. Assess for facial, neck flushing. Cardioverter/defibrillator must not be discharged through paddle electrode overlying nitroglycerin (transdermal, ointment) system (may cause burns to pt or damage to paddle via electrical arcing). Consider NS boluses for hypotension.

**Patient/family teaching**

- Go from lying to standing slowly.
- Take oral form on empty stomach (however, if headache occurs during therapy, take medication with meals).
- Use spray only when lying down.
- Dissolve sublingual tablet under tongue; do not swallow.
- Take at first sign of angina.
- May take additional dose q5min if needed up to a total of 3 doses.
- If not relieved within 5 min, contact physician or immediately go to emergency room.
- Do not change brands.
- Keep container away from heat, moisture.
- Do not inhale lingual aerosol but spray onto or under tongue (avoid swallowing after spray is administered).
- Expel from mouth any remaining lingual, sublingual, intrabuccal tablet after pain is completely relieved.
- Place transmucosal tablets under upper lip or buccal pouch (between cheek and gum); do not chew/swallow tablet.
- Avoid alcohol (intensifies hypotensive effect). If alcohol is ingested soon after taking nitroglycerin, possible acute hypotensive episode (marked drop in B/P, vertigo, diaphoresis, pallor) may occur.
- Do not use within 48 hrs of sildenafil, tadalafil, vardenafil (PDE5 inhibitors); may cause acute hypotensive episode.

---

**nivolumab**

**nys-vol-ue-mab**

**Opdvo**

**CLASSIFICATION**

**PHARMACOTHERAPEUTIC**: Monoclonal antibody.
Uses

Treatment of BRAF V600 wild-type unresectable or metastatic melanoma, as a single agent; BRAF V600 mutation-positive unresectable melanoma, as a single agent; unresectable or metastatic melanoma, in combination with ipilimumab. Treatment of metastatic non–small-cell lung cancer with progression on or after platinum-based chemotherapy. Treatment of advanced renal cell cancer in pts receiving prior antiangiogenic therapy. Treatment of classical Hodgkin lymphoma (cHL) that relapsed or progressed following autologous hematopoietic stem cell transplant (HSCT) and post-brentuximab, or 3 or more lines of systemic therapy that includes autologous HSCT. Treatment of recurrent or metastatic squamous cell carcinoma of the head and neck. Treatment of locally advanced or metastatic urothelial carcinoma with disease progression during or following platinum-containing chemotherapy; or within 12 mos of neoadjuvant or adjuvant treatment with platinum containing chemotherapy. Treatment of colorectal cancer in adults and children 12 yrs of age and older that has progressed following treatment with fluoropyrimidine, oxaliplatin and irinotecan. Treatment of hepatocellular carcinoma in pts previously treated with sorafenib.

Precautions

Contraindications: Hypersensitivity to nivolumab. Cautions: Thyroid/pituitary disease, hepatic/renal impairment, interstitial lung disease, electrolyte imbalance.

Action

Binds PD-1 ligands to PD-1 receptor found on T cells, blocking its interaction with the ligands (PD-L1 and PD-L2). Releases PD-1 pathway–mediated inhibition of immune response (including antitumor immune response). Therapeutic Effect: Inhibits T-cell proliferation and cytokine production. Inhibits tumor cell growth and metastasis.
Pharmacokinetics

Information on metabolism and elimination is not available. Steady-state concentration reached in 12 wks. **Half-life:** 26.7 days.

### Lifespan considerations

**Pregnancy/Lactation:** Avoid pregnancy; may cause fetal harm. Unknown if distributed in breast milk. Females of reproductive potential should use effective contraception during treatment and up to 5 mos after discontinuation. **Children:** Safety and efficacy not established. **Elderly:** May have increased risk of endocrine/hepatic/pulmonary/optic/renal injury due to age-related diseases.

### Interactions

**DRUG:** None known. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** **Single Therapy:** May increase serum alkaline phosphatase, ALT, AST, potassium. May decrease serum sodium. **Combo Therapy:** May increase serum alkaline phosphatase, ALT, AST, amylase, creatinine, lipase. May decrease RBC, Hct, Hgb, lymphocytes, neutrophils, platelets; serum calcium, sodium, magnesium. May increase or decrease serum calcium, potassium.

### Availability (Rx)

**Injection Solution:** 40 mg/4 mL, 100 mg/10 mL single-use vial.

### Administration/handling

#### IV

**Preparation**

- Visually inspect solution for particulate matter or discoloration. Solution should appear opalescent, colorless to pale yellow. Discard if solution is cloudy or contains particulate matter other than a few translucent to white proteinaceous particles.
- Do not shake vial.
- Withdraw required dose volume and dilute in 0.9% NaCl or 5% Dextrose injection. Final concentration will equal 1–10 mg/mL based on volume of
diluent.
• Mix by gentle inversion.
• Do not shake.
• Discard partially used or empty vials.

**Rate of Administration**
• Infuse over 60 min using sterile, nonpyrogenic, low protein-binding, 0.2- to 1.2-micron in-line filter.
• Flush IV line upon completion.

**Storage**
• Refrigerate diluted solution up to 24 hrs or store at room temperature for no more than 4 hrs (includes time of preparation and infusion).
• Do not freeze.

**IV incompatibilities**
Do not infuse with other medications.

**Indications/routes/dosage**

**Melanoma**
**IV ADULTS, ELDERLY:** (Single Agent): 240 mg q2wks until disease progression or unacceptable toxicity. (In combination with ipilimumab): 1 mg/kg, followed by ipilimumab on the same day, q3wks for 4 doses. Subsequent single-agent therapy dose is 240 mg q2wks until disease progression or unacceptable toxicity.

**Metastatic Non–Small-Cell Lung Cancer**
**IV:** ADULTS, ELDERLY: 240 mg q2wks until disease progression or unacceptable toxicity.

**Advanced Renal Cell Carcinoma, Urothelial Carcinoma, Hepatocellular Carcinoma**
**IV:** ADULTS, ELDERLY: 240 mg q2wks until disease progression or unacceptable toxicity.

**cHL (Recurrent or Metastatic)**
IV: ADULTS, ELDERLY: 3 mg/kg q2wks until disease progression or unacceptable toxicity.

Head and Neck Carcinoma

IV: ADULTS, ELDERLY: 3 mg/kg q2wks until disease progression or unacceptable toxicity.

Dose Modification

Based on Common Terminology Criteria for Adverse Events (CTCAE).

**Withhold Treatment for Any of the Following Adverse Events:**
Grade 2 or 3 diarrhea or colitis; single-agent therapy–associated colitis; grade 2 pneumonitis; serum AST or ALT greater than 3–5 times upper limit of normal (ULN) or serum bilirubin 1.5–3 times ULN; grade 2 or 3 hypophysitis; grade 2 adrenal insufficiency; serum creatinine greater than 1.5–6 times ULN; grade 3 rash; first occurrence of any other grade 3 adverse reaction. When nivolumab is administered in combination with ipilimumab and nivolumab is withheld, then ipilimumab should also be withheld.

**Restarting Therapy:**
Resume when adverse reactions return to grade 0 or 1.

**Permanently Discontinue for Any of the Following Adverse Events:**
Combo-agent therapy (ipilimumab)–associated colitis; grade 3 or 4 pneumonitis; serum AST or ALT greater than 5 times ULN or serum bilirubin 3 times ULN; pts with liver metastasis who begin treatment with baseline grade 2 serum ALT or AST elevation who experience serum ALT or AST elevation greater than or equal to 50% from baseline that persists for at least 1 wk; grade 4 hypophysitis; grade 3 or 4 adrenal insufficiency; serum creatinine greater than 6 times ULN; grade 4 rash; recurrence of any other grade 3 adverse reaction; any life-threatening or grade 4 adverse reaction; requirement for predniSTONE 10 mg/day or greater (or equivalent) for more than 12 wks; persistent grade 2 or 3 adverse reaction lasting longer than 12 wks.

Dosage in Renal Impairment
No dose adjustment.

Dosage in Hepatic Impairment

Mild to moderate impairment: No dose adjustment. **Severe impairment:** Not
specified; use caution.

**Side effects**

*Note:* Percentage of side effects may vary depending on the use of single or combination therapy. **Frequent (50%–24%):** Fatigue, dyspnea, musculoskeletal pain, decreased appetite, cough, nausea, headache, constipation. **Occasional (19%–10%):** Vomiting, asthenia, diarrhea, edema, pyrexia, cough, dehydration, rash, abdominal pain, chest pain, arthralgia, decreased weight, blurred vision, pruritus, peripheral edema, generalized pain.

**Adverse effects/toxic reactions**

Anemia, lymphopenia, neutropenia, thrombocytopenia is an expected response to therapy. May cause severe immune-mediated events including interstitial lung disease or pneumonitis (3%–10% of pts), colitis (21%–57% of pts), hepatitis (15%–28% of pts), hypophysitis (13% of pts), renal failure or nephritis (1%–2% of pts), hyperthyroidism (1% of pts), hypothyroidism (3%–19% of pts), rash (up to 37% of pts). Other adverse events including autoimmune nephropathy, demyelination, diabetic ketoacidosis, duodenitis, erythema multiforme, exfoliative dermatitis, facial and abducens nerve paresis, gastritis, iridocyclitis, motor dysfunction, pancreatitis, psoriasis, sarcoidosis, uveitis, vasculitis, ventricular arrhythmia, vitiligo reported in less than 2% of pts. Severe infusion-related reactions reported in less than 1% of pts. Occurrence of events is dependent on use of single or combination therapy. Upper respiratory tract infections including nasopharyngitis, pharyngitis, rhinitis reported in 11% of pts. Immunogenicity (auto-nivolumab antibodies) occurred in 8.5% of pts.

**Nursing considerations**

**Baseline assessment**

Obtain baseline CBC, BMP, ionized calcium, LFT, TSH; vital signs; urine pregnancy. Record weight in kg. Screen for history of arrhythmias, pituitary/pulmonary/thyroid disease, autoimmune disorders, diabetes, hepatic/renal impairment; allergy to predniSONE. Along with routine assessment, conduct full dermatologic exam, ophthalmologic exam/visual acuity.
Receive full medication history and screen for interactions.

**Intervention/evaluation**

Monitor CBC, LFT, serum electrolytes; thyroid panel if applicable. Diligently monitor for immune-mediated adverse events as listed in Adverse Effects/Toxic Reactions. Notify physician if any CTCAE toxicities occur (see Appendix M) and initiate proper treatment. Obtain chest X-ray if interstitial lung disease, pneumonitis suspected. Screen for tumor lysis syndrome in pts with high tumor burden. Monitor I&O, daily weight. If predniSONE therapy is initiated for immune-mediated events, monitor capillary blood glucose and screen for corticosteroid side effects.

**Patient/family teaching**

- Blood levels will be routinely monitored.
- Avoid pregnancy; treatment may cause birth defects or miscarriage. Do not breastfeed. Females of childbearing potential should use effective contraception during treatment and for at least 5 mos after discontinuation.
- Serious adverse reactions may affect lungs, GI tract, kidneys, or hormonal glands; anti-inflammatory medication may need to be started.
- Immediately contact physician if serious or life-threatening inflammatory reactions occur in the following body systems: colon (severe abdominal pain or diarrhea); kidney (decreased or dark-colored urine, flank pain); lung (chest pain, cough, shortness of breath); liver (bruising easily, dark-colored urine, clay-colored/tarry stools, yellowing of skin or eyes); pituitary (persistent or unusual headache, dizziness, extreme weakness, fainting, vision changes); thyroid (trouble sleeping, high blood pressure, fast heart rate [overactive thyroid]), (fatigue, goiter, weight gain [underactive thyroid]).

---

**norepinephrine**

**nor-ep-i-nef-rin**

Levophed

**CLASSIFICATION**

PHARMACOTHERAPEUTIC: Alpha, beta agonist.

CLINICAL: Vasopressor.

■ **BLACK BOX ALERT** ■ Extravasation may produce severe tissue
necrosis, sloughing. Using fine hypodermic needle, liberally infiltrate area with 10–15 mL saline solution containing 5–10 mg phentolamine.

Do not confuse Levophed with Levaquin or levoFLOXacin, or norepinephrine with EPINEPHrine.

**Uses**
Severe hypotension, treatment of shock persisting after fluid volume replacement.

**Precautions**

**Contraindications:** Hypersensitivity to norepinephrine. Hypotension related to hypovolemia (except in emergency to maintain coronary/cerebral perfusion until volume replaced), mesenteric/peripheral vascular thrombosis (unless it is lifesaving procedure). **Cautions:** Concurrent use of MAOIs.

**Action**
Stimulates beta₁-adrenergic receptors, alpha-adrenergic receptors, increasing contractility, heart rate and producing vasoconstriction. **Therapeutic Effect:** Increases systemic B/P, coronary blood flow.

**Pharmacokinetics**

<table>

<th>Peak</th>
<th>Duration</th>
</tr>
</thead>
<tbody>
<tr>
<td>IV</td>
<td>Rapid</td>
<td>1–2 min</td>
<td>N/A</td>
</tr>
</tbody>
</table>

Localized in sympathetic tissue. Metabolized in liver. Primarily excreted in urine.

**Lifespan considerations**

**Pregnancy/Lactation:** Readily crosses placenta. May produce fetal anoxia due to uterine contraction, constriction of uterine blood vessels. **Children/Elderly:** No age-related precautions noted.
Interactions

**DRUG:** MAOIs (e.g., phenelzine, selegiline), antidepressants (tricyclic) may prolong hypertension. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** None significant.

Availability (Rx)

**Injection Solution:** 1 mg/mL.

Administration/handling

**IV**

**Reconstitution**
- Add 4 mL (4 mg) to 250 mL D₅W (16 mcg/mL). **Maximum concentration:** 32 mL (32 mg) to 250 mL (128 mcg/mL).

**Rate of Administration**
- Closely monitor IV infusion flow rate (use infusion pump).
- Monitor B/P q2min during IV infusion until desired therapeutic response is achieved, then q5min during remaining IV infusion.
- Never leave pt unattended.
- Maintain B/P at 90–100 mm Hg in previously normotensive pts, and 30–40 mm Hg below preexisting B/P in previously hypertensive pts.
- Reduce IV infusion gradually. Avoid abrupt withdrawal.
- If using peripherally inserted catheter, it is imperative to check the IV site frequently for free flow and infused vein for blanching, hardness to vein, coldness, pallor to extremity.
- If extravasation occurs, area should be infiltrated with 10–15 mL sterile saline containing 5–10 mg phentolamine (does not alter pressor effects of norepinephrine).

**Storage**
- Do not use if solution is brown or contains precipitate.
- Store at room temperature. Diluted solution stable for 24 hrs at room temperature.

**IV incompatibilities**
Pantoprazole (Protonix), regular insulin.

**IV Compatibilities**

- Amiodarone (Cordarone), calcium gluconate, dexmedetomidine (Precedex), diltiaZEM (Cardizem), DOBUTamine (Dobutrex), DOPamine (Intropin), EPINEPHrine, esmolol (Brevibloc), fentaNYL (Sublimaze), furosemide (Lasix), haloperidol (Haldol), heparin, HYDROmophine (Dilaudid), labetalol (Trandate), lipids, LORazepam (Ativan), magnesium, midazolam (Versed), milrinone (Primacor), morphine, niCARdipine (Cardene), nitroglycerin, potassium chloride, propofol (Diprivan).

**Indications/routes/dosage**

- **If possible, blood, fluid volume depletion should be corrected before drug is administered.**

**Acute Hypotension Unresponsive to Fluid Volume Replacement**

**IV INFUSION: ADULTS, ELDERLY:** Initially, administer at 8–12 mcg/min. Adjust rate of flow to desired response. Average maintenance range: 2–4 mcg/min (varies greatly based on clinical situation). **CHILDREN:** Initially, 0.05–0.1 mcg/kg/min; titrate to desired effect. **Maximum:** 2 mcg/kg/min.

**Dosage in Renal/Hepatic Impairment**

No dose adjustment.

**Side effects**

Norepinephrine produces less pronounced, less frequent side effects than EPINEPHrine. **Occasional (5%–3%):** Anxiety, bradycardia, palpitations. **Rare (2%–1%):** Nausea, anginal pain, shortness of breath, fever.

**Adverse effects/toxic reactions**

Extravasation may produce tissue necrosis, sloughing. Overdose manifested as severe hypertension with violent headache (may be first clinical sign of overdose), arrhythmias, photophobia, retrosternal or pharyngeal pain, pallor,
diaphoresis, vomiting. Prolonged therapy may result in plasma volume depletion. Hypotension may recur if plasma volume is not maintained.

**Nursing considerations**

**Baseline assessment**
Assess EKG, B/P continuously (be alert to precipitous B/P drop). Be alert to pt complaint of headache.

**Intervention/evaluation**
Monitor IV flow rate diligently. Assess for extravasation characterized by blanching of skin over vein, coolness (results from local vasoconstriction); color, temperature of IV site extremity (pallor, cyanosis, mottling). Assess nailbed capillary refill. Monitor I&O; measure output hourly, report urine output less than 30 mL/hr. Once B/P parameter has been reached, IV infusion should not be restarted unless systolic B/P falls below 90 mm Hg.

<table>
<thead>
<tr>
<th>nortriptyline</th>

CLASSIFICATION
PHARMACOTHERAPEUTIC: Tricyclic compound.
CLINICAL: Antidepressant.

BLACK BOX ALERT Increased risk of suicidal thinking and behavior in children, adolescents, young adults 18–24 yrs with major depressive disorder, other psychiatric disorders.

Do not confuse Aventyl with Bentyl, or nortriptyline with amitriptyline, desipramine, or Norpramin.
Uses
Treatment of symptoms of depression. **OFF-LABEL:** Adjunctive therapy for smoking cessation, myofascial pain, postherpetic pain, orofacial pain, chronic pain, irritable bowel syndrome.

Precautions
**Contraindications:** Hypersensitivity to nortriptyline. Use during acute recovery period after MI. Use of MAOI intended to treat psychiatric disorders (concurrently or within 14 days of discontinuing either nortriptyline or MAOI). Initiation of nortriptyline in pt receiving linezolid or methylene blue. **Cautions:** Prostatic hyperplasia, history of urinary retention/obstruction, narrow-angle glaucoma, diabetes, history of seizures, hyperthyroidism, cardiac/hepatic/renal disease, psychosis, increased intraocular pressure, pts at high risk for suicide, elderly pts.

Action
Blocks reuptake of neurotransmitters (norepinephrine, serotonin) at neuronal presynaptic membranes, increasing their availability at postsynaptic receptor sites. **Therapeutic Effect:** Relieves depression, anxiety disorders, nocturnal enuresis.

Pharmacokinetics

Lifespan considerations
**Pregnancy/Lactation:** Crosses placenta, excreted in breast milk. **Children:** Safety and efficacy not established in children younger than 6 yrs. **Elderly:** Use caution.

Interactions
**DRUG:** Alcohol, other CNS depressants (e.g., LORazepam, morphine,
zolpidem) may increase CNS effects, respiratory depression, hypotensive effects. Cimetidine may increase concentration, risk of toxicity. MAOIs (e.g., phenelzine, selegiline) may increase risk of neuroleptic malignant syndrome, seizures, hyperpyrexia, hypertensive crisis. HERBAL: Gotu kola, kava kava, St. John’s wort, valerian may increase CNS depression and risk of serotonin syndrome. FOOD: Grape juice, carbonated beverages may decrease effectiveness. Grapefruit products may increase risk of side effects. LAB VALUES: May alter serum glucose, EKG readings. Therapeutic peak serum level: 6–10 mcg/mL; therapeutic trough serum level: 0.5–2 mcg/mL. Toxic peak serum level: greater than 12 mcg/mL; toxic trough serum level: greater than 2 mcg/mL.

Availability (Rx)
Capsules (Pamelor): 10 mg, 25 mg, 50 mg, 75 mg. Oral Solution: 10 mg/5 mL.

Administration/handling

PO

• Give with food, milk if GI distress occurs.
• Dilute oral solution in water, milk, or fruit juice. Give immediately. (Do not mix with grape juice/carbonated beverages.)

Indications/routes/dosage

⚠️ At least 14 days must elapse between use of MAOIs and nortriptyline. When discontinuing, gradually taper dose to minimize withdrawal symptoms.

Depression

PO: ADULTS: Initially, 25 mg 3–4 times/day up to 150 mg/day. Adjust dose based on response and tolerability. ELDERLY: Initially, 30–50 mg at bedtime. May increase by 25 mg every 3–7 days. Maximum: 150 mg/day.

Enuresis
PO: CHILDREN OLDER THAN 11 YRS: 25–35 mg/day. 8–11 YRS: 10–20 mg/day. 6–7 YRS: 10 mg/day.

Dosage in Renal Impairment
No dose adjustment.

Dosage in Hepatic Impairment
Use caution.

Side effects
**Frequent:** Drowsiness, fatigue, dry mouth, blurred vision, constipation, delayed micturition, orthostatic hypotension, diaphoresis, impaired concentration, increased appetite, urinary retention. **Occasional**: GI disturbances (nausea, GI distress, metallic taste), photosensitivity. **Rare**: Paradoxical reactions (agitation, restlessness, nightmares, insomnia), extrapyramidal symptoms (particularly fine hand tremor).

Adverse effects/toxic reactions
High dosage may produce cardiovascular effects (severe orthostatic hypotension, dizziness, tachycardia, palpitations, arrhythmias), altered temperature regulation (hyperpyrexia, hypothermia). Abrupt discontinuation from prolonged therapy may produce headache, malaise, nausea, vomiting, vivid dreams.

Nursing considerations

**Baseline assessment**
Assess for suicidal ideation/tendencies, behavior, thought content, appearance. Obtain baseline glucose, cholesterol levels. For pts on long-term therapy, hepatic/renal function tests, blood counts should be performed periodically.

**Intervention/evaluation**
Supervise suicidal-risk pt closely during early therapy (as depression lessens, energy level improves, increasing suicide potential). Assess appearance, behavior, speech pattern, level of interest, mood. Monitor daily pattern of bowel
activity, stool consistency. Avoid constipation with increased fluids, bulky foods. Monitor B/P, pulse for hypotension, arrhythmias, weight. Assess for urinary retention. Therapeutic peak serum level: 6–10 mcg/mL; trough serum level: 0.5–2 mcg/mL. Toxic peak serum level: greater than 12 mcg/mL; toxic trough: greater than 2 mcg/mL.

**Patient/family teaching**

- Slowly go from lying to standing to avoid hypotensive effect; tolerance to postural hypotension, sedative, anticholinergic effects usually develops during early therapy.
- Avoid alcohol.
- Avoid tasks that require alertness, motor skills until response to drug is established.
- Therapeutic effect may be noted in 2 wks or longer.
- Photosensitivity to sun may occur; use sunscreen, protective clothing.
- Dry mouth may be relieved by sugarless gum, sips of water.
- Report visual disturbances, worsening depression, suicidal ideation, unusual changes in behavior (esp. at initiation of therapy or with changes in dosage).
- Do not abruptly discontinue medication.

---

**Fixed-Combination(s)**

- **Mycolog, Myco-Triacet**: nystatin/triamcinolone (a steroid): 100,000 units/0.1%.

**CLASSIFICATION**

**PHARMACOTHERAPEUTIC**: Polyene antifungal antibiotic.

**CLINICAL**: Antifungal.

Do not confuse nystatin with atorvastatin, fluvastatin, lovastatin, Nitrostat, pitavastatin, pravastatin, rosuvastatin, or simvastatin.
Uses
Treatment of cutaneous, intestinal, oral cavity, infections caused by *Candida* spp.

Precautions

**Contraindications:** Hypersensitivity to nystatin. **Cautions:** None known.

Action
Binds to sterols in cell membrane, increasing fungal cell membrane permeability, permitting loss of potassium, other cellular components. **Therapeutic Effect:** Fungistatic.

Pharmacokinetics

**PO:** Poorly absorbed from GI tract. Eliminated unchanged in feces. **Topical:** Not absorbed systemically from intact skin.

*Lifespan considerations*

**Pregnancy/Lactation:** Unknown if distributed in breast milk. Vaginal applicators may be contraindicated, requiring manual insertion of tablets during pregnancy. **Children:** No age-related precautions noted for suspension, topical use. Lozenges not recommended in pts younger than 5 yrs. **Elderly:** No age-related precautions noted.

Interactions

**DRUG:** None significant. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** None significant.

Availability (Rx)

**Cream:** 100,000 units/g. **Ointment:** 100,000 units/g. **Oral Suspension:** 100,000 units/mL. **Tablets:** 500,000 units. **Topical Powder (Nystop, Pedi-Dri):** 100,000 units/g.
Administration/handling

PO
• Shake suspension well before administration.
• Place and hold suspension in mouth or swish throughout mouth as long as possible before swallowing.
• For neonates and infants, paint into recesses of the mouth.

Indications/routes/dosage

Intestinal Infection
PO: ADULTS, ELDERLY: (Tablets): 500,000–1,000,000 units q8h.

Oral Candidiasis
PO: ADULTS, ELDERLY, CHILDREN: (Suspension): 400,000–600,000 units 4 times/day. INFANTS: 200,000 units 4 times/day. PREMATURE INFANTS: 100,000 units 4 times/day.

Cutaneous Candidal Infections
Topical: ADULTS, ELDERLY, CHILDREN: Apply 2–3 times/day.

Dosage in Renal/Hepatic Impairment
No dose adjustment.

Side effects

Adverse effects/toxic reactions
High dosages of oral form may produce nausea, vomiting, diarrhea, GI distress.

Nursing considerations
**Baseline assessment**
Confirm cultures, histologic tests were obtained for accurate diagnosis. Inspect oral mucous membranes.

**Intervention/evaluation**
Assess for increased skin irritation with topical, increased vaginal discharge with vaginal application.

**Patient/family teaching**
- Do not miss doses; complete full length of treatment (continue vaginal use during menses).
- Report nausea, vomiting, diarrhea, stomach pain.
- **Vaginal:** Insert high in vagina.
- Check with physician regarding douching, sexual intercourse.
- **Topical:** Rub well into affected areas.
- Avoid contact with eyes.
- Use cream (sparingly) or powder on erythematous areas.
- Keep areas clean, dry; wear light clothing for ventilation.
- Separate personal items in contact with affected areas.

---

[Canadian trade name]

[High Alert drug]

_underlined_ underlined – top prescribed drug
obinutuzumab

oh-bi-nue-too-ue-mab

Gazyva

CLASSIFICATION

PHARMACOTHERAPEUTIC: Monoclonal antibody.

CLINICAL: Antineoplastic.

BLACK BOX ALERT

Hepatitis B virus reactivation, resulting in hepatic failure, fulminant hepatitis, and death have occurred. Screen all pts for hepatitis B virus infection before initiating treatment. Progressive multifocal leukoencephalopathy (PML) including fatal PML reported.

Uses

Treatment of previously untreated chronic lymphocytic leukemia (CLL), in combination with chlorambucil. Treatment of follicular lymphoma (in combination with bendamustine) in pts who relapsed after, or are refractory to, a riTUXimab-containing regimen. Treatment of previously untreated stage II bulky, stage III, or stage IV follicular lymphoma in combination with chemotherapy and followed by obinutuzumab monotherapy.

Precautions

Contraindications: Hypersensitivity to obinutuzumab. Cautions: Pts showing evidence of prior HBV infection, preexisting cardiac/pulmonary impairment; hematologic abnormalities (e.g., leukopenia, thrombocytopenia); electrolyte imbalance; avoid with active infection.
**Action**
Targets CD20 antigen expressed on surface of B lymphocytes. Mediates B-cell lysis, cellular cytotoxicity, and antibody-dependent cellular phagocytosis (macrophage ingestion). **Therapeutic Effect:** Inhibits tumor cell growth and proliferation in chronic lymphocytic leukemia.

**Pharmacokinetics**
Metabolism and elimination not specified. **Half-life:** 28 days.

**Lifespan considerations**

- **Pregnancy/Lactation:** Unknown if distributed in breast milk. Monoclonal antibodies are known to cross placenta. Effective contraception, discontinuation of breastfeeding recommended during therapy and for 18 months after discontinuation. **Children:** Safety and efficacy not established. **Elderly:** May have increased risk of adverse reactions.

**Interactions**
**DRUG:** ACE inhibitors (e.g., enalapril, lisinopril), angiotensin receptor blockers (e.g., losartan), beta blockers (e.g., metoprolol) may increase risk of hypotension. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** May increase serum alkaline phosphatase, ALT, AST, bilirubin, creatinine, uric acid. May decrease albumin, Hgb, Hct, lymphocytes, neutrophils, platelets; serum potassium, sodium.

**Availability (Rx)**
**Solution, Injection:** 1,000 mg/40 mL (25 mg/mL) single-use vial.

**Administration/handling**
- **Alert** Administer via dedicated line. Do not administer IV push or bolus. Withhold hypertensive medications at least 12 hrs before and 1 hr after administration. Do not mix with dextrose-containing fluids.

- **IV**
Reconstitution
• Visually inspect for particulate matter or discoloration.
• For 100-mg dose: withdraw 40 mL solution from vial and dilute only 4 mL (100 mg) in 100 mL 0.9% NaCl for immediate administration. Dilute remaining 36 mL (900 mg) into 250 mL 0.9% NaCl at same time and refrigerate for up to 24 hrs for cycle 1: day 2. For remaining infusions (day 8 and day 15 of cycle 1 and day 1 of cycles 2–6), dilute 40 mL (1,000 mg) solution in 250 mL NaCl infusion bag.
• Gently mix by inversion.
• Do not shake.

Rate of Administration
• Day 1 of Cycle 1 (100 mg): Infuse over 4 hrs (25 mg/hr).
• Do not increase infusion rate.
• Day 2 of Cycle 1 (900 mg): Infuse at 50 mg/hr.
• May increase by 50 mg/hr every 30 min to maximum rate of 400 mg/hr.
• Increase rate based on tolerability.

Storage
• Solution should appear clear, colorless to slightly brown.
• May refrigerate diluted solution up to 24 hrs.

Indications/routes/dosage

Chronic Lymphocytic Leukemia (CLL)
*Alert* Premedicate with glucocorticoid, acetaminophen, and antihistamine to decrease severity of infusion reaction. Consider premedication with antihyperuricemics (allopurinol) 12–24 hrs for pts with high tumor burden or high circulating absolute lymphocyte count greater than $25 \times 10^9/L$. Recommend antimicrobial prophylaxis throughout treatment for pts with neutropenia.

Follicular Lymphoma (Relapsed/Refractory)
IV: ADULTS, ELDERLY: Six treatment cycles of 28 days (in combination with bendamustine). Cycle 1: 1,000 mg on days 1, 8, 15. Cycles 2–6: 1,000 mg
on day 1 of each subsequent 28-day cycle for 5 doses. If achieves stable disease, complete or partial response, continue obinutuzumab (as monotherapy) 1,000 mg q2mos for 2 yrs.

**Follicular Lymphoma (previously untreated)**

**IV: ADULTS, ELDERLY:** Cycle 1 (either in combination with bedamstine or with CHOP or CVP chemotherapy): 1,000 mg wkly on days 1, 8 and 15. Cycles 2–6 (in combination with bendamustine): 1,000 mg on day 1 q28days for 5 doses. Cycles 2–8 (in combination with CHOP): 1,000 mg on day1 q21days for 5 doses (with CHOP), then 1,000 mg on day 1 q21 days for 2 doses (as monotherapy). Cycles 2–8 (in combination with CVP): 1,000 mg on day1 q21days for 7 doses. Then as monotherapy: 1,000 mg q2mos for up to 2 yrs beginning approximately 2 mos after last induction phase.

**Dosage in Renal/Hepatic Impairment**

No dose adjustment.

**Side effects**

**Frequent (69%):** Infusion reactions (pruritus, flushing, urticaria). **Occasional (10%):** Pyrexia, cough.

**Adverse effects/toxic reactions**

Thrombocytopenia, neutropenia, leukopenia, lymphopenia (47%–80% of pts) are expected responses to therapy, but more severe reactions including bone marrow failure, febrile neutropenia, opportunistic infection may result in life-threatening events. Hepatitis B virus reactivation may occur. Infusion reactions including hypotension, tachycardia, dyspnea, bronchospasm, wheezing, laryngeal edema, nausea, vomiting, flushing, pyrexia may occur during infusion. Tumor lysis syndrome may present as acute renal failure, hypocalcemia, hyperuricemia, hyperphosphatemia within 12–24 hrs of infusion. Immunogenicity (autoantibodies) occurred in 13% of pts. Progressive multifocal leukoencephalopathy (PML) occurred rarely and may include weakness, paralysis, vision loss, aphasia, cognition impairment.
Nursing considerations

Baseline assessment
Obtain baseline CBC, BMP, ionized calcium, phosphate, uric acid; vital signs. Screen for history of anemia, asthma, arrhythmias, COPD, diabetes, GI bleeding, hypertension, hepatitis B virus infection, hepatic/renal impairment, peripheral edema. Receive full medication history, esp. hypertension, anticoagulant medications. Perform baseline visual acuity. Offer emotional support.

Intervention/evaluation

Patient/family teaching
• Avoid pregnancy.
• Report any yellowing of skin or eyes, abdominal pain, bruising, black/tarry stools, amber or bloody urine.
• Fever, cough, burning with urination, body aches, chills may indicate acute infection.
• Avoid use of live virus vaccines.
• Avoid alcohol.
• Immediately report difficult breathing, severe coughing, chest tightness, wheezing.
• Paralysis, vision changes, impaired speech, altered mental status may indicate life-threatening neurologic event.

ocrelizumab
ok-re-liz-ue-mab
Ocrevus
◆CLASSIFICATION
PHARMACOTHERAPEUTIC: Anti-CD20 monoclonal antibody.
CLINICAL: Multiple sclerosis agent. Do not confuse ocrelizumab with certolizumab, daclizumab, efalizumab, mepolizumab, natalizumab, or omalizumab.

Uses

Treatment of adult pts with relapsing or primary progressive forms of multiple sclerosis (MS).

Precautions

Contraindications: Life-threatening infusion reaction to ocrelizumab. Active hepatitis B virus (HBV) infection confirmed by positive results for hepatitis B surface antigen (HBsAg) and anti-HBV tests. Cautions: History of chronic opportunistic infections (esp. bacterial, invasive fungal, mycobacterial, protozoal, viral, tuberculosis); active infection, conditions predisposing to infection (e.g., diabetes, immunocompromised pts, renal failure, open wounds); intolerance to corticosteroids; history of depression, malignancies, breast cancer. Avoid administration of live or live attenuated vaccines during treatment and after discontinuation until B-cells are no longer depleted.

Action

Monoclonal antibody that is directed against B cells, which express the cell surface antigen CD20 (thought to influence the course of MS through antigen presentation, autoantibody production, cytokine regulation, and formation of ectopic lymphoid aggregates in meninges). Binds to the cell surface to deplete CD20-expressing B cells. Therapeutic Effect: Reduces progression of MS.

Pharmacokinetics

Life expectancy considerations

Pregnancy/Lactation: May cause transient peripheral B-cell depletion and
lymphocytopenia in neonates when used during pregnancy. Immunoglobulins are known to cross the placenta. Females of reproductive potential must use effective contraception during treatment and up to 6 mos after discontinuation. Unknown if distributed in breast milk; however, immunoglobulin G (IgG) is present in breast milk. Breastfeeding not recommended. **Children:** Safety and efficacy not established. **Elderly:** No age-related precautions noted.

**Interactions**

**DRUG:** May decrease effect of **BCG, vaccines** (live and attenuated). May increase adverse effects/toxicity of **belimumab, natalizumab, picrolimus, tacrolimus.** **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** May decrease immunoglobulin A (IgA), immunoglobulin M (IgM), immunoglobulin G (IgG), neutrophils.

**Availability (Rx)**

**Injection, Solution:** 300 mg/10 mL (30 mg/mL).

**Administration/handling**

**IV**

**Preparation**
- Visually inspect for particulate matter or discoloration. Solution should appear clear to slightly opalescent, colorless to pale brown in color.
- Do not use if solution is cloudy, discolored, or if visible particles are observed.
- Withdraw proper dose from vial (10 mL for 300-mg dose; 20 mL for 600-mg dose) and dilute into 0.9% NaCl bag to a final concentration of approx. 1.2 mg/mL (300-mg dose in 250 mL 0.9% NaCl; 600-mg dose in 500 mL 0.9% NaCl).
- Mix by gentle inversion.
- Do not shake or agitate.

**Rate of Administration**
- **First and Second Infusion:** Start at 30 mL/hr via dedicated line using 0.2- or 0.22-micron in-line filter. If tolerated, increase rate by 30 mL/hr q30min to a maximum rate of 180 mL/hr for a duration of 2.5 hrs or longer. **Subsequent Infusions:** Start at 40 mL/hr via
dedicated line using 0.2- or 0.22-micron in-line filter. If tolerated, increase rate by 40 mL/hr q30min to a maximum rate of 200 mL/hr for a duration of 3.5 hrs or longer. **Mild Infusion Reactions:** Decrease rate by 50% and continue reduced rate for at least 30 min. If tolerated, may increase infusion rate as described above. **Severe Infusion Reactions:** Interrupt infusion until symptoms resolve, then resume infusion at 50% of the initial infusion rate. **Life-threatening Infusion Reaction:** Immediately stop infusion and permanently discontinue; do not restart.

**Storage**
- May refrigerate diluted solution up to 24 hrs or store at room temperature for up to 8 hrs (includes infusion time).
- If diluted solution is refrigerated, allow to warm to room temperature before administration.
- Discard solution if not administered within required time frame.

### IV incompatibilities
Do not dilute with other IV solutions. Do not mix or infuse with other medications.

**Indications/Routes/Dosage**
- **Multiple Sclerosis**
  - **IV: ADULTS, ELDERLY:** 300 mg once at wk 0 and wk 2, then 600 mg q6mos.
Observe pt for at least 1 hr after completion of infusion.

**Dosage in Renal/Hepatic Impairment**

**Mild impairment:** No dose adjustment. **Moderate to severe impairment:** Not specified; use caution.

**Side Effects**

**Occasional (8%–5%):** Back pain, cough, diarrhea, peripheral edema, extremity pain.

**Adverse Effects/Toxic Reactions**

Infusion-related reactions including bronchospasm, dizziness, dyspnea, erythema, fatigue, flushing, headache, hypotension, nausea, oropharyngeal pain, nausea, pharyngeal/laryngeal edema, pruritus, pyrexia, rash, tachycardia, throat irritation, urticaria was reported in 34%–40% of pts. Serious infusion reactions requiring hospitalization occurred in less than 1% of pts. Infections including upper respiratory tract infections (40%–49% of pts), lower respiratory tract infections (10% of pts), skin infections (16% of pts), herpes infection (6% of pts) may occur. Progressive multifocal leukoencephalopathy (PML), an opportunistic viral infection of the brain caused by the JC virus, has occurred in pts treated with other anti-CD20 antibodies; may result in progressive permanent disability and death. Symptoms of PML include altered mental status, aphasia, paralysis, vision loss, weakness. HBV reactivation was reported in pts treated with other anti-CD20 antibodies; may result in fulminant hepatitis, hepatic failure, death. May increase risk of malignancies including breast cancer. Immunogenicity (auto anti-ocrelizumab antibodies) reported in 1% of pts. Depression reported in 8% of pts.

**Nursing Considerations**

**Baseline Assessment**

Assess baseline symptoms of MS (e.g., bladder/bowel dysfunction, cognitive impairment, depression, dysphagia, fatigue, gait disorder, numbness/tingling, pain, seizures, spasticity, tremors, weakness). Obtain vital signs. Question
history of hypersensitivity reactions, infusion-related reactions. Ensure that proper resuscitative equipment, medical supplies are readily available (e.g., albuterol, antipyretics, antihistamines, epinephrine, isotonic IV fluids, bag-valve mask, oxygen, rapid sequence intubation kit). Screen all pts for active HBV. Pts who test negative for HBsAg and positive for anti-HBcAb+ should be referred to a hepatic specialist. If applicable, immunizations should be up-to-date according to guidelines at least 6 wks prior to initiation. Question history of chronic infections, herpes infection, depression, malignancies, breast cancer. Screen for active infection. Verify use of effective contraception in females of reproductive potential.

**Intervention/Evaluation**

Monitor vital signs. Diligently monitor for infusion-related reactions during infusion and for at least 1 hr after completion (esp. during initial infusions). If severe or life-threatening reactions occur, immediately stop infusion and provide appropriate medical support. Due to risk of respiratory compromise, pts with bronchospasm, dyspnea, hypoxia should be given immediate supplemental oxygen, hypersensitivity medications, hemodynamic support. If laryngeal or pharyngeal edema occurs, airway protection or possible intubation may be required. Mild to moderate infusion reactions may require interruption of infusion, decrease of infusion rate, symptom management. Closely monitor for HBV reactivation, symptoms of PML, new malignancies including breast cancer, infections. Conduct neurologic assessment. Assess for symptom improvement of MS.

**Patient/Family Teaching**

- Life-threatening infusion reactions, allergic reactions may occur during infusion and up to 24 hrs after completion of infusion. Immediately report difficulty breathing, chest pain, chest tightness, chills, dizziness, fast heart rate, fever, flushing, headache, hives, itching, low blood pressure, nausea, throat pain or swelling, rash.
- If applicable, vaccinations should be up-to-date at least 6 wks before starting treatment. Do not receive live vaccines.
- Treatment may depress your immune system and reduce your ability to fight infection. Report symptoms of infection such as body aches, burning with urination, chills, cough, fatigue, fever. Avoid those with active infection.
• Avoid pregnancy. Females of childbearing potential should use effective contraception during treatment and for at least 6 mos after last dose. Do not breastfeed.
• Due to pretreatment with a corticosteroid, pts with diabetes may experience a transient rise in blood sugar levels.
• PML, an opportunistic viral infection of the brain, may cause progressive, permanent disabilities and death. Report symptoms of PML such as confusion, memory loss, paralysis, trouble speaking, vision loss, seizures, weakness.
• Treatment may cause reactivation of HBV, depression, new cancers including breast cancer.
• Notify physician if symptoms of MS do not improve.

octreotide
ock-tree-oh-tide

SandoSTATIN
SandoSTATIN LAR Depot

CLASSIFICATION
PHARMACOTHERAPEUTIC: Somatostatin analogue.
CLINICAL: Secretory inhibitory, growth hormone suppressant; antidiarrheal.
Do not confuse SandoSTATIN with SandIMMUNE, SandoSTATIN LAR, sargramostim, or simvastatin.

Uses
Control of diarrhea and flushing in pts with metastatic carcinoid tumors, treatment of watery diarrhea associated with vasoactive intestinal peptic-secreting tumors (VIPomas), acromegaly (to reduce blood levels of growth hormone and insulin-like growth factor). OFF-LABEL: Control of bleeding esophageal varices, treatment of AIDS-associated secretory diarrhea, diarrhea, diarrhea associated with graft-vs-host disease, chemotherapy-induced diarrhea, insulinomas, small-bowel fistulas, Zollinger-Ellison syndrome, Cushing’s syndrome, hypothalamic obesity, malignant bowel obstruction, postgastrectomy dumping syndrome, islet cell tumors, sulfonylurea-induced hypoglycemia.

Precautions
**Contraindications:** Hypersensitivity to octreotide. **Cautions:** Diabetic pts with gastroparesis, renal failure, hepatic impairment, HF, concomitant medications altering heart rate or rhythm. Concurrent use of medications that prolong QT interval, elderly pts.

**Action**

Suppresses secretion of serotonin, gastrin, VIP, insulin, glucagon, secretin, pancreatic polypeptide. **Therapeutic Effect:** Prolongs intestinal transit time.

**Pharmacokinetics**

<table>

</table>

Rapidly, completely absorbed from injection site. Protein binding: 65%. Metabolized in liver. Excreted in urine. Removed by hemodialysis. **Half-life:** 1.7–1.9 hrs.

**Lifespan considerations**

**Pregnancy/Lactation:** Unknown if distributed in breast milk. **Children:** Safety and efficacy not established. **Elderly:** No age-related precautions noted.

**Interactions**

**DRUG:** May decrease effectiveness of cycloSPORINE. Glucagon, growth hormone, insulin, oral antidiabetics (e.g., glipiZIDE, metFORMIN) may alter glucose concentrations. **HERBAL:** Avoid herbs that have hypoglycemic activity (e.g., garlic, ginger, ginseng). **FOOD:** None known. **LAB VALUES:** May decrease serum thyroxine (T₄). May increase serum alkaline phosphatase, ALT, AST, GGT.

**Availability (Rx)**

**Injection Solution (SandoSTATIN):** 50 mcg/mL, 100 mcg/mL, 200 mcg/mL, 500 mcg/mL, 1,000 mcg/mL. **Injection Suspension (SandoSTATIN LAR):** 10-mg, 20-mg, 30-mg vials.
Administration/handling

**SANDOSTATIN** may be given IV, IM, SQ. SANDOSTATIN LAR Depot may be given only IM. Refrigerate.

**IM**
- Give immediately after mixing.
- Administer deep IM in large muscle mass at 4-wk intervals.
- Avoid deltoid injections.

**SQ**
- Do not use if discolored or particulates form.
- Avoid multiple injections at same site within short periods.

**IV**
- Dilute in 50–100 mL 0.9% NaCl or D$_5$W and infuse over 15–30 min. In emergency, may give IV push over 3 min. Following dilution, stable for 96 hrs at room temperature when diluted with 0.9% NaCl (24 hrs with D$_5$W). Infuse over 15–30 min.

**Indications/routes/dosage**

**Note:** Schedule injections between meals (to decrease GI effects).

**Carcinoid Tumor**

**IV, SQ (Sandostatin):** **ADULTS, ELDERLY:** Initial 2 wks, 100–600 mcg/day in 2–4 divided doses. Range: 50–750 mcg.

**IM (Sandostatin LAR):** **ADULTS, ELDERLY:** Must be stabilized on SQ octreotide for at least 2 wks. 20 mg q4wks for 2 mos, then modify based on response.

**Vasoactive Intestinal Peptic-Secreting Tumor (VIPoma)**

**IV, SQ (Sandostatin):** **ADULTS, ELDERLY:** Initial 2 wks, 200–300 mcg/day in 2–4 divided doses. Range: 150–750 mcg.

**IM (Sandostatin LAR):** **ADULTS, ELDERLY:** Must be stabilized on SQ octreotide for at least 2 wks; 20 mg q4wks for 2 mos, then modify based on
response.

**Esophageal Varices**

**IV (Sandostatin):** ADULTS, ELDERLY: Bolus of 25–100 mcg followed by IV infusion of 25–50 mcg/hr for 2–5 days.

**Acromegaly**

**IV, SQ (Sandostatin):** ADULTS, ELDERLY: Initially, 50 mcg 3 times/day. Increase as needed. Range: 300–1,500 mcg/day. Usual effective dose: 100–200 mcg 3 times/day.

**IM (Sandostatin Lar):** ADULTS, ELDERLY: Must be stabilized on SQ octreotide for at least 2 wks. 20 mg q4wks for 3 mos, then modify based on response. **Maximum:** 40 mg q4wks.

**Dosage in Renal/Hepatic Impairment**

No dose adjustment.

**Side effects**

**Frequent (10%–6%; 58%–30% in Acromegaly Pts):** Diarrhea, nausea, abdominal discomfort, headache, injection site pain. **Occasional (5%–1%):** Vomiting, flatulence, constipation, alopecia, facial flushing, pruritus, dizziness, fatigue, arrhythmias, ecchymosis, blurred vision. **Rare (less than 1%):** Depression, diminished libido, vertigo, palpitations, dyspnea.

**Adverse effects/toxic reactions**

Increased risk of cholelithiasis. Prolonged high-dose therapy may produce hypothyroidism. GI bleeding, hepatitis, seizures occur rarely.

**Nursing considerations**

**Baseline assessment**

Establish baseline B/P, weight, thyroid function, serum glucose, electrolytes.
**Intervention/evaluation**

**Patient/family teaching**

- Therapy should provide significant improvement of severe, watery diarrhea.

---

**ofatumumab**

oh-fa-tue-mue-mab

**Arzerra**

- **CLASSIFICATION**
  - **PHARMACOTHERAPEUTIC**: Monoclonal antibody.
  - **CLINICAL**: Antineoplastic.

- **BLACK BOX ALERT**
  - Hepatitis B virus (HBV) reactivation may occur, resulting in hepatitis, hepatic failure, death. Progressive multifocal leukoencephalopathy (PML) resulting in death may occur.

*Do not confuse ofatumumab with omalizumab.*

**Uses**

Treatment of chronic lymphocytic leukemia (CLL) in pts previously untreated, relapsed, or who require extended therapy. Treatment of CLL refractory to fludarabine and alemtuzumab.

**Precautions**

**Contraindications**: Hypersensitivity to ofatumumab. **Cautions**: Carriers of hepatitis B virus.

**Action**
Binds to CD20 molecule, the antigen on surface of B-cell lymphocytes; inhibits early-stage B-lymphocyte activation. **Therapeutic Effect:** Controls tumor growth, triggers cell death.

**Pharmacokinetics**
Eliminated through both a target-independent route and a B-cell–mediated route. Due to depletion of B cells, clearance is decreased substantially after subsequent infusions compared with first infusion. **Half-life:** 12–16 days.

**Lifespan considerations**
- **Pregnancy/Lactation:** Unknown if distributed in breast milk. **Children:** Safety and efficacy not established. **Elderly:** No age-related precautions noted.

**Interactions**
- **DRUG:** Bone marrow depressants may increase myelosuppression. **Live virus vaccines** may potentiate virus replication, increase vaccine side effects, decrease pt’s antibody response to vaccine. **HERBAL:** Echinacea may decrease concentration/effects. **FOOD:** None known. **LAB VALUES:** May decrease neutrophils, platelets.

**Availability (Rx)**
- **Injection, Solution:** 100 mg/5 mL, 1000 mg/50 mL.

**Administration/handling**

**IV**
- **ALERT** Do not give by IV push or bolus. Use in-line filter supplied with product.

**Reconstitution**
- **300-mg dose:** Withdraw and discard 15 mL from 1,000 mL 0.9% NaCl bag.
- **1,000-mg dose:** Withdraw and discard 50 mL from 1,000 mL NaCl bag. Withdraw 50 mL from 1 single-use 1,000-mg vial and add to bag.
- **Gently invert.**
- **2,000-mg dose:** Withdraw and discard 100 mL from
1,000 mL NaCl bag. Withdraw 50 mL from 2 single-use 1,000-mg vials and add to bag.
• Gently invert to mix.

Rate of Administration
• **Dose 1:** Initiate infusion at rate of 3.6 mg/hr (12 mL/hr).
• **Dose 2:** Initiate infusion at rate of 24 mg/hr (12 mL/hr).
• **Dose 3–12:** Initiate infusion at rate of 50 mg/hr (25 mL/hr).
• If no infusion toxicity, rate of infusion may be increased every 30 min, using following table:

<table>
<thead>
<tr>
<th>Interval After Start of Infusion (min)</th>
<th>Dose 1 (mL/hr)</th>
<th>Dose 2 (mL/hr)</th>

Storage
• Refrigerate vials.
• After dilution, solution should be used within first 12 hrs; discard preparation after 24 hrs.
• Discard if discoloration is present, but solution may contain visible, translucent-to-white particulates (will be removed by in-line filter).

⚠ IV Compatibilities
Prepare all doses with 0.9% NaCl. Do not mix with dextrose solutions or any other medications.

Indications/routes/dosage
**Alert** Premedicate 30 min to 2 hrs before each infusion with acetaminophen, an antihistamine, and a corticosteroid as prophylaxis for infusion reaction. Flush IV line with 0.9% NaCl before and after each dose. Interrupt infusion if infusion reaction of any severity occurs (do not resume for grade 4 reaction).

**Chronic Lymphocytic Leukemia (Untreated)**
**IV Infusion:** ADULTS, ELDERLY: Cycle 1: 300 mg, then 1,000 mg on day 8.
Subsequent cycles: 1,000 mg on day 1 q28days. Continue for at least 3 cycles or a maximum of 12 cycles (in combination with chlorambucil).

**Chronic Lymphocytic Leukemia (Refractory)**

**IV Infusion: ADULTS, ELDERLY:** Recommended dosage is 12 doses given on the following schedule: 300 mg initial dose (dose 1), followed 1 wk later by 2,000 mg wkly for 7 doses (doses 2–8), followed 4 wks later by 2,000 mg every 4 wks for 4 doses (doses 9–12).

**Chronic Lymphocytic Leukemia (Relapsed)**

**IV Infusion: ADULTS, ELDERLY:** 300 mg once on day 1, then 1,000 mg on day 8, then 1,000 mg on day 1 of subsequent 28-day cycles for a maximum of 6 cycles (in combination with fludarabine and cyclophosphamide).

**Extended Treatment of CLL**

**IV Infusion: ADULTS, ELDERLY:** 300 mg once on day 1, then 1,000 mg on day 8, then 1,000 mg 7 wks later and q8wks thereafter up to a maximum of 2 yrs.

**Dosage in Renal/Hepatic Impairment**

No dose adjustment.

**Side effects**

**Frequent (20%–14%):** Fever, cough, diarrhea, fatigue, rash. **Occasional (13%–5%):** Nausea, bronchitis, peripheral edema, nasopharyngitis, urticaria, insomnia, headache, sinusitis, muscle spasm, hypertension.

**Adverse effects/toxic reactions**

Most common serious adverse reactions were bacterial, viral, fungal infections (including pneumonia and sepsis), septic shock, neutropenia, thrombocytopenia. Infusion reactions occur more frequently with first 2 infusions. Severe infusion reactions manifested as angioedema, bronchospasm, dyspnea, fever, chills, back pain, hypotension. Progressive multifocal leukoencephalopathy may occur. Small bowel obstruction has been noted.
**Nursing considerations**

**Baseline assessment**
Screen pts at high risk of hepatitis B virus. Assess baseline CBC prior to therapy. Offer emotional support.

**Intervention/evaluation**
Monitor renal function, electrolytes. Monitor CBC for evidence of myelosuppression during therapy, and increase frequency of monitoring in pts who develop grade 3 or 4 cytopenia. Monitor for blood dyscrasias (fever, sore throat, signs of local infection, unusual bruising/bleeding from any site), symptoms of anemia (excessive fatigue, weakness). Closely monitor for infusion reactions.

**Patient/family teaching**
- Do not have immunizations without physician’s approval (lowers body’s resistance).
- Avoid contact with those who have recently received live virus vaccine.
- Avoid crowds, those with infection.
- Promptly report fever, sore throat, signs of infection.
- Report symptoms of infusion reactions (e.g., fever, chills, breathing problems, rash); bleeding, bruising, petechiae, worsening weakness or fatigue; new neurologic symptoms (e.g., confusion, loss of balance, vision problems); symptoms of hepatitis (e.g., fatigue, yellow discoloration of skin/eyes); worsening abdominal pain, nausea.

**OLANZapine**
oh-lan-za-peen

**Apo-OLANZapine**

**ZyPREXA**

**ZyPREXA Relprevv**

**ZyPREXA Zydis**
**Fixed-Combination(s)**

**Symbyax:** OLANZapine/FLUoxetine (an antidepressant): 6 mg/25 mg, 6 mg/50 mg, 12 mg/25 mg, 12 mg/50 mg.

**CLASSIFICATION**

**PHARMACOTHERAPEUTIC:** Second-generation (atypical) antipsychotic.

**CLINICAL:** Antipsychotic.

■ **BLACK BOX ALERT** ■ Elderly pts with dementia-related psychosis are at increased risk for mortality due to cerebrovascular events. Sedation (including coma), delirium reported following use of ZyPREXA Relprevv.

Do not confuse OLANZapine with olsalazine or QUEtiapine, or ZyPREXA with CeleXA or ZyrTEC.

**Uses**

**PO:** Management of manifestations of schizophrenia. Treatment of acute mania associated with bipolar disorder as monotherapy or in combination with lithium or valproate. In combination with FLUoxetine: treatment of depressive episodes associated with bipolar I disorder and treatment of treatment-resistant bipolar depression. **IM:** ZyPREXA Intramuscular: Controls acute agitation in schizophrenia and bipolar mania. **Relprevv:** Long-acting antipsychotic for IM injection for treatment of schizophrenia. **OFF-LABEL:** Prevention of chemotherapy-induced nausea/vomiting. Acute treatment of delirium. Treatment of anorexia nervosa, Tourette’s syndrome, tic disorder.

**Precautions**

**Contraindications:** Hypersensitivity to OLANZapine. **Cautions:** Disorders in which CNS depression is prominent; cardiac disease, hemodynamic instability, prior MI, ischemic heart disease; hyperlipidemia, pts at risk for aspiration pneumonia, decreased GI motility, urinary retention, BPH, narrow-angle glaucoma, diabetes, elderly, pts at risk for suicide, Parkinson’s disease, severe renal/hepatic impairment, predisposition to seizures.

**Action**
Antagonizes α₁-adrenergic, DOPamine, histamine, muscarinic, serotonin receptors. Produces anticholinergic, histaminic, CNS depressant effects. **Therapeutic Effect:** Diminishes psychotic symptoms.

**Pharmacokinetics**

Well absorbed after PO administration. Rapid absorption following IM administration. Protein binding: 93%. Widely distributed. Excreted in urine (57%), feces (30%). Not removed by dialysis. **Half-life:** 21–54 hrs.

**Lifespan considerations**

**Pregnancy/Lactation:** Unknown if drug crosses placenta or is distributed in breast milk. **Children:** Safety and efficacy not established. **Elderly:** Use caution. Consider lower starting doses.

**Interactions**

**DRUG:** Alcohol, CNS depressants (e.g., LORazepam, morphine, zolpidem) may increase CNS depressant effects. **Anticholinergics** may increase anticholinergic effects. **Hepatotoxic medications** (e.g., acetaminophen, simvastatin) may increase risk of hepatotoxicity. **HERBAL:** Dong quai, St. John’s wort may increase photosensitization. **Gotu kola, kava kava, St. John’s wort, valerian** may increase CNS depression. **FOOD:** None known. **LAB VALUES:** May increase serum GGT, cholesterol, prolactin, ALT, AST.

**Availability (Rx)**

**Injection, Powder for Reconstitution (ZyPREXA):** 10 mg. **Suspension for IM Injection (Relprevv):** 210 mg, 300 mg, 405 mg. **Tablets (ZyPREXA):** 2.5 mg, 5 mg, 7.5 mg, 10 mg, 15 mg, 20 mg. **Tablets (Orally Disintegrating [ZyPREXA Zydis]):** 5 mg, 10 mg, 15 mg, 20 mg.

**Administration/handling**

**PO**

• Give without regard to meals.
Orally Disintegrating

- Remove by peeling back foil (do not push through foil).
- Place in mouth immediately.
- Tablet dissolves rapidly with saliva and may be swallowed with or without liquid.

IM (ZyPREXA Intramuscular)

- Reconstitute 10-mg vial with 2.1 mL Sterile Water for Injection to provide concentration of 5 mg/mL.
- Use within 1 hr following reconstitution.
- Discard unused portion.

IM (Relprevv)

- Dilute to final concentration of 150 mg/mL.
- Shake vigorously to mix.
- Store at room temperature for up to 24 hrs.

Indications/routes/dosage

**Schizophrenia**

PO: **ADULTS, ELDERLY:** Initially, 5–10 mg once daily. May increase to 10 mg/day within 5–7 days. If further adjustments are indicated, may increase by 5 mg/day at 7-day intervals. **Maintenance:** 10–20 mg/day. **Maximum:** 20 mg/day.

**CHILDREN:** Initially, 2.5–5 mg/day. Titrate in 2.5- or 5-mg increments at wkly intervals. Target dose: 10 mg. **Maximum:** 20 mg/day.

IM (Long-Acting [Relprevv]): **ADULTS, ESTABLISHED ON 10 MG/DAY ORALLY:** 210 mg q2wks for 4 doses or 405 mg q4wks for 2 doses. **Maintenance:** 150 mg q2wks or 300 mg q4wks. **ESTABLISHED ON 15 MG/DAY ORALLY:** 300 mg q2wks for 4 doses. **Maintenance:** 210 mg q2wks or 405 mg q4wks. **ESTABLISHED ON 20 MG/DAY ORALLY:** 300 mg q2wks.

**Depression Associated with Bipolar Disorder (with FLUoxetine)**

PO: **ADULTS, ELDERLY:** Initially, 5 mg in evening. Range: 5–12.5 mg/day.

**CHILDREN 10–17 yrs:** Initially, 2.5 mg once daily. Adjust dose as tolerated.
Treatment-Resistant Depression (with FLUoxetine)

PO: ADULTS, ELDERLY: Initially, 5 mg in evening. Range: 5–20 mg/day.

Bipolar Mania

PO: ADULTS, ELDERLY: (Monotherapy) Initially, 10–15 mg/day. May increase by 5 mg/day at intervals of at least 24 hrs. Range: 5–20 mg/day. Maximum: 20 mg/day. (In Combination with Lithium or Valproate): Initially, 10 mg/day. Range: 5–20 mg/day. CHILDREN 13 YRS OF AGE AND OLDER: Initially, 2.5–5 mg/day. Adjust dose by 2.5–5 mg daily to target dose of 10 mg/day. Range: 2.5–20 mg/day.

Dosage for Elderly, Debilitated Pts, Pts Predisposed to Hypotensive Reactions

Initial dosage: 5 mg/day.

Control of Agitation

IM: ADULTS, ELDERLY: (Short-Acting): Initially, 5–10 mg. Additional doses (up to 10 mg) may be considered. However, allow at least 2 hrs (after initial dose) or 4 hrs (after second dose) to evaluate response. Maximum: 30 mg/day.

Dosage in Renal/Hepatic Impairment

No dose adjustment.

Side effects

Frequent (26%–10%): Drowsiness, agitation, insomnia, headache, nervousness, hostility, dizziness, rhinitis. Occasional (9%–5%): Anxiety, constipation, nonaggressive atypical behavior, dry mouth, weight gain, orthostatic hypotension, fever, arthralgia, restlessness, cough, pharyngitis, visual changes (dim vision). Rare: Tachycardia; back, chest, abdominal, or extremity pain; tremor.

Adverse effects/toxic reactions

Rare reactions include seizures, neuroleptic malignant syndrome, a potentially
fatal syndrome characterized by hyperpyrexia, muscle rigidity, irregular pulse or B/P, tachycardia, diaphoresis, cardiac arrhythmias. Extrapyramidal symptoms (EPS), dysphagia may occur. Overdose (300 mg) produces drowsiness, slurred speech.

**Nursing considerations**

**Baseline assessment**

Obtain baseline LFT, serum glucose, weight, lipid profile before initiating treatment. Assess behavior, appearance, emotional status, response to environment, speech pattern, thought content.

**Intervention/evaluation**

Monitor B/P, serum glucose, lipids, LFT. Assess for tremors, changes in gait, abnormal muscular movements, behavior. Supervise suicidal-risk pt closely during early therapy (as depression lessens, energy level improves, increasing suicide potential). Assess for therapeutic response (interest in surroundings, improvement in self-care, increased ability to concentrate, relaxed facial expression). Assist with ambulation if dizziness occurs. Assess sleep pattern. Notify physician if extrapyramidal symptoms (EPS) occur.

**Patient/family teaching**

- Avoid dehydration, particularly during exercise, exposure to extreme heat, concurrent use of medication causing dry mouth, other drying effects.
- Sugarless gum, sips of water may relieve dry mouth.
- Report suspected pregnancy.
- Take medication as prescribed; do not stop taking or increase dosage.
- Slowly go from lying to standing.
- Avoid alcohol.
- Avoid tasks that require alertness, motor skills until response to drug is established.
- Monitor diet, exercise program to prevent weight gain.

olaparib

**oh-lap-a-rib**
Lynparza

**CLASSIFICATION**
**PHARMACOTHERAPEUTIC:** Polymerase inhibitor.
**CLINICAL:** Antineoplastic.

**Uses**

**Capsules/Tablets:** Treatment of deleterious or suspected deleterious germline BRCA-mutated advanced ovarian cancer in pts who have been treated with three or more prior lines of chemotherapy.

**Tablets only:** Maintenance treatment of adults with recurrent epithelial, ovarian, fallopian tube or primary peritoneal cancer who are in complete or partial response to platinum-based chemotherapy.

**Precautions**

**Contraindications:** Hypersensitivity to olaparib. **Cautions:** Baseline anemia, neutropenia, lymphopenia, thrombocytopenia. History of pulmonary disease. Avoid concomitant use of strong or moderate CYP3A inhibitors, strong or moderate CYP3A inducers.

**Action**

Inhibits poly (ADP-ribose) polymerase enzymes, involved in normal cellular hemostasis (e.g., DNA transcription, cell cycle regulation, and DNA repair). Disrupts cellular homeostasis, resulting in cell death. **Therapeutic Effect:** Inhibits tumor cell growth and metastasis.

**Pharmacokinetics**

Rapidly absorbed. Metabolized in liver. Protein binding: 82%. Peak plasma concentration: 1–3 hrs. Steady-state concentration: 3–4 days. Excreted in urine (44%), feces (42%). **Half-life:** 11.9 hrs.

**Lifespan considerations**

**Pregnancy/Lactation:** Avoid pregnancy; may cause fetal harm. Females of reproductive potential should use effective contraception during treatment and
for at least 6 mos after discontinuation. Unknown if distributed in breast milk. Must either discontinue drug or discontinue breastfeeding. **Children:** Safety and efficacy not established. **Elderly:** No age-related precautions noted.

**Interactions**

**DRUG:** Strong CYP3A inhibitors (e.g., clarithromycin, ketoconazole, ritonavir), moderate CYP3A inhibitors (e.g., atazanavir, ciprofloxacin) may increase concentration/effect. **Strong CYP3A inducers** (e.g., carBAMazepine), moderate CYP3A inducers (e.g., nafcillin) may decrease concentration/effect. **HERBAL:** St. John’s wort may decrease concentration/effect. **FOOD:** Grapefruit products, Seville oranges may increase concentration/effect. **High-fat food** may delay absorption. **LAB VALUES:** May increase mean corpuscular volume, serum creatinine. May decrease Hct, Hgb, lymphocytes, neutrophils, RBC.

**Availability (Rx)**

**Capsules:** 50 mg. **Tablets:** 100 mg, 150 mg.

**Administration/handling**

**PO**

**Capsules:**
- Give without regard to meals.
- Administer capsules whole; do not break, cut, crush, or open. **Tablets:** May give with or without food. Administer tablet whole; do not break, cut, crush, or divide.

**Indications/routes/dosage**

**Note:** Do not substitute tablets with capsules on a mg to mg basis.

**Ovarian Cancer**

**PO:** **ADULTS, ELDERLY:** (Capsule) 400 mg twice daily. Continue until disease progression or unacceptable toxicity. If a dose is missed, give next dose at its scheduled time. (Tablet) 300 mg (2x150 mg) twice daily (100 mg tablets
available for dose reduction). **Maintenance: (Tablets only)** 300 mg (2x150 mg) twice daily (100 mg tablets available for dose reduction).

**Dose Modification**

**Dose Reduction for Adverse Reactions**
PO: ADULTS, ELDERLY: Interrupt treatment until resolved. Then, decrease to 200 mg twice daily. If further dose reduction is indicated, decrease to 100 mg twice daily.

**Concomitant Use of Strong CYP3A Inhibitors**
PO: ADULTS, ELDERLY: 150 mg twice daily.

**Concomitant Use of Moderate CYP3A Inhibitors**
PO: ADULTS, ELDERLY: 200 mg twice daily.

**Dosage in Renal Impairment**
Mild impairment: No dose adjustment. **Moderate to severe impairment:** Not specified; use caution.

**Dosage in Hepatic Impairment**
Not specified; use caution.

**Side effects**
**Frequent (66%–21%):** Fatigue, asthenia, nausea, vomiting, abdominal pain, diarrhea, dyspepsia, decreased appetite, headache, back pain, rash, myalgia, arthralgia, musculoskeletal pain, dysgeusia, cough.

**Adverse effects/toxic reactions**
Myelodysplastic syndrome/acute myeloid leukemia reported in 2% of pts. Pneumonitis, including fatal cases, occurred in less than 1% of pts. Respiratory tract infections including nasopharyngitis, pharyngitis, upper respiratory tract infection occurred in 43% of pts.
Nursing considerations

Baseline assessment
Obtain baseline CBC. Do not initiate therapy until pts have recovered from hematologic toxicities caused by previous chemotherapy. Question history of pulmonary disease. Receive full medication history and screen for interactions. Offer emotional support.

Intervention/evaluation
Monitor CBC monthly. For prolonged hematologic toxicities, interrupt treatment and monitor CBC wkly until recovery. If hematologic levels have not recovered to CTCAE grade 1 or 0 after 4 wks of treatment interruption, consider hematology consultation for further investigations such as bone marrow analysis and blood sample for cytogenetics. Monitor for myelodysplastic syndrome/acute myeloid leukemia, pneumonitis.

Patient/family teaching
• Report bleeding or bruising easily, bloody urine or stool, frequent infections, fatigue, shortness of breath, weakness, weight loss; may indicate acute bone marrow suppression or acute leukemia.
• Report new or worsening respiratory symptoms such as cough, difficulty breathing, fever, wheezing; may indicate severe lung inflammation.
• Do not ingest grapefruit product, Seville oranges.
• Do not take herbal products.
• Avoid pregnancy; treatment may cause birth defects or miscarriage. Do not breastfeed. Females of childbearing potential should use effective contraception during treatment and for at least 6 mos after stopping therapy.

olaratumab
oh-lar-at-ue-mab
Lartruvo
CLASSIFICATION
PHARMACOTHERAPEUTIC: Platelet-derived growth factor receptor (PDGFR) alpha blocker. Monoclonal antibody.
CLINICAL: Antineoplastic.
Do not confuse olaratumab with elotuzumab, obinutuzumab.

Uses
Treatment of adult pts with soft tissue sarcoma (STS), in combination with doxorubicin, with a histologic subtype for which an anthracycline-containing regimen is appropriate and which is not amendable to curative treatment with radiotherapy or surgery.

Precautions
**Contraindications:** Hypersensitivity to olaratumab. **Cautions:** Electrolyte imbalance, pts at risk for hyperglycemia (e.g., diabetes, recent surgery, chronic use of corticosteroids).

Action
A human IgG-1 antibody that binds to PDGFR-alpha. Blocks receptor activation and disrupts PDGF receptor signaling. PDGFR alpha receptor plays a role in cell differentiation, growth, and angiogenesis. **Therapeutic Effect:** Exhibits antitumor activity.

Pharmacokinetics
Widely distributed. Metabolism not specified. Excretion not specified. **Half-life:** 11 days (range: 6–24 days).

ıldığı
**Pregnancy/Lactation:** Avoid pregnancy; may cause fetal harm/malformations. Females of reproductive potential must use effective contraception during treatment and up to 3 mos after discontinuation. Unknown if distributed in breast milk. Breastfeeding not recommended during treatment and for at least 3 mos after discontinuation. **Children:** Safety and efficacy not established. **Elderly:** Not specified; use caution.

Interactions
**DRUG:** May decrease therapeutic effect of BCG vaccine. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** May increase serum alkaline phosphatase, glucose. May decrease lymphocytes, neutrophils, platelets; serum phosphate, potassium, magnesium. May prolong aPTT.

**Availability (Rx)**

**Injection, Solution:** 190 mg/19 mL, 500 mg/50 mL.

**Administration/handling**

**IV**

**Preparation**
- Visually inspect for particulate matter or discoloration. Solution should appear clear to slightly opalescent, colorless to slightly yellow in color.
- Do not use if solution is cloudy, discolored, or if visible particles are observed.
- Withdraw required dose from vial and dilute into 250 mL 0.9% NaCl bag.
- Mix by gently inversion.
- Do not shake or agitate.
- Discard used portions from vial.

**Infusion Guidelines**
- Do not give IV push or bolus.
- Do not mix or infuse with other medications, electrolytes.
- Flush IV line with 0.9% NaCl after completion of infusion.

**Rate of Administration**
- Infuse over 60 min via dedicated IV line.

**Storage**
- May refrigerate diluted solution up to 24 hrs or store at room temperature for up to 4 hrs (includes infusion time).
- Do not freeze.
- If diluted solution is refrigerated, allow to warm to room temperature before administration.
- Discard solution if not administered within required time frame.

**IV incompatibilities**

Do not dilute in dextrose-containing solutions.
Indications/Routes/Dosage

Note: Premedicate with diphenhydramine 25–50 mg IV and dexamethasone 10–20 mg IV on day 1 of cycle 1.

Soft Tissue Sarcoma

**IV: ADULTS, ELDERLY:** 15 mg/kg on days 1 and 8 of each 21-day cycle. Continue until disease progression or unacceptable toxicity. Administer with doxorubicin for the first 8 cycles (see manufacturer guidelines).

Dose Modification

Infusion Reaction

**CTCAE grade 1 or 2 infusion reaction:** Interrupt infusion until symptoms resolve, then resume infusion at 50% of the initial infusion rate. **CTCAE grade 3 or 4 infusion reaction:** Immediately stop infusion; do not restart.

Neutropenia

**Neutropenic fever/infection; CTCAE grade 4 neutropenia lasting greater than 1 wk:** Withhold treatment until ANC 1000 cells/mm$^3$ or greater, then reduce dose to 12 mg/kg. Do not increase dose for subsequent infusions.

Dosage in Renal/Hepatic Impairment

Not specified; use caution.

Side Effects

**Frequent (73%–22%):** Nausea, fatigue, asthenia, musculoskeletal pain, arthralgia, back pain, bone pain, flank pain, groin pain, musculoskeletal chest pain, myalgia, muscle spasm, neck pain, extremity pain, mucositis, alopecia, vomiting, diarrhea, decreased appetite, abdominal pain, neuropathy. **Occasional (20%–11%):** Headache, anxiety, dry eyes.

Adverse Effects/Toxic Reactions

Neutropenia, lymphopenia, thrombocytopenia are expected responses to therapy.
Life-threatening infusion-related reactions including anaphylaxis, bronchospasm, cardiac arrest, chills, dyspnea, hypotension, pyrexia occurred in 14% of pts. CTCAE grade 3 or 4 infusion-related reactions occurred in 2% of pts. Immunogenicity (auto anti-olaratumab antibodies) reported in 3.5% of pts.

**Nursing Considerations**

**Baseline Assessment**

Obtain ANC, CBC, BMP. Obtain pregnancy test in females of reproductive potential. Question history of hypersensitivity reactions, infusion-related reactions; diabetes. Ensure that proper resuscitative equipment, medications are readily available (e.g., albuterol, antipyretics, antihistamines, epinephrine; isotonic IV fluids; bag-valve mask, oxygen, rapid sequence intubation kit). Assess nutritional/hydration status. Offer emotional support.

**Intervention/Evaluation**

Monitor ANC, CBC for neutropenia, lymphopenia, thrombocytopenia; BMP for electrolyte imbalance; vital signs. Diligently monitor for infusion-related reactions. If severe or life-threatening reactions occur, immediately stop infusion and provide appropriate medical support. Due to risk of respiratory compromise, pts with bronchospasm, dyspnea, hypoxia should be given immediate supplemental oxygen, hypersensitivity medications, hemodynamic support. Mild to moderate infusion reactions may require interruption of infusion, decrease of infusion rate, symptom management. Offer antiemetic if nausea, vomiting occurs. Monitor daily pattern of bowel activity, stool consistency.

**Patient/Family Teaching**

- Life-threatening infusion reactions, allergic reactions, cardiac arrest may occur during infusion. Immediately report difficulty breathing, chest pain, chest tightness, chills, dizziness, fast heart rate, fever, flushing, headache, hives, itching, low blood pressure, nausea, throat pain or swelling, rash.
- Treatment may depress your immune system and reduce your ability to fight infection. Report symptoms of infection such as body aches, burning with urination, chills, cough, fatigue, fever. Avoid those with active infection.
- Females of childbearing potential should use effective contraception during treatment and for at least 3 mos after last dose. Do not breastfeed.
• Generalized pain is an expected side effect.
• Treatment may cause severe diarrhea. Drink plenty of fluids.
• Hair loss is an expected side effect of therapy.

olmesartan
ol-me-sar-tan
Benicar
Olmetec

Fixed-Combination(s)

Azor: olmesartan/amLODIPine (calcium channel blocker): 20 mg/5 mg, 40 mg/5 mg, 20 mg/10 mg, 40 mg/10 mg. Benicar HCT: olmesartan/hydroCHLORothiazide (a diuretic): 20 mg/12.5 mg, 40 mg/12.5 mg, 40 mg/25 mg.

Tribenzor: olmesartan/hydroCHLORothiazide/amLODIPine: 20 mg/12.5 mg/5 mg, 40 mg/25 mg/5 mg, 40 mg/12.5 mg/10 mg, 40 mg/25 mg/10 mg.

CLASSIFICATION
PHARMACOTHERAPEUTIC: Angiotensin II receptor antagonist.
CLINICAL: Antihypertensive.

■ BLACK BOX ALERT ■ May cause fetal injury, mortality. Discontinue as soon as possible once pregnancy is detected.

Do not confuse Benicar with Mevacor.

Uses

Treatment of hypertension alone or in combination with other antihypertensives.

Precautions

Contraindications: Hypersensitivity to olmesartan. Concomitant use with aliskiren in pts with diabetes. Cautions: Renal impairment, unstented unilateral or bilateral renal arterial stenosis, significant aortic/mitral stenosis. Concurrent potassium supplements; pts who are volume depleted.
**Action**

Blocks vasoconstrictor, aldosterone-secreting effects of angiotensin II by inhibiting binding of angiotensin II to AT, receptors in vascular smooth muscle. **Therapeutic Effect:** Causes vasodilation, decreases peripheral resistance, decreases B/P.

**Pharmacokinetics**

Moderately absorbed after PO administration. Hydrolyzed in GI tract to olmesartan. Protein binding: 99%. Excreted in urine (35%–50%), remainder in feces. Not removed by hemodialysis. **Half-life:** 13 hrs.

**Lifespan considerations**

**Pregnancy/Lactation:** Unknown if distributed in breast milk. **Children:** Safety and efficacy not established in children younger than 6 yrs of age. **Elderly:** No age-related precautions noted.

**Interactions**

**DRUG:** NSAIDs (e.g., ibuprofen, ketorolac, naproxen) may decrease antihypertensive effect. **HERBAL:** Ephedra, ginseng, yohimbe may worsen hypertension. **Garlic** may increase antihypertensive effect. **FOOD:** None known. **LAB VALUES:** May slightly decrease Hgb, Hct. May increase serum BUN, creatinine, bilirubin, ALT, AST.

**Availability (Rx)**

**Tablets:** 5 mg, 20 mg, 40 mg.

**Administration/handling**

**PO**

• Give without regard to meals.

**Indications/routes/dosage**
Hypertension

PO: ADULTS, ELDERLY: Initially, 20 mg/day. May increase to 40 mg/day after 2 wks. Lower initial dose may be necessary in pts receiving volume-depleting medications (e.g., diuretics). CHILDREN 6–16 YRS, WEIGHING 20 TO LESS THAN 35 KG: Initially, 10 mg once daily. Range: 10–20 mg once daily. WEIGHING 35 KG OR GREATER: Initially, 20 mg once daily. Range: 20–40 mg once daily. Use with caution.

Side effects

Occasional (3%): Dizziness. Rare (less than 2%): Headache, diarrhea, upper respiratory tract infection.

Dosage in Renal/Hepatic Impairment

Use caution.

Adverse effects/toxic reactions

Overdosage may manifest as hypotension, tachycardia. Bradycardia occurs less often. Rare cases of rhabdomyolysis have been reported.

Nursing considerations

Baseline assessment

Obtain B/P, apical pulse immediately before each dose in addition to regular monitoring (be alert to fluctuations). If excessive reduction in B/P occurs, place pt in supine position, feet slightly elevated. Question for possibility of pregnancy. Assess medication history (esp. diuretics).

Intervention/evaluation

Patient/family teaching
• Maintain adequate hydration.
• Avoid pregnancy.
• Avoid tasks that require alertness, motor skills until response to drug is established (possible dizziness effect).
• Report any signs of infection (sore throat, fever).
• Therapy requires lifelong control, diet, exercise.

olodaterol
oh-loe-da-ter-ol
Striverdi Respimat

Fixed-Combination(s)

Stioltto Respimat: olodaterol/tiotropium (bronchodilator): 2.5 mcg/2.5 mcg.

CLASSIFICATION
PHARMACOTHERAPEUTIC: Sympathomimetic (beta₂-adrenergic agonist).
CLINICAL: Bronchodilator.

■ BLACK BOX ALERT ■ Long-acting beta₂-adrenergic agonists (LABA) increase risk of asthma-related deaths. Not indicated for treatment of asthma.

Do not confuse olodaterol with albuterol, indacaterol, formoterol, or salmeterol.

Uses
Long-term, once-daily maintenance bronchodilator treatment of airflow obstruction in pts with chronic obstructive pulmonary disease (COPD), including chronic bronchitis and emphysema. Not indicated in asthma, acute deterioration of COPD.

Precautions
Contraindications: Hypersensitivity to olodaterol. Asthma without use of long-
term asthma control medication, history of hypersensitivity to sympathomimetics. **Cautions:** Diabetes, ketoacidosis, cardiovascular disorders (e.g., coronary insufficiency, arrhythmias, hypertension, hypertrophic obstructive cardiomyopathy), seizure disorder, hyperthyroidism; history of severe bronchospasm, long QT syndrome, electrolyte imbalance.

**Action**
Stimulates beta₂-adrenergic receptors in lungs, resulting in relaxation of bronchial smooth muscle. **Therapeutic Effect:** Relieves bronchospasm, reduces airway resistance, improves bronchodilation.

**Pharmacokinetics**
Rapidly absorbed following inhalation. Extensively distributed in tissue. Metabolized in liver. Protein binding: 60%. Peak plasma concentration: 10–20 min. Excreted in urine. **Half-life:** 45 hrs.

**Lifespan considerations**
**Pregnancy/Lactation:** Excretion into breast milk is probable. Breastfeeding not recommended. May interfere with uterine contractility. **Children:** Safety and efficacy not established. **Elderly:** No age-related precaution noted.

**Interactions**
**DRUG:** Beta blockers (e.g., metoprolol) may decrease therapeutic effect, cause bronchospasms. Beta₂-adrenergic agonists (e.g., salmeterol) may potentiate sympathomimetic effects. Xanthine derivatives (e.g., theophylline), steroids (e.g., methylPREDNISolone), non–potassium-sparing diuretics (e.g., furosemide) may increase risk of hypokalemia. Drugs that prolong QT interval (e.g., amiodarone, azithromycin, ciprofloxacin, haloperidol), MAOIs (e.g., phenelzine, selegiline), and tricyclic antidepressants (e.g., amitriptyline, doxepin) may potentiate cardiovascular effects. **HERBAL:** Caffeine, green tea, guarana may increase sympathomimetic effects. **FOOD:** None known. **LAB VALUES:** May increase serum glucose. May decrease serum potassium.
Availability (Rx)

**Inhalation Spray (2.5 mcg/actuation):** 28 metered actuations/cartridge with inhaler, 60 metered actuations/cartridge with inhaler.

Administration/handling

**Inhalation**

- While taking slow, deep breath through the mouth, press and release button and continue slow inhalation as long as possible. (See manufacturer guidelines for priming instructions and further information.)

Indications/routes/dosage

**COPD**

**Inhalation: ADULTS, ELDERLY:** Two inhalations (2.5 mcg per inhalation for total of 5 mcg) once daily, at same time each day. **Maximum:** 5 mcg within 24-hr period.

**Dosage in Renal Impairment**

No dose adjustment.

**Dosage in Hepatic Impairment**

**Mild to moderate impairment:** No dose adjustment. **Severe impairment:** Use caution.

Side effects

**Occasional (11%–4%):** Nasopharyngitis, upper respiratory tract infection, bronchitis, cough, back pain. **Rare (3%–2%):** Dizziness, insomnia, dry mouth, arthralgia, urinary retention.

Adverse effects/toxic reactions

Life-threatening asthma-related events, bronchospasm, or worsening of COPD-related symptoms have been reported. Serious cardiovascular events including...
arrhythmias, angina pectoris, cardiac arrest, hypertension, tachycardia; flattening of T wave, prolongation of QTc interval, ST segment depression have occurred. All beta-adrenergic agonists carry risk of hyperglycemia or significant hypokalemia. Pts with severe COPD or hypokalemia have additional increased risk of adverse effects related to hypoxia and concomitant medications.

**Nursing considerations**

**Baseline assessment**

Obtain ABG, capillary glucose, O₂ saturation, serum potassium level, vital signs; EKG, pulmonary function test if applicable. Assess respiratory rate, depth, rhythm. Assess lung sounds for wheezing, rales. Receive full medication history and screen for drug interactions. Question history of asthma, cardiovascular disease, diabetes, long QT syndrome, seizure disorder. Teach proper inhaler priming and administration techniques.

**Intervention/evaluation**

**Patient/family teaching**

- Refill prescription when dose indicator on left of inhaler reaches red area of scale.
- Follow manufacturer guidelines for proper use of inhaler.
- Drink plenty of fluids (decreases lung secretion viscosity).
- Rinse mouth with water after inhalation to decrease mouth/throat irritation.
- Avoid excessive use of caffeine derivatives (chocolate, coffee, tea, cola).
- Report fever, productive cough, body aches, difficulty breathing; may indicate lung infection or worsening of COPD.

**olsalazine**

*ole-sal-a-zeen*
Dipentum

**CLASSIFICATION**
**PHARMACOTHERAPEUTIC:** Salicylic acid derivative.
**CLINICAL:** Anti-inflammatory.
*Do not confuse Dipentum with Dilantin, or olsalazine with OLANZapine.*

**Uses**
Maintenance of remission of ulcerative colitis in pts intolerant of sulfaSALAZine medication.

**Precautions**
**Contraindications:** Hypersensitivity to olsalazine. History of hypersensitivity to salicylates. **Cautions:** Renal/hepatic impairment, elderly pts, severe allergies, asthma.

**Action**
Converted to mesalamine in colon by bacterial action. Blocks local chemical mediators of inflammatory response. **Therapeutic Effect:** Reduces colonic inflammation.

**Pharmacokinetics**
Small amount absorbed. Protein binding: 99%. Metabolized by bacteria in colon. Minimal excretion in urine, feces. **Half-life:** 0.9 hr.

**Lifespan considerations**
**Pregnancy/Lactation:** Crosses placenta; distributed in breast milk. **Children:** Safety and efficacy not established. **Elderly:** Age-related renal impairment may require dosage adjustment.

**Interactions**
**DRUG:** Heparin, warfarin may increase risk of bleeding. May increase risk of myelosuppression with mercaptopurine, thioguanine. **HERBAL:** None
significant. **FOOD:** None known. **LAB VALUES:** May increase serum ALT, AST.

**Availability (Rx)**

**Capsules:** 250 mg.

**Administration/handling**

**PO**
- Give with food.

**Indications/routes/dosage**

**Maintenance of Controlled Ulcerative Colitis**

**PO:** **ADULTS, ELDERLY:** 1 g/day in 2 divided doses, preferably q12h.

**Dosage in Renal/Hepatic Impairment**

No dose adjustment.

**Side effects**

**Frequent (10%–5%):** Headache, diarrhea, abdominal pain/cramps, nausea. **Occasional (4%–2%):** Depression, fatigue, dyspepsia, upper respiratory tract infection, decreased appetite, rash, pruritus, arthralgia. **Rare (1%):** Dizziness, vomiting, stomatitis.

**Adverse effects/toxic reactions**

Sulfite sensitivity may occur in susceptible pts (manifested as cramping, headache, diarrhea, fever, rash, urticaria, pruritus, wheezing). Excessive diarrhea associated with extreme fatigue is rarely noted.

**Nursing considerations**
**Intervention/evaluation**

**Patient/family teaching**

- Report if diarrhea, cramping continues or worsens or if rash, fever, pruritus occur.

---

**omacetaxine**

oh-ma-se-tax-een

**Synribo**

**CLASSIFICATION**

PHARMACOTHERAPEUTIC: Protein synthesis inhibitor.

CLINICAL: Antineoplastic.

---

**Uses**

Treatment of adult pts with chronic or accelerated phase chronic myeloid leukemia (CML) with resistance and/or intolerance to two or more tyrosine kinase inhibitors.

**Precautions**

**Contraindications:** Hypersensitivity to omacetaxine. **Cautions:** Glucose intolerance, poorly controlled diabetes, elderly, recent GI bleeding. Avoid all use of anticoagulants, aspirin, NSAIDs; all pts with baseline platelets less than 50,000 cells/mm³.

**Action**

Inhibits protein synthesis of Bcr-Abl tyrosine kinase, a translocation-created enzyme, created by the Philadelphia chromosome abnormality noted in chronic myeloid leukemia (CML). **Therapeutic Effect:** Inhibits tumor proliferation and
growth during accelerated and chronic stages of CML.

Pharmacokinetics
Rapidly absorbed following SQ administration. Maximum concentration: 30 min. Protein binding: Less than 50%. Hydrolyzed via plasma esterases. **Half-life:** 6 hrs.

Lifespan considerations

**Pregnancy/Lactation:** May cause fetal harm. Not recommended in nursing mothers. Unknown if distributed in breast milk. **Children:** Safety and efficacy not established. **Elderly:** Increased risk for toxicity (e.g., hematologic).

Interactions

**DRUG:** NSAIDs (e.g., ibuprofen, ketorolac, naproxen), anticoagulants (e.g., heparin, warfarin), antiplatelets (e.g., clopidogrel) may increase risk for bleeding. **HERBAL:** Echinacea may decrease levels/effects. **FOOD:** None known. **LAB VALUES:** May decrease platelets, Hgb, Hct, leukocytes, lymphocytes. May increase serum ALT.

Availability (Rx)

**Injection, Powder for Reconstitution:** 3.5-mg vial.

Administration/handling

**Alert** Must be administered by health care workers trained in proper chemotherapy handling and disposal procedures.

SQ

**Reconstitution**

- Reconstitute with 1 mL 0.9% NaCl.
- Gently swirl until powder is completely dissolved.
- Inspect vial for particular matter or discoloration.
- Reconstituted vial will provide a concentration of 3.5 mg/mL.
- Avoid contact with skin.
Storage
• Solution should appear clear.
• May store solution at room temperature for up to 12 hrs or may refrigerate up to 24 hrs.
• Discard unused solution.

Indications/routes/dosage

Note: If dose is missed, skip dose and resume next regularly scheduled dose.

Chronic or Accelerated Myeloid Leukemia

SQ: ADULTS, ELDERLY: Induction dose: 1.25 mg/m\(^2\) twice daily for 14 consecutive days every 28 days, over 28-day cycle. Continue induction dose until hematologic response achieved. Maintenance dose: 1.25 mg/m\(^2\) twice daily for 7 consecutive days every 28 days of a 28-day cycle. Continue until no longer achieving clinical treatment benefit.

Dosage Modification

Hematologic Toxicity: If neutrophils less than 500 cells/mm\(^3\) or platelets less than 50,000 cells/mm\(^3\), interrupt therapy. Restart when neutrophil count greater than or equal to 1000 cells/mm\(^3\) or platelet count greater than or equal to 50,000 cells/mm\(^3\) and reduce number of dosing days by 2. Nonhematologic Toxicity: Interrupt therapy until toxicity/adverse effects resolved. Continue indefinitely until pt no longer benefits from therapy.

Dosage in Renal/Hepatic Impairment
No dose adjustment.

Side effects

Chronic Phase

Frequent (45%–25%): Diarrhea, nausea, fatigue, pyrexia, asthenia. Occasional (20%–11%): Headache, arthralgia, cough, epistaxis, alopecia, constipation, abdominal pain, peripheral edema, vomiting, back pain, insomnia, rash.
Accelerated Phase

Occasional (19%–7%): Diarrhea, nausea, fatigue, pyrexia, asthenia, vomiting, cough, abdominal pain, chills, anorexia, headache. Rare (7% or less): Dyspnea, epistaxis.

Adverse effects/toxic reactions

Thrombocytopenia, neutropenia, leukopenia, lymphopenia, or myelosuppression is an expected response to therapy, but more severe reactions including bone marrow failure, febrile neutropenia may result in life-threatening events. Pts with neutropenia are at increased risk for infection. Thrombocytopenia may increase risk for intracranial hemorrhage, GI bleeding. Hyperglycemic events including hyperglycemic hyperosmolar nonketotic syndrome (HHNK) may occur. Pts with uncontrolled diabetes are at increased risk for hyperglycemic emergency.

Nursing considerations

Baseline assessment

Intervention/evaluation

Monitor CBC wkly, then q2wks during maintenance phase. Obtain frequent blood glucose levels, especially in diabetic pts. Do not initiate therapy until negative urine pregnancy confirmed. Monitor LFT if hepatic impairment suspected. If drug exposure occurs, immediately wash affected area with soap and water. Consider isolation protocol if pt develops neutropenia.

Patient/family teaching

• Report if pregnant or planning to become pregnant.
• Use barrier methods during sexual activity.
• Strictly avoid pregnancy.
• May cause male infertility.
• Immediately report yellowing of skin or eyes, abdominal pain, bruising, black/tarry stools, dark urine, dehydration, GI bleeding, nausea, vomiting, rash.
• Report fever, cough, night sweats, flu-like symptoms, skin changes.
• Shortness of breath, pale skin, weakness may indicate bleeding or severe myelosuppression.
• Avoid tasks that require alertness, motor skills until response to drug is established.

omalizumab
oh-ma-liz-ue-mab
Xolair

CLASSIFICATION
PHARMACOTHERAPEUTIC: Monoclonal antibody.
CLINICAL: Antiasthmatic.

BLACK BOX ALERT ■ Anaphylaxis (severe bronchospasm, hypotension, angioedema, syncope, urticaria) has occurred after first dose and in some cases after 1 yr of regular treatment.

Do not confuse omalizumab with ofatumumab.

Uses
Treatment of moderate to severe persistent asthma in adults and children 6 yrs of age and older reactive to perennial allergens and with symptoms inadequately controlled with inhaled corticosteroids. Chronic idiopathic urticaria in adults and children 12 yrs and older.

Precautions
Contraindications: Hypersensitivity to omalizumab. Do not use to treat acute bronchospasm, status asthmaticus. Cautions: Pts at risk for parasitic infections.

Action
Selectively binds to human immunoglobulin E (IgE). Inhibits binding of IgE on
surface of mast cells, basophils. **Therapeutic Effect:** Prevents/reduces number of asthmatic attacks.

**Pharmacokinetics**
Absorbed slowly after SQ administration, with peak concentration in 7–8 days. Excreted primarily via hepatic degradation. **Half-life:** 26 days.

**Lifespan considerations**

**Pregnancy/Lactation:** Because IgE is present in breast milk, omalizumab is expected to be present in breast milk. Use only if clearly needed. **Children:** Safety and efficacy not established in pts younger than 6 yrs. **Elderly:** No age-related precautions noted.

**Interactions**

**DRUG:** None significant. **HERBAL:** Echinacea may decrease effects. **FOOD:** None known. **LAB VALUES:** May increase serum IgE levels.

**Availability (Rx)**

**Injection, Powder for Reconstitution:** 150 mg/1.2 mL after reconstitution.

**Administration/handling**

**Subcutaneous**

**Reconstitution**
- Use only Sterile Water for Injection to prepare for SQ administration.
- Medication takes 15–20 min to dissolve.
- Draw 1.4 mL Sterile Water for Injection into 3-mL syringe with 1-inch, 18-gauge needle; inject contents into powdered vial.
- Swirl vial for approximately 1 min (do not shake) and again swirl vial for 5–10 sec every 5 min until no gel-like particles appear in the solution.
- Do not use if contents do not dissolve completely within 40 min.
- Invert vial for 15 sec (allows solution to drain toward the stopper).
- Using new 3-mL syringe with 1-inch 18-gauge needle, obtain required 1.2-mL dose, replace 18-gauge needle with 25-gauge needle for SQ administration.
Rate of Administration
• SQ administration may take 5–10 sec to administer due to its viscosity.

Storage
• Use only clear or slightly opalescent solution; solution is slightly viscous.
• Refrigerate.
• Reconstituted solution is stable for 8 hrs if refrigerated or within 4 hrs of reconstitution when stored at room temperature.

Indications/routes/dosage

**Alert** Give only under direct medical supervision. Should be administered in health care setting by health professionals. Dosage and frequency of administration are based upon total IgE levels and body weight (see table). IgE levels should be measured prior to initiating treatment and not during treatment. Pts should be observed a minimum of 2 hrs following each omalizumab treatment.

**Asthma**

**SQ: ADULTS, ELDERLY, CHILDREN 6 YRS AND OLDER:** 75–375 mg every 2 or 4 wks; dose and dosing frequency are individualized based on body weight and pretreatment IgE level (as shown in table). (Consult specific product labeling.)

**Chronic Idiopathic Urticaria**

**SQ: ADULTS, CHILDREN 12 YRS AND OLDER:** 150 mg or 300 mg q4wks. Dosing not dependent on IgE level or body weight.

**Dosage in Renal/Hepatic Impairment**

No dose adjustment.

**4-Wk Dosing Table**

Side effects

**Frequent (45%–11%)**: Injection site ecchymosis, redness, warmth, stinging, urticaria, viral infection, sinusitis, headache, pharyngitis. **Occasional (8%–3%)**: Arthralgia, leg pain, fatigue, dizziness. **Rare (2%)**: Arm pain, earache, dermatitis, pruritus.

Adverse effects/toxic reactions

Anaphylaxis, occurring within 2 hrs of first dose or subsequent doses, occurs in 0.1% of pts. Malignant neoplasms occur in 0.5% of pts.

Nursing considerations

Baseline assessment

Obtain baseline serum total IgE level before initiation of treatment (dosage is based on pretreatment levels). Drug is not for treatment of acute exacerbations of asthma, acute bronchospasm, status asthmaticus.

Intervention/evaluation

Monitor rate, depth, rhythm, type of respirations, quality/rate of pulse. Assess lung sounds for rhonchi, wheezing, rales. Observe lips, fingernails for cyanosis.

Patient/family teaching
• Increase fluid intake (decreases viscosity of pulmonary secretions).
• Do not alter/stop other asthma medications.
• Report allergic reactions (e.g., breathing difficulty, swelling of throat/tongue).

ombitasvir, paritaprevir, ritonavir, dasabuvir

Viekira Pak

Viekira XR

CLASSIFICATION
PHARMACOTHERAPEUTIC: NS5A inhibitor, protease inhibitor, CYP3A inhibitor, non-nucleoside inhibitor.

CLINICAL: Antiviral.

Do not confuse ombitasvir with daclatasvir, or paritaprevir with boceprevir or simeprevir, or ritonavir with Retrovir, lopinavir, darunavir, or saquinavir, or dasabuvir with sofosbuvir.

Uses

Treatment of genotype 1 chronic hepatitis C virus (HCV) infection including those with compensated hepatic cirrhosis, with or without ribavirin.

Precautions

Contraindications: Hypersensitivity to any component. Moderate to severe hepatic impairment; decompensated hepatic cirrhosis; contraindication or known hypersensitivity to ribavirin; concomitant use of strong CYP3A inducers, strong CYP2C8 inducers or strong CYP2C8 inhibitors; drugs highly dependent on CYP3A for clearance and for which elevated plasma concentrations are associated with serious and/or life-threatening events. Concurrent use of alfuzosin, carBAMazepine, colchicine, dronedarone, efavirenz, ergotamine, dihydroergotamine, ethinyl estradiol–containing drugs including combined oral contraceptives, gemfibrozil, lovastatin, lurasidone, midazolam (oral), phenytoin, PHENobarbital, pimozide, ranolazine, rifAMPin, sildenafil (when used for pulmonary arterial hypertension), simvastatin, St. John’s wort, triazolam. Cautions: History of anemia, hepatitis B virus infection, HIV infection.
Action

Pharmacokinetics

Readily absorbed. Paritaprevir, ritonavir, dasabuvir metabolized in liver. Ombitasvir metabolized by amide hydrolysis. Protein binding: ombitasvir: greater than 99%, paritaprevir: 97%–99%, ritonavir: 99%, dasabuvir: 99%. Peak plasma concentration: 4–5 hrs. Steady-state concentration: 12 days. Elimination: ombitasvir: feces (92%), urine (2%); paritaprevir: feces (88%), urine (9%); ritonavir: feces (86%), urine (11%); dasabuvir: feces (94%), urine (2%). **Half-life:** Ombitasvir: 21–25 hrs; paritaprevir: 5.5 hrs; ritonavir: 4 hrs; dasabuvir: 5.5–6 hrs.

Lifespan considerations

**Pregnancy/Lactation:** Avoid pregnancy; may cause fetal harm. When administered with ribavirin, therapy is contraindicated in pregnant women and in men whose female partners are pregnant. Unknown if distributed in breast milk. Concomitant use of ethinyl estradiol–containing drugs is contraindicated. Alternative contraception methods including progestin-only drugs, barrier methods, abstinence are recommended. **Children:** Safety and efficacy not established in pts younger than 18 yrs. **Elderly:** No age-related precautions noted.

Interactions

**DRUG:** May increase concentration/effects of antiarrhythmics (e.g., amiodarone), antifungals (e.g., itraconazole), calcium channel blockers (e.g., amLODIPine, NIFEdipine), corticosteroids (e.g., fluticasone), immunosuppressants (e.g., cycloSPORINE), digoxin, HIV antiretrovirals (e.g., paritaprevir, rilpivirine), phosphodiesterase-5 inhibitors (e.g.,
sildenafil), sedative/hypnotics (e.g., temazepam), statins (e.g., atorvastatin, simvastatin), sirolimus, tacrolimus. Anticonvulsants (e.g., carBAzepine, phenytoin), dexamethasone, efavirenz, omeprazole, rifAMPin may decrease concentration/effect. HERBAL: St. John’swort may decrease concentration/effect. Kava kava may increase risk of hepatotoxicity. Red yeast may increase risk of myopathy, rhabdomyolysis. Meals increase absorption. FOOD: Grapefruit products, Seville oranges may increase concentration/effect. LAB VALUES: May increase serum alkaline phosphatase, ALT, INR. May decrease Hct, Hgb.

Availability (Rx)

Fixed-Dose Combination Tablets (co-packaged with dasabuvir tablets): (Viekira Pak): Ombitasvir 12.5 mg/paritaprevir 75 mg/ritonavir 50 mg; dasabuvir 250 mg. (Viekira XR): Ombitasvir 8.33 mg/paritaprevir 50 mg/ritonavir 33.3 mg/dasabuvir 200 mg.

Administration/handling

PO
• Give with food. Do not cut, crush, break, or divide XR tablets.

Indications/routes/dosage

Hepatitis C Virus Infection
PO: ADULTS, ELDERLY: (Viekira Pak): 2 tablets of ombitasvir, paritaprevir, ritonavir once daily, plus 1 tablet of dasabuvir twice daily with or without ribavirin. (Viekira XR): 3 tablets once daily.

Treatment Regimen and Duration
THAN 75 KG: 1,000 mg/day in 2 divided doses. 75 KG OR GREATER: 1,200 mg/day in 2 divided doses. For ribavirin dose modifications, refer to prescribing information.

**Dose Modification**

**Liver Transplant Recipients**

**PO: ADULTS, ELDERLY:** 2 tablets of ombitasvir, paritaprevir, ritonavir once daily, plus 1 tablet of dasabuvir twice daily with ribavirin for 24 wks, irrespective of HCV genotype 1 subtype in pts with normal hepatic function and mild fibrosis.

**HCV/HIV-1 Coinfection**

Follow dose recommendations as listed in Treatment Regimen and Duration. Consider suppressive antiretroviral drug therapy during treatment.

**Dosage in Renal Impairment**

No dose adjustment.

**Dosage in Hepatic Impairment**

**Mild impairment:** No dose adjustment. **Moderate impairment:** Treatment not recommended. **Severe impairment:** Treatment contraindicated.

**Side effects**

**Frequent (34%–22%):** Fatigue, nausea. **Occasional (18%–14%):** Pruritus, rash, erythema, eczema, allergic dermatitis, skin exfoliation, urticaria, photosensitivity reaction, skin ulcer, insomnia, asthenia.

**Adverse effects/toxic reactions**

Serum ALT greater than 5 times upper limit of normal (ULN) reported in 1% of pts (usually occurred during the first 4 wks of treatment). Elevations of serum ALT were significantly higher in female pts using ethinyl estradiol–containing drugs such as contraceptive patches, combined oral contraceptives, vaginal rings. May increase risk of drug resistance in HCV/HIV-1 coinfected pts using HIV-1
protease inhibitors. Hypersensitivity reaction including angioedema may occur.

**Nursing considerations**

**Baseline assessment**
Obtain baseline CBC, LFT, HCV-RNA level, urine pregnancy. Confirm HCV genotype. Receive full medication history and screen for contraindications/interactions. Ethinyl estradiol–containing contraceptive drugs should be discontinued prior to initiation. Question history as listed in Precautions. To reduce risk of HIV-1 protease inhibitor drug resistance, consider suppressive antiretroviral drug therapy upon initiation.

**Intervention/evaluation**
Monitor LFT periodically during the first 4 wks of treatment, then as clinically indicated thereafter. Discontinue treatment for serum ALT persistently greater than 10 times ULN; serum ALT elevation associated with increase in serum alkaline phosphatase, bilirubin, or INR; hepatic injury. Periodically monitor CBC for anemia, HCV-RNA level for treatment effectiveness. Reinforce birth control compliance. Monitor for abdominal pain, bruising, jaundice, nausea, vomiting; may indicate hepatic injury. Ethinyl estradiol–containing contraceptives may be restarted approx. 2 wks after discontinuation.

**Patient/family teaching**
- Treatment must be used in combination with ribavirin.
- Take with meals.
- Inform pt of contraindications/adverse effects of therapy.
- Do not take newly prescribed medication unless approved by doctor who originally started treatment. Do not take herbal products.
- Pregnancy should be avoided when combination regimen is given with ribavirin. Female pts of childbearing potential must use reliable forms of birth control such as progestin-containing contraception, barrier methods, abstinence. Immediately report suspected pregnancy. Do not breastfeed.
- Report abdominal pain, bruising easily, dark-colored urine, fatigue, yellowing of the skin or eyes.
- Avoid alcohol.
- Report skin changes such as rash, peeling, ulcers; allergic reactions such as
difficulty breathing, itching, hives, tongue swelling.

**omega-3 acid-ethyl esters**

**CLASSIFICATION**

**PHARMACOTHERAPEUTIC**: Omega-3 fatty acid.

**CLINICAL**: Antihypertriglyceride agent.

**Uses**

Adjunct to diet to reduce very high (500 mg/dL or higher) serum triglyceride levels in adult pts. Dietary supplement for pts with early risk of CAD. **OFF-LABEL**: Treatment of IgA nephropathy.

**Precautions**

**Contraindications**: Hypersensitivity to omega-3 fatty acids. **Cautions**: Known sensitivity, allergy to fish.

**Action**

Inhibits esterification of fatty acids, prevents hepatic enzymes from catalyzing final step of triglyceride synthesis. **Therapeutic Effect**: Reduces serum triglyceride levels.

**Pharmacokinetics**

Well absorbed following PO administration. Incorporated into phospholipids. **Half-life**: N/A.

**Lifespan considerations**
Pregnancy/Lactation: Unknown if distributed in breast milk. Children: Safety and efficacy not established in pts younger than 18 yrs. Elderly: No age-related precautions noted.

Interactions

DRUG: Anticoagulants (e.g., heparin, warfarin) may increase risk of bleeding. HERBAL: None significant. FOOD: None known. LAB VALUES: May increase serum ALT, LDL.

Availability (Rx)

Capsules: 200 mg, 300 mg, 500 mg, 600 mg, 1000 mg, 1,200 mg.

Administration/handling

PO
• Give without regard to meals.

Indications/routes/dosage

_alert_ Before initiating therapy, pt should be on standard cholesterol-lowering diet for minimum of 3–6 mos. Continue diet throughout therapy.

Usual Dosage

PO: ADULTS, ELDERLY: 4 g/day, given as a single dose (4 capsules), or 2 capsules twice daily.

Dosage in Renal/Hepatic Impairment

No dose adjustment.

Side effects

Occasional (5%–3%): Eructation, altered taste, dyspepsia. Rare (2%–1%): Rash, back pain.
**Adverse effects/toxic reactions**

None known.

**Nursing considerations**

**Baseline assessment**

Assess baseline serum triglyceride level, LFT. Obtain diet history, esp. fat consumption.

**Intervention/evaluation**

**Patient/family teaching**

- Continue to adhere to lipid-lowering diet (important part of treatment).
- Periodic lab tests are essential part of therapy to determine drug effectiveness.

---

**omeprazole**

*oh-mep-ra-zole*

Apo-Omeprazole

Losec

**PriLOSEC**

**PriLOSEC OTC**

**Fixed-Combination(s)**

**Yosprala:** omeprazole/aspirin (a platelet aggregation inhibitor): 40 mg/81 mg, 40 mg/325 mg. **Zegerid:** omeprazole/sodium bicarbonate (an antacid): 20 mg/1,100 mg, 40 mg/1,100 mg. **Zegerid Powder:** 20 mg/1,680 mg, 40 mg/1,680 mg.

**CLASSIFICATION**

**PHARMACOTHERAPEUTIC:** Benzimidazole.

**CLINICAL:** Proton pump inhibitor.
Do not confuse omeprazole with ARIPiprazole, pantoprazole, or esomeprazole, or PriLOSEC with Plendil, Prevacid, Prinivil, or PROzac.

**Uses**

Short-term treatment (4–8 wks) of erosive esophagitis (diagnosed by endoscopy), symptomatic gastroesophageal reflux disease (GERD) poorly responsive to other treatment. *H. pylori*–associated duodenal ulcer (with amoxicillin and clarithromycin). Long-term treatment of pathologic hypersecretory conditions, treatment of active duodenal ulcer or active benign gastric ulcer. Maintenance healing of erosive esophagitis. **OTC, short-term:** Treatment of frequent, uncomplicated heartburn occurring 2 or more days/wk. **OFF-LABEL:** Prevention/treatment of NSAID-induced ulcers, stress ulcer prophylaxis in critically ill pts.

**Precautions**

**Contraindications:** Hypersensitivity to omeprazole, other proton pump inhibitors. Concomitant use with products containing rilpivirine. **Cautions:** May increase risk of fractures, gastrointestinal infections. Hepatic impairment, pts of Asian descent.

**Action**

Inhibits hydrogen-potassium adenosine triphosphatase (H\(^+\)/K\(^+\) ATP pump), an enzyme on the surface of gastric parietal cells. **Therapeutic Effect:** Increases gastric pH, reduces gastric acid production.

**Pharmacokinetics**

<table>
<thead>
<tr>
<th>Route</th>
<th>Onset</th>
<th>Peak</th>
<th>Duration</th>
</tr>
</thead>
<tbody>
<tr>
<td>PO</td>
<td>1 hr</td>
<td>2 hrs</td>
<td>72 hrs</td>
</tr>
</tbody>
</table>

Rapidly absorbed from GI tract. Protein binding: 95%. Primarily distributed into gastric parietal cells. Metabolized in liver. Primarily excreted in urine. Unknown if removed by hemodialysis. **Half-life:** 0.5–1 hr (increased in hepatic impairment).
Lifespan considerations

Pregnancy/Lactation: Unknown if drug crosses placenta or is distributed in breast milk. Children: Safety and efficacy not established. Elderly: Use caution (bioavailability may be increased).

Interactions

DRUG: May decrease concentration/effects of atazanavir, clopidogrel. May increase concentration/effects of diazepam, oral anticoagulants (e.g., warfarin), phenytoin. HERBAL: St. John’s wort may decrease concentration/effects. FOOD: None known. LAB VALUES: May increase serum alkaline phosphatase, ALT, AST.

Availability (Rx)

Granules for Oral Suspension: 2.5 mg/packet, 10 mg/packet. Powder for Oral Suspension: 2 mg/mL. Capsules (Delayed-Release [PriLOSEC]): 10 mg, 20 mg, 40 mg. Tablets (Delayed-Release [PriLOSEC OTC]): 20 mg.

Administration/handling

PO
• Give before meals (breakfast preferred).
• Give whole. Do not break, crush, dissolve, or divide delayed-release forms.
• May open capsule, mix with applesauce, and give immediately.

PO (Suspension)
• Following reconstitution, allow to thicken (2–3 min).
• Administer within 30 min.

Indications/routes/dosage

Active Duodenal Ulcer
PO: ADULTS, ELDERLY: 20 mg/day for 4–8 wks.
Symptomatic GERD

PO: ADULTS, ELDERLY, CHILDREN WEIGHING 20 KG OR MORE: 20 mg/day for up to 4 wks. 10–19 KG: 10 mg/day. 5–9 KG: 5 mg/day.

Erosive Esophagitis

PO: ADULTS, ELDERLY, CHILDREN WEIGHING 20 KG OR MORE: Treatment: 20 mg/day for 4–8 wks. CHILDREN 1–16 YRS WEIGHING 10–19 KG: 10 mg/day. WEIGHING 5–9 KG: 5 mg/day. CHILDREN 1–11 MOS WEIGHING 10 KG OR MORE: 10 mg/day. WEIGHING 5–9 KG: 5 mg/day. WEIGHING 3–4 KG: 2.5 mg/day. Maintenance: ADULTS, ELDERLY, CHILDREN WEIGHING 20 KG OR MORE: 20 mg/day for up to 12 mos (including treatment period). ASIAN PTS, CHILDREN WEIGHING 10–19 kg: 10 mg/day. WEIGHING 5–9 KG: 5 mg/day.

Pathologic Hypersecretory Conditions

Note: Doses more than 80 mg in divided doses. PO: ADULTS, ELDERLY: Initially, 60 mg/day up to 120 mg 3 times/day.

H. Pylori Duodenal Ulcer

PO: ADULTS, ELDERLY: 40 mg once daily (with clarithromycin) for 14 days or 20 mg twice daily (with amoxicillin and clarithromycin) for 10 days. Presence of ulcer at initiation may need 20 mg/day (monotherapy) for 14–18 days following combination therapy.

Gastric Ulcer

PO: ADULTS, ELDERLY: 40 mg/day for 4–8 wks.

OTC Use (Frequent Heartburn)

PO: ADULTS, ELDERLY: 20 mg/day for 14 days. May repeat after 4 mos if needed.

Dosage in Renal/Hepatic Impairment

No dose adjustment.
Side effects

Frequent (7%): Headache. Occasional (3%–2%): Diarrhea, abdominal pain, nausea. Rare (2%): Dizziness, asthenia, vomiting, constipation, upper respiratory tract infection, back pain, rash, cough.

Adverse effects/toxic reactions

Pancreatitis, hepatotoxicity, interstitial nephritis occur rarely. May increase risk of C. difficile infection.

Nursing considerations

Intervention/evaluation

Evaluate for therapeutic response (relief of GI symptoms). Question if GI discomfort, nausea, diarrhea occurs.

Patient/family teaching

• Report headache, onset of black, tarry stools, diarrhea, abdominal pain.
• Avoid alcohol.
• Swallow capsules whole; do not chew, crush, dissolve, or divide.
• Take before eating.

| ondansetron on-dan-se-tron Apo-Ondansetron Zofran Zofran ODT Zuplenz CLASSIFICATION | PHARMACOTHERAPEUTIC: Selective 5-HT_3 receptor antagonist. CLINICAL: Antinausea, antiemetic. Do not confuse ondansetron with dolasetron, granisetron, or palonosetron, or Zofran with Zantac or Zosyn. |
Uses
Prevention/treatment of nausea/vomiting due to cancer chemotherapy (including high-dose CISplatin). Prevention and treatment of postop nausea, vomiting. Prevention of radiation-induced nausea, vomiting. **OFF-LABEL:** Breakthrough treatment of nausea and vomiting associated with chemotherapy, hyperemesis gravidarum.

Precautions
**Contraindications:** Hypersensitivity to ondansetron, other HT₃ antagonists. Use of apomorphine. **Cautions:** Mild to moderate hepatic impairment, pts at risk for QT prolongation or ventricular arrhythmia (congenital long QT prolongation, medications prolonging QT interval, hypokalemia, hypomagnesemia).

Action
Blocks serotonin, both peripherally on vagal nerve terminals and centrally in chemoreceptor trigger zone. **Therapeutic Effect:** Prevents nausea/vomiting.

Pharmacokinetics
Readily absorbed from GI tract. Protein binding: 70%–76%. Metabolized in liver. Primarily excreted in urine. Unknown if removed by hemodialysis. **Half-life:** 3–6 hrs (increased in hepatic impairment).

🎉 Lifespan considerations
**Pregnancy/Lactation:** Unknown if drug crosses placenta or is distributed in breast milk. **Children:** Safety and efficacy not established in children younger than 1 mo. **Elderly:** No age-related precautions noted.

Interactions
**DRUG:** Apomorphine may cause profound hypotension, altered LOC. QT interval–prolonging medications (e.g., amiodarone, azithromycin, ciprofloxacin, haloperidol) may increase risk of QT interval prolongation, torsades de pointes. **HERBAL:** St. John’s wort may decrease concentration.
FOOD: None known. LAB VALUES: May transiently increase serum bilirubin, ALT, AST.

Availability (Rx)

Injection Solution (Zofran): 2 mg/mL. Oral Soluble Film (Zuplenz): 4 mg, 8 mg. Oral Solution (Zofran): 4 mg/5 mL. Tablets (Zofran): 4 mg, 8 mg, 24 mg. Tablets (Orally Disintegrating [Zofran ODT]): 4 mg, 8 mg.

Administration/handling

分配/处理

IV

Reconstitution
• May give undiluted.
• For IV infusion, dilute with 50 mL D5W or 0.9% NaCl before administration.

Rate of Administration
• Give IV push over 2–5 min.
• Give IV infusion over 15–30 min.

Storage
• Store at room temperature.
• Stable for 48 hrs at room temperature following dilution.

IM
• Inject undiluted into large muscle mass.

PO
• Give without regard to food.

Orally Disintegrating Tablets
• Do not remove from blister pack until needed.
• Peel backing off; do not push through.
• Place tablet on tongue; allow to dissolve.
• Swallow with saliva.

Oral Soluble Film
• Keep film in pouch until ready to use.
• Remove film strip from pouch and place on top of tongue; allow to dissolve.
• Swallow after film dissolves. Do not chew or swallow film whole.
• If using more than one, each should be allowed to dissolve before administering the next one.

IV incompatibilities
Acyclovir (Zovirax), allopurinol (Aloprim), amphotericin B (Fungizone), amphotericin B complex (Abelcet, AmBisome, Amphotec), ampicillin (Polycillin), ampicillin and sulbactam (Unasyn), cefepime (Maxipime), 5-fluorouracil, LORazepam (Ativan), meropenem (Merrem IV), methylPREDNISolone (Solu-Medrol).

IV Compatibilities
CARBOplatin (Paraplatin), CISplatin (Platinol), cyclophosphamide (Cytoxan), cytarabine (Cytosar), dacarbazine (DTIC-Dome), DAUNOrubicin (Cerubidine), dexmedetomididine (Precedex), dexamethasone (Decadron), diphenhydrAMINE (Benadryl), DOCEtaxel (Taxotere), DOPamine (Intropin), etoposide (VePesid), gemcitabine (Gemzar), heparin, HYDROmorphine (Dilaudid), ifosfamide (Ifex), magnesium, mannitol, mesna (Mesnex), methotrexate, metoclopramide (Reglan), mitoMYcin (Mutamycin), mitoXANTRONE (Novantrone), morphine, PACLitaxel (Taxol), potassium chloride, teniposide (Vumon), topotecan (Hycamtin), vinBLASTine (Velban), vinCRIStine (Oncovin), vinorelbine (Navelbine).

Indications/routes/dosage
Chemotherapy-Induced Nausea/Vomiting
IV: ADULTS, ELDERLY, CHILDREN 6 MOS AND OLDER: 0.15 mg/kg (Maximum: 16 mg/dose) 3 times/day beginning 30 min before chemotherapy, followed by subsequent doses 4 and 8 hrs after the first dose.
PO: ADULTS, ELDERLY, CHILDREN 12 YRS AND OLDER:(highly emetogenic) 24 mg 30 min before start of chemotherapy, (moderately emetogenic) 8 mg repeat dose 8 hrs after initial dose, then q12h, beginning 30
min before chemotherapy and continuing for 1–2 days after completion of chemotherapy. **CHILDREN 4–11 YRS:** 4 mg 30 min before chemotherapy, repeat 4 and 8 hrs after initial dose then q8h for 1–2 days after chemotherapy completed.

**Prevention of Postop Nausea/Vomiting**

**IV, IM:** **ADULTS, ELDERLY, CHILDREN OLDER THAN 12 YRS:** 4 mg as a single dose. **CHILDREN 1 MO–12 YRS WEIGHING MORE THAN 40 KG:** 4 mg as a single dose. **CHILDREN 1 MO–12 YRS WEIGHING 40 KG OR LESS:** 0.1 mg/kg as a single dose. **PO:** **ADULTS, ELDERLY:** 16 mg 1 hr before induction of anesthesia.

**Prevention of Radiation-Induced Nausea/Vomiting**

**PO:** **ADULTS, ELDERLY:** (Total body irradiation): 8 mg 1–2 hrs before each fraction of radiotherapy administered each day. (Single high-dose radiotherapy to abdomen): 8 mg 1–2 hrs before irradiation, then 8 mg q8h after first dose for 1–2 days after completion of radiotherapy. (Daily fractionated radiotherapy to abdomen): 8 mg 1–2 hrs before irradiation, then 8 mg 8 hrs after first dose for each day of radiotherapy.

**Dosage in Renal Impairment**

No dose adjustment.

**Dosage in Hepatic Impairment**

**Mild to moderate impairment:** No dose adjustment. **Severe impairment:** **Maximum daily dose:** 8 mg.

**Side effects**

**Frequent (13%–5%):** Anxiety, dizziness, drowsiness, headache, fatigue, constipation, diarrhea, hypoxia, urinary retention. **Occasional (4%–2%):** Abdominal pain, xerostomia, fever, feeling of cold, redness/pain at injection site, paresthesia, asthenia (loss of strength, energy). **Rare (1%):** Hypersensitivity reaction (rash, pruritus), blurred vision.
**Adverse effects/toxic reactions**

Hypertension, acute renal failure, GI bleeding, respiratory depression, coma, extrapyramidal effects occur rarely. QT interval prolongation, torsades de pointes may occur.

**Nursing considerations**

**Baseline assessment**

Assess degree of nausea, vomiting. Assess for dehydration if excessive vomiting occurs (poor skin turgor, dry mucous membranes, longitudinal furrows in tongue). Provide emotional support.

**Intervention/evaluation**

Monitor EKG in pts with electrolyte abnormalities (e.g., hypokalemia, hypomagnesemia), HF, bradyarrhythmias, concurrent use of other medications that may cause QT prolongation, pts receiving high doses or frequent doses. Provide supportive measures. Assess mental status. Assess bowel sounds for peristalsis. Monitor daily pattern of bowel activity, stool consistency. Record time of evacuation.

**Patient/family teaching**

- Relief from nausea/vomiting generally occurs shortly after drug administration.
- Avoid alcohol, barbiturates.
- Report persistent vomiting.
- Avoid tasks that require alertness, motor skills until response to drug is established (may cause drowsiness, dizziness).

---

**Oritavancin**

**or-it-a-van-sin**

**Orbactiv**

- **CLASSIFICATION**
  - **PHARMACOTHERAPEUTIC:** Lipoglycopeptide (antibacterial).
  - **CLINICAL:** Antibiotic.

**Do not confuse oritavancin with dalbavancin or telavancin.**
Uses

Treatment of adult pts with acute bacterial skin and skin structure infections (ABSSSI) caused by susceptible strains of gram-positive microorganisms including *Staphylococcus aureus* (including methicillin-susceptible and methicillin-resistant strains), *Streptococcus agalactiae*, *Streptococcus dysgalactiae*, *Streptococcus pyogenes*, *Streptococcus anginosus* group (including *S. anginosus*, *S. intermedius*, *S. constellatus*), and *E. faecalis* (vancomycin-susceptible strains only).

Precautions

**Contraindications:** Hypersensitivity to oritavancin. Concomitant use of IV unfractionated heparin sodium for 120 hrs (5 days) after oritavancin administration. **Cautions:** Severe hepatic impairment, history of hypersensitivity reaction to glycopeptides (e.g., vancomycin), recent *C. difficile* infection or antibiotic-associated colitis.

Action

Inhibits cell wall synthesis by binding to bacterial cell membrane, disrupting membrane integrity. **Therapeutic Effect:** Bactericidal.

Pharmacokinetics

Widely distributed. Not metabolized. Protein binding: 85%. Excreted unchanged in feces, urine. Not removed by hemodialysis. **Half-life:** 10.2 days.

✈️ Lifespan considerations

**Pregnancy/Lactation:** Unknown if distributed in breast milk. **Children:** Safety and efficacy not established in pts younger than 18 yrs. **Elderly:** No age-related precautions noted.

Interactions

**DRUG:** Use of heparin within 48 hrs of dose contraindicated. May increase risk of bleeding with warfarin. **Concomitant use of other antibiotics** may increase risk of antibiotic-associated colitis. **HERBAL:** None significant. **FOOD:** None
known. **LAB VALUES:** May prolong aPTT (falsely elevates aPTT for up to 120 hrs after oritavancin administration), PT/INR. May increase ALT, AST, bilirubin, uric acid. May decrease glucose.

**Availability (Rx)**

**Sterile Powder for Injection:** 400 mg/vial.

**Administration/handling**

cesso.

**IV**

No preservatives or bacteriostatic agent is present in product. Aseptic technique must be used when preparing solution. Must be reconstituted with Sterile Water for Injection and subsequently diluted with 5% Dextrose in Water only.

**Reconstitution**

- Obtain three 400-mg vials to equal required 1,200-mg dose.
- Add 40 mL of Sterile Water for Injection to each vial for final concentration of 10 mg/mL per vial.
- To avoid foaming, gently swirl until contents completely dissolve.
- Visually inspect each vial for particulate matter or discolouration.

**Dilution**

- Using D$_5$W, withdraw 120 mL from 1,000-mL bag and discard.
- Withdraw 40 mL from each vial and mix into D$_5$W to provide a final concentration of 1.2 mg/mL.

**Rate of Administration**

- Administer over 3 hrs.

**Storage**

- Reconstituted solution should appear clear, colorless to pale yellow.
- Infuse diluted solution within 6 hrs when stored at room temperature or 12 hrs when refrigerated.
- Combined storage time and 3-hr infusion time should not exceed 6 hrs if at room temperature or 12 hrs if refrigerated.

**IV incompatibilities**
Dilute using 5% Dextrose in Water only. Dilution with normal saline may cause precipitate formation. Infuse via dedicated line only. Do not piggyback through maintenance IV line.

**Indications/routes/dosage**

**Acute Bacterial Skin and Skin Structure Infection**  
IV: **ADULTS, ELDERLY:** 1,200 mg as single dose.

**Dosage in Renal/Hepatic Impairment**  
**Mild to moderate impairment:** No dose adjustment. **Severe impairment:** Use caution.

**Side effects**  
**Occasional (10%–5%):** Nausea, headache, vomiting. **Rare (4%–3%):** Diarrhea, dizziness, tachycardia.

**Adverse effects/toxic reactions**  
Serious hypersensitivity reactions including anaphylaxis, angioedema, bronchospasm, severe skin reactions, wheezing have been reported with glycopeptide antibacterial agents. *C. difficile*–associated diarrhea with severity ranging from mild diarrhea to fatal colitis has occurred. Treatment in the absence of proven or strongly suspected bacterial infection may increase risk of drug-resistant bacteria. Infusion site reactions, phlebitis, irritation, abscess, rash, pruritus have occurred. Increased incidence of osteomyelitis has been reported.

**Nursing considerations**

**Baseline assessment**  
Obtain baseline CBC (WBC), BMP, LFT, wound culture and sensitivity, vital signs. Question history of recent *C. difficile* infection, hepatic/renal impairment, hypersensitivity reaction. Assess skin wound characteristics, hydration status. Question pt’s usual stool characteristics (color, frequency, consistency).
**Intervention/evaluation**
Assess skin infection/wound for improvement. Monitor daily pattern of bowel activity, stool consistency; increasing severity of diarrhea may indicate antibiotic-associated colitis. If frequent diarrhea occurs, obtain *C. difficile* toxin screen and initiate isolation precautions until result confirmed. Encourage PO intake. Monitor I&O. If osteomyelitis suspected, other antimicrobial agents may be required. Screen for hypersensitivity reaction.

**Patient/family teaching**
- Treatment will consist of a single infusion only.
- Report episodes of diarrhea, esp. the following weeks after treatment completion. Frequent diarrhea, fever, abdominal pain, blood-streaked stool may indicate *C. difficile* infection, which may be contagious to others.
- Report abdominal pain, black/tarry stools, bruising, yellowing of skin or eyes; dark urine, decreased urine output; or allergic reactions including difficulty breathing, itching, hives, tongue swelling, wheezing.
- Do not breastfeed.
- Drink plenty of fluids.
- Report symptoms of bone pain; may indicate bone infection.

<table>
<thead>
<tr>
<th>orlistat</th>
<th>or-lye-stat</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Alli</strong></td>
<td>Xenical</td>
</tr>
</tbody>
</table>

**CLASSIFICATION**
***PHARMACOTHERAPEUTIC*: Gastric/pancreatic lipase inhibitor.*
***CLINICAL*: Obesity management agent.

**Do not confuse Xenical with Xeloda.**

**Uses**
Management of obesity, including weight loss/maintenance, when used in conjunction with reduced-calorie diet. Reduces risk of weight regain after previous weight loss. Indicated for pts with initial BMI of 30 kg/m² or greater or 27 kg/m² or greater with other risk factors (e.g., diabetes, dyslipidemia,
hypertension). **OTC:** Weight loss in overweight adults when used along with a reduced-calorie and low-fat diet.

### Precautions

**Contraindications:** Hypersensitivity to orlistat. Cholestasis, chronic malabsorption syndrome, pregnancy. **Cautions:** History of hyperoxaluria or calcium oxalate nephrolithiasis.

### Action

Inhibits absorption of dietary fats by inhibiting gastric and pancreatic lipases. **Therapeutic Effect:** Resulting caloric deficit may have positive effects on weight control.

### Pharmacokinetics

Minimal absorption after administration. Protein binding: 99%. Metabolized within GI wall. Primarily excreted in feces. Unknown if removed by hemodialysis. **Half-life:** 1–2 hrs.

### Lifespan considerations

**Pregnancy/Lactation:** Unknown if distributed in breast milk. Not recommended during pregnancy (contraindicated). Breastfeeding not recommended. **Children:** Safety and efficacy not established in children younger than 12 yrs. **Elderly:** No age-related precautions noted.

### Interactions

**DRUG:** May decrease concentration/effects of amiodarone, anticonvulsants, cycloSPORINE, levothyroxine. May reduce absorption of vitamin E. May alter effect of warfarin by altering vitamin K level. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** May decrease serum glucose, cholesterol, LDL.

### Availability (Rx)
Capsules (Alli): 60 mg. (Xenical): 120 mg.

Administration/handling

PO
• Multivitamin supplements containing fat-soluble vitamins should be taken once daily at least 2 hrs before or after taking orlistat.
• Distribute daily fat intake over 3 main meals (GI effects may increase when taken with any 1 meal very high in fat). Administer during or up to 1 hr after each meal containing fat.

Indications/routes/dosage

Weight Reduction
PO: ADULTS, ELDERLY, CHILDREN 12–16 YRS: (Xenical): 120 mg 3 times/day. (Alli): 60 mg 3 times/day with each main meal containing fat (do not take if meal is occasionally missed or contains no fat).

Dosage with Other Medication
(Cyclosporine): Give 3 hrs after orlistat. (Levothyroxine): Give at least 4 hrs apart. Monitor thyroid function.

Dosage in Renal/Hepatic Impairment
No dose adjustment.

Side effects
Frequent (30%–20%): Headache, abdominal discomfort, flatulence, fecal urgency, fatty/oily stool. Occasional (14%–5%): Back pain, menstrual irregularity, nausea, fatigue, diarrhea, dizziness. Rare (less than 4%): Anxiety, rash, myalgia, dry skin, vomiting.

Adverse effects/toxic reactions
Hypersensitivity reaction occurs rarely.
Nursing considerations

Baseline assessment
Obtain baseline laboratory tests. Obtain pt weight.

Intervention/evaluation
Monitor serum cholesterol, LDL, glucose, changes in coagulation parameters. Monitor weight wkly.

Patient/family teaching
• Maintain nutritionally balanced, reduced-calorie diet.
• Daily intake of fat, carbohydrates, protein to be distributed over 3 main meals.

**oseltamivir**
oh-sel-tam-i-veer

**Tamiflu**

CLASSIFICATION
PHARMACOTHERAPEUTIC: Neuraminidase inhibitor.
CLINICAL: Antiviral.
Do not confuse Tamiflu with Thera-flu.

Uses
Symptomatic treatment of uncomplicated acute illness caused by influenza A or B virus in adults and children 2 wks of age and older who are symptomatic no longer than 2 days. Prevention of influenza in adults, children.

Precautions
Contraindications: Hypersensitivity to oseltamivir. Cautions: Renal impairment.

Action
Selective inhibitor of influenza virus neuraminidase, an enzyme essential for viral replication. Acts against influenza A and B viruses. Therapeutic Effect:
Suppresses spread of infection within respiratory system, reduces duration of clinical symptoms.

**Pharmacokinetics**

Readily absorbed after PO administration. Protein binding: 3%. Metabolized in liver. Primarily excreted in urine. **Half-life:** 6–10 hrs.

**Lifespan considerations**

**Pregnancy/Lactation:** Unknown if distributed in breast milk. **Children:** Safety and efficacy not established in pts younger than 2 wks. **Elderly:** No age-related precautions noted.

**Interactions**

**DRUG:** Live attenuated influenza virus vaccine intranasal may interfere with effect. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** None significant.

**Availability (Rx)**

**Capsules:** 30 mg, 45 mg, 75 mg. **Powder for Oral Suspension:** 6 mg/mL.

**Administration/handling**

**PO**

• Give without regard to food.
• May open capsules and mix with sweetened liquid.
• Oral suspension stable for 10 days (room temperature) or 17 days (refrigerated) following reconstitution.

**Indications/routes/dosage**

**Treatment of Influenza**

**Note:** Hospitalized pts may require longer treatment course. Initiate within 48 hrs of onset of symptoms. Consider duration longer than 5 days in pts with
severe or complicated influenza.

**PO: ADULTS, ELDERLY, CHILDREN 13 YRS AND OLDER:** 75 mg twice daily for 5 days. **CHILDREN 1–12 YRS, WEIGHING MORE THAN 40 KG:** 75 mg twice daily for 5 days. **WEIGHING 24–40 KG:** 60 mg twice daily for 5 days. **WEIGHING 16–23 KG:** 45 mg twice daily for 5 days. **WEIGHING 15 KG OR LESS:** 30 mg twice daily for 5 days. **NEONATES, INFANTS AGES 2 WKS TO YOUNGER THAN 1 YR:** 3 mg/kg twice daily for 5 days.

**Prevention of Influenza**

**Note:** Initiate within 48 hrs of contact with an infected individual. Duration: 7–10 days (longer during community outbreaks). **PO: ADULTS, ELDERLY, CHILDREN 13 YRS AND OLDER:** 75 mg once daily. **CHILDREN 1–12 YRS, WEIGHING MORE THAN 40 KG:** 75 mg once daily. **WEIGHING 24–40 KG:** 60 mg once daily. **WEIGHING 15–23 KG:** 45 mg once daily. **WEIGHING LESS THAN 15 KG:** 30 mg once daily. **INFANTS 9–11 mos:** 3.5 mg/kg/dose. **INFANTS 3–8 mos:** 3 mg/kg/dose.

**Dosage in Renal Impairment**

**CrCl 31–60 mL/min:** Treatment: 30 mg twice daily. Prevention: 30 mg once daily. **CrCl 11–30 mL/min:** Treatment: 30 mg once daily. Prevention: 30 mg every other day. **End-stage renal disease:** Not recommended.

**Dosage in Hepatic Impairment**

No dose adjustment.

**Side effects**

**Frequent (10%–7%):** Nausea, vomiting, diarrhea. **Rare (2%–1%):** Abdominal pain, bronchitis, dizziness, headache, cough, insomnia, fatigue, vertigo.

**Adverse effects/toxic reactions**

Colitis, pneumonia, tympanic membrane disorder, fever occur rarely.

**Nursing considerations**
Baseline assessment
Obtain baseline laboratory tests as indicated. Confirm presence of influenza A or B virus.

Intervention/evaluation
Monitor serum glucose, renal function in pts with influenza symptoms, diabetes.

Patient/family teaching
• Begin as soon as possible from first appearance of flu symptoms (recommended within 2 days from symptom onset).
• Avoid contact with those who are at high risk for influenza.
• Not a substitute for flu shot.

osimertinib
oh-sim-er-ti-nib
Tagrisso
♦CLASSIFICATION
PHARMACOTHERAPEUTIC: Tyrosine kinase inhibitor (TKI).
CLINICAL: Antineoplastic.
Do not confuse osimertinib with afatinib, dasatinib, erlotinib, ibrutinib, imatinib, olaparib, or ospemifene, or Tagrisso with Targretin or Tasigna.

Uses
Treatment of pts with metastatic epidermal growth factor receptor (EGFR) T790M mutation-positive non–small-cell lung cancer (NSCLC), as detected by FDA-approved test, who have progressed on or after EGFR TKI therapy.

Precautions
Contraindications: Hypersensitivity to osimertinib. Cautions: Baseline anemia, lymphopenia, neutropenia, thrombocytopenia; COPD, heart disease (bradycardia, cardiomyopathy, heart block, HF, recent MI), pts at risk for QTc interval prolongation or ventricular arrhythmia (congenital long QT syndrome, history for QT prolongation, medications that prolong QT interval, hypokalemia,
hypomagnesemia); history of CVA, pulmonary embolism. Concomitant use of CYP3A inducers.

**Action**

Exhibits antitumor activity by irreversibly binding to mutant forms of EGFR. **Therapeutic Effect:** Inhibits tumor cell growth and metastasis.

**Pharmacokinetics**

**Lifespan considerations**

**Pregnancy/Lactation:** Avoid pregnancy; may cause fetal harm. Females of reproductive potential should use effective contraception during treatment and for at least 6 wks after discontinuation. Males with female partners of reproductive potential must use effective barrier methods during treatment and at least 4 mos after discontinuation. Unknown if distributed in breast milk. Breastfeeding not recommended during treatment and for up to 2 wks after discontinuation. May impair fertility in both females and males. **Children:** Safety and efficacy not established. **Elderly:** May have increased risk of CTCAE grade 3 or 4 adverse events. May require more frequent dose modifications.

**Interactions**

**DRUG:** QTc interval–prolonging medications (e.g., amiodarone, FLUoxetine, haloperidol, sotalol) may increase risk of QTc prolongation. **Strong CYP3A inducers** (e.g., carBAMazepine, phenytoin, rifAMPin) may decrease concentration/effect. **Strong CYP3A inhibitors** (e.g., clarithromycin, ketoconazole, ritonavir) may increase concentration/risk of adverse effects. **Osimertinib** may alter concentration of medications that are sensitive substrates of CYP3A, breast cancer resistance protein (BCRP), or CYP1A2 (e.g., carBAMazepine, cycloSPORINE, phenytoin). **HERBAL:** St. John’s wort may decrease concentration/effect. **FOOD:** None known. **LAB VALUES:** May
decrease serum sodium, magnesium; Hgb, Hct, lymphocytes, neutrophils, platelets, RBCs. May decrease diagnostic effect of *Coccidioides immitis* skin test.

**Availability (Rx)**

**Tablets:** 40 mg, 80 mg.

**Administration/handling**

**PO**

- Tablets are hazardous; use cytotoxic precautions during handling and disposal. Recommend single gloving when handling intact tablets; double gloving, protective gown when handling liquid preparations.
- Do not divide, crush, cut, or ultrasonicate tablets.
- Give without regard to food.
- If a dose is missed, skip missed dose and administer the next dose on schedule.
- **Pts with dysphagia:** Disperse tablet in 60 mL of water (noncarbonated) only.
- Stir until dissipated into small pieces (does not completely dissolve).
- Deliver orally or via gastric tube.
- Rinse container with 120–240 mL of water and administer any remaining drug residue. After oral administration of residue, instruct pt to thoroughly rinse mouth with water and swallow.

**Indications/routes/dosage**

**Non–Small-Cell Lung Cancer**

**PO:** **ADULTS, ELDERLY:** 80 mg once daily. Continue until disease progression or unacceptable toxicity.

**Dose Modification**

Based on Common Terminology Criteria for Adverse Events (CTCAE).

**Cardiac Toxicity**

**QTc interval greater than 500 msec on at least two separate ECGs:** Withhold
treatment until QTc interval is less than 481 msec or recovers to baseline. Once resolved, resume at 40 mg once daily.

QTc interval prolongation with symptoms of life-threatening arrhythmia: Permanently discontinue.

Asymptomatic, absolute decrease in left ventricular ejection fraction (LVEF) of 10% from baseline and below 50%: Withhold treatment for up to 4 wks. Resume treatment if improved to baseline. If not improved to baseline, permanently discontinue.

**Pulmonary Toxicity**

**Interstitial lung disease/pneumonitis:** Permanently discontinue.

**Other Toxicities**

Any grade 3 or higher reaction: Withhold treatment for up to 3 wks. Resume treatment at 80 mg once daily or 40 mg once daily if improved to grade 2 or lower within 3 wks. If not improved within 3 wks, permanently discontinue.

Concomitant use of strong CYP3A4 inducers: Start dose at 160 mg once daily. May decrease dose to 80 mg once daily if strong CYP3A4 inducer has been discontinued for at least 3 wks.

**Dosage in Renal/Hepatic Impairment**

Mild to moderate impairment: No dose adjustment. Severe impairment: Not specified; use caution.

**Side effects**

**Frequent (42%–17%):** Diarrhea, rash (generalized, erythematous, macular, maculopapular, papular, papulocatatonic), erythema, folliculitis, acne, dermatitis, acneiform dermatitis, dry skin, eczema, skin fissures, xerosis, nail disorders (inflammation, tenderness, discoloration, dystrophy, infection, ridging, onychoclasis, onycholysis, onychomadesis, paronychia), dry eye, blurry vision, keratitis, cataract, eye irritation, blepharitis, eye pain, increased lacrimation, vitreous floaters, nausea. **Occasional (16%–10%):** Decreased appetite, constipation, pruritus, cough, fatigue, back pain, stomatitis, headache.

**Adverse effects/toxic reactions**
Anemia, leukopenia, neutropenia, thrombocytopenia are expected responses to therapy. Interstitial lung disease/pneumonitis reported in 3% of pts. May cause QTc interval prolongation (up to 3% of pts); cardiac toxicities including cardiomyopathy (1% of pts), decreased LVEF (2% of pts); other adverse effects including CVA, intracranial hemorrhage; pneumonia (4% of pts); venous thromboembolism including pulmonary embolism, jugular venous thrombosis, DVT (7% of pts).

Nursing considerations

Baseline assessment
Obtain CBC, BMP, serum magnesium; vital signs; EKG. Confirm presence of T790M mutation in tumor specimen prior to initiation. Obtain pregnancy test in females of reproductive potential. Receive full medication history and screen for interactions. Question history of CVA, DVT, pulmonary embolism, pulmonary disease, cardiac disease. Obtain baseline echocardiogram to assess LVEF. Obtain visual acuity. Screen for active infection. Offer emotional support.

Intervention/evaluation
Monitor CBC for cytopenias; BMP, serum magnesium for electrolyte abnormalities.
Pts with cough, dyspnea, fever, worsening of respiratory status should be investigated for interstitial lung disease/pneumonitis. Pts with sudden chest pain, dyspnea, hypoxia, tachycardia should be evaluated for pulmonary embolism. Monitor for symptoms of DVT (leg or arm pain/swelling); CVA, intracranial hemorrhage (aphasia, altered LOC, facial droop, headache, hemiplegia, seizures). Assess LVEF by echocardiogram q3mos during therapy or more frequently in pts suspected of HF, congestive HF. Assess for eye pain, visual changes. Monitor for skin rash/toxicities, hypersensitivity reaction. Diligently monitor for infection. Monitor daily stool pattern, consistency.

Patient/family teaching
• Blood levels, echocardiograms will be routinely monitored.
• Treatment may cause life-threatening adverse effects. Report symptoms of abnormal heartbeats (dizziness, fainting, light-headedness, palpitations), heart failure (shortness of breath, fast or slow heart rate, exercise intolerance, swelling
of the ankles or legs), severe lung inflammation (difficulty breathing, cough with fever, lung pain).

- Avoid pregnancy; treatment may cause birth defects. Female pts of childbearing potential should use effective contraception during treatment and for at least 6 wks after last dose. Male pts with female partners of childbearing potential should use condoms, abstinence during treatment and for at least 4 mos after last dose. Do not breastfeed during therapy and for at least 2 wks after last dose.
- Treatment may cause blood clots in the arms, legs, lungs, or brain. Immediately report symptoms of stroke (difficulty speaking, confusion, paralysis, vision loss), lung embolism (difficulty breathing, fast heart rate, chest pain), blood clots in the arms or legs (pain/swelling).
- Do not take any newly prescribed medications unless approved by doctor who originally started treatment.
- Avoid crowds, people with active infection.
- Do not take herbal supplements.

**oxaliplatin**

ox-al-i-pla-tin

**Eloxatin**

**CLASSIFICATION**

PHARMACOTHERAPEUTIC: Platinum-containing complex.

CLINICAL: Antineoplastic.

■ **BLACK BOX ALERT** ■ Anaphylactic-like reaction may occur within minutes of administration; may be controlled with EPINEPHrine, corticosteroids, antihistamines.

Do not confuse oxaliplatin with Aoli, CARBOplatin, or CISplatin.

**Uses**

Treatment of stage III colon cancer after complete resection of primary tumor (in combination with infusional 5-fluorouracil and leucovorin); treatment of advanced colon cancer (in combination with infusional 5-fluorouracil and leucovorin). OFF-LABEL: Treatment of ovarian cancer, pancreatic cancer, hepatobiliary cancer, testicular cancer, esophageal cancer, gastric cancer, non-
Hodgkin’s lymphoma, chronic lymphocytic leukemia.

**Precautions**

**Contraindications:** History of allergy to oxaliplatin, other platinum compounds. **Cautions:** Previous therapy with other antineoplastic agents; radiation, renal impairment, pregnancy, immunosuppression, presence or history of peripheral neuropathy, elderly pts.

**Action**

Inhibits DNA replication by cross-linking with DNA strands. Cell cycle–phase nonspecific. **Therapeutic Effect:** Prevents cell division.

**Pharmacokinetics**

Rapidly distributed. Protein binding: 90%. Undergoes rapid, extensive nonenzymatic biotransformation. Excreted in urine. **Half-life:** 391 hrs.

**Life expectancy considerations**

**Pregnancy/Lactation:** If possible, avoid use during pregnancy, esp. first trimester. May cause fetal harm. Breastfeeding not recommended. **Children:** Safety and efficacy not established. **Elderly:** Increased incidence of diarrhea, dehydration, hypokalemia, fatigue.

**Interactions**

**DRUG:** Bone marrow depressants may increase myelosuppression, GI effects. **Live virus vaccines** may potentiate virus replication, increase vaccine side effects, decrease pt’s antibody response to vaccine. **Nephrotic medications** may increase concentration. **HERBAL:** Echinacea may decrease effects. **FOOD:** None known. **LAB VALUES:** May increase serum creatinine, bilirubin, ALT, AST, INR. May prolong prothrombin time.

**Availability (Rx)**

**Injection, Solution:** 5 mg/mL (20-mL, 40-mL vials).
Administration/handling

- Wear protective gloves during handling of oxaliplatin. If solution comes in contact with skin, wash skin immediately with soap, water. Do not use aluminum needles or administration sets that may come in contact with drug; may cause degradation of platinum compounds.
- **Alert** Pt should avoid ice, drinking cold beverages, touching cold objects during infusion and for 5 days thereafter (can exacerbate acute neuropathy).

IV

Reconstitution
- Dilute with 250–500 mL D$_5$W (never dilute with sodium chloride solution or other chloride-containing solutions) to final concentration of 0.2–0.6 mg/mL.

Rate of Administration
- Infuse over 2–6 hrs.

Storage
- Do not freeze.
- Protect from light.
- Store vials at room temperature.
- After dilution, solution is stable for 6 hrs at room temperature, 24 hrs if refrigerated.

IV incompatibilities

Do not infuse oxaliplatin with alkaline medications.

IV Compatibilities

Dexamethasone, diphenhydramINE (Benadryl), granisetron (Kytril), ondansetron (Zofran), palonosetron (Aloxi).

Indications/routes/dosage

Refer to individual protocols.
- **Alert** Pretreat pt with antiemetics. Repeat courses should not be given more frequently than every 2 wks.

Advanced Colorectal Cancer
IV: **ADULTS:** 85 mg/m$^2$ q2wks until disease progression or unacceptable toxicity (in combination with fluorouracil/leucovorin).

**Stage III Colon Cancer**
IV: **ADULTS:** 85 mg/m$^2$ q2wks for total of 6 months (in combination with fluorouracil/leucovorin).

**Dosage in Renal Impairment**
CrCl less than 30 mL/min: Reduce dose to 65 mg/m$^2$.

**Dosage in Hepatic Impairment**
No dose adjustment.

**Side effects**
**Frequent (76%–20%):** Peripheral/sensory neuropathy (usually occurs in hands, feet, perioral area, throat but may present as: jaw spasm, abnormal tongue sensation, eye pain, chest pressure, difficulty walking, swallowing, writing), nausea, fatigue, diarrhea, vomiting, constipation, abdominal pain, fever, anorexia. **Occasional (14%–10%):** Stomatitis, earache, insomnia, cough, difficulty breathing, backache, edema. **Rare (7%–3%):** Dyspepsia, dizziness, rhinitis, flushing, alopecia.

**Adverse effects/toxic reactions**
Peripheral/sensory neuropathy can occur without any prior event by drinking or holding a glass of cold liquid during IV infusion. Pulmonary fibrosis (characterized as nonproductive cough, dyspnea, crackles, radiologic pulmonary infiltrates) may warrant drug discontinuation. Hypersensitivity reaction (rash, urticaria, pruritus) occurs rarely.

**Nursing considerations**

**Baseline assessment**
Obtain baseline renal function, WBC, platelet count. Question medical history as listed in Precautions. Offer emotional support.
**Intervention/evaluation**

Monitor for decrease in WBC, platelets (myelosuppression is minimal). Monitor daily pattern of bowel activity, stool consistency. Monitor for diarrhea, GI bleeding (bright red, black tarry stool), signs of neuropathy. Pt should avoid ice or drinking, holding glass of cold liquid during IV infusion and for 5 days following completion of infusion; may precipitate/exacerbate neuropathy (occurs within hrs or 1–2 days of dosing, lasts up to 14 days). Maintain strict I&O. Assess oral mucosa for stomatitis.

**Patient/family teaching**

- Promptly report fever, sore throat, signs of local infection, unusual bruising/bleeding from any site, persistent diarrhea, difficulty breathing.
- Do not have immunizations without physician’s approval (drug lowers resistance).
- Avoid contact with those who have recently taken oral polio vaccine.
- Avoid cold drinks, ice, cold objects (may produce neuropathy).

### OXcarbazepine

*ox-kar-baz-e-peon*

**Oxtellar XR**

**Trileptal**

**CLASSIFICATION**

PHARMACOTHERAPEUTIC: Carboxamide derivative, anticonvulsant.

CLINICAL: Anticonvulsant.

Do not confuse OXcarbazepine with carBAMazepine, or Trileptal with TriLipix.

### Uses

**Trileptal:** Monotherapy, adjunctive therapy in treatment of partial seizures in adults. Monotherapy in children 4 yrs and older, adjunctive therapy in children 2 yrs and older. **Oxtellar XR:** Adjunctive therapy in treatment of partial seizures in children 6–17 yrs. **OFF-LABEL:** Treatment of neuropathic pain, bipolar disorder.
Precautions

Contraindications: Hypersensitivity to OXcarbazepine. Cautions: Renal impairment, sensitivity to carBAMazepine, pts at increased risk for suicide.

Action

Blocks sodium channels, stabilizing hyperexcited neural membranes, inhibiting repetitive neuronal firing, diminishing synaptic impulses. Therapeutic Effect: Prevents seizures.

Pharmacokinetics

Completely absorbed from GI tract. Metabolized in liver. Protein binding: 40%. Primarily excreted in urine. Half-life: 2 hrs; metabolite, 6–10 hrs.

Lifespan considerations

Interactions

DRUG: Alcohol, CNS depressants (e.g., LORazepam, morphine, zolpidem) may have additive sedative effect. May decrease effectiveness of felodipine, oral contraceptives, verapamil. May increase concentration, risk of toxicity of PHENobarbital, phenytoin. HERBAL: Gotu kola, kava kava, St. John’s wort, valerian may increase CNS depression. Evening primrose may decrease seizure threshold. St. John’s wort may decrease concentration. FOOD: None known. LAB VALUES: May increase serum alkaline phosphatase, ALT, AST. May decrease serum sodium.

Availability (Rx)

Oral Suspension (Trileptal): 300 mg/5 mL. Tablets (Trileptal): 150 mg, 300 mg, 600 mg. Tablets, Extended-Release (Oxtellar XR): 150 mg, 300 mg, 600
mg.

**Administration/handling**

**PO**

- Give without regard to food. Do not break, crush, dissolve, or divide extended-release tablets. Swallow whole.

**Indications/routes/dosage**

**Adjunctive Treatment of Seizures**

**PO: ADULTS, ELDERLY: (Immediate-Release):** Initially, 600 mg/day in 2 divided doses. May increase by up to 600 mg/day at wkly intervals. **Maximum:** 2,400 mg/day. **Usual maintenance dose:** 600 mg twice daily. **CHILDREN 4–16 YRS:** Initially, 8–10 mg/kg in 2 divided doses. **Maximum:** 600 mg/day. Increase dose slowly over 2 wks. **Maintenance (based on weight):**

**CHILDREN WEIGHING MORE THAN 39 KG:** 1,800 mg/day in 2 divided doses; **CHILDREN WEIGHING 29.1–39 KG:** 1,200 mg/day in 2 divided doses; **CHILDREN WEIGHING 20–29 KG:** 900 mg/day in 2 divided doses. **CHILDREN 2–3 YRS:** Initially, 8–10 mg/kg/day in 2 divided doses. **Maximum:** 600 mg/day in 2 divided doses. Increase dose slowly over 2 wks up to a maximum of 60 mg/kg/day in 2 divided doses. **(Extended-Release):**

**ADULTS:** Initially, 600 mg once daily. May increase by 600 mg/day at wkly intervals. Range: 1,200–2,400 mg/day. **ELDERLY:** Initially, 300–450 mg/day. May increase by 300–450 mg/day at wkly intervals to desired clinical response. Range: Up to 2,400 mg/day.

**Conversion to Monotherapy**

**PO: ADULTS, ELDERLY: (Immediate-Release):** 600 mg/day in 2 divided doses (while decreasing concomitant anticonvulsant over 3–6 wks). May increase by 600 mg/day at wkly intervals up to 2,400 mg/day. **CHILDREN 4–16 YRS:** Initially, 8–10 mg/kg/day in 2 divided doses with simultaneous initial reduction of dose of concomitant antiepileptic over 3–6 wks. May increase by maximum of 10 mg/kg/day at wkly intervals (see below for recommended daily dose by weight).
Initiation of Monotherapy

PO: ADULTS, ELDERLY: (Immediate-Release): 600 mg/day in 2 divided doses. May increase by 300 mg/day every 3 days up to 1,200 mg/day.

CHILDREN 4–16 YRS: Initially, 8–10 mg/kg/day in 2 divided doses. Increase at 3-day intervals by 5 mg/kg/day to achieve maintenance dose by weight as follows:

<table>
<thead>
<tr>
<th>Weight</th>

Dosage in Renal Impairment

Mild to moderate impairment: No dose adjustment. CrCl less than 30 mL/min: Give 50% of normal starting dose, then titrate slowly to desired dose.

Dosage in Hepatic Impairment

Mild to moderate impairment: No dose adjustment. Severe impairment: Use caution with immediate-release; not recommended with extended-release.

Side effects

Frequent (22%–13%): Dizziness, nausea, headache. Occasional (7%–5%): Vomiting, diarrhea, ataxia (muscular incoordination), nervousness, dyspepsia, constipation. Rare (4%): Tremor, rash, back pain, epistaxis, sinusitis, diplopia.

Adverse effects/toxic reactions

Clinically significant hyponatremia may occur, manifested as leg cramping, hypotension, cold/clammy skin, increased pulse rate, headache, nausea, vomiting, diarrhea. Suicidal ideation occurs rarely.
Nursing considerations

Baseline assessment
Review history of seizure disorder (type, onset, intensity, frequency, duration, LOC), drug history (esp. other anticonvulsants). Provide safety precautions; quiet, dark environment.

Intervention/evaluation

Patient/family teaching
• Do not abruptly stop taking medication (may increase seizure activity).
• Report if rash, nausea, headache, dizziness occurs.
• May need periodic blood tests.
• Avoid tasks that require alertness, motor skills until response to drug is established.
• Avoid alcohol.
• May decrease effectiveness of oral contraceptives.

oxybutynin
ox-i-bue-ti-nin
Apo-Oxybutynin
Ditropan XL
Gelnique
Oxytrol for Women

CLASSIFICATION
PHARMACOTHERAPEUTIC: Anticholinergic.
CLINICAL: Antispasmodic.
Do not confuse oxybutynin with OxyContin.
**Uses**

Relief of symptoms (urgency, incontinence, frequency, nocturia, urge incontinence) associated with uninhibited neurogenic bladder, reflex neurogenic bladder. **Extended-Release (additional):** Treatment of symptoms associated with detrusor overactivity due to neurologic disorder (e.g., spina bifida).

**Precautions**

**Contraindications:** Hypersensitivity to oxybutynin. Pts with or at risk for uncontrolled narrow-angle glaucoma, urinary retention, gastric retention, or conditions with severely decreased GI motility. **Cautions:** Renal/hepatic impairment, pts with bladder outflow obstruction, treated narrow-angle glaucoma, hyperthyroidism, coronary artery disease, HF, hypertension, arrhythmias, prostatic hyperplasia, myasthenia gravis, reduced GI motility, GI obstructive disorder, gastroesophageal reflux.

**Action**

Direct antispasmodic effect on smooth muscle; inhibits action of acetylcholine on smooth muscle. **Therapeutic Effect:** Increases bladder capacity, delays desire to void. Decreases urgency and frequency.

**Pharmacokinetics**

<table>
<thead>
<tr>
<th>Route</th>
<th>Onset</th>
<th>Peak</th>
<th>Duration</th>
</tr>
</thead>
<tbody>
<tr>
<td>PO</td>
<td>0.5–1 hr</td>
<td>3–6 hrs</td>
<td>6–10 hrs</td>
</tr>
</tbody>
</table>

Rapidly, well absorbed from GI tract. Metabolized in liver. Primarily excreted in urine. Unknown if removed by hemodialysis. **Half-life:** 1–2.3 hrs; metabolite, 7–8 hrs.

**Lifespan considerations**

**Pregnancy/Lactation:** Unknown if drug crosses placenta or is distributed in breast milk. **Children:** No age-related precautions noted in those older than 5 yrs. **Elderly:** May be more sensitive to anticholinergic effects (e.g., dry mouth, urinary retention).
Interactions

**DRUG:** Medications with anticholinergic action (e.g., antihistamines) may increase anticholinergic effects. Clarithromycin, erythromycin,itraconazole, ketoconazole may alter pharmacokinetic parameters. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** None significant.

Availability (Rx)

**Syrup:** 5 mg/5 mL. **Tablets:** 5 mg. **Topical Gel (10%) (Gelnique):** 100 mg/unit dose sachet. **(3% Gel):** 30 mg/mL. **Transdermal (Oxytrol for Women):** 3.9 mg/24 hrs.

**Tablets (Extended-Release [Ditropan XL]):** 5 mg, 10 mg, 15 mg.

Administration/handling

PO

- Give without regard to meals.
- Extended-release tablet must be swallowed whole; do not break, crush, dissolve, or divide.

Transdermal

- Apply patch to dry, intact skin on abdomen, hip, buttock.
- Use new application site for each new patch; avoid reapplication to same site within 7 days.
- Normal exposure to water (e.g., bathing, swimming) should not affect patch.

Topical Gel

- **(Gelnique):** Apply contents of 1 sachet once daily to dry, intact skin on abdomen, upper arms/shoulders, or thighs.
- Do not bathe/shower until 1 hr after gel is applied.
- **(3% Gel):** Apply 3 mL to thigh, upper arm, or shoulder.

Indications/routes/dosage

Neurogenic Bladder
PO *(Immediate-Release)*: ADULTS: 5 mg 2–3 times/day. May increase to 5 mg 4 times/day. ELDERRLY: 2.5–5 mg 2–3 times/day. CHILDREN OLDER THAN 5 YRS: 5 mg twice daily. May increase to 5 mg 3 times/day. 

PO *(Extended-Release)*: ADULTS, ELDERRLY: 5–10 mg/day. May increase by 5-mg increments at weekly intervals. Maximum: 30 mg/day. CHILDREN 6 YRS AND OLDER: Initially, 5–10 mg once daily. May increase in 5 mg increments at weekly intervals. Maximum: 20 mg/day.

Transdermal: ADULTS: 3.9 mg applied twice wkly. Apply every 3–4 days. 

Topical Gel: ADULTS, ELDERRLY:(10%) 100 mg once daily. 

**Dosage in Renal/Hepatic Impairment**

No dose adjustment.

**Side effects**

**Frequent:** Constipation, dry mouth, drowsiness, decreased perspiration. **Occasional:** Decreased lacrimation/salivation, impotence, urinary hesitancy/retention, suppressed lactation, blurred vision, mydriasis, nausea/vomiting, insomnia.

**Adverse effects/toxic reactions**

Overdose produces CNS excitation (nervousness, restlessness, hallucinations, irritability), hypotension/hypertension, confusion, tachycardia, facial flushing, respiratory depression.

**Nursing considerations**

**Baseline assessment**

Assess degree of dysuria, urgency, frequency, incontinence. Question medical history as listed in Precautions.

**Intervention/evaluation**

Patient/family teaching

- Avoid alcohol.
- May cause dry mouth (sugarless candy/gum may reduce effect).
- Avoid tasks that require alertness, motor skills until response to drug is established (may cause drowsiness).
- Avoid strenuous activity in warm environment.

oxyCODONE
ox-ee-koe-done
Oxaydo

OxyCONTIN
OxyIR
Roxicodone
Supeudol
Xtampza
XR

Fixed-Combination(s)

**Combunox:** oxyCODONE/ibuprofen (an NSAID): 5 mg/400 mg. **Endocet:** oxyCODONE/acetaminophen (a non-narcotic analgesic): 5 mg/325 mg, 7.5 mg/325 mg, 7.5 mg/500 mg, 10 mg/325 mg, 10 mg/650 mg. **Magnacet:** oxyCODONE/acetaminophen (a non-narcotic analgesic): 2.5 mg/400 mg, 7.5 mg/400 mg, 10 mg/400 mg. **Percocet:** oxyCODONE/acetaminophen: 2.5 mg/325 mg, 5 mg/325 mg, 5 mg/500 mg, 7.5 mg/325 mg, 7.5 mg/500 mg, 10 mg/325 mg, 10 mg/650 mg. **Percocet, Roxicet, Tylox:** oxyCODONE/acetaminophen (a non-narcotic analgesic): 5 mg/500 mg. **Percodan:** oxyCODONE/ aspirin (a non-narcotic analgesic): 2.25 mg/325 mg, 4.5 mg/325 mg. **Targiniq ER:** oxyCODONE/naloxone (opioid antagonist): 10 mg/5 mg, 20 mg/10 mg, 40 mg/20 mg. **Troxyca ER:** oxyCODONE/naltrexone (an opioid antagonist): 10 mg/1.2 mg, 20 mg/2.4 mg, 30 mg/3.6 mg, 40 mg/4.8 mg, 60 mg/7.2 mg, 9.6 mg/80 mg. **Xartemis XR:** oxyCODONE/acetaminophen (non-narcotic analgesic): 7.5 mg/325 mg.

CLASSIFICATION
PHARMACOTHERAPEUTIC: Opioid agonist (Schedule II).

CLINICAL: Analgesic.

■ BLACK BOX ALERT ■ OxyContin (controlled-release): Not intended as an "as needed" analgesic or for immediate postop pain control. Extended-release should not be crushed, broken, or chewed (otherwise leads to rapid release and absorption of potentially fatal dose). Be alert to signs of abuse, misuse, and diversion. May cause potentially life-threatening respiratory depression. Prolonged use during pregnancy can cause neonatal withdrawal syndrome. Use of CYP3A4 inhibitors may increase effects/cause fatal respiratory depression.

Do not confuse oxyCODONE with HYDROcodone, oxybutynin, or oxyMORphone, OxyCONTIN with MS Contin or oxybutynin, or Roxicodone with Roxanol.

Uses

Immediate-Release: Relief of acute or chronic, moderate to severe pain (usually in combination with nonopioid analgesics). Extended-Release: Around-the-clock management of moderate to severe pain when continuous analgesic is needed.

Precautions

Contraindications: Hypersensitivity to oxyCODONE. Acute or severe bronchial asthma, hypercarbia, paralytic ileus (known or suspected), GI obstruction, significant respiratory depression. Extreme Caution: CNS depression, anoxia, hypercapnia, respiratory depression, seizures, acute alcoholism, shock, untreated myxedema, respiratory dysfunction. Cautions: Elevated ICP, hepatic/renal impairment, coma, debilitated pts, head injury, biliary tract disease, toxic psychosis, acute abdominal conditions, hypothyroidism, prostatic hypertrophy, Addison’s disease, urethral stricture, COPD, history of substance abuse, elderly pts.

Action
Binds with opioid receptors within CNS, causing inhibition of ascending pain pathway. **Therapeutic Effect:** Alters perception of and emotional response to pain.

### Pharmacokinetics

<table>
<thead>
<tr>
<th>Route</th>
<th>Onset</th>
<th>Peak</th>
<th>Duration</th>
</tr>
</thead>
<tbody>
<tr>
<td>PO (immediate-release)</td>
<td>10–15 min</td>
<td>0.5–1 hr</td>
<td>3–6 hrs</td>
</tr>
<tr>
<td>PO (controlled-release)</td>
<td>10–15 min</td>
<td>0.5–1 hr</td>
<td>Up to 12 hrs</td>
</tr>
</tbody>
</table>

Moderately absorbed from GI tract. Protein binding: 38%–45%. Widely distributed. Metabolized in liver. Excreted in urine. Unknown if removed by hemodialysis. **Half-life:** 2–3 hrs (5 hrs controlled-release).

### Lifespan considerations

**Pregnancy/Lactation:** Readily crosses placenta. Distributed in breast milk. Respiratory depression may occur in neonate if mother received opiates during labor. Regular use of opiates during pregnancy may produce withdrawal symptoms in neonate (irritability, excessive crying, tremors, hyperactive reflexes, fever, vomiting, diarrhea, yawning, sneezing, seizures). **Children:** Paradoxical excitement may occur. Pts younger than 2 yrs are more susceptible to respiratory depressant effects. **Elderly:** Age-related renal impairment may increase risk of urinary retention. May be more susceptible to respiratory depressant effects.

### Interactions

**DRUG:** Alcohol, other CNS depressants (e.g., LORazepam, gabapentin, zolpidem) may increase CNS effects, respiratory depression, hypotension. **CYP3A4 inhibitors** (clarithromycin, ketoconazole) may increase concentration, toxicity. **CYP3A4 inducers** (carBAMazepine, rifAMPin) may decrease concentration/effects. **MAOIs** may produce serotonin syndrome, a severe, sometimes fatal reaction (administer 1/4 of usual oxyCODONE dose). **HERBAL:** Gotu kola, kava kava, St. John’s wort, valerian may increase CNS depression. **FOOD:** Grapefruit products may increase potential for respiratory depression. **LAB VALUES:** May increase serum amylase, lipase.
Availability (Rx)

New formulation of controlled-release is intended to prevent medication from being cut, broken, chewed, crushed, or dissolved to reduce risk of overdose due to tampering, snorting, or injection.

**Capsules:** 5 mg. **Oral Concentrate:** 20 mg/mL. **Oral Solution:** 5 mg/5 mL. **Tablets:** 5 mg, 10 mg, 15 mg, 20 mg, 30 mg. **Tablets, Abuse Deterrent (Oxxydo):** 5 mg, 7.5 mg.

**Capsules (Extended-Release [Xtampza]):** 9 mg, 13.5 mg, 18 mg, 27 mg, 36 mg. **Tablets (Controlled-Release 12 Hour Abuse Deterrent [OxyCONTIN]):** 10 mg, 15 mg, 20 mg, 30 mg, 40 mg, 60 mg, 80 mg.

Administration/handling

**PO**

- Give without regard to meals.
- **Controlled-release:** Swallow whole; do not break, crush, dissolve, or divide.

Indications/routes/dosage

**Note:** All doses should be titrated to desired effect. Do not abruptly discontinue in physically dependent pts. **Discontinuation:** (immediate-release): Reduce dose by 25%-50% q2-4 days while monitoring for withdrawal; (extended-release): Gradually titrate downward.

**Analgesia**

**PO (Immediate-Release):** ADULTS, ELDERLY: Initially, 5–15 mg q4–6h as needed. Range: 5–20 mg/dose. CHILDREN, 6–18 YRS: 0.1–0.2 mg/kg/dose q4–6h as needed.

**Opioid Naive**

**PO (Controlled-Release):** ADULTS, ELDERLY:(Tablets) Initially, 10 mg q12h. (Capsules) Initially, 9 mg q12h.

To convert from other opioids or nonopioid analgesics to oxyCODONE controlled-release, refer to OxyCONTIN package insert. Dosages are reduced in
pts with severe hepatic disease.

**Dosage in Renal/Hepatic Impairment**
Use caution. Titrate carefully.

**Side effects**

*Alert:* Effects are dependent on dosage amount. Ambulatory pts, pts not in severe pain may experience dizziness, nausea, vomiting, hypotension more frequently than those in supine position or having severe pain. **Frequent:** Drowsiness, dizziness, hypotension (including orthostatic hypotension), anorexia. **Occasional:** Confusion, diaphoresis, facial flushing, urinary retention, constipation, dry mouth, nausea, vomiting, headache. **Rare:** Allergic reaction, depression, paradoxical CNS hyperactivity, nervousness in children, paradoxical excitement, restlessness in elderly, debilitated pts.

**Adverse effects/toxic reactions**
Overdose results in respiratory depression, skeletal muscle flaccidity, cold/clammy skin, cyanosis, extreme drowsiness progressing to seizures, stupor, coma. Hepatotoxicity may occur with overdose of acetaminophen component of fixed-combination product. Tolerance to analgesic effect, physical dependence may occur with repeated use. **Antidote:** Naloxone (see Appendix J for dosage).

**Nursing considerations**

**Baseline assessment**
Assess onset, type, location, duration of pain. Effect of medication is reduced if full pain recurs before next dose. Obtain vital signs before giving medication. If respirations are 12/min or less (20/min or less in children), withhold medication, contact physician.

**Intervention/evaluation**
Palpate bladder for urinary retention. Monitor daily pattern of bowel activity, stool consistency. Initiate deep breathing, coughing exercises, esp. in pts with pulmonary impairment. Monitor pain relief, respiratory rate, mental status, B/P,
LOC.

**Patient/family teaching**
- May cause dry mouth, drowsiness.
- Avoid tasks that require alertness, motor skills until response to drug is established.
- Avoid alcohol.
- May be habit forming.
- Do not chew, crush, dissolve, or divide controlled-release tablets.
- Report severe constipation, absence of pain relief.

---

**OxyMORphone**

*ox-ee-mor-fone*

Opana

Opana ER

**CLASSIFICATION**

**PHARMACOTHERAPEUTIC**: Opioid agonist *(Schedule II).*

**CLINICAL**: Narcotic analgesic, antianxiety, preop anesthetic.

■ **BLACK BOX ALERT** ■ Has abuse liability. Concern about increased risk of abuse, misuse, or diversion. Prolonged use during pregnancy can cause neonatal withdrawal syndrome.

Do not confuse OxyMORphone with oxyCODONE.

---

**Uses**

**Injection**: Relief of moderate to severe acute pain. **PO (Immediate-release)**: Relief of moderate to severe acute pain. **(Extended-release)**: Relief of moderate to severe pain in pts requiring continuous treatment for extended period of time.

---

**Precautions**

**Contraindications**: Hypersensitivity to OxyMORphone, morphine, acute severe bronchial asthma, severe respiratory depression, paralytic ileus (known or suspected), moderate to severe hepatic function impairment, hypercarbia.

Action
Binds to opiate receptor sites within CNS, causing inhibition of ascending pain pathways. Therapeutic Effect: Reduces intensity of pain stimuli, alters pain perception, emotional response to pain.

Pharmacokinetics

<table>
<thead>
<tr>
<th>Route</th>
<th>Onset</th>
<th>Peak</th>
<th>Duration</th>
</tr>
</thead>
<tbody>
<tr>
<td>Parenteral</td>
<td>5–10 min</td>
<td>N/A</td>
<td>3–6 hrs</td>
</tr>
</tbody>
</table>

Lifespan considerations

Pregnancy/Lactation: Unknown if distributed in breast milk. May prolong labor if administered in latent phase of first stage of labor or before cervical dilation of 4–5 cm has occurred. Respiratory depression may occur in neonate if mother received opiates during labor. Regular use of opiates during pregnancy may produce withdrawal symptoms in the neonate (irritability, excessive crying, tremors, hyperactive reflexes, fever, vomiting, diarrhea, yawning, sneezing, seizures). Children: Safety and efficacy not established in those younger than 18 yrs. Elderly: May be more susceptible to respiratory depression, may cause paradoxical excitement. Age-related hepatic impairment, debilitation may require dosage adjustment.

Interactions

DRUG: Alcohol, other CNS depressants (e.g., LORazepam, gabapentin, zolpidem) may increase CNS effects, respiratory depression, hypotension.
**Anticholinergics** may increase risk of urinary retention, severe constipation (may lead to paralytic ileus). **Propofol** increases risk of bradycardia. Decreased effect when given concurrently with **phenothiazines**. **HERBAL:** **Gotu kola, kava kava, St. John’s wort, valerian** may produce CNS depressant effects. **FOOD:** None known. **LAB VALUES:** May increase serum amylase, lipase.

**Availability (Rx)**

**Injection:** 1 mg/mL. **Tablets:** 5 mg, 10 mg. **Tablets (Extended-Release):** 5 mg, 7.5 mg, 10 mg, 15 mg, 20 mg, 30 mg, 40 mg.

**Administration/handling**

**IV**

**Rate of Administration**

- Administer IV push very slowly.
- Rapid IV increases risk of severe adverse reactions (chest wall rigidity, apnea, peripheral circulatory collapse, anaphylactoid effects, cardiac arrest).

**IM/SQ**

- Inject deep IM, preferably in upper, outer quadrant of buttock.
- Use short 30-gauge needle for SQ injection.
- Administer slowly, rotating injection sites.
- Pts with circulatory impairment experience higher risk of overdosage due to delayed absorption of repeated administration.

**Storage**

- Store parenteral form at room temperature. Refrigerate suppository form.
- Discard parenteral form if discolored or particulate forms.

**PO**

- Give 1 hr before or 2 hrs after meals.
- Do not break, crush, dissolve, or divide extended-release tablet.

**IV Compatibilities**
Indications/routes/dosage

Analgesia

**IV: ADULTS 18 YRS AND OLDER, ELDERLY:** Initially, 0.5 mg. Dose may be cautiously increased until satisfactory response is achieved.

*Alert* IM preferred over SQ route (SQ rate of absorption is less reliable).

**IM/SQ: ADULTS 18 YRS AND OLDER, ELDERLY:** Initially, 1–1.5 mg every 4–6 hrs as needed.

**PO: ADULTS, ELDERLY:** *(IMMEDIATE-RELEASE):* 5–10 mg q4–6h. *(EXTENDED-RELEASE):* Initially, 5 mg q12h. May increase by 5–10 mg q12h at intervals of every 3–7 days.

Dosage in Renal Impairment
Reduce initial dose with CrCl less than 50 mL/min.

Dosage in Hepatic Impairment
Reduce initial dose with mild impairment (contraindicated in moderate to severe impairment).

Side effects

*Note:* Effects are dependent on dosage amount, route of administration. Ambulatory pts, pts not in severe pain may experience dizziness, nausea, vomiting, hypotension more frequently than those in supine position or having severe pain. **Frequent (10% or higher):** Drowsiness, hypotension, dizziness, nausea, vomiting, constipation, weakness. **Occasional (9%–2%):** Nervousness, headache, restlessness, malaise, confusion, anorexia, abdominal cramps, dry mouth, decreased urinary output, ureteral spasm, pain at injection site. **Rare (1% or less):** Depression, paradoxical CNS stimulation, hallucinations, rash, urticaria.

Adverse effects/toxic reactions

Overdose results in respiratory depression, skeletal muscle flaccidity,
cold/clammy skin, cyanosis, extreme drowsiness progressing to convulsions, stupor, coma. Tolerance to analgesic effect, physical dependence may occur with repeated use. Prolonged duration of action, cumulative effect may occur in those with hepatic/renal impairment.

**Nursing considerations**

**Baseline assessment**
Assess onset, type, location, duration of pain. Obtain vital signs before giving medication. If respirations are 12/min or lower, withhold medication, contact physician. Effect of medication is reduced if full pain recurs before next dose.

**Intervention/evaluation**
Monitor vital signs 5–10 min after IV administration, 15–30 min after SQ, IM. Be alert for decreased respirations, B/P. To prevent pain cycles, instruct pt to request pain medication as soon as discomfort begins. Assess for clinical improvement, record onset of pain relief. Consult physician if pain relief is not adequate.

**Patient/family teaching**
- Discomfort may occur with injection.
- Slowly go from lying to standing to avoid postural hypotension.
- Avoid tasks that require alertness, motor skills until response to drug is established.
- Avoid alcohol.
- Tolerance/dependence may occur with prolonged use of high doses.

---

**oxytocin**

ox-ee-toe-sin

**Pitocin**

**CLASSIFICATION**

PHARMACOTHERAPEUTIC: Uterine smooth muscle stimulant.

CLINICAL: Oxytocic agent.

**BLACK BOX ALERT**
Not to be given for elective labor induction, but can be used when there is a clear medical indication for induction.
Do not confuse Pitocin with Pitressin.

Uses

**Antepartum:** Induction of labor in pts with medical indication (e.g., at or near term), to stimulate reinforcement of labor, as adjunct in managing incomplete or inevitable abortion. **Postpartum:** To produce uterine contractions during third stage of labor and to control postpartum bleeding/hemorrhage.

Precautions

**Contraindications:** Hypersensitivity to oxytocin. Adequate uterine activity that fails to progress, cephalopelvic disproportion, fetal distress without imminent delivery, grand multiparity, hyperactive or hypertonic uterus, obstetric emergencies that favor surgical intervention, prematurity, unengaged fetal head, unfavorable fetal position/presentation, when vaginal delivery is contraindicated (e.g., active genital herpes infection, invasive cervical cancer, placenta previa, cord presentation). **Cautions:** Induction of labor should be for medical, not elective, reasons. Generally not recommended in fetal distress, hydramnios, partial placental previa, predisposition to uterine rupture.

Action

Activates receptors that trigger increase in intracellular calcium levels in uterine myofibrils; increases prostaglandin production. **Therapeutic Effect:** Stimulates uterine contractions.

Pharmacokinetics

Rapidly absorbed through nasal mucous membranes. Protein binding: 30%. Distributed in extracellular fluid. Metabolized in liver, kidney. Primarily excreted in urine. **Half-life:** 1–6 min.
Lifespan considerations

Pregnancy/Lactation: Used as indicated, not expected to present risk of fetal abnormalities. Small amounts in breast milk. Breastfeeding not recommended. Children/Elderly: Not used in these pt populations.

Interactions

DRUG: Caudal block anesthetics, vasopressors may increase pressor effects. Other oxytocics may cause cervical lacerations, uterine hypertonus, uterine rupture. HERBAL: None significant. FOOD: None known. LAB VALUES: None significant.

Availability (Rx)

Injection (Pitocin): 10 units/mL. Injection, Solution: 30 units/500 mL.

Administration/handling

IV

Reconstitution
• Dilute 10–40 units (1–4 mL) in 1,000 mL of 0.9% NaCl, lactated Ringer’s, or D₅W to provide concentration of 10–40 milliunits/mL solution.

Rate of Administration
• Give by IV infusion (use infusion device to carefully control rate of flow as ordered by physician).

Storage
• Store at room temperature.

IV incompatibilities

No known incompatibilities via Y-site administration.

IV Compatibilities

Heparin, insulin (regular), multivitamins, potassium chloride, zidovudine.
Indications/routes/dosage

Induction or Stimulation of Labor

**IV:** **ADULTS:** 0.5–1 milliunit/min. May gradually increase in increments of 1–2 milliunits/min q30–60 minutes until desired contraction pattern is established. Rates greater than 9–10 milliunits/min are rarely required.

Abortion

**IV:** **ADULTS:** *(Midterm elective abortion):* 10–20 milliunits/min. **Maximum:** 30 units/12-hr dose. *(Incomplete, inevitable abortion):* 10 units as IV infusion after suction or a sharp curettage.

Control of Postpartum Bleeding

**IV Infusion:** **ADULTS:** 10–40 units in 1,000 mL IV fluid at rate sufficient to sustain uterine contractions and control uterine atony.

**IM:** **ADULTS:** 10 units (total dose) after delivery.

Dosage in Renal/Hepatic Impairment

No dose adjustment.

Side effects

**Occasional:** Tachycardia, premature ventricular contractions, hypotension, nausea, vomiting. **Rare:** Nasal: Lacrimation/tearing, nasal irritation, rhinorrhea, unexpected uterine bleeding/contractions.

Adverse effects/toxic reactions

Hypertonicity may occur with tearing of uterus, increased bleeding, abruptio placentae (i.e., placental abruption), cervical/vaginal lacerations. **Fetal:** Bradycardia, CNS/brain damage, trauma due to rapid propulsion, low Apgar score at 5 min, retinal hemorrhage occur rarely. Prolonged IV infusion of oxytocin with excessive fluid volume has caused severe water intoxication with seizures, coma, death.
Nursing considerations

Baseline assessment
Assess baselines for vital signs, B/P, fetal heart rate. Determine frequency, duration, strength of contractions.

Intervention/evaluation
Monitor B/P, pulse, respirations, fetal heart rate, intrauterine pressure, contractions (duration, strength, frequency) q15min. Notify physician of contractions that last longer than 1 min, occur more frequently than every 2 min, or stop. Maintain careful I&O; be alert to potential water intoxication. Check for blood loss.

Patient/family teaching
- Keep pt, family informed of labor progress.
**PACLitaxel**

pak-li-tax-el

Abraxane

Apo-PACLitaxel

**CLASSIFICATION**

**PHARMACOTHERAPEUTIC**: Taxoid, antimitotic agent.

**CLINICAL**: Antineoplastic.

■ **BLACK BOX ALERT** ■ Myelosuppression is major dose-limiting toxicity. Must be administered by certified chemotherapy personnel. Severe hypersensitivity reactions reported.

Do not confuse PACLitaxel with DOCEtaxel, PARoxetine, or Paxil.

**Uses**

**Conventional**: Treatment of node-positive breast cancer, metastatic breast cancer after failure of combination therapy or relapse within 6 mos of adjuvant therapy; subsequent therapy for advanced ovarian cancer or as first line therapy (in combination with CISplatin). Treatment of AIDS-related Kaposi’s sarcoma; non-small-cell lung cancer (NSCLC) as first line therapy (in combination with CISplatin). **Abraxane**: Treatment of breast cancer after failure of combination chemotherapy or relapse within 6 mos of adjuvant chemotherapy. First-line treatment of metastatic adenocarcinoma of pancreas. Treatment of locally advanced or metastatic NSCLC. **OFF-LABEL**: Bladder, cervical, small-cell lung, head and neck cancers. Treatment of adenocarcinoma. **Abraxane**: Recurrent/persistent ovarian, fallopian tube, primary peritoneal cancers.
Precautions

Contraindications: Hypersensitivity to PACLitaxel. Hypersensitivity to drugs developed with Cremophor EL (polyoxyethylated castor oil). Treatment of solid tumors with baseline neutrophil count less than 1,500 cells/mm³; treatment of Kaposi’s sarcoma with baseline neutrophil count less than 1,000 cells/mm³. Cautions: Hepatic impairment, severe neutropenia, peripheral neuropathy.

Action

Increases action of tubulin dimers; stabilizes existing microtubules; inhibits their disassembly; interferes with late G₂ mitotic phase. Therapeutic Effect: Inhibits cellular mitosis, replication.

Pharmacokinetics

Does not readily cross blood-brain barrier. Protein binding: 89%–98%. Metabolized in liver. Excreted in bile/feces (71%), urine (14%). Not removed by hemodialysis. Half-life: 3-hr infusion: 13.1–20.2 hrs; 24-hr infusion: 15.7–52.7 hrs.

Lifespan considerations

Interactions

DRUG: CYP3A4, CYP2C8 inhibitors (e.g., clarithromycin, ketoconazole, ritonavir) may increase concentration/effects. CYP3A4, CYP2C8 inducers (e.g., carBAMazepine, phenytoin, rifAMPin) may decrease effects. Bone marrow depressants may increase myelosuppression. Live virus vaccines may potentiate virus replication, increase vaccine side effects, decrease pt’s antibody response to vaccine. HERBAL: Avoid black cohosh, dong quai in estrogen-dependent tumors. Gotu kola, kava kava, St. John’s wort, valerian may increase CNS depression. St. John’s wort may decrease concentration. FOOD: None known. LAB VALUES: May elevate serum alkaline phosphatase,
bilirubin, ALT, AST, triglycerides.

**Availability (Rx)**

**Injection, Powder for Reconstitution (Abraxane):** 100-mg vial. **Injection Solution:** 6 mg/mL (5-mL, 16.7-mL, 25-mL, 50-mL vials).

**Administration/handling**

- **IV**
  - Wear gloves during handling; if contact with skin occurs, wash hands thoroughly with soap, water. If contact with mucous membranes occurs, flush with water.

**PACLitaxel**

**Reconstitution**
- Dilute with 250–1,000 mL 0.9% NaCl, D$_5$W to final concentration of 0.3–1.2 mg/mL.

**Rate of Administration**
- Administer at rate per protocol (range: 1–96 hrs) through in-line filter not greater than 0.22 microns.
- Monitor vital signs during infusion, esp. during first hour.
- Discontinue administration if severe hypersensitivity reaction occurs.

**Storage**
- Store unopened vials at room temperature.
- Reconstituted solution is stable at room temperature for 72 hrs.
- Store diluted solutions in bottles or plastic bags. Administer through polyethylene-lined administration sets (avoid plasticized PVC equipment or devices).

**Abraxane (PACLitaxel—Protein Bound)**

**Reconstitution**
- Reconstitute each vial with 20 mL 0.9% NaCl to provide concentration of 5 mg/mL.
- Slowly inject onto inside wall of vial; gently swirl over 2 min to avoid foaming.
• Inject appropriate amount into empty PVC-type bag.

**Rate of Administration**
• Infuse over 30 min. Do not use in-line filter.

**Storage**
• Store unopened vials at room temperature.
• Once reconstituted, use immediately but may refrigerate for up to 8 hrs.

### IV incompatibilities

**Alert** **IV compatibility:** Data for Abraxane not known; avoid mixing with other medication.
Amphotericin B complex (Abelcet, AmBisome, Amphotec), DOXOrubicin liposomal (Doxil), hydrOXYzine (Vistaril), methylPREDNISolone (Solu-Medrol), mitoXANTRONE (Novantrone).

### IV Compatibilities
CARBOplatin (Paraplatin), CISplatin (Platinol AQ), cyclophosphamidide (Cytoxan), cytarabine (Cytosar), dacarbazine (DTIC-Dome), dexamethasone (Decadron), diphenhydRAMINE (Benadryl), DOXOrubicin (Adriamycin), etoposide (VePesid), gemcitabine (Gemzar), granisetron (Kytril), HYDROmorphine (Dilaudid), lipids, magnesium sulfate, mannitol, methotrexate, morphine, ondansetron (Zofran), potassium chloride, vinBLASTine (Velban), vinCRIStine (Oncovin).

### Indications/routes/dosage

**Note:** Premedication with dexamethasone, diphenhydRAMINE, and cimetidine, famotidine, or raNITIdine recommended. Refer to individual protocols.

**PACLitaxel (Conventional)**

**Ovarian Cancer**

**IV:** **ADULTS, ELDERLY:** *(Previously Treated):* 135–175 mg/m²/dose over 3 hrs q3wks. *(Previously Untreated):* 175 mg/m² over 3 hrs q3wks (in combination with CISplatin) or 135 mg/m² over 24 hrs q3wks (in combination with CISplatin).
Breast Cancer (Adjuvant)
**IV: ADULTS, ELDERLY:** 175 mg/m\(^2\) over 3 hrs for 4 cycles (give sequentially following anthracycline-containing regimen).

Breast Cancer (Metastatic/Relapsed)
**IV: ADULTS, ELDERLY:** 175 mg/m\(^2\) over 3 hrs q3wks.

Non–Small-Cell Lung Cancer
**IV: ADULTS, ELDERLY:** 135 mg/m\(^2\) over 24 hrs (in combination with CISplatin).

Kaposi’s Sarcoma (AIDS-Related)
**IV: ADULTS, ELDERLY:** 135 mg/m\(^2\)/dose over 3 hrs q3wks or 100 mg/m\(^2\)/dose over 3 hrs q2wks.

**Dosage in Renal Impairment**
No dose adjustment.

**Dosage in Hepatic Impairment**

**ULN:** upper limit of normal

**Dose Modification**
Courses of PACLitaxel should be withheld until neutrophil count is 1,500 cells/mm\(^3\) or more and platelet count is 100,000 cells/mm\(^3\) or more.
Abraxane

Breast Cancer (Metastatic)
IV Infusion: ADULTS, ELDERLY: 260 mg/m² q3wks.

Dose Modification
Severe neutropenia (ANC less than 500 cells/mm³ for 1 wk or longer); severe sensory neuropathy: Reduce dose to 220 mg/m² for subsequent courses.
Recurrence of severe neutropenia, severe neuropathy: Reduce dose to 180 mg/m² q3wks for subsequent courses.
CTCAE grade 3 sensory neuropathy: Hold until resolved to grade 2 or 1, then reduce dose for subsequent courses.
Dosage of Abraxane for serum bilirubin greater than 1.5 mg/dL: Dose unknown.

NSCLC (Locally Advanced or Metastatic)
IV: ADULTS, ELDERLY: 100 mg/m² on days 1, 8, 15 of each 21-day cycle (in combination with CARBOplatin).

Adenocarcinoma of Pancreas (Metastatic) (in combination with gemcitabine)
IV: ADULTS, ELDERLY: 125 mg/m² on days 1, 8, 15 of each 28-day cycle (in combination with gemcitabine).

Dosage in Renal Impairment
No dose adjustment.

### Side effects

**Expected (90%–70%):** Diarrhea, alopecia, nausea, vomiting. **Frequent (48%–46%):** Myalgia, arthralgia, peripheral neuropathy. **Occasional (20%–13%):** Mucositis, hypotension during infusion, pain/redness at injection site. **Rare (3%):** Bradycardia.

### Adverse effects/toxic reactions

Neutropenic nadir occurs at median of 11 days. Anemia, leukopenia occur commonly; thrombocytopenia occurs occasionally. Severe hypersensitivity reaction (dyspnea, severe hypotension, angioedema, generalized urticaria) occurs rarely.

### Nursing considerations

**Baseline assessment**

Obtain CBC (note neutrophil count), BMP, LFT prior to each course. Receive full medication history and screen for interactions. Offer emotional support.

**Intervention/evaluation**

Monitor CBC, LFT, vital signs. Monitor for hematologic toxicity (fever, sore throat, signs of local infections, unusual bleeding/bruising), symptoms of anemia (excessive fatigue, weakness). Monitor daily pattern of bowel activity, stool consistency; report diarrhea. Avoid IM injections, rectal temperatures, other traumas that may induce diarrhea. Hold pressure to injection sites for full 5 min.

**Patient/family teaching**

• Hair loss is reversible, but new hair may have different color, texture.
• Do not have immunizations without physician’s approval (drug lowers resistance).
• Avoid crowds, persons with known infections.
• Report signs of infection at once (fever, flu-like symptoms).
• Report persistent nausea/vomiting.
• Be alert for signs of peripheral neuropathy.
• Avoid pregnancy.
• Avoid tasks that may require alertness, motor skills until response to drug is established.

**palbociclib**  
*pal-boe-sye-klib*  
*Ibrance*

**CLASSIFICATION**  
P**HARMACOTHERAPEUTIC:** Kinase inhibitor.  
**CLINICAL:** Antineoplastic.

**Uses**  
Used in combination with an aromatase inhibitor (e.g., letrozole) for treatment of postmenopausal women with estrogen receptor–positive, human epidermal growth factor receptor 2 (*HER2*)–negative advanced breast cancer as initial endocrine-based therapy for metastatic disease or in combination with fulvestrant in women with disease progression following endocrine therapy.

**Precautions**

**Contraindications:** Hypersensitivity to palbociclib. **Cautions:** Baseline anemia, lymphopenia, neutropenia, thrombocytopenia. History of pulmonary embolism. Avoid concomitant use of strong or moderate CYP3A inhibitors, strong or moderate CYP3A inducers.

**Action**
Inhibits proliferation of tumor cells that overexpress *HER2* by blocking cellular progression from G1 into S phase of cell cycle. Promotes cellular death
(apoptosis). **Therapeutic Effect:** Inhibits tumor cell growth and metastasis.

**Pharmacokinetics**

Readily absorbed. Widely distributed. Metabolized in liver. Protein binding: 85%. Peak plasma concentration: 6–12 hrs. Steady state reached in 8 days. Excreted in feces (74%), urine (18%). **Half-life:** 29 hrs.

**Lifespan considerations**

**Pregnancy/Lactation:** Treatment is indicated for postmenopausal women. However, treatment may cause fetal harm when administered during pregnancy. Females of reproductive potential should use effective contraception during treatment and up to 2 wks after discontinuation. Unknown if distributed in breast milk. Must either discontinue drug or discontinue breastfeeding. **Children:** Safety and efficacy not established. Not indicated in this population. **Elderly:** No age-related precautions noted.

**Interactions**

**DRUG:** Strong CYP3A inhibitors (e.g., clarithromycin, ketoconazole, ritonavir), moderate CYP3A inhibitors (e.g., atazanavir, ciprofloxacin) may increase concentration/effect; avoid use. **Strong CYP3A inducers** (e.g., carBAMazepine, rifampin), **moderate CYP3A inducers** (e.g., nafcillin) may decrease concentration/effect; avoid use. May increase concentration/effects of medications with a narrow therapeutic index (e.g., cycloSPORINE, ergotamine, tacrolimus). **HERBAL:** St. John’s wort may decrease concentration/effect. **FOOD:** Grapefruit products may increase concentration/effect. **LAB VALUES:** May decrease Hgb, lymphocytes, neutrophils, platelets, WBC.

**Availability (Rx)**

**Capsules:** 75 mg, 100 mg, 125 mg.

**Administration/handling**

**PO**
• Give with food.
• Administer whole; do not break, crush, cut, or open capsule.
• If vomiting occurs after dosing, do not readminister dose; give dose at next scheduled time.

Indications/routes/dosage

Breast Cancer

PO: ADULTS, ELDERLY: 125 mg once daily for 21 days, followed by a 7-day rest period to complete a 28-day cycle. Use in combination with an aromatase inhibitor (e.g., letrozole) once daily throughout 28-day cycle or with fulvestrant 500 mg on days 1, 15, 29 and once monthly thereafter. Continue until disease progression or unacceptable toxicity.

Dose Reduction for Adverse Events

<table>
<thead>
<tr>
<th>Dose Level</th>
<th>Dose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Recommended starting dose</td>
<td>125 mg/day</td>
</tr>
<tr>
<td>First dose reduction</td>
<td>100 mg/day</td>
</tr>
<tr>
<td>Second dose reduction</td>
<td>75 mg/day</td>
</tr>
<tr>
<td>Unable to tolerate 75 mg/day</td>
<td>Permanently discontinue</td>
</tr>
</tbody>
</table>

Dose Modification

Based on Common Terminology Criteria for Adverse Events (CTCAE).

Hematologic Toxicities

Grade 1 or 2: No dose adjustment. Grade 3 (except lymphopenia unless associated with clinical events [e.g., opportunistic infection]): No dose adjustment. Withhold treatment until recovery to less than grade 2. Grade 3, ANC 500–1000/mm³ plus fever that is greater than or equal to 38.5°C and/or active infection: Interrupt treatment (and initiation of the next cycle) until recovery to grade 2 or less. Resume at reduced dose upon starting.

Nonhematologic Toxicities

Grade 1 or 2: No dose adjustment. Grade 3 or greater (if persistent despite
optimal medical management): Interrupt treatment until resolved to grade 1 or less; grade 2 or less if the event is not considered a serious medical risk. Resume at reduced dose upon starting.

Concomitant Use of Strong CYP3A Inhibitors

PO: ADULTS, ELDERLY: 75 mg once daily if unable to use alternative drug with minimal CYP3A inhibition. If CYP3A inhibitor is discontinued, increase palbociclib dose (after 3–5 half-lives of CYP3A inhibitor have elapsed) to the dose used prior to initiating strong CYP3A inhibitor.

Dosage in Renal Impairment

Mild to moderate impairment: No dose adjustment. Severe impairment: Not studied; use caution.

Dosage in Hepatic Impairment

Mild impairment: No dose adjustment. Moderate to severe impairment: Not studied; use caution.

Side effects

Frequent (41%–21%): Fatigue, nausea, alopecia, diarrhea. Occasional (16%–13%): Decreased appetite, vomiting, asthenia.

Adverse effects/toxic reactions

Anemia, leukopenia, neutropenia, thrombocytopenia are expected responses to therapy. CTCAE grade 3 neutropenia reported in 57% of pts. The median onset of neutropenia was 15 days. Pulmonary embolism (5% of pts); upper respiratory tract infections including influenza, laryngitis, nasopharyngitis, pharyngitis, rhinitis, sinusitis (31% of pts); peripheral neuropathy (31% of pts); cheilitis, glossitis, glossodynia, mouth ulceration, stomatitis (25% of pts); epistaxis (11% of pts) were reported.

Nursing considerations

Baseline assessment
Obtain baseline ANC, CBC. Confirm estrogen receptor–positive, HER2-negative status. Verify pregnancy status before start of each cycle. Screen for history of pulmonary embolism. Receive full medication history and screen for interactions. Assess hydration status. Screen for active infection. Offer emotional support.

**Intervention/evaluation**

Monitor ANC, CBC at start of each cycle and on day 14 on the first two cycles. If any grade 3 or 4 hematologic toxicity occurs, repeat CBC 7 days after interruption of therapy and at start of next cycle. If neutropenia occurs specifically, recommend treatment interruption, dose reduction, or delay in starting treatment for next cycle. Monitor for neurotoxicity (peripheral neuropathy), epistaxis. If chest pain, dyspnea, tachycardia occurs, provide supplemental O₂ and obtain radiologic testing to rule out pulmonary embolism.

**Patient/family teaching**

- Blood levels will monitored regularly.
- Treatment may cause fetal harm. Women of childbearing potential should use effective contraception during treatment and up to 2 wks following discontinuation. Immediately report suspected pregnancy. Do not breastfeed.
- Immediately report chest pain, difficult breathing, fast heart rate, rapid breathing; may indicate life-threatening blood clot in the lungs.
- Report symptoms of bone marrow suppression or infection such as bruising easily, chills, cough, dizziness, fainting, fever, shortness of breath, weakness.
- Swallow capsules whole; do not chew, crush, cut, or open capsules.
- Take each dose with food.
- Treatment may increase risk of infection, nosebleeds.
- Drink plenty of fluids.
- Do not ingest grapefruit products or herbal supplements.
- Avoid crowds, those with active infection.

**paliperidone**

pal-ee-*per*-i-done

Invega

Invega Sustenna
Invega Trinza

**CLASSIFICATION**
- **PHARMACOTHERAPEUTIC**: Benzisoxazole derivative.
- **CLINICAL**: Second-generation (atypical) antipsychotic.

**BLACK BOX ALERT**
- Elderly pts with dementia-related psychosis are at increased risk for mortality due to cerebrovascular events.

**Uses**

**Oral**: Treatment of schizophrenia. Acute treatment of schizoaffective disorder as monotherapy or as adjunct to mood stabilizers and/or antidepressants. **Injection**: Acute and maintenance treatment of schizophrenia. **OFF-LABEL**: Treatment of irritability associated with autistic disorder.

**Precautions**

**Contraindications**: Sensitivity to paliperidone, risperiDONE. **Cautions**: History of cardiac arrhythmias, mild renal impairment (not recommended in moderate to severe impairment), diabetes, HF, active seizures or predisposition to seizures, history of seizures, cardiovascular disease, congenital long QT syndrome, concomitant use with other medications that prolong QT interval, pts at risk for aspiration pneumonia. May increase risk of stroke in pts with dementia-related psychosis. CNS depression, concomitant use of antihypertensives, hypovolemia or dehydration, high risk for suicide. Pts with breast cancer, other prolactin-dependent tumors; children, adolescents.

**Action**

Exact mechanism of action is unknown, but may antagonize DOPamine and serotonin receptors. **Therapeutic Effect**: Suppresses behavioral response in psychosis.

**Pharmacokinetics**

Absorbed from GI tract. Metabolized in liver. Primarily excreted in urine. **Half-**
life: 23 hrs.

Lifespan considerations

Pregnancy/Lactation: Unknown if drug crosses placenta or is distributed in breast milk. Children: Safety and efficacy not established. Elderly: Potential for orthostatic hypotension. Age-related renal impairment may require dosage adjustment.

Interactions

DRUG: May decrease effects of DOPamine agonists, levodopa. Alcohol, CNS depressants (e.g., LORazepam, morphine, zolpidem) may increase CNS depression. HERBAL: None significant. FOOD: None known. LAB VALUES: May increase serum creatine phosphatase, uric acid, triglycerides, ALT, AST, prolactin. May decrease serum potassium, sodium, protein, glucose.

Availability (Rx)

Injection Suspension (Invega Sustenna): 39 mg/0.25 mL, 78 mg/0.5 mL, 117 mg/0.75 mL, 156 mg/mL, 234 mg/1.5 mL. (Invega Trinza): 273 mg, 410 mg, 546 mg, 819 mg.

Tablets, Extended-Release: 1.5 mg, 3 mg, 6 mg, 9 mg.

Administration/handling

PO

• May give without regard to food.
• Do not break, crush, dissolve, or divide extended-release tablets.

IM

• Administer both initial injections (first injection on day 1 and the second injection 1 wk later) into deltoid muscle (helps attain therapeutic concentration rapidly).
• Maintenance doses may be given in gluteal or deltoid muscle.

Indications/routes/dosage
Treatment of Schizophrenia

**PO: ADULTS, ELDERLY:** Initially, 6 mg once daily in the morning. May increase dose in increments of 3 mg/day at intervals of more than 5 days. Range: 3–12 mg/day. **ADOLESCENTS (51 KG OR GREATER):** Initially, 3 mg once daily. Range: 3–12 mg/day. **(50 KG OR LESS):** Initially, 3 mg once daily. Range: 3–6 mg/day.

**IM: (Invega Sustenna): ADULTS, ELDERLY:** Initially, 234 mg on day 1 followed by 156 mg 1 wk later (second dose may be given 4 days before or after the wkly time point). **Maintenance:** Following the 1-wk initiation regimen, begin 117 mg monthly. Range: 39–234 mg (based on response and tolerability). Monthly maintenance dose may be given 7 days before or after the monthly time point. **(Invega Trinza):** 273 mg to 819 mg q3mos (based on last dose of Invega Sustenna). Three-month IM used only after monthly IM dose established for at least 4 mos. The last 2 mos of monthly IM should be the same dosage strength before starting 3-mo injections.

Schizoaffective Disorder

**PO: ADULTS, ELDERLY:** 6 mg once daily in the morning. May increase in increments of 3 mg/day at intervals of more than 4 days. Range: 3–12 mg/day.

**IM: ADULTS, ELDERLY:** Initially, 234 mg, then 156 mg 1 wk later. **Maintenance range:** 78–234 mg monthly (based on response and tolerability). May be given 7 days before or after the monthly time point.

</table>

Dosage in Hepatic Impairment

No dose adjustment.

Side effects
Occasional (14%–4%): Tachycardia, headache, drowsiness, akathisia, anxiety, dizziness, dyspepsia, nausea.

**Adverse effects/toxic reactions**

Neuroleptic malignant syndrome (NMS), hyperpyrexia, muscle rigidity, change in mental status, unstable pulse or B/P, tachycardia, diaphoresis, cardiac arrhythmias, rhabdomyolysis, acute renal failure, tardive dyskinesia (protrusion of tongue, puffing of cheeks, chewing/puckering of mouth) may occur rarely. May prolong QT interval.

**Nursing considerations**

**Baseline assessment**

Obtain baseline renal function tests. Assess behavior, appearance, emotional status, response to environment, speech pattern, thought content. Screen for comorbidities as listed in Precautions.

**Intervention/evaluation**

Monitor B/P, heart rate, weight, renal function tests, EKG. Monitor for fine tongue movement (may be first sign of tardive dyskinesia). Supervise suicidal-risk pt closely during early therapy (as depression lessens, energy level improves, increasing suicide potential). Assess for therapeutic response (greater interest in surroundings, improved self-care, increased ability to concentrate, relaxed facial expression). Monitor for potential neuroleptic malignant syndrome (fever, muscle rigidity, unstable B/P or pulse, altered mental status).

**Patient/family teaching**

- Avoid tasks that may require alertness, motor skills until response to drug is established.
- Use caution when changing position from lying or sitting to standing.
- Report trembling in fingers, altered gait, unusual muscle/skeletal movements, palpitations, severe dizziness, fainting, swelling/pain in breasts, visual changes, rash, difficulty in breathing.

**palonosetron**
**Aloxi**

**Fixed-Combination(s)**

**Akynzeo:** palonosetron/netupitant (a substance P/neurokinin receptor antagonist): 0.5 mg/300 mg.

**CLASSIFICATION**

**PHARMACOTHERAPEUTIC:** 5-HT₃ receptor antagonist.

**CLINICAL:** Antiemetic.

Do not confuse Aloxi with Eloxatin or oxaliplatin, or palonosetron with dolasetron, granisetron, or ondansetron.

**Uses**

Prevention of acute and delayed nausea/vomiting associated with initial/repeated courses of moderately or highly emetogenic chemotherapy. Prevention of postop nausea/vomiting for up to 24 hrs following surgery.

**Precautions**

**Contraindications:** Hypersensitivity to palonosetron. **Cautions:** History of cardiovascular disease; congenital long QT syndrome, risk factors for QT prolongation (hypokalemia, hypomagnesemia), medications that prolong QT interval or reduce potassium/magnesium levels, pts at risk for ventricular arrhythmias.

**Action**

Acts centrally in chemoreceptor trigger zone, peripherally at vagal nerve terminals. **Therapeutic Effect:** Fewer episodes of nausea/vomiting associated with chemotherapy or postoperative recovery.

**Pharmacokinetics**

Protein binding: 52%. Metabolized in liver. Excreted in urine. **Half-life:** 40 hrs.
Lifespan considerations

**Pregnancy/Lactation:** Unknown if distributed in breast milk. **Children:** Safety and efficacy not established. **Elderly:** No age-related precautions noted.

Interactions

**DRUG:** FentaNYL, lithium, MAOIs (e.g., phenelzine, selegiline), SNRIs (e.g., DULoxetine, venlafaxine), SSRIs (e.g., citalopram, FLUoxetine, sertraline), tricyclic antidepressants (e.g., amitriptyline, doxepin) may increase risk of serotonin syndrome. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** May transiently increase serum bilirubin, ALT, AST.

Availability (Rx)

**Injection Solution:** 0.25 mg/5 mL.

Administration/handling

**IV**

**Reconstitution**
• Give undiluted as IV push.

**Rate of Administration**
• Give IV push over 30 sec. Children: Infuse over 15 min.
• Flush infusion line with 0.9% NaCl before and following administration.

**Storage**
• Store at room temperature. Solution should appear colorless, clear. Discard if cloudy precipitate forms.

**IV Compatibilities**

Famotidine (Pepcid), LORazepam (Ativan), midazolam (Versed), potassium chloride.

Indications/routes/dosage

**Chemotherapy-Induced Nausea/Vomiting**
**IV: ADULTS, ELDERLY:** 0.25 mg as single dose 30 min before starting chemotherapy. **CHILDREN 1 MO TO YOUNGER THAN 17 YRS:** 20 mcg/kg as single dose 30 min before starting chemotherapy. **Maximum:** 1.5 mg.

**Postop Nausea/Vomiting**
**IV: ADULTS, ELDERLY:** 0.075 mg over 10 sec immediately before induction of anesthesia.

**Dosage in Renal/Hepatic Impairment**
No dose adjustment.

**Side effects**
**Occasional (9%–5%):** Headache, constipation. **Rare (less than 1%):** Diarrhea, dizziness, fatigue, abdominal pain, insomnia.

**Adverse effects/toxic reactions**
Overdose may produce combination of CNS stimulation, depressant effects. May prolong QT interval. 5-HT₃ receptor antagonists are known to potentiate serotonin syndrome, esp. in pts taking serotonergic medications.

**Nursing considerations**

**Baseline assessment**
Obtain BMP, serum magnesium in pts at risk for hypokalemia, hypomagnesemia, QT interval prolongation. Assess for signs of dehydration due to excessive vomiting (poor skin turgor, dry mucous membranes). Question history of cardiac disease, long QT syndrome, cardiac arrhythmias. Screen for concomitant home medications that prolong QT interval, increase risk of serotonin syndrome. Provide emotional support.

**Intervention/evaluation**
Monitor BMP, serum magnesium; EKG in pts suspected of arrhythmia, QT interval prolongation. Assess for symptoms of serotonin syndrome (e.g., altered

**Patient/family teaching**

- Relief from nausea/vomiting generally occurs shortly after drug administration.
- Avoid alcohol, barbiturates.
- Report persistent vomiting.
- Report palpitations, light-headedness, fainting; allergic reactions of any kind.

<table>
<thead>
<tr>
<th>pamidronate</th>
</tr>
</thead>
<tbody>
<tr>
<td><em>pam</em>-id-roe*-nate</td>
</tr>
<tr>
<td><strong>Aredia</strong></td>
</tr>
</tbody>
</table>

**CLASSIFICATION**

**PHARMACOTHERAPEUTIC**: Bisphosphonate.

**CLINICAL**: Hypocalcemic.

Do not confuse Aredia with Adriamycin, or pamidronate with alendronate, ibandronate, or risedronate.

**Uses**

Treatment of moderate to severe hypercalcemia associated with malignancy (with/without bone metastases). Treatment of moderate to severe Paget’s disease, osteolytic bone lesions of multiple myeloma or metastatic breast cancer. **OFF-LABEL**: Inhibits bone resorption in osteogenesis imperfecta, treatment of bone metastases of thyroid cancer, prevention of bone loss associated with androgen deprivation treatment in prostate cancer.

**Precautions**

**Contraindications**: Hypersensitivity to pamidronate, other bisphosphonates (e.g., etidronate, tiludronate, risedronate, alendronate). **Cautions**: Renal impairment, concurrent use with other nephrotoxic medications, history of thyroid surgery. Preexisting anemia, leukopenia, thrombocytopenia.
**Action**

Inhibits bone resorption, decreases mineralization by disrupting activity of osteoclasts. **Therapeutic Effect:** Lowers serum calcium concentration.

**Pharmacokinetics**

<table>

</tbody>
</table>

After IV administration, rapidly absorbed by bone. Slowly excreted unchanged in urine. Unknown if removed by hemodialysis. **Half-life:** 21–35 hrs.

**Lifespan considerations**

**Pregnancy/Lactation:** Unknown if crosses placenta. Recommend discontinuation of drug as early as possible before a planned pregnancy. Unknown if fetal harm can occur. Unknown if distributed in breast milk. **Children:** Safety and efficacy not established. **Elderly:** May become overhydrated. Careful monitoring of fluid and electrolytes indicated; recommend dilution in smaller volume.

**Interactions**

**DRUG:** Nephrotoxic medications (e.g., acyclovir, amphotericin B, diclofenac, gentamicin, IV contrast dye, NSAIDs, vancomycin) may increase potential for nephrotoxicity. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** None significant.

**Availability (Rx)**

**Injection, Powder for Reconstitution:** 30 mg, 90 mg. **Injection Solution:** 3 mg/mL, 6 mg/mL, 9 mg/mL.

**Administration/handling**

**IV**

Reconstitution
• Reconstitute each vial with 10 mL Sterile Water for Injection to provide concentration of 3 mg/mL or 9 mg/mL.
• Allow drug to dissolve before withdrawing.
• Further dilute with 250–1,000 mL sterile 0.45% or 0.9% NaCl or D5W (1,000 mL for hypercalcemia of malignancy, 500 mL for Paget’s disease, multiple myeloma, 250 mL for breast cancer).

**Rate of Administration**
• Adequate hydration is essential in conjunction with pamidronate therapy (avoid overhydration in pts with potential for HF).
• Administer as IV infusion over 2–24 hrs for treatment of hypercalcemia; over 2 hrs for breast cancer; over 4 hrs for Paget’s disease or multiple myeloma.

**Storage**
• Store parenteral form at room temperature.
• Reconstituted vial is stable for 24 hrs if refrigerated; IV solution is stable for 24 hrs after dilution.

### IV incompatibilities
Calcium-containing IV fluids.

### Indications/routes/dosage

**Hypercalcemia of Malignancy**

**IV Infusion:** ADULTS, ELDERLY: Moderate hypercalcemia (corrected serum calcium level 12–13.5 mg/dL): 60–90 mg as a single dose over 2–24 hrs. Severe hypercalcemia (corrected serum calcium level greater than 13.5 mg/dL): 90 mg as a single dose over 2–24 hrs.

**Paget’s Disease**

**IV Infusion:** ADULTS, ELDERLY: 30 mg/day over 4 hrs for 3 consecutive days.

**Osteolytic Bone Lesion (Multiple Myeloma)**

**IV Infusion:** ADULTS, ELDERLY: 90 mg over 4 hrs once monthly.

**Osteolytic Bone Lesion (Breast Cancer)**
**IV Infusion:** **ADULTS, ELDERLY:** 90 mg over 2 hrs q3–4wks.

**Dosage in Renal Impairment**
Not recommended.

**Dosage in Hepatic Impairment**
No dose adjustment.

**Side effects**

**Frequent (27%–18%):** Temperature elevation (at least 1°C) 24–48 hrs after administration; erythema, swelling, induration, pain at catheter site in pts receiving 90 mg; anorexia, nausea, fatigue. **Occasional (10%–1%):** Constipation, rhinitis.

**Adverse effects/toxic reactions**

Hypophosphatemia, hypokalemia, hypomagnesemia, hypocalcemia occur more frequently with higher dosages. Anemia, hypertension, tachycardia, atrial fibrillation, drowsiness occur more frequently with 90-mg doses. GI hemorrhage occurs rarely.

**Nursing considerations**

**Baseline assessment**
Obtain CBC, serum calcium, ionized calcium, magnesium, phosphate; renal function test level prior to therapy. Determine hydration status.

**Intervention/evaluation**
Patient/family teaching

- Report symptoms of low blood calcium levels, including confusion, muscle twitching/cramps, numbness, seizures, tingling, jaw pain.
- Immediately report GI bleeding.

**panitumumab**

pan-i-toom-ue-mab

**Vectibix**

**CLASSIFICATION**

**PHARMACOTHERAPEUTIC:** Epidermal growth factor receptor (EGFR) inhibitor, monoclonal antibody.

**CLINICAL:** Antineoplastic.

- **BLACK BOX ALERT** - 90% of pts experience dermatologic toxicities (dermatitis acneiform, pruritus, erythema, rash, skin exfoliation, skin fissures, abscess). Severe infusion reactions (anaphylaxis, bronchospasm, fever, chills, hypotension), fatal reactions have occurred.

**Uses**

Treatment of wild-type RAS metastatic colorectal cancer either as first-line therapy in combination with FOLFOX or as monotherapy following disease progression after prior treatment with fluoropyrimidine-, oxaliplatin-, or irinotecan-based regimens.

**Precautions**

- **Contraindications:** Hypersensitivity to panitumumab. **Cautions:** Interstitial pneumonitis, pulmonary fibrosis, pulmonary infiltrates, renal impairment, baseline electrolyte imbalance. Not indicated in pts with RAS-mutant metastatic colorectal cancer or for whom RAS mutation status is unknown.

**Action**

Binds specifically to epidermal growth factor receptor (EGFR) and
competitively inhibits binding of epidermal growth factor. **Therapeutic Effect:** Inhibits tumor cell growth and metastasis.

### Pharmacokinetics

Clearance varies by body weight, gender, tumor burden. **Half-life:** 3–10 days.

#### Lifespan considerations

**Pregnancy/Lactation:** May cause fetal harm. May impair fertility. May decrease fetal body weight, increase risk of skeletal fetal abnormalities. Use effective contraception during and for at least 6 mos after treatment. Breastfeeding not recommended. **Children:** Safety and efficacy not established. **Elderly:** No age-related precautions noted.

### Interactions

**DRUG:** None significant. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** May decrease serum magnesium, calcium.

### Availability (Rx)

**Injection Solution:** 20 mg/mL vial (5-mL, 20-mL vials).

### Administration/handling

#### IV

**Alert** Do not give by IV push or bolus. Use low protein-binding 0.2- or 0.22-micron in-line filter. Flush IV line before and after chemotherapy administration with 0.9% NaCl.

**Reconstitution**

- Dilute in 100–150 mL 0.9% NaCl to provide concentration of 10 mg/mL or less.
- Do not shake solution. Invert gently to mix.
- Discard any unused portion.

**Rate of Administration**

- Give as IV infusion over 60 min.
- Infuse doses greater than 1,000 mg over 90 min.
**Storage**
- Refrigerate vials.
- After dilution, solution may be stored for up to 6 hrs at room temperature, up to 24 hrs if refrigerated.
- Discard if discolored, but solution may contain visible, translucent-to-white particulates (will be removed by in-line filter).

**IV incompatibilities**
Do not mix with dextrose solutions or any other medications.

**Indications/routes/dosage**

<alert>Stop infusion immediately in pts experiencing severe infusion reactions.</alert>

**Metastatic Colorectal Cancer**

**IV Infusion:** **ADULTS, ELDERLY:** 6 mg/kg given over 60 min once every 14 days. Doses greater than 1,000 mg should be infused over 90 min. Continue until disease progression or unacceptable toxicity.

**Dose Modification**

**Infusion Reactions**

**Mild to moderate reactions:** Reduce infusion rate by 50% for remainder of infusion. **Severe reactions:** Discontinue infusion. Depending on severity, consider permanent discontinuation.

**Skin Toxicity**

For all CTCAE grade 3 skin toxicities, withhold treatment for 1–2 doses until improved to better than grade 3. Then, reduce dose as follows: **First occurrence of CTCAE grade 3:** Resume at same dose. **Second occurrence of CTCAE grade 3:** Reduce dose to 80% of initial dose. **Third occurrence of CTCAE grade 3:** Reduce dose to 60% of initial dose. **Fourth occurrence of CTCAE grade 3:** Permanently discontinue.

**Dosage in Renal/Hepatic Impairment**
No dose adjustment.

**Side effects**

**Common (65%–57%):** Erythema, acneiform dermatitis, pruritus. **Frequent (26%–20%):** Fatigue, abdominal pain, skin exfoliation, paronychia (soft tissue infection around nailbed), nausea, rash, diarrhea, constipation, skin fissures. **Occasional (19%–10%):** Vomiting, acne, cough, peripheral edema, dry skin. **Rare (7%–2%):** Stomatitis, mucosal inflammation, eyelash growth, conjunctivitis, increased lacrimation.

**Adverse effects/toxic reactions**

Pulmonary fibrosis, severe dermatologic toxicity (complicated by infectious sequelae) occur rarely. Severe infusion reactions manifested as bronchospasm, fever, chills, hypotension occur rarely. Hypomagnesemia occurs in 39% of pts. Life-threatening and/or fatal bullous fasciitis, abscess, sepsis were reported. Severe dehydration and diarrhea may increase risk of acute renal failure. Exposure to sunlight may exacerbate skin toxicities. May cause ocular toxicities including keratitis, ulcerative keratitis, corneal ulceration.

**Nursing considerations**

**Baseline assessment**

Assess serum magnesium, calcium prior to therapy, periodically during therapy, and for 8 wks after completion of therapy. Assess KRAS mutational status in colorectal tumors and confirm the absence of a RAS mutation.

**Intervention/evaluation**

Assess for skin, ocular, mucosal, pulmonary toxicity; report effects. Median time to development of skin/ocular toxicity is 14–15 days; resolution after last dosing is 84 days. Monitor serum electrolytes for hypomagnesemia, hypocalcemia. Offer antiemetic if nausea/vomiting occurs. Monitor daily pattern of bowel activity, stool consistency.

**Patient/family teaching**
• Do not have immunizations without physician’s approval (drug lowers resistance).
• Avoid contact with those who have recently received a live virus vaccine.
• Avoid crowds, those with infection.
• There is a potential risk for development of fetal abnormalities if pregnancy occurs; take measures to prevent pregnancy.
• Report skin reactions, including rash, sloughing, blisters, erosions.
• Report difficulty breathing, fever with cough, lung pain; may indicate life-threatening lung inflammation.
• Limit sun, UV exposure. Wear protective sunscreen, hats, and clothing while outdoors.

**panobinostat**

**pan-oh-bin-oh-stat**

**Farydak**

**CLASSIFICATION**

PHARMACOTHERAPEUTIC: Histone deacetylase inhibitor.

CLINICAL: Antineoplastic.

■ **BLACK BOX ALERT** ■ Severe cases of diarrhea reported in 25% of pts. If diarrhea occurs, interrupt treatment, initiate antidiarrheal therapy, and then reduce or discontinue treatment. Severe and/or fatal cases of cardiac arrhythmias, cardiac ischemic events, EKG changes may occur. Electrolyte abnormalities may increase risk of arrhythmias. Obtain EKG, serum electrolytes at baseline and monitor during treatment.

Do not confuse panobinostat with febuxostat or pentostatin.

**Uses**

Used in combination with bortezomib and dexamethasone for treatment of pts with multiple myeloma who have received at least 2 prior regimens, including bortezomib and an immunomodulatory agent.

**Precautions**
**Contraindications:** Hypersensitivity to panobinostat. **Cautions:** Congenital long QT syndrome, concurrent medications that prolong QT interval, electrolyte abnormalities (hypokalemia, hypomagnesemia), renal impairment. Not recommended in pts with recent MI or unstable angina, severe hepatic impairment. Concurrent use of strong CYP3A inhibitors and/or CYP3A inducers, CYP2D6 substrates not recommended. Preexisting myelosuppression. Avoid use in pts with active infection.

**Action**

Inhibits enzymatic activity of histone deacetylase. Increases acetylation of histone proteins, resulting in cell cycle arrest and/or cellular death (apoptosis). **Therapeutic Effect:** Inhibits tumor growth and metastasis. Promotes tumor cell death.

**Pharmacokinetics**

Widely distributed. Extensively metabolized. Protein binding: 90%. Peak plasma concentration: 2 hrs. Excreted in feces (44%–77%), urine (29%–51%). **Half-life:** 37 hrs.

**Lifespan considerations**

**Pregnancy/Lactation:** Avoid pregnancy; may cause fetal harm/malformations. Females of reproductive potential should use effective contraception during treatment and up to 1 mo after discontinuation. Unknown if distributed in breast milk. **Males:** Males should use condoms during sexual activity during treatment and up to 3 mos after discontinuation. **Children:** Safety and efficacy not established. **Elderly:** May have increased risk of adverse effects (e.g., cardiac/GI/hematologic toxicities).

**Interactions**

**DRUG:** Strong CYP3A inhibitors (e.g., clarithromycin, ketoconazole, ritonavir) may increase concentration/effect. Strong CYP3A inducers (e.g., carBAMazepine, rifAMPin) may decrease concentration/effect. May increase concentration/effects of **CYP2D6 substrates** (e.g., metoprolol, venlafaxine). Medications prolonging QT interval (e.g., amiodarone, azithromycin,
ceritinib, haloperidol, moxifloxacin) not recommended. HERBAL: St. John’s wort may decrease concentration/effect. FOOD: High-fat meals may delay absorption. Grapefruit products may increase concentration/effect. LAB VALUES: May decrease Hct, Hgb, leukocytes, lymphocytes, neutrophils, platelets; serum albumin, calcium, potassium, sodium. May increase serum bilirubin, creatinine, magnesium. May increase or decrease phosphate.

Availability (Rx)
Capsules: 10 mg, 15 mg, 20 mg.

Administration/handling

PO
• May give without regard to food; avoid grapefruit products (dexamethasone should be given with food to decrease GI upset).
• Administer capsule whole; do not break, cut, crush, or open.
• If vomiting occurs after dosing, do not readminister dose; give dose at next scheduled time.

Indications/routes/dosage

Multiple Myeloma
PO: ADULTS, ELDERLY: 20 mg once every other day for 3 doses/wk during wk 1 and 2 of each 21-day cycle for up to 8 cycles, in combination with bortezomib and dexamethasone. Consider continuing treatment for additional 8 cycles based on tolerability. Total duration: Up to 16 cycles (48 wks). Recommended dose of bortezomib: 1.3 mg/m² as injection/day per dosing schedule. Recommended dose of dexamethasone: 20 mg orally/day on a full stomach per dosing schedule.

Dosing Schedule for Cycles 1–8 of 21-Day Cycle
Week 1: Panobinostat: days 1, 3, 5. Bortezomib: days 1, 4. Dexamethasone: days 1, 2, 4, 5.
Week 2: Panobinostat: days 8, 10, 12. Bortezomib: days 8, 11. Dexamethasone: days 8, 9, 11, 12.
Week 3: Rest period (all 3 drugs).

Dosing Schedule for Cycles 9–16 of 21-Day Cycle

Week 1: Panobinostat: days 1, 3, 5. Bortezomib: day 1 only. Dexamethasone: days 1, 2.
Week 2: Panobinostat: days 8, 10, 12. Bortezomib: day 8 only. Dexamethasone: days 8, 9.
Week 3: Rest period (all 3 drugs).

Dose Reduction for Adverse Events

If reduction required, reduce panobinostat in increments of 5 mg. If the reduced dose is less than 10 mg 3 times/wk, discontinue treatment. Keep same schedule (21-day cycle) when dose reduced.

Dose Modification for Clinical Toxicities

Based on Common Terminology Criteria for Adverse Events (CTCAE).

Thrombocytopenia

Grade 3: No dose adjustment. Bortezomib: No dose adjustment. **Grade 3 with bleeding/grade 4:** Interrupt treatment until platelet count 50,000 cells/mm³ or greater, then resume at reduced dose. **Bortezomib:** Interrupt bortezomib until platelet count 75,000 cells/mm³ or greater. If only 1 dose was held prior to resolution of platelet count, resume bortezomib at same dose. If more than 2 doses were held consecutively, resume bortezomib at reduced dose.

Neutropenia

Grade 3: No dose adjustment. Bortezomib: No dose adjustment. **Two or more occurrences of grade 3:** Interrupt treatment until ANC 1,000 cells/mm³ or greater, then resume at same dose. **Bortezomib:** No dose adjustment. **Grade 3 with febrile neutropenia/grade 4:** Interrupt treatment until febrile neutropenia resolves and ANC is 1,000 cells/mm³ or greater, then resume at reduced dose. **Bortezomib:** Interrupt bortezomib until febrile neutropenia resolves and ANC is 1,000 cells/mm³ or greater. If only 1 dose was held prior resolution of platelet count, resume bortezomib at same dose. If more than 2 doses were held consecutively, resume bortezomib at reduced dose.
Anemia

**Grade 3:** Interrupt panobinostat until Hgb greater than or equal to 10 g/dL, then resume at reduced dose. **Bortezomib:** Not specified.

Diarrhea

**Grade 2:** Interrupt treatment until resolved, then resume at same dose. **Bortezomib:** Consider interruption of bortezomib until resolved, then resume at same dose. **Grade 3 or hospitalization/administration of IV fluids:** Interrupt until resolved, then resume bortezomib at reduced dose. **Bortezomib:** Interrupt until resolved, then resume bortezomib at reduced dose. **Grade 4:** Permanently discontinue panobinostat and bortezomib.

Nausea/Vomiting

**Grade 3 or 4:** Interrupt until resolved, then resume at reduced dose. **Bortezomib:** Not specified.

Other Toxicities (Other CTCAE Grades)

**Any grade 2 recurrence, any other grade 3 or 4:** Interrupt until resolved to grade 1 or 0, then resume at reduced dose. **Bortezomib:** Not specified. **Any other grade 3 or 4 recurrence:** Consider further dose reduction once resolved to grade 1 or 0.

Concomitant Use of Strong CYP3A Inhibitors

PO: **ADULTS, ELDERLY:** 10 mg per dosing schedule.

Dosage in Renal Impairment

No dose adjustment.

Dosage in Hepatic Impairment

PO: **ADULTS, ELDERLY:** Mild impairment: 15 mg per dosing schedule. Moderate impairment: 10 mg per dosing schedule. **Severe impairment:** Treatment not recommended.

Side effects
**Frequent (60%–2%):** Fatigue, asthenia, lethargy, diarrhea, nausea, peripheral edema, decreased appetite, vomiting, pyrexia. **Occasional (12%):** Decreased weight.

**Adverse effects/toxic reactions**

Anemia, leukopenia, neutropenia, thrombocytopenia are expected responses to therapy. Diarrhea occurred in 68% of pts. Severe cases of diarrhea occurred in 25% of pts. Cardiac toxicities such as cardiac ischemic events, ST-segment depression, T-wave abnormalities were reported. Cardiac arrhythmias including atrial fibrillation, atrial flutter, bradycardia, SVT, atrial/ventricular/sinus tachycardia occurred in 12% of pts. Severe thrombocytopenia may increase risk of fatal hemorrhage. Infectious processes such as bacterial infections, invasive fungal infections, pneumonia, sepsis, viral infections were reported. Severe and/or fatal infections occurred in 31% of pts.

**Nursing considerations**

**Baseline assessment**

Obtain CBC, BMP, LFT; serum magnesium, phosphate; EKG, vital signs. Correct electrolyte imbalances prior to each cycle. Verify platelet count is at least 100,000 cells/mm$^3$, ANC is 1,500 cells/mm$^3$, QTc interval is less than 450 msec on EKG prior to each cycle. Verify pregnancy status. Assess hydration status, usual stool characteristics. Question history if acute MI, unstable angina, arrhythmia. Screen for active infection.

**Intervention/evaluation**

Monitor CBC, BMP; serum magnesium, phosphate wkly; LFT as indicated; vital signs. Monitor EKG periodically. If QTc interval increases to greater than 480 msec on EKG, interrupt treatment and correct any electrolyte abnormalities. If QT prolongation does not resolve, permanently discontinue treatment. Initiate medical management for nausea, vomiting, diarrhea prior to any interruption or dose reduction. Consider blood transfusion in pts with severe anemia, thrombocytopenia. Diligently monitor daily pattern bowel activity, stool consistency. Start antidiarrheal therapy at first sign of loose stool/diarrhea. Obtain 2D cardiac echocardiogram, EKG if cardiac decompensation is
suspected. Monitor for infection.

**Patient/family teaching**

- Blood levels will be monitored regularly.
- Treatment may cause fetal harm. Women of childbearing potential should use effective contraception during treatment and up to 1 mo after final dose. Immediately report suspected pregnancy. Do not breastfeed.
- Therapy may reduce fertility in both female and male pts.
- Male pts must use condoms during sexual activity.
- Report liver problems such as upper abdominal pain, bruising, dark or amber-colored urine, nausea, vomiting, or yellowing of the skin or eyes; heart problems such as chest tightness, dizziness, fainting, palpitations, shortness of breath; kidney problems such as dark-colored urine, decreased urine output, extremity swelling, flank pain; skin changes such as rash, redness.
- Report mouth ulceration, jaw pain.
- Swallow capsules whole; do not chew, crush, cut, or open capsules.
- Treatment may increase risk of bleeding, nosebleeds.
- Drink plenty of fluids.
- Report the first signs of abdominal cramping, loose stool, diarrhea.

<tbody>
<tr>
<td>pan-toe-pra-zole</td>
</tr>
<tr>
<td>Apo-Pantoprazole</td>
</tr>
</tbody>
</table>

**Protonix**

**CLASSIFICATION**

**PHARMACOTHERAPEUTIC:** Benzimidazole.

**CLINICAL:** Proton pump inhibitor.

Do not confuse pantoprazole with ARIPiprazole.

**Uses**

**PO:** Treatment, maintenance of healing of erosive esophagitis associated with gastroesophageal reflux disease (GERD). Reduction of relapse rate of heartburn symptoms in GERD. Treatment of hypersecretory conditions including Zollinger-Ellison syndrome. **IV:** Short-term treatment of erosive esophagitis associated with GERD, treatment of hypersecretory conditions. **OFF-LABEL:**
Peptic ulcer disease, active ulcer bleeding (injection), adjunct in treatment of *H. pylori*, stress ulcer prophylaxis in critically ill pts.

**Precautions**

**Contraindications:** Hypersensitivity to pantoprazole, other proton pump inhibitors (e.g., omeprazole). **Cautions:** May increase risk of fractures, GI infections.

**Action**

Irreversibly binds to, inhibits hydrogen-potassium adenosine triphosphate, an enzyme on surface of gastric parietal cells. Inhibits hydrogen ion transport into gastric lumen. **Therapeutic Effect:** Increases gastric pH, reduces gastric acid production.

**Pharmacokinetics**

<table>
<thead>

Well absorbed from GI tract. Protein binding: 98% (primarily albumin). Primarily distributed into gastric parietal cells. Metabolized in liver. Primarily excreted in urine. Not removed by hemodialysis. **Half-life:** 1 hr.

**Lifespan considerations**

**Pregnancy/Lactation:** Unknown if drug crosses placenta or is distributed in breast milk. **Children:** Safety and efficacy not established. **Elderly:** No age-related precautions noted.

**Interactions**

**DRUG:** May increase effects of warfarin. May decrease effects of atazanavir, captopril, clopidogrel, dasatinib, nelfinavir. **HERBAL:** Ginger, goldenseal may decrease effect. **FOOD:** None known. **LAB VALUES:** May increase serum creatinine, cholesterol, uric acid, glucose, lipoprotein, ALT.
**Availability (Rx)**

Granules for Suspension: 40 mg/packet. Injection, Powder for Reconstitution (Protonix): 40 mg.

Tablets (Delayed-Release [Protonix]): 20 mg, 40 mg.

**Administration/handling**

- **PO**
  - May be given without regard to food. Best given before breakfast.
  - Do not break, crush, dissolve, or divide tablets; give whole.
  - Administer oral suspension only in apple juice or applesauce. Best taken 30 min before a meal.

- **IV Compatibilities**
  DOPamine, EPINEPHrine, furosemide (Lasix), insulin (regular), potassium chloride, vasopressin.

- **IV incompatibility**
  DOBUTamine.
Indications/routes/dosage

Erosive Esophagitis
PO: ADULTS, ELDERLY: 40 mg/day for up to 8 wks. If not healed after 8 wks, may continue an additional 8 wks. CHILDREN 5 YRS AND OLDER (WEIGHING 40 KG OR MORE): 40 mg/day for up to 8 wks. (WEIGHING 15–39 KG): 20 mg/day for up to 8 wks.
IV: ADULTS, ELDERLY: 40 mg/day for 7–10 days.

Maintenance of Healing of Erosive Esophagitis
PO: ADULTS, ELDERLY: 40 mg once daily.

Hypersecretory Conditions
PO: ADULTS, ELDERLY: Initially, 40 mg twice daily. May increase to 240 mg/day.
IV: ADULTS, ELDERLY: 80 mg twice daily. May increase to 80 mg q8h.

Prevention of Re-bleeding in Peptic Ulcer Bleed (Unlabeled)
IV: ADULTS, ELDERLY: 80 mg followed by 8 mg/hr infusion for 72 hrs or 80 mg then 40 mg q12h for 72 hrs.

Dosage in Renal/Hepatic Impairment
No dose adjustment.

Side effects
Rare (less than 2%): Diarrhea, headache, dizziness, pruritus, rash.

Adverse effects/toxic reactions
Hyperglycemia occurs rarely. May increase risk of *C. difficile*–associated diarrhea.

Nursing considerations
Baseline assessment
Question history of GI disease, ulcers, GERD.

Intervention/evaluation
Evaluate for therapeutic response (relief of GI symptoms). Question if GI discomfort, nausea occur. Monitor for abdominal pain, diarrhea (with or without fever).

Patient/family teaching
• Report abdominal pain, diarrhea (with or without fever) that does not resolve; may indicate colon infection.
• Avoid alcohol.
• Swallow tablets whole; do not chew, crush, dissolve, or divide.
• Best if given before breakfast. May give without regard to food.

PARoxetine
par-ox-e-teen
Apo-PARoxetine
Brisdelle
Novo-PARoxetine
Paxil
Paxil CR
Pexeva

CLASSIFICATION
PHARMACOTHERAPEUTIC: Selective serotonin reuptake inhibitor (SSRI).
CLINICAL: Antidepressant, antiobsessive-compulsive, antianxiety.

BLACK BOX ALERT Increased risk of suicidal thinking and behavior in children, adolescents, young adults 18–24 yrs with major depressive disorder, other psychiatric disorders.

Do not confuse PARoxetine with piroxicam, FLUoxetine or pyridoxine, or
Paxil with Doxil, Plavix, PROzac, or Taxol.

**Uses**

**Precautions**

**Contraindications:** Hypersensitivity to PARoxetine. Concurrent use of MAOIs with or within 14 days of MAOIs intended to treat psychiatric disorders, initiation in pts treated with linezolid or methylene blue; concomitant use with thioridazine, pimozide. *(Brisdelle):* Pregnancy. **Cautions:** History of seizures, renal/hepatic impairment, pts with suicidal tendencies, elderly pts, narrow-angle glaucoma; avoid use in first trimester of pregnancy, alcohol use.

**Action**

Selectively blocks uptake of neurotransmitter serotonin at CNS neuronal presynaptic membranes, increasing its availability at postsynaptic receptor sites. **Therapeutic Effect:** Relieves depression, reduces obsessive-compulsive behavior, decreases anxiety.

**Pharmacokinetics**

**Lifespan considerations**

**Pregnancy/Lactation:** May impair reproductive function. Not distributed in breast milk. May increase risk of congenital malformations. **Children:** Safety
and efficacy not established. **Elderly:** Age-related renal impairment may require dosage adjustment. Use caution.

**Interactions**

**DRUG:** May increase concentration, risk of toxicity of tricyclic antidepressants (e.g., amitriptyline, doxepin). Triptans, lithium, tramADol may increase risk of serotonin syndrome. Aspirin, NSAIDs (e.g., ibuprofen, ketorolac, naproxen), warfarin may increase risk of bleeding. MAOIs (e.g., phenelzine, selegiline) may cause confusion, agitation, severe seizures; increase risk of serotonin syndrome, hypertensive crises. Thioridazine may prolong QT interval. **HERBAL:** Kava kava, St. John’s wort, valerian may increase CNS depression, risk of serotonin syndrome. **FOOD:** None known. **LAB VALUES:** May decrease Hgb, Hct, WBC count.

**Availability (Rx)**

Capsules (Brisdelle): 7.5 mg. Oral Suspension (Paxil): 10 mg/5 mL. Tablets (Paxil, Pexeva): 10 mg, 20 mg, 30 mg, 40 mg.

 Crawley Tablets (Controlled-Release [Paxil CR]): 12.5 mg, 25 mg, 37.5 mg.

**Administration/handling**

**PO**

- May give without regard to food.
- Give with food, milk if GI distress occurs.
- Scored tablet may be crushed.
- Do not crush, break, dissolve, or divide controlled-release tablets.

**Indications/routes/dosage**

**Depression**

**PO: (Immediate-Release):** ADULTS: Initially, 20 mg/day. May increase by 10 mg/day at intervals of more than 1 wk. **Maximum:** 50 mg/day.

**PO: (Controlled-Release):** ADULTS: Initially, 25 mg/day. May increase by
12.5 mg/day at intervals of more than 1 wk. **Maximum:** 62.5 mg/day.

**Generalized Anxiety Disorder (GAD)**

**PO: (Immediate-Release):** **ADULTS:** Initially, 20 mg/day. May increase by 10 mg/day at intervals of more than 1 wk. Range: 20–50 mg/day.

**Obsessive-Compulsive Disorder (OCD)**

**PO: (Immediate-Release):** **ADULTS:** Initially, 20 mg/day. May increase by 10 mg/day at intervals of more than 1 wk. Range: 20–60 mg/day. **Recommended dose:** 40 mg/day.

**Panic Disorder**

**PO: (Immediate-Release):** **ADULTS:** Initially, 10–20 mg/day. May increase by 10 mg/day at intervals of more than 1 wk. Range: 10–60 mg/day.

**PO (Controlled-Release):** **ADULTS, ELDERLY:** Initially, 12.5 mg once daily. May increase by 12.5 mg/day at wkly intervals. **Maximum:** 75 mg/day.

**Social Anxiety Disorder (SAD)**

**PO: (Immediate-Release):** **ADULTS:** Initially, 20 mg/day. Range: 20–60 mg/day.

**PO (Controlled-Release):** **ADULTS, ELDERLY:** Initially, 12.5 mg once daily. May increase by 12.5 mg/day at wkly intervals. **Maximum:** 37.5 mg/day.

**Post-Traumatic Stress Disorder (PTSD)**

**PO: (Immediate-Release):** **ADULTS:** Initially, 20 mg/day. May increase by 10 mg/day at intervals of more than 1 wk. Range: 20–50 mg/day.

**Premenstrual Dysphoric Disorder (PMDD)**

**PO: (Controlled-Release):** **ADULTS:** Initially, 12.5 mg/day. May increase by 12.5 mg at wkly intervals. **Maximum:** 25 mg/day.

**Vasomotor Symptoms**

**PO: ADULTS: (Brisdelle):** 7.5 mg once daily at bedtime.

**Usual Elderly Dosage**
PO: Initially, 10 mg/day. May increase by 10 mg/day at intervals of more than 1 wk. Maximum: 40 mg/day.

PO: (Controlled-Release): Initially, 12.5 mg/day. May increase by 12.5 mg/day at intervals of more than 1 wk. Maximum: 50 mg/day.

Dosage Renal/Hepatic Impairment
CrCl less than 30 mL/min, severe hepatic impairment. Immediate-Release: Initially, 10 mg/day. May increase by 10 mg/dose at wkly intervals. Maximum: 40 mg/day. Extended-Release: Initially, 12.5 mg/day. May increase by 12.5 mg/day at wkly intervals. Maximum: 50 mg/day. Brisdelle: No dosage adjustment.

Side effects
Frequent (26%–8%): Nausea, drowsiness, headache, dry mouth, asthenia, constipation, dizziness, insomnia, diarrhea, diaphoresis, tremor. Occasional (6%–3%): Decreased appetite, respiratory disturbance (e.g., increased cough), anxiety, flatulence, paresthesia, yawning, decreased libido, sexual dysfunction, abdominal discomfort. Rare: Palpitations, vomiting, blurred vision, altered taste, confusion.

Adverse effects/toxic reactions
Hyponatremia, seizures have been reported. Serotonin syndrome (agitation, confusion, diaphoresis, hallucinations, hyperreflexia) occurs rarely.

Nursing considerations
Baseline assessment
Obtain baseline CBC, LFT, renal function test, serum sodium. Assess appearance, behavior, speech pattern, level of interest, mood.

Intervention/evaluation
For pts on long-term therapy, CBC, LFT, renal function test should be performed periodically. Assess mental status for depression, suicidal ideation (esp. at beginning of therapy or change in dosage), anxiety, social functioning, panic
attacks. Assess appearance, behavior, speech pattern, level of interest, mood.

**Patient/family teaching**
- May cause dry mouth.
- Avoid alcohol, St. John’s wort.
- Therapeutic effect may be noted within 1–4 wks.
- Do not abruptly discontinue medication.
- Avoid tasks that require alertness, motor skills until response to drug is established.
- May impair reproductive function.
- Inform physician of intention for pregnancy or if pregnancy occurs.
- Report worsening depression, suicidal ideation, unusual changes in behavior.

</tr>
</tbody>
</table>

**Uses**

Treatment of advanced renal cell carcinoma (RCC), advanced soft-tissue sarcoma (STS) (in pts previously treated with chemotherapy). **OFF-LABEL:** Advanced thyroid cancer.

**Precautions**

**Contraindications:** Hypersensitivity to PAZOPanib. **Cautions:** Avoid use of strong CYP3A4 inhibitors (e.g., clarithromycin, ketoconazole) or CYP3A inducers (carBAMazepine, rifAMPin), and grapefruit products. Cautious use in pts with increased risk or history of arterial thrombotic events (e.g., angina, MI, ischemic stroke), QT prolongation, hypokalemia, hypomagnesemia,
hypertension, severe hepatic impairment, history of hemoptysis, cerebral hemorrhage or significant GI hemorrhage. Concomitant use of medications that may prolong QT interval not recommended.

**Action**

Inhibits cell surface vascular endothelial growth factor receptors. **Therapeutic Effect:** Inhibits angiogenesis, blocks tumor growth.

**Pharmacokinetics**

Peak concentration occurs 2–4 hrs following oral administration. Metabolized in liver. Protein binding: greater than 99%. Excreted in feces (60%), urine (23%). **Half-life:** 31 hrs.

**Lifespan considerations**

**Pregnancy/Lactation:** May cause fetal harm. Unknown if distributed in breast milk. **Children:** Safety and efficacy not established in pts younger than 18 yrs. **Elderly:** No age-related precautions noted.

**Interactions**

**DRUG:** Famotidine, proton pump inhibitors (e.g., omeprazole, pantoprazole) may decrease effect. QT interval–prolonging medications (e.g., amiodarone, citalopram, dasatinib, haloperidol, levoFLOXacin, ondansetron) may prolong QT interval. CYP3A4 inhibitors (e.g., clarithromycin, ketoconazole, ritonavir) may increase concentration. CYP3A4 inducers (e.g., carBAMazepine, phenytoin, rifAMPin) may decrease concentration. Simvastatin may increase serum ALT. **Medications that increase gastric pH** may decrease concentration/effect. **HERBAL:** St. John’s wort decreases concentration. **FOOD:** Food may increase concentration. **Grapefruit products** may increase concentration, potential for torsades de pointes, myelotoxicity. **LAB VALUES:** May decrease serum phosphorus, sodium, magnesium, glucose, WBC count. May increase serum ALT, AST.

**Availability (Rx)**
Tablets: 200 mg.

Administration/handling

PO

• Give at least 1 hr before or 2 hrs after ingestion of food.
• Give tablets whole; do not break, crush, dissolve, or divide.

Indications/routes/dosage

Renal Cell Carcinoma, Soft-Tissue Sarcoma

PO: ADULTS, ELDERLY: 800 mg once daily. If concomitant CYP3A4 inhibitor cannot be discontinued, reduce initial dose to 400 mg/day.

Dose Adjustment for Toxicity

Prior to dose reduction, temporarily discontinue therapy if 24-hr urine protein 3 g or more (or for other toxicities). Initial dose reduction: Renal cell carcinoma: 400 mg/day. Soft tissue sarcoma: 600 mg/day. Further dose adjustment: 200 mg/day.

Dosage in Renal Impairment

No dose adjustment.

Dosage in Hepatic Impairment

Mild impairment: No dose adjustment. Moderate impairment: Reduce dose to 200 mg/day. Severe impairment: Not recommended.

Side effects

Frequent (52%–19%): Diarrhea, hypertension, hair color changes, nausea, fatigue, anorexia, vomiting. Occasional (14%–10%): Asthenia, abdominal pain, headache. Rare (less than 10%): Alopecia, chest pain, altered taste, dyspepsia, proteinuria, rash, decreased weight.
Adverse effects/toxic reactions

Hepatotoxicity, manifested as increase in serum bilirubin, ALT, AST, has been observed and may be fatal. Hemorrhagic events (hematuria, epistaxis, hemoptysis, GI bleeding or perforation, intracranial hemorrhage) have been noted and may be fatal. Hypertension (B/P greater than 150/100 mm Hg) is common (47% of pts), usually occurring early in the first 18 wks of treatment. Hypothyroidism has been reported occasionally. Arterial thrombotic events (MI, CVA), QT prolongation, torsades de pointes have been seen rarely.

Nursing considerations

Baseline assessment

Obtain baseline EKG, CBC, serum chemistries, LFT. Assess medical history, esp. hepatic impairment. Question history of hepatic impairment, arterial or venous thromboembolism, GI bleeding. Receive full medication history and screen for interactions.

Intervention/evaluation

Patient/family teaching

• Avoid crowds, those with known infection.
• Avoid contact with anyone who recently received live virus vaccine; do not receive vaccinations.
• Swallow tablets whole; do not chew, crush, dissolve, or divide.
• No food should be taken at least 1 hr before and 2 hrs after dose is taken.
• Avoid grapefruit products.
• Report diarrhea, abdominal pain, yellowing of skin or sclera, discolored urine, fatigue.
• Report bleeding of any kind, esp. bloody stools, nosebleeds, coughing up blood.
• Treatment may increase risk of heart attack, stroke, blood clots, or heart arrhythmias.

**Uses**

Decreases incidence of infection (as manifested by febrile neutropenia) in cancer pts receiving myelosuppressive chemotherapy associated with febrile neutropenia. To increase survival in pts acutely exposed to myelosuppressive doses of radiation.

**Precautions**

**Contraindications:** Hypersensitivity to pegfilgrastim, filgrastim. **Cautions:** Any malignancy with myeloid characteristics, sickle cell disease. The 6-mg fixed dose not to be used in infants, children, or adolescents weighing less than 45 kg. Do not administer within 14 days before and 24 hrs after cytotoxic chemotherapy.

**Action**

Regulates production of neutrophils within bone marrow. A glycoprotein, primarily affects neutrophil progenitor proliferation, differentiation, selected end-cell functional activation. **Therapeutic Effect:** Increases phagocytic ability, antibody-dependent destruction; decreases incidence of infection.

**Pharmacokinetics**

Readily absorbed after SQ administration. **Half-life:** 15–80 hrs.
Lifespan considerations

**Pregnancy/Lactation:** Unknown if drug crosses placenta or is distributed in breast milk. **Children:** Safety and efficacy not established in children younger than 12 yrs. **Elderly:** No age-related precautions noted.

Interactions

**DRUG:** None significant. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** May increase serum LDH, alkaline phosphatase, uric acid.

Availability (Rx)

**Injection Solution:** (Neulasta): 6 mg/0.6 mL syringe. **Prefilled Syringe Kit:** (Neulasta Onpro): 6 mg/0.6 mL; dose delivers over 45 min. time period about 27 hrs after application.

Administration/handling

**SQ**

**Storage**
- Store in refrigerator. Warm to room temperature prior to administering injection.
- Administer to outer upper arms, abdomen (except within 2 inches of navel), front middle thigh or upper outer buttocks. Discard if left at room temperature for more than 48 hrs.
- Protect from light.
- Avoid freezing; but if accidentally frozen, may allow to thaw in refrigerator before administration. Discard if freezing takes place a second time.
- Discard if discolored or precipitate forms.

**On Body Injector (OnPro)**

A health care provider must fill the injector prior to applying to pt’s skin. Apply to intact, nonirritated skin on back of arms or abdomen. Delivers pegfilgrastim over 45 min. time period about 27 hrs after application. May apply on same day as chemotherapy. Keep injector at least 4 inches away from electrical equipment.
Indications/routes/dosage

Neutropenia (Chemotherapy-Induced)
SQ: ADULTS, ELDERLY, CHILDREN 12–17 YRS, WEIGHING MORE THAN 45 KG: Give as single 6-mg injection once per chemotherapy cycle beginning 24–72 hrs after completion of chemotherapy. Do not administer between 14 days before and 24 hrs after cytotoxic chemotherapy. Do not use in infants, children, adolescents weighing less than 45 kg.

Radiation Injury Syndrome
Note: Prefilled syringe not designed to give doses less than 6 mg. Not recommended; use caution to avoid dosing errors.
SQ: ADULTS, ELDERLY, CHILDREN WEIGHING 45 KG OR MORE: 6 mg once wkly for 2 doses. 31–44 KG: 4 mg once wkly for 2 doses. 21–30 KG: 2.5 mg once wkly for 2 doses. 10–20 KG: 1.5 mg once wkly for 2 doses. LESS THAN 10 KG: 0.1 mg/kg once wkly for 2 doses.

Dosage in Renal/Hepatic Impairment
No dose adjustment.

Side effects
Frequent (72%–15%): Bone pain, nausea, fatigue, alopecia, diarrhea, vomiting, constipation, anorexia, abdominal pain, arthralgia, generalized weakness, peripheral edema, dizziness, stomatitis, mucositis, neutropenic fever.

Adverse effects/toxic reactions
Allergic reactions (anaphylaxis, rash, urticaria) occur rarely. Cytopenia resulting from antibody response to growth factors occurs rarely. Splenomegaly occurs rarely. Severe sickle cell crisis reported in pts with sickle cell disease. Glomerulonephritis, capillary leak syndrome, tumor growth stimulatory effect on malignant cells, acute respiratory distress syndrome may occur.
Nursing considerations

Baseline assessment
Obtain CBC prior to initiation and routinely thereafter. Question history of sickle cell disease, glomerulonephritis, splenic disease, hypersensitivity reaction to acrylic adhesive on body (injector uses acrylic adhesive).

Intervention/evaluation

Patient/family teaching
• Inform pt of possible side effects, signs/symptoms of allergic reaction.
• Counsel pt on importance of compliance with pegfilgrastim treatment, including regular monitoring of blood counts.
• Report unusual fever or chills, severe bone pain, chest pain or palpitations.

peglocticase
peg-loe-ti-kase
Krystexxa

CLASSIFICATION
PHARMACOTHERAPEUTIC: Uric acid enzyme.
CLINICAL: Antigout agent.

BLACK BOX ALERT ■ Severe infusion reactions, anaphylaxis (bronchospasm, stridor, urticaria, hypotension, dyspnea, flushing, circumural swelling) have occurred, especially within 2 hrs of first infusion. Premedicate pt with corticosteroids, antihistamines. Should be administered in health care setting by health care providers prepared to manage infusion reactions.

Do not confuse peglocticase with Activase, cholinesterase, or pegasparagase.
**Uses**

Treatment of chronic gout in adult pts refractory to conventional therapy. Not recommended for treatment of asymptomatic hyperuricemia.

**Precautions**

**Contraindications:** Hypersensitivity to pegloticase. Glucose-6-phosphate dehydrogenase (G6PD) deficiency due to hemodialysis, methemoglobinemia.

**Cautions:** History of HF, elderly, debilitated.

**Action**

Decreases uric acid production by catalyzing oxidation of uric acid to allantoin, lowering serum uric acid. **Therapeutic Effect:** Lowers serum uric acid concentration.

**Pharmacokinetics**

Catalyzes oxidation of uric acid to allantoin, an inert and water-soluble purine metabolite. Readily eliminated, primarily by renal excretion. **Half-life:** 14.5 days.

**Lifespan considerations**

**Pregnancy/Lactation:** Unknown if drug crosses placenta or is distributed in breast milk. **Children:** Safety and efficacy not established in pts younger than 18 yrs. **Elderly:** No age-related precautions noted.

**Interactions**

**DRUG:** None significant. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** Decreases serum uric acid (expected).

**Availability (Rx)**

**Injection Solution:** 2-mL (8 mg/mL) single-use vials.

**Administration/handling**
IV

Reconstitution
• Withdraw 1 mL from single-use vial and inject into 250 mL 0.9% NaCl or 0.45% NaCl.
• Invert infusion bag a number of times to ensure thorough mixing; do not shake.

Rate of Administration
• Infuse slowly over no less than 120 min.

Storage
• Store in refrigerator.
• Solution should appear clear; discard if particulate is present.
• Allow diluted solution to reach room temperature prior to infusion.
• Following dilution, solution remains stable for 4 hrs if refrigerated or at room temperature.

Indications/routes/dosage

**Alert**: Give by IV infusion; do not give as IV push or IV bolus. Pt to be pretreated with corticosteroids, antihistamines to reduce risk of infusion reaction, anaphylaxis.

Gout

**Note**: Discontinue oral agents prior to initiating pegloticase and do not initiate during course of therapy.

**IV Infusion**: ADULTS, ELDERLY: 8 mg every 2 wks.

Dosage in Renal/Hepatic Impairment
No dose adjustment.

Side effects

**Occasional (12%–9%)**: Nausea, ecchymosis at IV site, nasopharyngitis. **Rare (6%–5%)**: Constipation, vomiting.

Adverse effects/toxic reactions
Exacerbation of HF has been noted. Infusion-related reaction (urticaria, dyspnea,
Nursing considerations

Baseline assessment
If gout flare occurs during treatment, prophylaxis with an NSAID or colchicine is recommended. Pts at higher risk for G6PD deficiency (e.g., pts of African or Mediterranean ancestry) should be screened for G6PD deficiency before starting therapy. Obtain serum uric acid levels prior to each infusion. If levels reach greater than 6 mg/dL, particularly when 2 consecutive levels greater than 6 mg/dL are observed, treatment should be discontinued.

Intervention/evaluation
Monitor closely for infusion reaction during therapy and for 2 hrs post-treatment. If infusion reaction occurs during administration, infusion may be slowed, or stopped and restarted at slower rate. If severe infusion reaction occurs, discontinue infusion and institute treatment as needed. Assess for therapeutic response (reduced joint tenderness, swelling, redness, limitation of motion).

Patient/family teaching
• Educate pts on the most common signs and symptoms of infusion reaction (rash, redness of skin, difficulty breathing, flushing, chest discomfort, chest pain).
• Advise pts to seek medical care immediately if they experience any symptoms of allergic reaction during or at any time after infusion.

pembrolizumab
classification MONOCLONAL ANTIBODY
pharmacotherapeutic ANTINEOPLASTIC
clinical: Monoclonal antibody. Antineoplastic.
Do not confuse pembrolizumab with palivizumab.
Uses

Treatment of unresectable or metastatic melanoma. Treatment of metastatic head and neck squamous cell carcinoma (HNSCC) with disease progression on or after platinum-containing chemotherapy. Treatment of metastatic non–small-cell lung (NSCL) cancer in pts with PD-L1–expressing tumors as a single agent for first line tx, with disease progression on or after platinum-containing chemotherapy; or in combination with pemetrexed and carboplatin, as first line tx of metastatic non-squamous NSCLC. Treatment of refractory classical Hodgkin lymphoma (cHL) or relapse after 3 or more lines of therapy. Treatment of locally advanced or metastatic urothelial carcinoma not eligible for cisplatin containing chemotherapy or who have disease progression during or following platinum-containing chemotherapy; or with 12 mos of neoadjuvant or adjuvant tx with platinum containing chemotherapy. Treatment of unresectable or metastatic microsatellite instability high (MSI-H) or mismatch repair deficient solid tumors or colorectal cancer. Treatment of gastric cancer (advanced or metastatic) or gastroesophageal junction adenocarcinoma whose tumor express PD-L1 with disease progression on or after 2 or more lines of therapy.

Precautions

Contraindications: Hypersensitivity to pembrolizumab. Cautions: Thyroid disease, hepatic/renal impairment, interstitial lung disease, electrolyte imbalance, hypertriglyceridemia.

Action

Binds PD-1 ligands to PD-1 receptor found on T cells, blocking its interaction with the ligands (PD-L1 and PD-L2). Releases PD-1 pathway–mediated inhibition of immune response (including antitumor immune response). Therapeutic Effect: Inhibits T-cell proliferation and cytokine production.

Pharmacokinetics

Lifespan considerations

Pregnancy/Lactation: Avoid pregnancy; may cause fetal harm. Unknown if distributed in breast milk. Must either discontinue drug or discontinue breastfeeding. Recommend effective contraception during treatment and up to 4 mos after discontinuation. Children: Safety and efficacy not established. Elderly: No age-related precautions noted.

Interactions

DRUG: None known. HERBAL: None significant. FOOD: None known. LAB VALUES: May increase serum AST, glucose, triglycerides. May decrease albumin, serum calcium, sodium.

Availability (Rx)

Injection, Lyophilized Powder for Reconstitution: 50 mg/vial. Injection solution: 100 mg/4 mL.

Administration/handling

IV

Use 0.2–0.5-micron in-line filter.

Reconstitution

• Verify weight in kg.
• Inject 2.3 mL of Sterile Water for Injection against glass wall of vial. Do not inject directly onto lyophilized powder.
• Gently swirl contents until completely dissolved; do not shake.
• Allow vial to stand for up to 5 min for bubbles to clear.
• Visually inspect for particulate matter.
• Do not use if extraneous particulate matter other than translucent to white protein-like particles observed.
• Final concentration of reconstituted vial equals 25 mg/mL.
• Withdraw required dose and mix into 0.9% NaCl infusion bag (diluent volume depends on dose required).
• Final concentration of diluent bag should equal 1–10 mg/mL.
• Allow refrigerated solution to warm to room temperature before infusing.
Rate of Administration
• Infuse via dedicated line over 30 min using a 0.2–0.5-micron filter.

Storage
• Reconstituted solution should appear clear to slightly opalescent, colorless to slightly yellow.
• Refrigerate reconstituted or diluted solution up to 24 hrs, or at room temperature up to 4 hrs. Store time should not exceed total combined time of reconstitution, dilution, storage, and infusion.

Indications/routes/dosage

cHL, MSI-H Cancer:
**IV: ADULTS, ELDERLY:** 200 mg q3wks. **CHILDREN:** 2 mg/kg (up to 200 mg) q3wks until disease progression or unacceptable toxicity.

NSCL, HNSCC, Melanoma, Urothelial Cancer, Gastric Cancer
**IV: ADULTS, ELDERLY:** 200 mg q3wks. Continue until disease progression or unacceptable toxicity, or in pts without disease progression for up to 24 months.

Dose Modification

Based on Common Terminology Criteria for Adverse Events (CTCAE).

**Withhold treatment for any of the following adverse events:** ALT or AST greater than 3–5 times upper limit of normal (ULN) or bilirubin 1.5–3 times ULN, grade 2 or 3 colitis, grade 3 hyperthyroidism, grade 2 nephritis, grade 2 pneumonitis, symptomatic hypophysitis; any grade 3 treatment-related adverse reaction.

**Permanently discontinue for any of the following adverse events:** ALT or AST greater than 5 times ULN or bilirubin 3 times ULN (or pts with liver metastasis who begin treatment with grade 2 ALT, AST, if ALT or AST increases greater than or equal to 50% from baseline and lasts for at least 1 wk), grade 3 or 4 infusion-related reaction, grade 3 or 4 nephritis, grade 3 or 4 pneumonitis; inability to reduce corticosteroid dose to 10 mg/day or less (or predniSONE equivalent) after last dose; persistent grade 2 or 3 adverse reaction that does not recover to grade 0–1 within 12 wks after last dose; any severe or grade 3 treatment-related adverse reaction that reoccurs.
Dosage in Renal Impairment
No dose adjustment.

Dosage in Hepatic Impairment
Mild impairment: No dose adjustment. Moderate to severe impairment: Not studied, use caution.

Side effects
Frequent (47%–20%): Fatigue, nausea, cough, pruritus, rash, decreased appetite, constipation, diarrhea, arthralgia. Occasional (18%–11%): Dyspnea, extremity pain, peripheral edema, vomiting, headache, chills, insomnia, myalgia, abdominal pain, back pain, pyrexia, vitiligo, dizziness, upper respiratory tract infection.

Adverse effects/toxic reactions
May cause severe immune-mediated events such as pneumonitis (2.9% of pts), colitis (1% of pts), hepatitis (0.5% of pts), hypophysitis (0.5% of pts), renal failure or nephritis (0.7% of pts), hyperthyroidism (1.2% of pts), hypothyroidism (8.3% of pts). Other reported events include adrenal insufficiency, arthritis, cellulitis, exfoliative dermatitis, hemolytic anemia, myositis, myasthenic syndrome, pancreatitis, partial seizures, pneumonia, optic neuritis, rhabdomyolysis, sepsis. Immunogenicity (anti-pembrolizumab antibody formation) may occur.

Nursing considerations

Baseline assessment
Obtain baseline CBC, BMP, ionized calcium, LFT, TSH, free $T_4$, vital signs, urine pregnancy. Obtain weight in kg. Screen for history of adrenal/pituitary/pulmonary/thyroid disease, autoimmune disorders, hepatic/renal impairment, allergy to predniSONE. Question plans for breastfeeding. Along with routine assessment, conduct full dermatologic exam, visual acuity.
**Intervention/evaluation**

Monitor CBC, LFT, serum electrolytes; thyroid panel if applicable. Monitor for immune-mediated adverse events. Notify physician if any CTCAE toxicities occur (see Appendix M) and initiate proper treatment. Obtain chest X-ray if pneumonitis suspected. Screen for tumor lysis syndrome in pts with high tumor burden. Offer antiemetics if nausea, vomiting occurs. Monitor I&O, daily weight. If predniSONE therapy initiated, monitor capillary blood glucose and screen for corticosteroid side effects.

**Patient/family teaching**

- Blood levels will be routinely monitored.
- Avoid pregnancy; treatment may cause birth defects or miscarriage. Do not breastfeed.
- Serious adverse reactions may affect lungs, GI tract, kidneys, or hormonal glands, and predniSONE therapy may need to be started.
- Immediately contact physician if serious or life-threatening inflammatory reactions occur in the following body systems: lung (chest pain, cough, shortness of breath); colon (severe abdominal pain or diarrhea); liver (bruising, clay-colored/tarry stools, yellowing of skin or eyes); pituitary (persistent or unusual headache, dizziness, extreme weakness, fainting, vision changes); kidney (decreased or dark-colored urine, flank pain); thyroid (insomnia, hypertension, tachycardia [overactive thyroid]), (fatigue, goiter, weight gain [underactive thyroid]).

---

**PEMExtrexed**

pem-e-trex-ed

**Alimta**

CLASSIFICATION

PHARMACOTHERAPEUTIC: Antimetabolite.

CLINICAL: Antineoplastic.

Do not confuse PEMExtrexed with methotrexate or PRALAtrexate.

---

**Uses**

Treatment of unresectable malignant pleural mesothelioma in combination with CISplatin. Initial treatment of locally advanced or metastatic non–squamous
non–small-cell lung cancer (NSCLC) in combination with CISplatin. Single-agent maintenance treatment of NSCLC in pts whose disease has not progressed following 4 cycles of platinum-based first-line chemotherapy. **OFF-LABEL:** Treatment of bladder, cervical, ovarian, thymic malignancies; malignant pleural mesothelioma.

**Precautions**

**Contraindications:** Severe hypersensitivity to PEMEtrexed. **Cautions:** Hepatic/renal impairment, concurrent use of nephrotoxic medications, preexisting myelosuppression. Not indicated for squamous cell NSCLC.

**Action**

Disrupts folate-dependent enzymes essential for cell replication. **Therapeutic Effect:** Inhibits growth of mesothelioma cell lines.

**Pharmacokinetics**

Protein binding: 81%. Not metabolized. Excreted in urine. **Half-life:** 3.5 hrs.

**Lifespan considerations**

**Pregnancy/Lactation:** Unknown if drug crosses placenta or is distributed in breast milk. Breastfeeding not recommended. May cause fetal harm. Not recommended during pregnancy. **Children:** Safety and efficacy not established in pts younger than 18 yrs. **Elderly:** Higher incidence of fatigue, leukopenia, neutropenia, thrombocytopenia in pts 65 yrs and older.

**Interactions**

**DRUG:** NSAIDs (e.g., ibuprofen, ketorolac, naproxen) may increase concentration/effects. **Bone marrow depressants** may increase risk of myelosuppression. **Live virus vaccines** may potentiate virus replication, increase vaccine side effects, decrease pt’s antibody response to vaccine. **HERBAL:** Echinacea may decrease effects. **FOOD:** None known. **LAB VALUES:** May increase serum ALT, AST, creatinine.
Availability (Rx)

Injection, Powder for Reconstitution: 100 mg; 500 mg.

Administration/handling

IV Infusion

Reconstitution
• Dilute 500-mg vial with 20 mL (4.2 mL to 100-mg vial) 0.9% NaCl to provide concentration of 25 mg/mL.
• Gently swirl each vial until powder is completely dissolved.
• Solution appears clear and ranges in color from colorless to yellow or green-yellow.
• Further dilute reconstituted solution with 100 mL 0.9% NaCl.

Rate of Administration
• Infuse over 10 min.

Storage
• Store at room temperature.
• Diluted solution is stable for up to 24 hrs at room temperature or if refrigerated.

IV incompatibilities

Use only 0.9% NaCl to reconstitute; flush line prior to and following infusion. Do not add any other medications to IV line.

Indications/routes/dosage

Refer to individual protocols.

Pretreatment with dexamethasone (or equivalent) will reduce risk, severity of cutaneous reaction; treatment with folic acid and vitamin B_{12} beginning 1 wk before treatment and continuing for 21 days after last PEMEtrexed dose will reduce risk of side effects. Do not begin new treatment cycles unless ANC 1,500 cells/mm^3 or greater, platelets 100,000 cells/mm^3 or greater, and CrCl 45 mL/min or greater.

Malignant Pleural Mesothelioma
IV: ADULTS, ELDERLY: 500 mg/m² on day 1 of each 21-day cycle in combination with CISplatin.

Nonsquamous Non–Small-Cell Lung Cancer (NSCLC)
IV: ADULTS, ELDERLY: Initial treatment 500 mg/m² on day 1 of each 21-day cycle (in combination with CISplatin). Maintenance or second-line treatment: 500 mg/m² on day 1 of each 21-day cycle (as single agent).

Dose Modification for Toxicity

Hematologic Toxicity
Nadir ANC less than 500 cells/mm³ and platelets 50,000 cells/mm³ or more: Reduce dose to 75% of previous dose. Nadir platelets less than 50,000 cells/mm³ without bleeding: Reduce dose to 75% of previous dose. Nadir platelets less than 50,000 cells/mm³ with bleeding: Reduce dose to 50% of previous dose. Nonhematologic toxicity grade 3 or greater (excluding neurotoxicity): Reduce dose to 75% of previous dose (excluding mucositis). Grade 3 or 4 mucositis: Reduce dose to 50% of previous dose.

Dosage in Renal Impairment
Not recommended with CrCl less than 45 mL/min.

Dosage in Hepatic Impairment
Grade 3 (5.1–20 times upper limit of normal) or grade 4 (greater than 20 times upper limit of normal): 75% of previous dose.

Side effects

Frequent (12%–10%): Fatigue, nausea, vomiting, rash, desquamation. Occasional (8%–4%): Stomatitis, pharyngitis, diarrhea, anorexia, hypertension, chest pain. Rare (less than 3%): Constipation, depression, dysphagia.

Adverse effects/toxic reactions
Myelosuppression, characterized as grade 1–4 neutropenia, thrombocytopenia, anemia, was reported.
Nursing considerations

Baseline assessment
Question for possibility of pregnancy before initiating therapy. Obtain CBC, serum chemistry tests before therapy and at regular intervals throughout therapy.

Intervention/evaluation

Patient/family teaching
• Maintain strict oral hygiene.
• Do not have immunizations without physician’s approval (drug lowers resistance).
• Avoid crowds, those with infection.
• Use contraceptive measures during therapy.
• Promptly report fever, sore throat, signs of local infection, unusual bruising/bleeding from any site.
• Do not breastfeed.

penicillin G potassium
pen-i-sil-in G po-tas-ee-um
Crystapen
Pfizerpen

CLASSIFICATION
PHARMACOTHERAPEUTIC: Penicillin.
CLINICAL: Antibiotic.
Do not confuse penicillin with penicillAMINE.

Uses
Treatment of susceptible infections including sepsis, meningitis, endocarditis, pneumonia. Active against gram-positive organisms (except S. aureus), some gram-negative organisms (e.g., N. gonorrhoeae), and some anaerobes and spirochetes.

**Precautions**

**Contraindications:** Hypersensitivity to any penicillin. **Cautions:** Renal/hepatic impairment, seizure disorder, hypersensitivity to cephalosporins, pts with asthma.

**Action**

Inhibits bacterial cell wall synthesis by binding to one or more of the penicillin-binding proteins of bacteria. **Therapeutic Effect:** Bactericidal.

**Pharmacokinetics**

Protein binding: 60%. Widely distributed (poor CNS penetration). Metabolized in liver. Primarily excreted in urine. **Half-life:** 0.5–1 hr (increased in renal impairment).

- **Lifespan considerations**
  - **Pregnancy/Lactation:** Readily crosses placenta; distributed in breast milk. **Children:** May delay renal excretion in neonates, young infants. **Elderly:** Age-related renal impairment may require dosage adjustment.

**Interactions**

**DRUG:** Probenecid increases concentration. **HERBAL:** None significant. **FOOD:** None significant. **LAB VALUES:** May cause positive Coombs’ test. May increase serum ALT, AST, alkaline phosphatase, LDH. May decrease WBC count.

**Availability (Rx)**

**Injection, Powder for Reconstitution:** 5 million units.
Administrations/handling

IV

Reconstitution
• After reconstitution, further dilute with 50–100 mL D<sub>5</sub>W or 0.9% NaCl for final concentration of 100,000–500,000 units/mL (50,000 units/mL for infants, neonates).

Rate of Administration
• Infuse over 15–30 min.

Storage
• Reconstituted solution is stable for 7 days if refrigerated.

IV incompatibilities
DOPamine (Intropin), sodium bicarbonate.

IV Compatibilities
Amiodarone (Cordarone), calcium gluconate, diltiazEM (Cardizem), heparin, magnesium sulfate, potassium chloride.

Indications/routes/dosage

Usual Dosage
IV, IM: ADULTS, ELDERLY: 12–24 million units/day in divided doses q4–6h.
CHILDREN: 100,000–300,000 units/kg/day in divided doses q4–6h.
Maximum: 24 million units/day. NEONATES: 25,000–50,000 units/kg/dose q8–12h.

Dosage in Renal Impairment
Dosage interval is modified based on creatinine clearance.

<table>

</table>
### Dosage in Hepatic Impairment

No dose adjustment.

### Side effects

**Occasional:** Lethargy, fever, dizziness, rash, electrolyte imbalance, diarrhea, thrombophlebitis. **Rare:** Seizures, interstitial nephritis.

### Adverse effects/toxic reactions

Hypersensitivity reactions ranging from rash, fever, chills to anaphylaxis occur occasionally.

### Nursing considerations

#### Baseline assessment

Question for history of allergies, particularly penicillins, cephalosporins.

#### Intervention/evaluation

Promptly report rash (hypersensitivity), diarrhea (with fever, abdominal pain, mucus, or blood in stool, may indicate antibiotic-associated colitis). Monitor I&O, urinalysis electrolytes, renal function tests for nephrotoxicity.

### penicillin V potassium

*pen-i-sil-in V po-tas-eem*  
Apo-Pen-VK  
Novo-Pen-VK  
NuPen VK
CLASSIFICATION
PHARMACOTHERAPEUTIC: Penicillin.
CLINICAL: Antibiotic.

Uses
Treatment of infections of respiratory tract, skin/skin structure, otitis media, necrotizing ulcerative gingivitis; prophylaxis for rheumatic fever, dental procedures. **OFF-LABEL:** Prosthetic joint infection.

Precautions
**Contraindications:** Hypersensitivity to any penicillin. **Cautions:** Severe renal impairment, history of allergies (particularly cephalosporins), history of seizures, asthma.

Action
Inhibits cell wall synthesis by binding to bacterial cell membranes. **Therapeutic Effect:** Bactericidal.

Pharmacokinetics
Moderately absorbed from GI tract. Protein binding: 80%. Widely distributed. Metabolized in liver. Primarily excreted in urine. **Half-life:** 1 hr (increased in renal impairment).

*Lifespan considerations*
**Pregnancy/Lactation:** Readily crosses placenta; appears in cord blood, amniotic fluid. Distributed in breast milk in low concentrations. May lead to allergic sensitization, diarrhea, candidiasis, skin rash in infant. **Children:** Use caution in neonates and young infants (may delay renal elimination). **Elderly:** Age-related renal impairment may require dosage adjustment.

Interactions
**DRUG:** ACE inhibitors (e.g., enalapril, lisinopril), potassium-sparing
diuretics (e.g., spironolactone), potassium supplements may increase risk of hyperkalemia. May increase methotrexate concentration, toxicity. Probenecid may increase concentration, risk of toxicity. Tetracycline may decrease concentration/effect. HERBAL: None significant. FOOD: None known. LAB VALUES: May cause positive Coombs’ test. May increase serum ALT, AST, alkaline phosphatase, LDH. May decrease WBC count.

Availability (Rx)

Powder for Oral Solution: 125 mg/5 mL, 250 mg/5 mL. Tablets: 250 mg, 500 mg.

Administration/handling

PO

• Give on empty stomach 1 hr before or 2 hrs after meals (increases absorption).
• After reconstitution, oral solution is stable for 14 days if refrigerated.
• Space doses evenly around the clock.

Indications/routes/dosage

Usual Dosage

PO: ADULTS, ELDERLY, CHILDREN 12 YRS AND OLDER: 125–500 mg q6–8h. CHILDREN YOUNGER THAN 12 YRS: 25–75 mg/kg/day in divided doses q6–8h. Maximum: 2,000 mg/day.

Dosage in Renal/Hepatic Impairment

No dose adjustment.

Side effects

Frequent: Mild hypersensitivity reaction (chills, fever, rash), nausea, vomiting, diarrhea. Rare: Bleeding, allergic reaction.

Adverse effects/toxic reactions
Severe hypersensitivity reactions, including anaphylaxis, may occur. Nephrotoxicity, antibiotic-associated colitis, other superinfections (abdominal cramps, severe watery diarrhea, fever) may result from high dosages, prolonged therapy.

**Nursing considerations**

**Baseline assessment**

Question for history of allergies, particularly penicillins, cephalosporins.

**Intervention/evaluation**

Hold medication, promptly report rash (hypersensitivity), diarrhea (with fever, abdominal pain, mucus or blood in stool may indicate antibiotic-associated colitis). Be alert for superinfection: fever, vomiting, diarrhea, anal/genital pruritus, oral mucosal change (ulceration, pain, erythema). Review Hgb levels; check for bleeding (overt/occult bleeding, ecchymosis, swelling of tissue). Monitor I&O, urinalysis, renal function tests for nephrotoxicity.

**Patient/family teaching**

- Continue antibiotic for full length of treatment.
- Space doses evenly.
- Report immediately if rash, diarrhea, bleeding, bruising, other new symptoms occur.

**perampanel**

per-am-pa-nel

**Fycompa**

CLASSIFICATION

PHARMACOTHERAPEUTIC: Noncompetitive AMPA glutamate receptive antagonist.

CLINICAL: Anticonvulsant.

- **BLACK BOX ALERT** Risk for serious neuropsychiatric events, including irritability, aggression, anger, anxiety, paranoia, euphoric mood, agitation, mental status changes. Some of these events reported as serious
and life-threatening. Violent thoughts or threatening behavior were also observed. Immediately report any changes in mood or behavior that are not typical for the patient. Health care professionals should closely monitor patients during titration period when higher doses are used.

**Uses**

**Precautions**

**Contraindications:** Hypersensitivity to perampanel. **Cautions:** Elderly (increased falls, dizziness, gait disturbances), severe renal/hepatic impairment, dialysis, concurrent use of CNS depressants, pts at risk for suicidal behavior.

**Action**

Noncompetitive antagonist of AMPA glutamate receptors, a primary excitatory neurotransmitter on postsynaptic neurons. **Therapeutic Effect:** Reduces frequency of seizure activity.

**Pharmacokinetics**

Rapidly, completely absorbed. Peak concentration: 0.5–2.5 hrs. Protein binding: 95%–96%. Steady-state reached in 2–3 wks. Metabolized via oxidation/glucuronidation. Excreted in feces (48%), urine (22%). **Half-life:** 105 hrs.

**Lifespan considerations**

**Pregnancy/Lactation:** Unknown if distributed in breast milk. Use caution when breastfeeding. **Children:** Safety and efficacy not established in pts younger than 12 yrs. **Elderly:** Due to increased risk of adverse reactions in the elderly, dosing titration should proceed very slowly.
Interactions

DRUG: CYP450 inducers (e.g., carBAMazepine, OXcarbazepine, phenytoin) may decrease concentration/effects. May decrease effectiveness of hormonal contraceptives containing levonorgestrel. Alcohol, other CNS depressants (e.g., LORazepam, morphine, zolpidem) may increase CNS depression. HERBAL: St. John’s wort, kava kava, valerian may increase CNS depression. Evening primrose may decrease seizure threshold. FOOD: None known. LAB VALUES: None significant.

Availability (Rx)

먼기, Oral: 0.5 mg/mL. Tablets, Film-Coated: 2 mg, 4 mg, 6 mg, 8 mg, 10 mg, 12 mg.

Administration/handling

PO

• Give at bedtime.
• Give tablet whole; do not break, crush, dissolve, or divide tablet.
• Measure oral suspension using provided adapter and dosing syringe.

Indications/routes/dosage

Initial starting dose should be increased when enzyme-inducing anticonvulsants are given concurrently. Individual dosing based on clinical response, tolerability. Do not use in severe hepatic/renal impairment, pts on hemodialysis.

Partial-Onset Seizures, Generalized Tonic-Clonic Seizures in Absence of an Enzyme-Inducing Anticonvulsant

PO: ADULTS, ELDERLY, CHILDREN 12 YRS AND OLDER: Initially, 2 mg once daily at bedtime. May titrate in 2-mg increments at wkly intervals (in elderly, no more frequently than every 2 wks). Recommended maintenance dose: (Partial Seizures): 8–12 mg/day at bedtime. (Tonic-Clonic Seizures): 8 mg/day at bedtime.
Partial-Onset Seizures, Generalized Tonic-Clonic Seizures
(Concurrently Taking an Enzyme-Inducing Anticonvulsant)

PO: ADULTS, ELDERLY, CHILDREN 12 YRS AND OLDER: Initially, 4 mg once daily at bedtime. May titrate in 2-mg increments at wkly intervals (in elderly, no more frequently than q2wks). Recommended maintenance dose: 8–12 mg/day at bedtime.

Dosage in Renal Impairment
CrCl less than 30 mL/min: Not recommended.

Dosage in Hepatic Impairment
PO: ADULTS, ELDERLY, CHILDREN 12 YRS AND OLDER: 2 mg once daily with wkly increase of 2 mg daily q2wks until target dose is achieved. **Mild impairment:** Maximum: 6 mg. **Moderate impairment:** Maximum: 4 mg. **Severe impairment:** Not recommended.

Side effects
Frequent (32%–11%): Dizziness, sleepiness, headache. Occasional (8%–3%): Fatigue, irritability, nausea, balance disorder, weight gain, gait disturbance, vertigo, blurred vision, vomiting, arthralgia, anxiety. Rare (2%–1%): Constipation, back pain, extremity pain, asthenia, oropharyngeal pain, aggression.

Adverse effects/toxic reactions
Irritability, aggression, anger, anxiety, affect lability, agitation occurred rarely (2% of pts). Increased risk for seizures when anticonvulsants are withdrawn abruptly.

Nursing considerations

Baseline assessment
Review history of seizure disorder (intensity, frequency, duration, LOC). Initiate seizure precautions. Obtain medication history (esp. use of other anticonvulsant...
therapy; dosage based on concurrent seizure medication). Observe clinically. Assist with ambulation until response to drug is established (32% of pts experience dizziness).

**Intervention/evaluation**
Assess mental status, cognitive abilities, behavioral changes. Monitor for clinical response, tolerability to medication, dosing level during treatment and for at least 1 mo after last therapy dose. Report persistent, severe, or worsening psychiatric symptoms or behaviors. Assess for clinical improvement (decrease in intensity, frequency of seizures).

**Patient/family teaching**
• Avoid alcohol (greater risk for adverse effects).
• The combination of alcohol and perampanel may significantly worsen mood, increase anger.
• Counsel pts, families, and caregivers of need to monitor for emergence of anger, aggression, hostility, unusual changes in mental status.
• Avoid tasks that require alertness, motor skills until response to drug is established (greater risk for dizziness, sleepiness).

---

dose

**pertuzumab**
*per-tue-zue-mab*

Perjeta

**CLASSIFICATION**

**PHARMACOTHERAPEUTIC**: HER2 receptor antagonist.

**CLINICAL**: Antineoplastic.

■ **BLACK BOX ALERT** ■ Can result in embryo-fetal death, birth defects. Pts must be made aware of danger to fetus, need for effective contraception. May result in cardiac failure. Assess left ventricular ejection fraction.

**Uses**
Treatment of *HER2*-positive metastatic breast cancer in pts who have not received prior anti-*HER2* therapy or chemotherapy for metastatic disease in
combination with trastuzumab and DOCEtaxel. Neoadjuvant treatment of pts with HER2-positive, locally advanced inflammatory, or early-stage breast cancer in combination with trastuzumab and DOCEtaxel.

Precautions

Contraindications: Hypersensitivity to pertuzumab. Cautions: Conditions that may impair left ventricular function (e.g., uncontrolled hypertension, recent MI, severe cardiac arrhythmia), history of infusion-related reaction. Prior anthracycline therapy or irradiation.

Action

Targets human epidermal growth factor 2 (HER2), blocking ligand-initiated intercellular signaling, which can result in cell growth arrest and cell death. Therapeutic Effect: Inhibits cell growth and metastasis.

Pharmacokinetics

Peak plasma concentration reached after first maintenance dose. Half-life: 18 days.

攽 Lifespan considerations

Pregnancy/Lactation: May cause embryo-fetal harm. Females of reproductive potential must use effective contraception in addition to barrier methods. Unknown if distributed in breast milk. Children: Safety and efficacy not established. Elderly: No age-related precautions noted.

Interactions

DRUG: None significant. HERBAL: None significant. FOOD: None known. LAB VALUES: None significant.

Availability (Rx)

Injection Solution: 420 mg/14 mL (30 mg/mL) vial.
Administration/handling

Reconstitution

• Withdraw ordered volume of solution from vial.
• Dilute into 250 mL 0.9% NaCl only (do not use D5W).
• Gently invert solution (do not shake).

Rate of Administration

• Initial dose to be infused over 60 min.
• Subsequent doses may be infused over 30–60 min.

Storage

• Refrigerate vials. Store vials in outside cartons (protects from light).
• Once diluted, use immediately or refrigerate for up to 24 hrs.
• Do not use if solution appears cloudy or contains particulate.

IV incompatibilities

Do not mix with any other medications.

Indications/routes/dosage

Give as an IV infusion only. Do not give by IV push or bolus. If diluted solution is not used immediately, may refrigerate for up to 24 hrs.

Breast Carcinoma

IV Infusion: ADULTS/ELDERLY: Initially, 840 mg given over 60 min, followed q3wks thereafter by 420 mg given as a 30–60 min infusion for 3–6 cycles in combination with trastuzumab and DOCEtaxel. Continue until disease progression or unacceptable toxicity.

Breast Cancer (Neoadjuvant)

IV Infusion: ADULTS, ELDERLY: 840 mg once followed by 420 mg q3wks for 3–6 cycles. May be administered as: 4 preoperative cycles of pertuzumab, trastuzumab, DOCEtaxel, then 3 postoperative cycles of 5-fluorouracil, epiRUBicin, and cyclophosphamide (FEC) or 3 preoperative cycles of FEC alone, then 3 preoperative cycles of pertuzumab, trastuzumab, DOCEtaxel or 6
cycles of pertuzumab, trastuzumab, DOCEtaxel, and CARBOplatin. **Note:** Continue trastuzumab postoperatively to complete 1 yr of treatment.

**Dosage in Renal/Hepatic Impairment**

No dose adjustment.

**Side effects**

**Frequent (67%–21%):** Diarrhea, alopecia, nausea, fatigue, rash, peripheral neuropathy, anorexia, asthenia, mucosal inflammation, vomiting, peripheral edema, myalgia, nail disorder, headache. **Occasional (19%–12%):** Stomatitis, pyrexia, dysgeusia, arthralgia, constipation, increased lacrimation, pruritus, insomnia, dizziness. **Rare (10%–7%):** Nasopharyngitis, dry skin, paronychia.

**Adverse effects/toxic reactions**

Neutropenia occurs in 53% of pts, anemia occurs in 23% of pts, and leukopenia occurs in 18% of pts. Upper respiratory tract infection occurs in 17% of pts. Dyspnea, febrile neutropenia occurs in 14% of pts. Pleural effusion occurs in 5% of pts, left ventricular dysfunction occurs in 4% of pts.

**Nursing considerations**

**Baseline assessment**

Obtain baseline left ventricular ejection fraction (LVEF) before initiating therapy. Negative pregnancy test must be confirmed before initiating treatment. Obtain HER2 testing by an FDA-approved laboratory. Assess daily serum blood chemistries, CBC.

**Intervention/evaluation**

Monitor daily ANC. Monitor LVEF and withhold dosing if ordered. Assess skin, IV site for infusion-associated reactions, hypersensitivity reactions, anaphylaxis. If a significant infusion-associated reaction occurs, slow or interrupt infusion and administer appropriate medical treatment. If a reaction is noted, the most common is pyrexia. Chills, fatigue, headache, asthenia, or vomiting usually occurs during the infusion or on the same day as the infusion. Observe pt closely.
for 60 min after the first infusion and for 30 min after subsequent infusions. Offer antiemetics if nausea occurs.

**Patient/family teaching**

- Avoid pregnancy.
- Use effective contraceptive measures, including condoms, during treatment and for 6 mos after treatment in women of childbearing potential.
- If pregnancy occurs, inform physician immediately.
- Do not breastfeed.
- Alopecia is reversible, but new hair growth may have different color, texture.

**PHENobarbital**

fee-noe-bar-bi-tal

**Fixed-Combination(s)**

**Donnatal:** PHENobarbital/atropine (an anticholinergic)/hyoscyamine (an anticholinergic)/scopolamine (an anticholinergic): 16.2 mg/0.0194 mg/0.1037 mg/0.0065 mg.

**CLASSIFICATION**

**PHARMACOTHERAPEUTIC:** Barbiturate (Schedule IV).

**CLINICAL:** Anticonvulsant, hypnotic.

Do not confuse PHENobarbital with pentobarbital, Phenergan, or phenytoin.

**Uses**

Management of generalized tonic-clonic (grand mal) seizures, partial seizures, control of acute seizure episodes (status epilepticus). **OFF-LABEL:** Treatment of alcohol withdrawal, sedative/hypnotic withdrawal.

**Precautions**

**Contraindications:** Hypersensitivity to PHENobarbital, other barbiturates, porphyria, dyspnea or airway obstruction, use in nephritic pts (large doses), severe hepatic impairment. Pts with history of sedative/hypnotic addiction.
arterial or subcutaneous administration. **Cautions:** Renal/hepatic impairment, acute/chronic pain, depression, suicidal tendencies, history of drug abuse, elderly pts, debilitated pts, children, hemodynamically unstable pts, hypoadrenalism, respiratory disease.

**Action**

Depresses sensory cortex, decreases motor activity, alters cerebellar function. **Therapeutic Effect:** Induces drowsiness, sedation, anticonvulsant activity.

**Pharmacokinetics**

</tbody>
</table>

Well absorbed after PO, parenteral administration. Protein binding: 20%–45%. Rapidly and widely distributed. Metabolized in liver. Primarily excreted in urine. Removed by hemodialysis. **Half-life:** 53–140 hrs.

**Lifespan considerations**

**Pregnancy/Lactation:** Readily crosses placenta. Distributed in breast milk. Produces respiratory depression in neonates during labor. May cause postpartum hemorrhage, hemorrhagic disease in newborn. Withdrawal symptoms may appear in neonates born to women receiving barbiturates during last trimester of pregnancy. Lowers serum bilirubin in neonates. **Children:** May cause paradoxical excitement. **Elderly:** May exhibit excitement, confusion, mental depression. Use caution.

**Interactions**

**DRUG:** Alcohol, other CNS depressants (e.g., LORazepam, morphine) may increase effects. May decrease effects of warfarin, oral contraceptives. **Valproic acid** may increase concentration, risk of toxicity. **HERBAL:** Evening primrose may decrease seizure threshold. **Gotu kola, kava kava, St. John’s wort, valerian** may increase CNS depression. **FOOD:** None known. **LAB VALUES:** May decrease serum bilirubin. **Therapeutic serum level:** 10–40
mcg/mL; toxic serum level: greater than 40 mcg/mL.

**Availability (Rx)**

**Elixir:** 20 mg/5 mL. **Oral Solution:** 20 mg/5 mL. **Injection, Solution:** 65 mg/mL, 130 mg/mL. **Tablets:** 15 mg, 30 mg, 60 mg, 100 mg.

**Administration/handling**

### IV

**Reconstitution**
- May give undiluted or may dilute with NaCl.

**Rate of Administration**
- Adequately hydrate pt before and immediately after drug therapy (decreases risk of adverse renal effects).
- Do not inject IV faster than 30 mg/min for children and 60 mg/min for adults. Too-rapid IV may produce severe hypotension, marked respiratory depression.
- Inadvertent intra-arterial injection may result in arterial spasm with severe pain, tissue necrosis. Extravasation in SQ tissue may produce redness, tenderness, tissue necrosis.

**Storage**
- Store vials at room temperature.

### IM

- Do not inject more than 5 mL in any one IM injection site (produces tissue irritation).
- Inject deep IM into large muscle mass.

### PO

- Give without regard to meals.
- Tablets may be crushed.
- Elixir may be mixed with water, milk, fruit juice.

### IV incompatibilities

Amphotericin B complex (Abelcet, AmBisome, Amphotec).
IV Compatibilities
Calcium gluconate, enalapril (Vasotec), fosphenytoin (Cerebyx), propofol (Diprivan).

Indications/routes/dosage

Status Epilepticus
**IV: ADULTS, ELDERLY, CHILDREN:** 20 mg/kg. May repeat once in 10 min with a dose of 5–10 mg/kg. **CHILDREN:** 20 mg/kg (**Maximum:** 1,000 mg) over 10 min; may repeat after 15 min (**Maximum dose:** 40 mg/kg).

Seizure Control (Maintenance)
**Note:** Maintenance dose usually starts 12 hrs after loading dose.
**PO, IV: ADULTS, ELDERLY, CHILDREN OLDER THAN 12 YRS:** 1–3 mg/kg/day. **CHILDREN 5–12 YRS:** 4–6 mg/kg/day in divided doses. **CHILDREN 1–5 YRS:** 6–8 mg/kg/day in divided doses. **CHILDREN YOUNGER THAN 1 YR:** 5–8 mg/kg/day in 1–2 divided doses. **NEONATES:** 3–4 mg/kg/day given once daily.

Dosage in Renal/Hepatic Impairment
No dose adjustment.

Side effects
**Occasional (3%–1%):** Drowsiness. **Rare (less than 1%):** Confusion, paradoxical CNS reactions (hyperactivity, anxiety in children; excitement, restlessness in elderly, generally noted during first 2 wks of therapy, particularly in presence of uncontrolled pain).

Adverse effects/toxic reactions
Abrupt withdrawal after prolonged therapy may produce increased dreaming, nightmares, insomnia, tremor, diaphoresis, vomiting, hallucinations, delirium, seizures, status epilepticus. Skin eruptions appear as hypersensitivity reaction. Blood dyscrasias, hepatic disease, hypocalcemia occur rarely. Overdose
produces cold/clammy skin, hypothermia, severe CNS depression, cyanosis, tachycardia, Cheyne-Stokes respirations. Toxicity may result in severe renal impairment.
Nursing considerations

Baseline assessment

Intervention/evaluation
Monitor CNS status, seizure activity, hepatic/renal function, respiratory rate, heart rate, B/P. Monitor for therapeutic serum level. Neurological assessments may be inaccurate until drug has properly cleared the body. Therapeutic serum level: 10–40 mcg/mL; toxic serum level: greater than 40 mcg/mL.

Patient/family teaching
• Avoid alcohol, limit caffeine.
• May be habit-forming.
• Do not discontinue abruptly.
• May cause dizziness/drowsiness; avoid tasks that require alertness, motor skills until response to drug is established.

phenylephrine
fen-il-e-f-rin
AK-Dilate
Mydfrin
Neo-Synephrine
Sudafed PE

CLASSIFICATION
PHARMACOTHERAPEUTIC: Alpha-adrenergic agonist.
CLINICAL: Nasal decongestant, mydriatic, vasopressor.

BLACK BOX ALERT Intravenous use should be administered by
Do not confuse Mydfrin with Midrin, or Sudafed PE with Sudafed.

Minimal absorption after intranasal, ophthalmic administration. Metabolized in liver, GI tract. Primarily excreted in urine. Half-life: 2.5 hrs.

*Lifespan considerations*
**Pregnancy/Lactation:** Crosses placenta. Distributed in breast milk. **Children:** May exhibit increased absorption, toxicity with nasal preparation. No age-related precautions noted with systemic use. **Elderly:** More likely to experience adverse effects.

**Interactions**

**DRUG:** MAOIs (e.g., phenelzine, selegiline) may increase vasopressor effects. Tricyclic antidepressants (e.g., amitriptyline, doxepin) may increase cardiovascular effects. **HERBAL:** Ephedra, yohimbe may increase CNS stimulation. **FOOD:** None known. **LAB VALUES:** None significant.

**Availability (OTC)**

**Injection, Solution:** 10 mg/mL. **Solution, Nasal Drops (Neo-Synephrine):** 0.125%, 0.25%. **Solution, Nasal Spray (Neo-Synephrine):** 0.25%, 0.5%. **Solution, Oral:** 2.5 mg/5 mL. **Tablets (Sudafed PE):** 10 mg.

**Administration/handling**

**IV**

**Reconstitution**

- For IV push, dilute 1 mL of 10 mg/mL solution with 9 mL Sterile Water for Injection to provide concentration of 1 mg/mL.
- For IV infusion, dilute 10–100 mg with 500 mL 0.9% NaCl or D₅W.

**Rate of Administration**

- For IV push, give over 20–30 sec.
- For IV infusion, titrate dose to maintain systolic B/P greater than 90 mm Hg.

**Storage**

- Store vials at room temperature.

**Nasal**

- Instruct pt to blow nose prior to administering medication.
- With head tilted back, apply drops in 1 nostril. Wait 5 min before applying drops in other nostril.
- Sprays should be administered into each nostril with head erect.
- Pt should sniff briskly while squeezing container, then wait 3–5 min before
blowing nose gently.
• Rinse tip of spray bottle.

**IV incompatibility**
Furosemide (Lasix).

**IV Compatibilities**
Amiodarone (Cordarone), dexmedetomidine (Precedex), DOBUTamine (Dobutrex), lidocaine, potassium chloride, propofol (Diprivan), vasopressin.

**Indications/routes/dosage**

**Nasal Decongestant**

- **Alert**: Do not use for more than 3 days.

**Intranasal:** **ADULTS, ELDERLY, CHILDREN 12 YRS AND OLDER:** 2-3 drops or 2-3 sprays of 0.25%–0.5% solution into each nostril q4h as needed. **CHILDREN 6–11 YRS:** 2-3 drops or 2-3 sprays of 0.25% solution into each nostril q4h as needed. **CHILDREN 2–5 YRS:** 1 drop of 0.125% solution (dilute 0.5% solution with 0.9% NaCl to achieve 0.125%) in each nostril. Repeat q2–4h as needed.

**PO:** **ADULTS, ELDERLY, CHILDREN 13 YRS AND OLDER:** 10 mg q4h as needed for up to 7 days. **CHILDREN 6–11 YRS:** 5 mg q4h as needed for up to 7 days. **CHILDREN 4–5 YRS:** 2.5 mg q4h as needed for up to 7 days.

**Hypotension, Shock**

**IV Bolus:** **ADULTS, ELDERLY:** 100–500 mcg (0.1–0.5 mg)/dose q10–15min as needed. **CHILDREN:** 5–20 mcg/kg/dose q10–15min as needed.

**IV Infusion:** **ADULTS, ELDERLY:** 100–180 mcg/min or 0.5 mcg/kg/min. Titrate to desired response. **CHILDREN:** 0.1–0.5 mcg/kg/min. Titrate to desired effect.

**Side effects**

**Frequent:** **Nasal:** Rebound nasal congestion due to overuse, esp. when used
longer than 3 days. **Occasional:** Mild CNS stimulation (restlessness, nervousness, tremors, headache, insomnia, particularly in those hypersensitive to sympathomimetics, such as elderly pts). **Nasal:** Stinging, burning, drying of nasal mucosa.

**Adverse effects/toxic reactions**

Large doses may produce tachycardia, palpitations (particularly in pts with cardiac disease), dizziness, nausea, vomiting. Overdose in pts older than 60 yrs may result in hallucinations, CNS depression, seizures. Prolonged nasal use may produce chronic swelling of nasal mucosa, rhinitis. If phenylephrine 10% ophthalmic is instilled into denuded/damaged corneal epithelium, corneal clouding may result.

**Nursing considerations**

**Baseline assessment**

Obtain baseline symptomology, vital signs. Question history of hypertension, cardiac disease, asthma, recent use of MAOI therapy.

**Intervention/evaluation**

Monitor B/P, heart rate. For severe hypotension or shock states, monitor central venous pressure noninvasive hemodynamic monitoring systems.

**Patient/family teaching**

- Discontinue drug if adverse reactions occur.
- Do not use for nasal decongestion for longer than 3 days (rebound congestion).
- Discontinue drug if insomnia, dizziness, weakness, tremor, palpitations occur.
- **Nasal:** Stinging/burning of nasal mucosa may occur.
- **Ophthalmic:** Blurring of vision with eye instillation generally subsides with continued therapy.
- Discontinue medication if redness/swelling of eyelids, itching occurs.

---

**phenytoin**

fen-i-toyn
CLASSIFICATION
PHARMACOTHERAPEUTIC: Hydantoin.
CLINICAL: Anticonvulsant, antiarrhythmic.

BLACK BOX ALERT ■ Do not exceed IV rate of 50 mg/min in adults and 1–3 mg/kg/min in pediatric pts.

Do not confuse Dilantin with Dilaudid or diltiazEM, or phenytoin with phenelzine or fosphenytoin.

Uses

Precautions

Action

Pharmacokinetics
Slowly, variably absorbed after PO administration. Protein binding: 90%–95%. Widely distributed. Metabolized in liver. Primarily excreted in urine. Not removed by hemodiafiltration. **Half-life:** 7–42 hrs.

**Lifespan considerations**

**Pregnancy/Lactation:** Crosses placenta; distributed in small amount in breast milk. Fetal hydantoin syndrome (craniofacial abnormalities, nail/digital hypoplasia, prenatal growth deficiency) has been reported. Increased frequency of seizures in pregnant women due to altered absorption of metabolism of phenytoin. May increase risk of hemorrhage in neonate, maternal bleeding during delivery. **Children:** More susceptible to gingival hyperplasia, coarsening of facial features; excess body hair. **Elderly:** No age-related precautions noted but lower dosages recommended.

**Interactions**

**DRUG:** Alcohol, other CNS depressants (e.g., LORazepam, morphine, zolpidem) may increase CNS depression. Amiodarone, cimetidine, disulfiram, FLUoxetine, isoniazid, sulfonamides may increase concentration/effects, risk of toxicity. Calcium-containing antacids may decrease absorption. May decrease effects of glucocorticoids (e.g., dexamethasone, predniSONE), anticoagulants (e.g., heparin, warfarin), oral contraceptives. Lidocaine, propranolol may increase cardiac depressant effects. Valproic acid may decrease metabolism, increase concentration. May increase metabolism, decrease effects of xanthines. **HERBAL:** Evening primrose may decrease seizure threshold. Gotu kola, kava kava, St. John’s wort, valerian may increase CNS depression. **FOOD:** None known. **LAB VALUES:** May increase serum glucose, GGT, alkaline phosphatase. **Therapeutic serum level:** 10–20 mcg/mL; **toxic serum level:** greater than 20 mcg/mL.

**Availability (Rx)**

**Capsules, Extended-Release:** 30 mg, 100 mg, 200 mg, 300 mg. **Injection, Solution:** 50 mg/mL. **Suspension, Oral:** 125 mg/5 mL. **Tablets, Chewable:** 50 mg.

**Administration/handling**
**IV**

**Alert** Give by IV push or IV piggyback. IV push very painful (chemical irritation of vein due to alkalinity of solution). To minimize effect, flush vein with sterile saline solution through same IV needle and catheter after each IV push.

**Reconstitution**
- May give undiluted or may dilute with 0.9% NaCl to a concentration of 5 mg/mL or more.

**Rate of Administration**
- Administer 50 mg over 1 min in adults, 20 mg/min in elderly, pts with preexisting cardiovascular conditions. In neonates, administer at rate not exceeding 1–3 mg/kg/min.
- Infuse diluted solutions using an in-line filter.
- Severe hypotension, cardiovascular collapse occur if rate of IV injection exceeds 50 mg/min for adults.
- IV toxicity characterized by CNS depression, cardiovascular collapse.

**Storage**
- Precipitate may form if parenteral form is refrigerated (will dissolve at room temperature).
- Slight yellow discoloration of parenteral form does not affect potency, but do not use if solution is cloudy or precipitate forms. Discard if not used within 4 hrs of preparation.

**PO**
- Give with food if GI distress occurs.
- Tablets may be chewed.
- Shake oral suspension well before using.
- Separate administration of phenytoin with antacids or tube feeding by 2 hrs.

**IV incompatibilities**

DiltiaZEM (Cardizem), DOBUTamine (Dobutrex), enalapril (Vasotec), heparin, HYDROMorphine (Dilaudid), insulin, lidocaine, morphine, nitroglycerin, norepinephrine (Levophed), potassium chloride, propofol (Diprivan).

**Indications/routes/dosage**
Status Epilepticus

**IV: ADULTS, ELDERLY, ADOLESCENTS: Loading dose:** 20 mg/kg at maximum rate of 50 mg/min. May repeat in 10 min after loading dose with dose of 5–10 mg/kg. **INFANTS, CHILDREN: Loading dose:** 20 mg/kg at maximum rate of 1 mg/kg/min. May give additional dose of 5–10 mg/kg after loading dose.

Seizure Control (Maintenance)

**Note:** Loading dose not used in pts with history of renal/hepatic disease.

**PO: ADULTS, ELDERLY:** Loading Dose: 1 g divided into 3 doses given at 2-hr intervals. **Maintenance** (begins 24 hrs after loading dose): Initially 100 mg 3 times/day; adjust at no less than 7–10-day intervals. Usual dose: 100 mg 3–4 times/day up to 200 mg 3 times/day (may consider 300 mg once daily in pts established on 100 mg 3 times/day). **CHILDREN:** Initially, 5 mg/kg/day in 2–3 divided doses. Adjust dose at 7- to 10-day intervals. **Maintenance:** 4–8 mg/kg/day. **Maximum:** 300 mg/day.

Dosage in Renal/Hepatic Impairment

No dose adjustment.

Side effects

**Frequent:** Drowsiness, lethargy, confusion, slurred speech, irritability, gingival hyperplasia, hypersensitivity reaction (fever, rash, lymphadenopathy), constipation, dizziness, nausea. **Occasional:** Headache, hirsutism, coarsening of facial features, insomnia, muscle twitching.

Adverse effects/toxic reactions

Abrupt withdrawal may precipitate status epilepticus. Blood dyscrasias, lymphadenopathy, osteomalacia (due to interference of vitamin D metabolism) may occur. Toxic phenytoin blood concentration (25 mcg/mL or more) may produce ataxia, nystagmus, diplopia. As level increases, extreme lethargy to comatose state occurs.

Nursing considerations
Baseline assessment

Anticonvulsant: Review history of seizure disorder (intensity, frequency, duration, LOC). Initiate seizure precautions. LFT, CBC should be performed before beginning therapy and periodically during therapy. Repeat CBC 2 wks following initiation of therapy and 2 wks following administration of maintenance dose.

Intervention/evaluation

Observe frequently for recurrence of seizure activity. Monitor ECG for cardiac arrhythmia. Assess for clinical improvement (decrease in intensity/frequency of seizures). Monitor for signs/symptoms of depression, suicidal tendencies, unusual behavior. Monitor CBC with differential, renal function, LFT, B/P (with IV use). Assist with ambulation if drowsiness, lethargy occurs. Monitor for therapeutic serum level (10–20 mcg/mL). **Therapeutic serum level**: 10–20 mcg/mL; **toxic serum level**: greater than 20 mcg/mL. **Free unbound levels**: **Therapeutic**: 1–2 mcg/mL; **toxic**: more than 2 mcg/mL.

Patient/family teaching

• Pain may occur with IV injection.
• To prevent gingival hyperplasia (bleeding, tenderness, swelling of gums), maintain good oral hygiene, gum massage, regular dental visits.
• Serum levels should be performed every mo for 1 yr after maintenance dose is established and q3mos thereafter.
• Report sore throat, fever, glandular swelling, skin reaction (hematologic toxicity).
• Drowsiness usually diminishes with continued therapy.
• Avoid tasks that require alertness, motor skills until response to drug is established.
• Do not abruptly withdraw medication after long-term use (may precipitate seizures).
• Strict maintenance of drug therapy is essential for seizure control, arrhythmias.
• Avoid alcohol.
• Report any unusual changes in behavior.

phosphates potassium sodium
fes-fates
**CLASSIFICATION**

**PHARMACOTHERAPEUTIC:** Electrolyte supplement.

**CLINICAL:** Mineral.

---

**Uses**

Prevention and treatment of hypophosphatemia.

**Precautions**

**Contraindications:** (K-phosphate): Hyperkalemia, hyperphosphatemia, hypocalcemia. (Na-phosphate): Hypocalcemia, hypernatremia, hyperphosphatemia. **Cautions:** Renal impairment, concomitant use of potassium-sparing drugs, acid-base alteration, digitalized pts, cardiac disease, metabolic alkalosis.

**Action**

Active in bone deposition, calcium metabolism, utilization of B complex vitamins. Act as buffers in maintaining acid-base balance. Exert osmotic effect in small intestine. **Therapeutic Effect:** Correct hypophosphatemia, acidify urine, prevent calcium deposits in urinary tract, promote peristalsis in GI tract.

**Pharmacokinetics**

Poorly absorbed after PO administration. PO form excreted in feces; IV form excreted in urine.

**Lifespan considerations**

- **Pregnancy/Lactation:** Use caution in pregnant women with other medical conditions (e.g., preeclampsia). **Children:** Increased risk of dehydration in pts younger than 12 yrs. **Elderly:** No age-related precautions noted.

**Interactions**

**DRUG:** ACE inhibitors (e.g., enalapril, lisinopril), NSAIDs (e.g., ibuprofen, ketorolac, naproxen), potassium-containing medications, potassium-sparing
diuretics (e.g., spironolactone, triamterene), salt substitutes containing potassium phosphate may increase serum potassium. Antacids may decrease absorption. Calcium-containing medications may increase risk of calcium deposition in soft tissues, decrease phosphate absorption. HERBAL: None significant. FOOD: None known. LAB VALUES: None significant.

Availability (Rx)

Injection Solution (Potassium Phosphate): 3 mmol phosphate and 4.4 mEq potassium per mL. Injection Solution (Sodium Phosphate): 3 mmol phosphate and 4 mEq sodium per mL.

Administration/handling

IV

Reconstitution
• Must be diluted. Soluble in all commonly used IV solutions.

Rate of Administration
• Infuse over minimum of 4 hrs (usually over 6 hrs). Maximum rate: 0.06 mmol/kg/hr.

Storage
• Store at room temperature.

IV incompatibility

Amiodarone, DOBUTamine (Dobutrex), pantoprazole (Protonix).

IV Compatibilities

DiltiaZEM (Cardizem), enalapril (Vasotec), famotidine (Pepcid), metoclopramide (Reglan), niCARdipine (Cardene).

Indications/routes/dosage

Note: (K-Phosphate): For each mmol of phosphate, 1.5 mEq of K will be given. (Na-Phosphate): For each mmol of phosphate, 1.3 mEq of Na will be given.
Hypophosphatemia

Potassium/Sodium Phosphate: (Phosphate level 2.3–3 mg/dL): 0.16–0.32 mmol/kg over 4–6 hr. (Phosphate level 1.6–2.2 mg/dL): 0.32–0.64 mmol/kg over 4–6 hr. (Phosphate level <1.5 mg/dL): 0.64–1 mmol/kg over 8–12 hr.

Side effects

Frequent: Mild laxative effect (in first few days of therapy). Occasional: Diarrhea, nausea, abdominal pain, vomiting. Rare: Headache, dizziness, confusion, heaviness of lower extremities, fatigue, muscle cramps, paresthesia, peripheral edema, arrhythmias, weight gain, thirst.

Adverse effects/toxic reactions

Hyperphosphatemia may produce extraskeletal calcification.

Nursing considerations

Baseline Assessment

Intervention/evaluation

Routinely monitor serum calcium, phosphorus, potassium, sodium, ALT, AST, alkaline phosphatase, bilirubin.

Patient/family teaching

• Report diarrhea, nausea, vomiting.

pimavanserin
pim-a-van-ser-in

Nuplazid

CLASSIFICATION
PHARMACOTHERAPEUTIC: Second-generation (atypical) antipsychotic.
CLINICAL: Antipsychotic. Do not confuse pimavanserin with eplivanserin, flibanserin, or pravastatin, or Nuplazid with Neulasta or Neupogen.

Uses
Treatment of hallucinations and delusions associated with Parkinson’s disease psychosis.

Precautions
**Contraindications:** Hypersensitivity to pimavanserin. **Cautions:** Concomitant use of strong CYP3A4 inhibitors, strong CYP3A4 inducers. History of orthostatic hypotension, hepatic impairment. Avoid use in pts with history of cardiac arrhythmias, symptomatic bradycardia; conditions predisposing to sudden cardiac failure, torsades de pointes (congenital long QT syndrome, medications known to prolong QT interval, HF; hypokalemia, hypomagnesemia). Not approved for dementia-related psychosis unrelated to the hallucinations and delusions associated with Parkinson’s disease psychosis.

Action
Exact mechanism unknown. Displays agonist and antagonist activity with high affinity for 5-HT$_{2A}$ receptors and low affinity to 5-HT$_{2C}$ receptors. **Therapeutic Effect:** Produces tranquilizing effect. Reduces symptoms of psychosis.

Pharmacokinetics
Widely distributed. Metabolized in liver. Protein binding: 95%. Peak plasma concentration: 6 hrs (range: 4–24 hrs). Excreted in feces (less than 2%), urine (less than 1%). **Half-life:** 57 hrs.

Lifespan considerations
**Pregnancy/Lactation:** Unknown if distributed in breast milk. **Children:** Safety and efficacy not established. **Elderly:** No age-related precautions noted.
Interactions

DRUG: QT interval–prolonging medications (e.g., amiodarone, FLUoxetine, haloperidol, moxifloxacin, sotalol) may increase risk of QT interval prolongation. **Strong CYP3A inducers** (e.g., carBAMazepine, PHENobarbital, rifAMPin) may decrease concentration/effect. **Strong CYP3A inhibitors** (e.g., clarithromycin, ketoconazole, ritonavir) may increase concentration/effects. **HERBAL:** St. John’s wort may decrease concentration/effect. **FOOD:** None known. **LAB VALUES:** None known.

Availability (Rx)

Tablets: 17 mg.

Administration/handling

PO
  • Give without regard to food.

Indications/routes/dosage

Parkinson’s Disease Psychosis

PO: ADULTS, ELDERLY: 34 mg (two 17-mg tablets) once daily.

Dose Modification

Concomitant use of strong CYP3A4 inhibitors: 17 mg once daily.

Concomitant use of strong CYP3A4 inducers: 34 mg once daily (dosage increase may be necessary due to reduced effectiveness).

Dosage in Renal Impairment

Mild to moderate impairment: No dose adjustment. **Severe impairment:** Not recommended.

Dosage in Hepatic Impairment

Not recommended.
**Side effects**

**Occasional (7%–4%):** Peripheral edema, confusion, hallucinations (auditory, tactile, somatic, visual), constipation. **Rare (2%):** Gait disturbance.

**Adverse effects/toxic reactions**

May increase risk of death in pts with dementia-related psychosis. Drug-related deaths were reported in 5% of pts and were mainly cardiovascular (e.g., sudden death, cardiac failure) or infectious (e.g., pneumonia) in nature. May prolong QT interval. May increase risk for cardiac arrhythmias.

**Nursing considerations**

**Baseline assessment**

Obtain vital signs, EKG. Assess behavior, appearance, emotional status, response to environment, speech pattern, thought content. Therapy is intended only for Parkinson’s disease psychosis. Screen pts for dementia-related psychosis. Receive full medication history and screen for interactions. Question history of cardiac arrhythmias, symptomatic bradycardia, HF, QT interval prolongation, heart block.

**Intervention/evaluation**

**Patient/family teaching**

- Do not abruptly withdraw from long-term therapy.
- Drowsiness may subside after continued therapy.
- Avoid tasks that require alertness, motor skills until response to drug established.
• Go slowly from lying to standing.
• Avoid alcohol.
• Use caution when taking other drugs that depress the central nervous system.
• Do not take newly prescribed medications unless approved by prescriber who originally started therapy.
• Do not take herbal products.
• Therapy may cause life-threatening cardiac arrhythmias. Seek immediate medical attention if chest pain, dizziness, fainting, palpitations, or feelings of impending doom occur.
• Report continued hallucinations or delirium.

**pioglitazone**
pye-oh-glit-a-zone
Actos
Apo-Pioglitazone

**Fixed-Combination(s)**

**Actoplus Met**: pioglitazone/metFORMIN (an antidiabetic): 15 mg/500 mg, 15 mg/850 mg. **Duetact**: pioglitazone/glimepiride (an antidiabetic): 30 mg/2 mg, 30 mg/4 mg. **Oseni**: pioglitazone/alogliptin (an antidiabetic): 15 mg/25 mg, 30 mg/25 mg, 45 mg/25 mg, 15 mg/12.5 mg, 30 mg/12.5 mg, 45 mg/12.5 mg.

**CLASSIFICATION**

**PHARMACOTHERAPEUTIC**: Thiazolidinedione antihyperglycemic. **CLINICAL**: Antidiabetic agent.

■ **BLACK BOX ALERT** ■ May cause or exacerbate HF.

Do not confuse Actos with Actidose or Actonel.

**Uses**
Adjunct to diet and exercise to lower serum glucose in those with type 2 diabetes. Used as monotherapy or combination therapy.

**Precautions**
**Contraindications:** Hypersensitivity to pioglitazone. NYHA class III/IV HF (at initiation of therapy). **Cautions:** Hepatic impairment, anemia, pts with edema; avoid in pts with bladder cancer. For premenopausal, anovulatory women may result in ovulation resumption, increased risk of pregnancy. NYHA class I/II HF.

**Action**

Improves target-cell response to insulin without increasing pancreatic insulin secretion. Action dependent on presence of insulin. **Therapeutic Effect:** Lowers serum glucose concentration.

**Pharmacokinetics**

**Lifespan considerations**

**Pregnancy/Lactation:** Unknown if drug crosses placenta or is distributed in breast milk. Not recommended in pregnant or breastfeeding women. **Children:** Safety and efficacy not established. **Elderly:** No age-related precautions noted.

**Interactions**

**DRUG:** CYP2C8 inhibitors (e.g., gemfibrozil) may increase concentration/effects. CYP2C8 inducers (e.g., rifAMPin) may decrease concentration. **HERBAL:** Garlic, ginger, ginseng may cause hypoglycemia. **FOOD:** None known. **LAB VALUES:** May increase serum creatine kinase (CK). May decrease Hgb (by 2%–4%). May increase serum alkaline phosphatase, bilirubin, ALT. Less than 1% of pts experience ALT values 3 times the normal level.

**Availability (Rx)**

**Tablets:** 15 mg, 30 mg, 45 mg.

**Administration/handling**
PO
• Give without regard to meals.

**Indications/routes/dosage**

**Diabetes**

**PO: ADULTS, ELDERLY:** 15–30 mg once daily. **Maximum:** 45 mg once daily.

**Dosage Adjustment with Strong CYP2C8 Inhibitors**

**Note:** Not recommended in pts with symptomatic HF.

**PO: ADULTS, ELDERLY:** 15 mg once daily.

**Dosage in Renal/Hepatic Impairment**

No dose adjustment. **Note:** Hepatic injury has been associated with use. Use caution.

**Side effects**

**Frequent (13%–9%):** Headache, upper respiratory tract infection. **Occasional (6%–5%):** Sinusitis, myalgia, pharyngitis, aggravated diabetes, edema.

**Adverse effects/toxic reactions**

Hepatotoxicity occurs rarely. May cause/worsen macular edema. Increased risk of HF. May increase risk of fractures. Pts with ischemic heart disease are at high risk of MI.

**Nursing considerations**

**Baseline assessment**

Obtain baseline chemistries, esp. LFT, before initiating therapy and periodically thereafter.

**Intervention/evaluation**
Monitor serum glucose, Hgb A1c, LFT. Assess for hypoglycemia (cool/wet skin, tremors, dizziness, anxiety, headache, tachycardia, numbness in mouth, hunger, diplopia), hyperglycemia (polyuria, polyphagia, polydipsia, nausea, vomiting, dim vision, fatigue, deep rapid breathing). Be alert to conditions that alter serum glucose requirements: fever, increased activity, trauma, stress, surgical procedures. Monitor for signs/symptoms of HF.

**Patient/family teaching**

- Be alert for signs/symptoms of hypoglycemia and take measures to manage it.
- Avoid alcohol.
- Report chest pain, palpitations, abdominal pain, fever, rash, hypoglycemic reactions, yellowing of skin/eyes, dark urine, light stool, nausea, vomiting.
- Report any change in vision.
- Report rapid weight gain, edema, difficulty breathing.
- Ensure follow-up instruction if pt, family do not thoroughly understand diabetes management, glucose-testing technique.

<table>
<thead>
<tr>
<th>piperacillin sodium/tazobactam sodium</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>pys</strong>-per-a-sil-in/tay-zoe-bak-tam</td>
</tr>
<tr>
<td>Tazocin 🌟</td>
</tr>
<tr>
<td>Zosyn</td>
</tr>
</tbody>
</table>

**CLASSIFICATION**

- **PHARMACOTHERAPEUTIC**: Penicillin.
- **CLINICAL**: Antibiotic.

Do not confuse Zosyn with Zofran or Zyvox.

**Uses**

Treatment of moderate to severe bacterial infections, including community-acquired/nosocomial pneumonia, intra-abdominal, pelvic, skin, and skin structure infections. Tazobactam expands piperacillin activity to include beta-lactamase–producing strains of *S. aureus, H. influenzae, Bacteroides, PsAg, Acinetobacter, Klebsiella pneumoniae, E. coli*. **OFF-LABEL**: Surgical prophylaxis, complicated intra-abdominal infections.
Precautions

Contraindications: Hypersensitivity to piperacillin/tazobactam, any penicillin. Cautions: History of allergies (esp. cephalosporins, beta-lactamase inhibitors), renal impairment, preexisting seizure disorder.

Action

Pharmacokinetics

Protein binding: 16%–30%. Widely distributed. Primarily excreted unchanged in urine. Removed by hemodialysis. Half-life: 0.7–1.2 hrs (increased in hepatic cirrhosis, renal impairment).

Lifespan considerations

Pregnancy/Lactation: Readily crosses placenta; appears in cord blood, amniotic fluid. Distributed in breast milk in low concentrations. May lead to allergic sensitization, diarrhea, candidiasis, skin rash in infant. Children: Dosage not established for pts younger than 12 yrs. Elderly: Age-related renal impairment may require dosage adjustment.

Interactions

DRUG: Concurrent use of aminoglycosides (e.g., gentamicin, tobramycin) may cause mutual inactivation (must give at least 1 hr apart). May increase concentration, toxicity of methotrexate. Probenecid may increase concentration, risk of toxicity. High-dose piperacillin may increase risk of bleeding with heparin, NSAIDs (e.g., ibuprofen, ketorolac, naproxen), platelet inhibitors (e.g., aspirin, clopidogrel), thrombolytic agents (e.g., alteplase), warfarin. HERBAL: None significant. FOOD: None known. LAB VALUES: May increase serum sodium, alkaline phosphatase, bilirubin, LDH, ALT, AST, BUN, creatinine, PT, PTT. May decrease serum potassium. May
cause positive Coombs’ test.

**Availability (Rx)**

*Alert* Piperacillin/tazobactam is a combination product in an 8:1 ratio of piperacillin to tazobactam. **Injection Powder:** 2.25 g, 3.375 g, 4.5 g. **Premix Ready to Use:** 2.25 g (50 mL), 3.375 g (50 mL), 4.5 g (100 mL).

**Administration/handling**

шей IV

**Reconstitution**
• Reconstitute each 1 g with 5 mL D₅W or 0.9% NaCl. Shake vigorously to dissolve.
• Further dilute with at least 50 mL D₅W or 0.9% NaCl.

**Rate of Administration**
• Infuse over 30 min. Expanded infusion over 3–4 hrs.

**Storage**
• Reconstituted vial is stable for 24 hrs at room temperature or 48 hrs if refrigerated.
• After further dilution, stable for 24 hrs at room temperature or 7 days if refrigerated.

**IV incompatibilities**

Amphotericin B (Fungizone), amphotericin B complex (Abelcet, AmBisome, Amphotec), famotidine (Pepcid), haloperidol (Haldol), hydRoxyzine (Vistaril), vancomycin (Vancocin).

**IV Compatibilities**

Bumetanide (Bumex), calcium gluconate, dexmedetomidine (Precedex), diphenhydramINE (Benadryl), DOPamine (Intropin), enalapril (Vasotec), furosemide (Lasix), granisetron (Kytril), heparin, hydrocortisone (Solu-Cortef), HYDROmorphe (Dilaudid), LORazepam (Ativan), magnesium sulfate, methylPREDNISolone (Solu-Medrol), metoclopramide (Reglan), morphine, ondansetron (Zofran), potassium chloride.
Indications/routes/dosage

Note: Extended Infusion: ADULTS, ELDERLY: 3.375–4.5 g over 4 hrs q8h.

Usual Dosage

**IV: ADULTS, ELDERLY:** 4.5 g q6–8h or 3.375 g q6h. **Maximum:** 18 g daily. **CHILDREN 10 MOS AND OLDER:** 100 mg piperacillin component/kg/dose q8h. **Maximum:** 16 g/day. **CHILDREN 2–9 MOS:** 80 mg piperacillin component/kg/dose q8h. **NEONATES:** 80–100 mg piperacillin component/kg/dose q6-12.

Dosage in Renal Impairment

Dosage and frequency are modified based on creatinine clearance.

Dosage in Hepatic Impairment

No dose adjustment.

**Side effects**

**Frequent:** Diarrhea, headache, constipation, nausea, insomnia, rash.

**Occasional:** Vomiting, dyspepsia, pruritus, fever, agitation, candidiasis,
dizziness, abdominal pain, edema, anxiety, dyspnea, rhinitis.

**Adverse effects/toxic reactions**

Antibiotic-associated colitis, other superinfections (abdominal cramps, severe watery diarrhea, fever) may result from altered bacterial balance in GI tract. Overdose, more often with renal impairment, may produce seizures, neurologic reactions. Severe hypersensitivity reactions, including anaphylaxis, occur rarely.

**Nursing considerations**

**Baseline assessment**

Question for history of allergies, esp. to penicillins, cephalosporins. Obtain baseline CBC with differential, BMP, LFT; urinalysis; PT, aPTT (if on anticoagulants or history of coagulopathy).

**Intervention/evaluation**

Monitor daily pattern of bowel activity, stool consistency; mild GI effects may be tolerable, but increasing severity may indicate onset of antibiotic-associated colitis. Be alert for superinfection: fever, vomiting, diarrhea, anal/genital pruritus, oral mucosal changes (ulceration, pain, erythema). Monitor I&O, urinalysis. Monitor serum electrolytes, esp. potassium, renal function tests.

<table>
<thead>
<tr>
<th><strong>pitavastatin</strong></th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>pit-av-a-stat-in</strong></td>
</tr>
<tr>
<td><strong>Livalo</strong></td>
</tr>
</tbody>
</table>

**CLASSIFICATION**

**PHARMACOTHERAPEUTIC**: HMG-CoA reductase inhibitor.

**CLINICAL**: Antihyperlipidemic.

Do not confuse pitavastatin with atorvastatin, lovastatin, pravastatin, or simvastatin.

**Uses**

Reduces elevated total cholesterol, low-density lipoproteins (LDLs),
apolipoprotein B, triglycerides; increases low high-density lipoproteins (HDLs) in primary hyperlipidemia and mixed dyslipidemia. **OFF-LABEL:** Primary and secondary prevention of atherosclerotic cardiovascular disease.

**Precautions**

**Contraindications:** Hypersensitivity to pitavastatin. Active hepatic disease, persistent or unexplained elevations of LFT; concurrent cycloSPORINE use, pregnancy, breastfeeding. **Cautions:** History of hepatic disease, substantial alcohol consumption, moderate renal impairment. Withholding/discontinuing pitavastatin may be necessary when pt at risk for renal failure. Pts at risk for myopathy: elderly, renal impairment, inadequately treated hypothyroidism.

**Action**

Interferes with cholesterol biosynthesis by inhibiting conversion of HMG-CoA reductase to a precursor to cholesterol. **Therapeutic Effect:** Lowers total cholesterol, LDL cholesterol, apolipoprotein B (Apo B), plasma triglycerides; increases HDL cholesterol.

**Pharmacokinetics**

Poorly absorbed from GI tract. Protein binding: greater than 99%. Metabolized in liver. Primarily excreted in feces. **Half-life:** 12 hrs.

**Lifespan considerations**

**Pregnancy/Lactation:** Contraindicated in pregnancy (suppression of cholesterol biosynthesis may cause fetal toxicity) and lactation. Unknown if drug is distributed in breast milk (risk of serious adverse reactions in nursing infants). **Children:** Safety and efficacy not established in pts younger than 18 yrs. **Elderly:** No age-related precautions noted.

**Interactions:**

**DRUG:** Increased risk of rhabdomyolysis, acute renal failure with gemfibrozil, niacin, other fibrates. CycloSPORINE, erythromycin, rifAMPin may increase serum pitavastatin levels. **HERBAL:** None significant. **FOOD:** None
known. **LAB VALUES:** May increase serum creatine kinase (CPK), ALT, AST concentrations.

### Availability (Rx)

**Tablets:** 1 mg, 2 mg, 4 mg.

### Administration/handling

**PO**
- Give without regard to meals or time of day.

### Indications/routes/dosage

**ALERT** Before initiating therapy, pt should be on standard cholesterol-lowering diet for minimum of 3–6 mos. Continue diet throughout pitavastatin therapy.

**Usual Dosage**

**PO:** **ADULTS:** Initially, 2 mg/day. **Maximum:** 4 mg/day. Range: 1–4 mg/day. **Maximum dosage with erythromycin:** 1 mg/day; with rifAMPin: 2 mg/day.

**Dosage in Renal Impairment**

CrCl 30–59, 15–60 mL/min not receiving hemodialysis, or end-stage renal disease in pts on hemodialysis: Initially, 1 mg/day. **Maximum:** 2 mg/day.

**Dosage in Hepatic Impairment**

See contraindications.

### Side effects

Generally well tolerated. Side effects usually mild and transient. **Rare (less than 4%):** Myalgia, constipation/diarrhea, back/extremity pain, arthralgia, headache, nasopharyngitis.

### Adverse effects/toxic reactions
Hypersensitivity (rash, pruritus, urticaria) occurs rarely. Myopathy, rhabdomyolysis.

**Nursing considerations**

**Baseline assessment**
Obtain LFT, serum cholesterol, triglycerides. Question for possibility of pregnancy before initiating therapy.

**Intervention/evaluation**
Monitor cholesterol and triglyceride levels; LFT. Monitor daily pattern of bowel activity, stool consistency. Check for myalgia, arthralgia, headache. Assess for rash, pruritus. Be alert for malaise, muscle cramping/weakness.

**Patient/family teaching**
- Follow special diet (important part of treatment).
- Periodic lab tests are essential part of therapy.
- Report promptly any muscle pain/weakness.
- Use nonhormonal contraception.

<table>
<thead>
<tr>
<th>plecanatide</th>
</tr>
</thead>
<tbody>
<tr>
<td>ple-kan-a-tide</td>
</tr>
<tr>
<td><strong>Trulance</strong></td>
</tr>
</tbody>
</table>

**CLASSIFICATION**
**PHARMACOTHERAPEUTIC**: Guanylate cyclase-C agonist.
**CLINICAL**: GI agent.

**BLACK BOX ALERT**
Contraindicated in pts younger than 6 yrs due to risk of life-threatening dehydration and death. Safety and efficacy not established in pts younger than 18 yrs; avoid use.

Do not confuse plecanatide with exenatide, lixisenatide, pramlintide or Trulance with Truvada.
Uses
Treatment of adults with chronic idiopathic constipation.

Precautions
**Contraindications:** Hypersensitivity to plecanatide. Pts younger than 6 yrs of age, mechanical GI obstruction (known or suspected). **Cautions:** Dehydration. Avoid use in pts younger than 18 yrs of age.

Action
Binds and agonizes guanylate cyclase-C on luminal surface of intestinal epithelium, increasing cyclic guanosine monophosphate (cGMP), resulting in chloride and bicarbonate secretion into the intestinal lumen. **Therapeutic Effect:** Increases intestinal fluid and transit time.

Pharmacokinetics
Minimal absorption systemically; mainly confined to GI tract. Metabolized within GI tract to active metabolite. Undergoes proteolytic degradation within intestinal lumen to smaller peptides and amino acids. **Half-life:** Not specified.

💡 Lifespan considerations
**Pregnancy/Lactation:** Unknown if distributed in breast milk. **Children:** Contraindicated in pts younger than 6 yrs. Safety and efficacy not established in pts aged 6 to less than 18 yrs. Severe, possibly fatal, dehydration may occur in pediatric pts younger than 18 yrs due to increased intestinal fluid secretion; avoid use. **Elderly:** No age-related precautions noted.

Interactions
**DRUG:** None known. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** May increase serum ALT, AST.

Availability (Rx)
**Tablets:** 3 mg.
Administration/handling

PO

• Give with or without food.
• If a dose is missed, skip the dose and give at next regularly scheduled time; do not double dose.
• Give tablet whole; do not break, cut, or divide.
• For pts with dysphagia, tablet may be crushed and mixed in applesauce, or dispersed in 30 mL of water and given orally or via NG tube. After administration of dispersed tablet, refill container with additional 30 mL of water and give remaining contents. Flush NG tube with additional 10 mL of water.

Indications/Routes/Dosage

Chronic Idiopathic Constipation

PO: ADULTS, ELDERLY: 3 mg once daily.

Dosage in Renal/Hepatic Impairment

Not specified; use caution.

Side Effects

Occasional (5%): Diarrhea. Rare (less than 2%): Abdominal pain/tenderness, flatulence.

Adverse Effects/Toxic Reactions

Severe diarrhea reported in less than 1% of pts; usually occurred within the first 3 days.

Nursing Considerations

Baseline Assessment

Question characteristics of constipation, frequency of bowel movements. Assess bowel sounds. Assess hydration status.
**Intervention/Evaluation**

**Patient/Family Teaching**

- Report severe diarrhea.
- Drink plenty of fluids.
- Do not take laxatives unless approved by prescriber.
- Tablets may be taken whole, dispersed in water, or crushed and mixed in applesauce.
- Securely store tablets away from children; life-threatening dehydration may occur if accidentally ingested by children younger than 6 yrs.

MiraLax
NuLytely
Peglyte
TriLyte

**CLASSIFICATION**

**PHARMACOTHERAPEUTIC:** Osmotic/laxative.

**CLINICAL:** Bowel evacuant.

**Do not confuse MiraLax with Mirapex.**

**Uses**
**Polyethylene glycol-electrolyte solution:** Bowel cleansing before GI examination, colon surgery. **Polyethylene glycol:** Treatment of occasional constipation.

**Precautions**

**Contraindications:** Hypersensitivity to polyethylene glycol. Bowel perforation, gastric retention, GI obstruction, megacolon, toxic colitis, toxic ileus. **Cautions:** *(Propylene glycol):* Renal impairment. *(Propylene glycol-electrolyte solution):* Ulcerative colitis, medications altering electrolytes, hyponatremia, cardiac arrhythmias, impaired gag reflex, history of seizures, elderly.

**Action**

Osmotic effect. **Therapeutic Effect:** Induces diarrhea, cleanses bowel without depleting electrolytes.

**Pharmacokinetics**

**Lifespan considerations**

**Pregnancy/Lactation:** Unknown if drug crosses placenta or is distributed in breast milk. **Children/Elderly:** No age-related precautions noted.

**Interactions**

**DRUG:** May decrease absorption of oral medications if given within 1 hr (may be flushed from GI tract). **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** None significant.

**Availability (Rx)**

**Powder for Oral Solution:** Propylene glycol (Miralax): 17 g/dose. **Propylene**
glycol-electrolyte solution (CoLyte, GoLYTELY): See individual product for specific ingredients.

Administration/handling

PO
*Polyethylene Glycol-Electrolyte Solution*
• Refrigerate reconstituted solutions; use within 48 hrs.
• May use tap water to prepare solution. Shake vigorously for several min to ensure complete dissolution of powder.
• Fasting should occur for more than 3 hrs prior to ingestion of solution (always avoid solid food less than 2 hrs prior to administration).
• Only clear liquids permitted after administration.
• May give via NG tube.
• Rapid drinking preferred. Chilled solution is more palatable.

*Polyethylene Glycol*
• Add to 4- to 8-oz beverage.

Indications/routes/dosage

Bowel Evacuant
PO: ADULTS, ELDERLY: Before GI examination: 240 mL (8 oz) q10min until 4 L consumed or rectal effluent clear. NG tube: 20–30 mL/min until 4 L given. CHILDREN 6 MOS AND OLDER: 25 mL/kg/hr until rectal effluent clear. Maximum: 4 L.

Constipation
PO (Miralax): ADULTS: 17 g or 1 heaping tbsp/day. CHILDREN 6 MOS AND OLDER: 0.5–1.5 g/kg/day. Maximum: 17 g/day.

Dosage in Renal/Hepatic Impairment
No dose adjustment.

Side effects
Frequent (50%): Some degree of abdominal fullness, nausea, bloating. Occasional (10%–1%): Abdominal cramping, vomiting, anal irritation. Rare (less than 1%): Urticaria, rhinorrhea, dermatitis.

**Adverse effects/toxic reactions**
None known.

**Nursing considerations**

**Baseline assessment**
Do not give oral medication within 1 hr of start of therapy (may not adequately be absorbed before GI cleansing).

**Intervention/evaluation**

**Patient/family teaching**
- May take 2–4 days to produce a bowel movement.
- Report unusual cramps, bloating, diarrhea.

---

**pomalidomide**
poe-ma-lid-oh-mide

**Pomalyst**

**CLASSIFICATION**
PHARMACOTHERAPEUTIC: Thalidomide analogue.
CLINICAL: Antineoplastic.

■ **BLACK BOX ALERT** ■ May cause life-threatening birth defects. Pregnancy contraindicated. Exclude pregnancy before initiating treatment. Females of reproductive potential must use two reliable forms of contraception or continuously abstain during treatment and for 4 wks after treatment. Deep vein thrombosis and pulmonary embolism may occur.
Consider venous thromboembolism (VTE) prophylaxis during treatment.

**Uses**

Treatment of multiple myeloma in pts who have received at least two prior therapies including lenalidomide and bortezomib and who have demonstrated disease progression on or within 60 days of completion of the last therapy.

**Precautions**

- Do not donate blood products during therapy and for 1 month after therapy discontinuation; male pts must not donate sperm.
- **Contraindications:** Hypersensitivity to pomalidomide. Pregnancy.  
  **Cautions:** Anemia, HF, hepatic/renal impairment, smoking, breastfeeding, or prior history of CVA, MI, DVT, PE.

**Action**

Inhibits tumor cell proliferation and induces apoptosis (cell death) of hematopoietic cells. Enhances T-cell– and natural killer (NK) cell–mediated immunity. Inhibits proinflammatory cytokines.  
**Therapeutic Effect:** Inhibits tumor cell growth and metastasis.

**Pharmacokinetics**

Readily absorbed following PO administration. Metabolized in liver. Protein binding: 12%–44%. Peak plasma concentration: 2–3 hrs. Excreted in urine (73%), feces (15%).  
**Half-life:** 8–10 hrs.

**Lifespan considerations**

- **Pregnancy/Lactation:** Pregnancy/breastfeeding contraindicated. May cause fetal harm. Unknown if distributed in breast milk. Do not breastfeed. Must verify negative pregnancy status before initiation. Must use two reliable forms of birth control (intrauterine device [IUD], tubal ligation) plus barrier methods. Avoid pregnancy for at least 4 wks after discontinuation.  
  **Males:** Must use condoms during treatment and up to 1 mo after treatment, despite prior history of
vasectomy. Do not donate sperm. **Children:** Safety and efficacy not established. **Elderly:** May have increased risk of serious adverse effects, renal failure, electrolyte imbalance.

**Interactions**

**DRUG:** CYP3A4, P-glycoprotein inhibitors (e.g., erythromycin, ketoconazole) may increase concentration/effects. CYP3A4, P-glycoprotein inducers (e.g., carBAMazepine, rifAMPin) may decrease concentration/effects. **HERBAL:** None significant. **FOOD:** All foods may reduce absorption/concentration. **LAB VALUES:** May decrease Hgb, Hct, neutrophils, platelets, leukocytes, lymphocytes, serum calcium, potassium, sodium. May increase serum calcium, creatinine, glucose.

**Availability (Rx)**

**Capsules:** 1 mg, 2 mg, 3 mg, 4 mg.

**Administration/handling**

**PO**

• Do not break, crush, or open capsule.
• Give on empty stomach; must administer at least 2 hrs before or 2 hrs after meal.

**Indications/routes/dosage**

**Note:** Absolute neutrophil count (ANC) should be 500 cells/mm$^3$ or greater and platelets 50,000 cells/mm$^3$ or greater prior to starting new cycles of therapy.

**Multiple Myeloma**

**PO:** **ADULTS/ELDERLY:** 4 mg once daily on days 1–21 of 28-day cycle (in combination with dexamethasone). Continue until disease progression or unacceptable toxicity.

**Dose Modification**
**Neutropenia**

ANC less than 500 cells/mm\(^3\) or febrile neutropenia: Interrupt treatment until ANC is greater than 500 cells/mm\(^3\), then reduce dose to 3 mg once daily. **Any subsequent drop of ANC less than 500 cells/mm\(^3\) after prior reduction:** Interrupt treatment until ANC is greater than 500 cells/mm\(^3\), then reduce dose at 1 mg less than previous dose. Discontinue if 1-mg dose is intolerable.

**Thrombocytopenia**

Platelet count less than 25,000 cells/mm\(^3\): Interrupt treatment until platelet count greater than 50,000 cells/mm\(^3\), then reduce dose to 3 mg once daily. **Any subsequent platelet drop to less than 25,000 cells/mm\(^3\):** Interrupt treatment until platelet count greater than 50,000 cells/mm\(^3\), then reduce dose at 1 mg less than previous dose. Discontinue if 1-mg dose is intolerable.

**Dosage in Renal Impairment**

Avoid use in pts with serum creatinine more than 3 mg/dL or CrCl less than 45 mL/min.

**Dosage in Hepatic Impairment**

Avoid use with bilirubin more than 2 mg/dL and ALT, AST more than 3 times upper limit of normal (ULN).

**Side effects**

**Frequent (55%–22%):** Fatigue, constipation, nausea, diarrhea, dyspnea, back pain, peripheral edema, musculoskeletal chest pain, anorexia, rash. **Occasional (20%–7%):** Dizziness, pyrexia, muscle spasms, arthralgia, pruritus, vomiting, cough, weight loss, headache, bone pain, muscular weakness, anxiety, musculoskeletal pain, peripheral neuropathy, chills, dry skin, tremor, insomnia. **Rare (6%–1%):** Hyperhidrosis, extremity pain, back pain, night sweats, constipation.

**Adverse effects/toxic reactions**

Myelosuppression (neutropenia, leukopenia, thrombocytopenia) is an expected outcome of therapy; may increase risk of infection such as pneumonia, upper respiratory tract infection, UTI. Neurologic events such as acute confusion, dizziness reported. Peripheral neuropathy occurred in 18% of pts. Venous
thromboembolism including DVT, PE occurred in 3% of pts. Epistaxis occurred in 15% of pts. Increased risk of secondary malignancies reported. Acute renal failure reported in 16% of pts. Additional adverse events may include interstitial lung disease (ILD), neutropenic sepsis, *Pneumocystis jiroveci* pneumonia, respiratory syncytial virus infection, urinary retention, vertigo.

**Nursing considerations**

**Baseline assessment**

**Intervention/evaluation**

Monitor CBC, serum chemistries, PT/INR. Offer antiemetics for nausea, vomiting. Monitor pregnancy status every mo during treatment and for at least 4 mos after discontinuation. Obtain EKG for palpitations, chest pain, hypokalemia, hyperkalemia, hypocalcemia, bradycardia, ventricular arrhythmias. Immediately report dyspnea, chest pain, hypoxia, unilateral peripheral edema/pain (may indicate thromboembolic event). Consider sequential compression device (SCD) for immobilized pts. Perform routine neurologic assessments to screen for confusion, delirium. Monitor urine output, frequency.

**Patient/family teaching**

• May cause birth defects or miscarriage. Do not breastfeed. Consult with gynecologist for appropriate birth control methods. Female pts must use contraception during treatment and for at least 1 mo after treatment. Immediately report suspected pregnancy. Male pts must use condoms with spermicide during sexual activity, despite history of vasectomy.
• Do not donate blood.
• Swallow capsules whole; do not break, crush, or open.
• Go from lying to standing slowly (prevents postural hypotension, dizziness). Avoid tasks that require alertness, motor skills until response to drug is
established.
• Do not smoke.
• Do not eat 2 hrs before or 2 hrs after dose.
• Avoid alcohol.
• Report difficulty breathing, chest pain, extremity pain or swelling, dizziness, confusion.

ponatinib

e- 

po- 

na-

ti-

nib

Iclusig

CLASSIFICATION
PHARMACOTHERAPEUTIC: BCR-ABL tyrosine kinase inhibitor.
CLINICAL: Antineoplastic.

■ BLACK BOX ALERT ■ Arterial occlusions have occurred, including CVA, fatal MI, large arterial vessel stenosis of the brain, severe peripheral vascular disease requiring revascularization. Events may occur in pts with or without cardiovascular risks, including pts younger than 50 yrs of age. Venous thromboembolism, serious HF, or left ventricular dysfunction were reported. Hepatotoxicity, including fatal hepatic failure, may occur.

Do not confuse ponatinib with afatinib, alectinib, dasatinib, bosutinib, gefitinib, imatinib, lapatinib, lenvatinib, neratinib, or tofacitinib.

Uses
Treatment of pts with chronic, accelerated, or blast phase chronic myeloid leukemia (CML) or Philadelphia chromosome (Ph+) acute lymphoblastic leukemia (ALL) for whom no other kinase inhibitor therapy is indicated. Treatment of adults with T315I-positive CML (chronic, accelerated, or blast phase) or T315I-positive ALL (Ph+ ALL). Not indicated for treatment of newly diagnosed chronic phase CML.

Precautions
Contraindications: Hypersensitivity to ponatinib. Cautions: Baseline
hematologic cytopenias; conditions predisposing to infection (e.g., diabetes, immunocompromised pts, open wounds), history of arterial/venous thrombosis (e.g., CVA, DVT, MI, PE), cardiac disease, cardiac conduction disorders, HF, hypertension; diabetes, electrolyte imbalance, glaucoma, hepatic impairment, hyperlipidemia, GI perforation, neuropathy (peripheral or cranial), ocular disorders, pancreatitis or alcohol abuse, history of ischemia, vascular stenosis; pts with high tumor burden; pts at risk for hemorrhage (e.g., history of intracranial/GI bleeding, coagulation disorders, recent trauma; concomitant use of anticoagulants, antiplatelets, NSAIDs).

**Action**

Inhibits viability of cells expressing native or mutant BCR-ABL tyrosine kinase, including T315I mutation, created by the Philadelphia chromosome abnormality. **Therapeutic Effect:** Inhibits tumor cell growth and metastasis.

**Pharmacokinetics**

Widely distributed. Metabolized in liver. Protein binding: greater than 99%. Peak plasma concentration: 6 hrs or less. Excreted in feces (87%), urine (5%). **Half-life:** 24 hrs (Range: 12–66 hrs).

**Lifespan considerations**

**Pregnancy/Lactation:** Avoid pregnancy; may cause fetal harm/malformations. Unknown if distributed in breast milk. Breastfeeding not recommended during treatment and for at least 6 days after discontinuation. Females of reproductive potential and males with female partners of reproductive potential should use effective contraception during treatment and for at least 3 wks after discontinuation. May impair fertility in females. **Children:** Safety and efficacy not established. **Elderly:** May have increased risk of adverse reactions/toxic effects. Use caution.

**Interactions**

**DRUG:** Strong CYP3A4 inhibitors (e.g., ketoconazole, ritonavir) may increase concentration/effect. **Strong CYP3A4 inducers** (e.g., carBAMazepine, phenytoin, rifAMPin) may decrease concentration/effect.
May decrease therapeutic effect of BCG vaccine. **HERBAL: St. John’s wort** may decrease concentration/effect. **FOOD: Grapefruit products** may increase concentration/effect. **LAB VALUES:** May increase serum alkaline phosphatase, amylase, ALT, AST, bilirubin, creatinine, lipase, triglycerides, uric acid. May decrease Hgb, Hct, leukocytes, lymphocytes, neutrophils, platelets; serum albumin, bicarbonate, phosphate. May increase or decrease serum calcium, glucose, potassium, sodium.

**Availability (Rx)**

**Tablets:** 15 mg, 30 mg, 45 mg.

**Administration/handling**

**PO**

- Give with or without food.
- Administer tablets whole; do not break, cut, crush, or divide.

**Indications/Routes/Dosage**

**CML, Ph+ ALL**

**PO: ADULTS, ELDERLY:** 45 mg once daily. Consider dose reduction in pts with chronic or accelerated phase CML who have achieved a major cytogenetic response. If an adequate response has been not achieved within 90 days, consider discontinuation.

**Dose Modification**

**Hepatotoxicity**

**CTCAE grade 2 or greater serum ALT/AST elevation (greater than 3 times upper limit normal [ULN]):** Withhold treatment until improved to grade 1 or 0, then resume dose based on occurrence. **Occurrence at 45-mg dose:** Resume treatment at 30-mg dose. **Occurrence at 30-mg dose:** Resume treatment at 15-mg dose. **Occurrence at 15-mg dose:** Permanently discontinue. **Serum ALT/AST elevation greater than or equal to 3 times ULN with concurrent serum bilirubin elevation greater than 2 times ULN and serum alkaline phosphatase greater than 1.5 times ULN:** Withhold treatment until improved to grade 1 or 0, then resume dose based on occurrence. **Occurrence at 45-mg dose:** Resume treatment at 30-mg dose. **Occurrence at 30-mg dose:** Resume treatment at 15-mg dose. **Occurrence at 15-mg dose:** Permanently discontinue.
**phosphatase less than 2 times ULN:** Permanently discontinue.

**Neutropenia/Thrombocytopenia**
ANC less than 1000 cells/mm$^3$; platelets less than 50,000 cells/mm$^3$: Withhold treatment until ANC greater than or equal to 1500 cells/mm$^3$; or platelets greater than or equal to 75,000 cells/mm$^3$, then resume dose based on occurrence. **First occurrence:** Resume treatment at 45-mg dose. **Second occurrence:** Resume treatment at 30-mg dose. **Third occurrence:** Resume treatment at 15-mg dose.

**Pancreatitis/Elevated Lipase:**
Asymptomatic CTCAE grade 1 or 2 serum lipase elevation: Consider withholding treatment or reducing dose. Asymptomatic CTCAE grade 3 or 4 serum lipase elevation (greater than 2 times ULN); asymptomatic radiologic pancreatitis (grade 2 pancreatitis): Withhold treatment until improved to grade 1 or 0, then resume dose based on occurrence. **Occurrence at 45-mg dose:** Resume treatment at 30-mg dose. **Occurrence at 30-mg dose:** Resume treatment at 15-mg dose. **Occurrence at 15-mg dose:** Permanently discontinue. **Grade 4 pancreatitis:** Permanently discontinue.

**Concomitant Use Of Strong Cyp3a4 Inhibitors**
Reduce initial dose to 30 mg.

**Dosage in Renal Impairment**
Not specified; use caution.

**Dosage in Hepatic Impairment**
Mild, moderate, severe impairment (Child-Pugh A, B, or C): Reduce initial dose to 30 mg.

**Side Effects**
**Note:** Percentages of side effects of chronic phase, accelerated phase, blast phase CML; Ph+ ALL may vary.
**Frequent (69%–18%):** Hypertension, abdominal pain, fatigue, asthenia, headache, dry skin, constipation, arthralgia, nausea, pyrexia, burning sensation, hyperesthesia, hypoesthesia, neuralgia, paresthesia, dysgeusia, muscular
weakness, gait disturbance, areflexia, hypotonia, restless legs syndrome, myalgia, extremity pain, back pain, diarrhea, vomiting. **Occasional (17%–2%):** Dyspnea, dizziness, peripheral edema, cough, bone pain, musculoskeletal pain, mucositis, aphthous stomatitis, lip blister, mouth ulceration, mucosal eruption, oral pain, oropharyngeal pain, stomatitis, tongue ulceration, muscle spasm, conjunctival irritation, corneal abrasion/erosion, dry eye, hyperemia, eye pain, pruritus, decreased appetite, insomnia, decreased weight, generalized pain, erythema, alopecia, chills, blurry vision, tachycardia.

**Adverse Effects/Toxic Reactions**

Anemia, leukopenia, lymphopenia, neutropenia, thrombocytopenia are expected responses to therapy, but more severe reactions including bone marrow failure, febrile neutropenia may be life-threatening. Fatal arterial occlusions including CVA, MI, stenosis of large arterial vessel of the brain, severe peripheral vascular disease requiring revascularization reported in 35% of pts; may occur within 2 wks of initiation (even at reduced doses of 15 mg/day). Coronary artery occlusion, MI occurred in 21% of pts. Venous thromboembolism (DVT, PE, superficial thrombophlebitis) occurred in 5–9% of pts. Life-threatening events including cardiac bradyarrhythmias (requiring pacemaker implantation), complete heart block, sick sinus syndrome, atrial fibrillation with bradycardic pauses, atrial fibrillation, SVT, ventricular tachycardia; emergent hypertension (68% of pts), GI/intracranial hemorrhage (28% of pts), hepatotoxicity (54% of pts), pancreatitis (6%), HF, left ventricular dysfunction (6% of pts); infections including cellulitis, nasopharyngitis, pneumonia, sepsis, upper respiratory tract infection, UTI; ocular toxicities including blindness, conjunctival hemorrhage, cataracts, periorbital edema, ocular hyperemia, iritis, iridocyclitis, ulcerative keratitis; peripheral edema (31% of pts), pleural effusion (2% of pts), pericardial effusion (1% of pts); peripheral neuropathy, polyneuropathy, nerve compression (20% of pts) may occur. Tumor lysis syndrome may present as acute renal failure, hypocalcemia, hyperuricemia, hyperphosphatemia. Reversible posterior leukoencephalopathy may include aphasia, cognition impairment, paralysis, vision loss, weakness. Pts with newly diagnosed CML have an increased risk of severe toxicities. Improper wound healing, GI perforation may occur.

**Nursing Considerations**
Baseline Assessment

Obtain CBC, BMP, LFT, serum ionized calcium, phosphate, uric acid; vital signs; weight. Obtain pregnancy test in females of reproductive potential. Question plans of breastfeeding. Receive full medication history including herbal products and screen for interactions. Question history as listed in Precautions. Screen for active infection. Conduct ophthalmologic, neurologic exam. Due to increased risk of tumor lysis syndrome, assess adequate hydration prior to initiation. Consider correcting electrolyte abnormalities prior to initiation. Obtain dietary consult. Screen for risk of bleeding; active infection. Assess skin for rash, lesions. Offer emotional support.

Intervention/Evaluation

Obtain ANC, CBC for myelosuppression q2wks for 3 mos, then monthly thereafter. Monitor serum lipase monthly; BMP, LFT, serum ionized calcium, phosphate, uric acid as indicated. Monitor ECG for cardiac arrhythmias. Due to extremely high risk for arterial occlusions, be vigilant when screening for CVA (aphasia, confusion, paresthesia, hemiparesis, seizures), MI (chest pain, diaphoresis, left arm/jaw pain, increased serum troponin, ST segment elevation), vascular compromise. Be alert for serious infection, opportunistic infection, sepsis. Monitor for GI perforation, hepatotoxicity, ocular disease, pancreatitis; symptoms of thromboembolism (arm/leg pain, swelling; chest pain, dyspnea, hypoxia, tachycardia), reversible posterior leukoencephalopathy, tumor lysis syndrome; other toxicities as listed in Adverse Reactions/Toxic Effects. Monitor daily pattern of bowel activity, stool consistency. Ensure adequate hydration, nutrition. Monitor weight, I&O.

Patient/Family Teaching

• Treatment may cause life-threatening arterial blood clots; report symptoms of heart attack (chest pain, difficulty breathing, jaw pain, nausea, pain that radiates to the left arm, sweating), stroke (blindness, confusion, one-sided weakness, loss of consciousness, trouble speaking, seizures).
• Report symptoms of DVT (swelling, pain, hot feeling in the arms or legs), lung embolism (difficulty breathing, chest pain, rapid heart rate); liver problems (abdominal pain, bruising, clay-colored stool, amber or dark-colored urine, yellowing of the skin or eyes); HF (difficulty breathing, extremity swelling, sudden loss of breath, palpitations); inflammation of the pancreas (abdominal
bruising; persistent, severe abdominal pain that radiates to the back [with or without vomiting]; eye problems (blindness, blurred vision, eye inflammation or bleeding, severe eye or head pain); heart arrhythmias (chest pain, dizziness, fainting, palpitations, slow or rapid heart rate, irregular heart rate); intestinal perforation (severe abdominal pain, fever, nausea).

- Treatment may depress your immune system response and reduce your ability to fight infection. Report symptoms of infection such as body aches, chills, cough, fatigue, fever. Avoid those with active infection.
- Treatment may cause severe bone marrow depression; report bruising, fatigue, fever, shortness of breath, weight loss, bleeding easily, bloody urine or stool.
- Avoid pregnancy; may cause birth defects or miscarriage. Females and males of childbearing potential should use effective contraception during treatment and for at least 3 wks after final dose.
- Do not breastfeed during treatment and for at least 6 days after final dose.
- Report planned surgical/dental procedures.
- Immediately report bleeding of any kind.
- Do not ingest grapefruit products, herbal supplements.
- Do not take newly prescribed medications unless approved by the prescriber who originally started treatment.

**posaconazole**

poe-sa-kon-a-zole

Noxafil

Posanol

**CLASSIFICATION**

PHARMACOTHERAPEUTIC: Azole derivative.

CLINICAL: Antifungal.

Do not confuse Noxafil with minoxidil.

**Uses**

Prophylaxis of invasive *Aspergillus* and *Candida* infections in pts 13 yrs and older (IV for pts 18 yrs and older) who are at high risk for developing these infections due to severely immunocompromised conditions. Treatment of oropharyngeal candidiasis. **OFF-LABEL:** Salvage therapy of refractory
invasive fungal infections, mucormycosis, pulmonary infections.

**Precautions**

**Contraindications:** Hypersensitivity to posaconazole, other azole antifungals. Coadministration with pimozide, quiNIDine (may cause QT prolongation, torsades de pointes), HMG-CoA reductase inhibitors metabolized by CYP3A4 (e.g., atorvastatin, lovastatin, simvastatin), sirolimus, ergot alkaloids. **Cautions:** Renal/hepatic impairment, hypokalemia, hypomagnesemia, pts at increased risk of arrhythmias. Concomitant administration of medications that prolong QT interval, pts with long QT syndrome.

**Action**

Inhibits synthesis of ergosterol, a vital component of fungal cell wall formation. **Therapeutic Effect:** Damages fungal cell wall membrane, altering its function.

**Pharmacokinetics**

Moderately absorbed following PO administration. Absorption increased if drug is taken with food. Widely distributed. Protein binding: 98%. Not significantly metabolized. Primarily excreted in feces. **Half-life:** 20–66 hrs.

*Lifespan considerations*

**Pregnancy/Lactation:** May cause fetal harm. Breastfeeding not recommended. **Children:** Safety and efficacy not established in pts younger than 13 yrs. **Elderly:** No age-related precautions noted.

**Interactions**

**DRUG:** May increase concentrations of atorvastatin, cycloSPORINE, ergot alkaloids, felodipine, midazolam, phenytoin, pimozide, quiNIDine, rifabutin, simvastatin, sirolimus, tacrolimus, vinBLASTine, vinCRIStine. Cimetidine, phenytoin may decrease concentration. **HERBAL:** None significant. **FOOD:** Concentration higher when given with food or nutritional supplements. **Grapefruit products** may decrease concentration/effects. **LAB VALUES:** May decrease WBC, RBC, Hgb, Hct, platelets, serum calcium,
potassium, magnesium. May increase serum glucose, bilirubin, ALT, AST, alkaline phosphatase.

Availability (Rx)

Injection Solution: 300 mg/16.7 mL (18 mg/mL). Oral Suspension: 40 mg/mL. Tablets (Delayed-Release): 100 mg.

Administration/handling

IV

Reconstitution
• Transfer 300 mg (16.7 mL) posaconazole into 150 mL D_{5}W or 0.9% NaCl bag.

Rate of Administration
• Infuse over 90 min via central venous line. Must be infused through in-line filter (0.22 microns) or PVD filter.

Storage
• Refrigerate vials. Once diluted, use immediately. May refrigerate solution up to 24 hrs if not used immediately.

PO
• Administer with or within 20 min of full meal, liquid nutritional supplement, or acidic carbonated beverage (e.g., ginger ale) (enhances absorption).
• Store oral suspension at room temperature.
• Shake suspension well before use.
• Tablets: Swallow whole; do not crush, cut, dissolve, or divide. Administer with food.

Indications/routes/dosage

Note: The delayed-release tablets and oral suspension are not to be used interchangeably.

Prophylaxis of Invasive Aspergillus and Candida

PO: ADULTS, ELDERLY, CHILDREN 13 YRS AND OLDER: (Oral
**Suspension):** 200 mg (5 mL) 3 times/day, given with full meal or liquid nutritional supplement. **(Delayed-Release):** 300 mg twice daily on first day, then 300 mg once daily. **IV:** 300 mg twice daily on first day, then 300 mg once daily thereafter.

**Oropharyngeal Candidiasis**

**PO:** ADULTS, ELDERLY, CHILDREN 13 YRS AND OLDER: 100 mg twice daily for 1 day, then 100 mg once daily for 13 days.

**Oropharyngeal Candidiasis Refractory to Fluconazole**

**PO:** ADULTS, ELDERLY: **(Suspension):** 400 mg twice daily for 3 days, then 400 mg once daily for up to 28 days. **HIV-Infected Pts: (Suspension):** 400 mg twice daily on day 1, then 400 mg once daily for 7–14 days (28 days in azole refractory pts).

**Dosage in Renal Impairment**

**PO:** No dose adjustment. **IV:** Avoid use in pts with CrCl less than 50 mL/min.

**Dosage in Hepatic Impairment**

No dose adjustment.

**Side effects**

**Common (42%–24%):** Diarrhea, nausea, vomiting, headache, abdominal pain, cough. **Frequent (20%–15%):** Constipation, rigors, rash, hypertension, fatigue, insomnia, mucositis, musculoskeletal pain, edema of lower extremities, herpes simplex, anorexia. **Occasional (14%–8%):** Hypotension, epistaxis, tachycardia, pharyngitis, dizziness, pruritus, arthralgia, dyspepsia, back pain, generalized edema, weakness.

**Adverse effects/toxic reactions**

Bacteremia occurs in 18% of pts; upper respiratory tract infection occurs in 7%. Allergic/hypersensitivity reactions, QT prolongation, hemolytic uremic syndrome, thrombotic thrombocytopenic purpura, pulmonary embolus have been reported.
Nursing considerations

Baseline assessment
Obtain BMP, LFT, EKG. Receive full medication history and screen for interactions (esp. drugs known to prolong QT interval).

Intervention/evaluation

Patient/family teaching
• Take each dose with full meal or liquid nutritional supplement.
• Report severe diarrhea, vomiting, chest pain, yellowing of skin/eyes.
• Maintain strict oral hygiene.

</tr>
</tbody>
</table>
CLINICAL: Potassium replenisher.
Do not confuse Micro-K with Macrobid or Micronase.

Uses

Potassium acetate, potassium bicarbonate/citrate: Treatment, prevention of hypokalemia when necessary to avoid chloride or acid/base imbalance (requires bicarbonate). Potassium chloride: Treatment, prevention of hypokalemia.

Precautions

Contraindications: Renal failure, hyperkalemia, conditions in which potassium retention is present. Solid oral dosage form in pts in whom there is structural, pathologic cause for delay in passage through GI tract. Cautions: Cardiac disease, acid-base disorders, potassium-altering disorders, digitalized pts, concomitant therapy that increases serum potassium (e.g., ACE inhibitors), renal impairment. Do not administer IV undiluted.

Action

Necessary for multiple cellular metabolic processes. Primary action is intracellular. Therapeutic Effect: Required for nerve impulse conduction, contraction of cardiac, skeletal, smooth muscle; maintains normal renal function, acid-base balance.

Pharmacokinetics

Well absorbed from GI tract. Enters cells by active transport from extracellular fluid. Primarily excreted in urine.

❖ Lifespan considerations

Pregnancy/Lactation: Unknown if drug crosses placenta or is distributed in breast milk. Children: No age-related precautions noted. Elderly: May be at increased risk for hyperkalemia. Age-related ability to excrete potassium is reduced.
Interactions

**DRUG:** ACE inhibitors (e.g., enalapril, lisinopril), potassium-containing medications, potassium-sparing diuretics (e.g., spironolactone, triamterene), salt substitutes may increase serum potassium concentration. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** None known.

Availability (Rx)

POTASSIUM ACETATE  
**Injection, Solution:** 2 mEq/mL.

POTASSIUM BICARBONATE AND POTASSIUM CITRATE  
**Tablets for Solution:** (Effer-K): 10 mEq, 20 mEq, 25 mEq. (Klor-Con EF): 25 mEq.

POTASSIUM CHLORIDE  
**Injection, Solution:** 2 mEq/mL. **Oral Solution:** 20 mEq/15 mL, 40 mEq/15 mL. **Powder for Oral Solution:** 20 mEq/packet, 25 mEq/packet.  
enuous Capsules, **Extended-Release (Micro-K):** 8 mEq, 10 mEq.  
enuous Tablets, **Extended-Release:** 8 mEq, 10 mEq, 15 mEq, 20 mEq.

Administration/handling

**IV**

**Reconstitution**  
- For IV infusion only, must dilute before administration, mix well, infuse slowly.
- Avoid adding potassium to hanging IV.

**Rate of Administration**  
- Routinely, give at concentration of no more than 40 mEq/L, no faster than 10 mEq/hr for peripheral infusion, 40 mEq/hr for central infusion.
- Check IV site closely during infusion for evidence of phlebitis (heat, pain, red streaking of skin over vein, hardness to vein), extravasation (swelling, pain, cool skin, little/no blood return).

**Storage**  
- Store at room temperature. Use admixtures within 24 hrs.

PO
• Take with or after meals, with full glass of water (decreases GI upset).
• Liquids, powder, effervescent tablets: Mix, dissolve with juice, water before administering.
• Do not break, crush, dissolve, or divide tablets; give whole.

**IV incompatibilities**

Amphotericin B complex (Abelcet, AmBisome, Amphotec), phenytoin (Dilantin).

**IV Compatibilities**

Amiodarone (Cordarone), atropine, aztreonam (Azactam), calcium gluconate, cefepime (Maxipime), ciprofloxacin (Cipro), clindamycin (Cleocin), dexamethasone (Decadron), dexametomidine (Precedex), digoxin (Lanoxin), diltiaZEM (Cardizem), diphenhydramINE (Benadryl), DOBUTamine (Dobutrex), DOPamine (Intropin), enalapril (Vasotec), famotidine (Pepcid), fluconazole (Diflucan), furosemide (Lasix), granisetron (Kytril), heparin, hydrocortisone (Solu-Cortef), insulin, lidocaine, LORazepam (Ativan), magnesium sulfate, methylPREDNISolone (Solu-Medrol), metoclopramide (Reglan), midazolam (Versed), milrinone (Primacor), morphine, norepinephrine (Levophed), ondansetron (Zofran), oxytocin (Pitocin), piperacillin and tazobactam (Zosyn), procaainamide (Pronestyl), propofol (Diprivan), propranolol (Inderal).

**Indications/routes/dosage**

**Treatment of Hypokalemia**

**Potassium Acetate**

**IV: ADULTS, ELDERLY:** 5–10 mEq/dose (*Maximum:* 40 mEq/dose) to infuse over 2–3 hrs. **Usual Range:** 40-100 mEq/day.

**Dose/rate guidelines**

<table>
<thead>
<tr>
<th>Serum potassium</th>
<th>Greater than 2.5–3.5 mEq/L</th>
<th>2.5 mEq/L or less</th>
</tr>
</thead>
<tbody>
<tr>
<td>Maximum infusion rate</td>
<td>10 mEq/hr</td>
<td>40 mEq/hr</td>
</tr>
<tr>
<td>Maximum concentration</td>
<td>40 mEq/L</td>
<td>80 mEq/L</td>
</tr>
</tbody>
</table>
**Potassium Chloride**

**PO: ADULTS, ELDERLY: (Mild to moderate):** Initially, 10–20 mEq given 2–4 times/day. **(Severe):** Initially, 40 mEq given 3–4 times/day. (May also give 20 mEq q2–3h in conjunction with careful monitoring.) **CHILDREN:** Initially, 1–2 mEq/kg, then as needed based on lab values.

**IV: ADULTS, ELDERLY:** 10 mEq/hr (or less); repeat as needed based on lab values. **CHILDREN:** 0.5–1 mEq/kg/dose **(Maximum: 40 mEq);** repeat as needed based on lab values.

**Dosage in Renal/Hepatic Impairment**

No dose adjustment. Use caution with potassium acetate (may increase serum aluminum and/or potassium).

**Side effects**

**Occasional:** Nausea, vomiting, diarrhea, flatulence, abdominal discomfort with distention, phlebitis with IV administration (particularly when potassium concentration of greater than 40 mEq/L is infused). **Rare:** Rash.

**Adverse effects/toxic reactions**

Hyperkalemia (more common in elderly, pts with renal impairment) manifested as paresthesia, feeling of heaviness in lower extremities, cold skin, grayish pallor, hypotension, confusion, irritability, flaccid paralysis, cardiac arrhythmias.

**Nursing considerations**

**Baseline assessment**

Assess for hypokalemia (weakness, fatigue, polyuria, polydipsia). PO should be given with food or after meals with full glass of water, fruit juice (minimizes GI irritation).

**Intervention/evaluation**

Monitor serum potassium (particularly in renal impairment). If GI disturbance is noted, dilute preparation further or give with meals. Be alert to decreased urinary
output (may be indication of renal insufficiency). Monitor daily pattern of bowel activity, stool consistency. Assess I&O diligently during diuresis, IV site for extravasation, phlebitis. Be alert to evidence of hyperkalemia (skin pallor/coldness, complaints of paresthesia, feeling of heaviness of lower extremities).

**Patient/family teaching**

- Foods rich in potassium include beef, veal, ham, chicken, turkey, fish, milk, bananas, dates, prunes, raisins, avocados, watermelon, cantaloupe, apricots, molasses, beans, yams, broccoli, brussels sprouts, lentils, potatoes, spinach.
- Report paresthesia, feeling of heaviness of lower extremities, tarry or bloody stools, weakness, unusual fatigue.

<table>
<thead>
<tr>
<th>PRALAtrexate</th>
</tr>
</thead>
<tbody>
<tr>
<td>pral-a-trex-ate</td>
</tr>
</tbody>
</table>

**Folotyn**

- **CLASSIFICATION**
  - PHARMACOTHERAPEUTIC: Antimetabolite.
  - CLINICAL: Antineoplastic.

Do not confuse Folotyn with Focalin, or PRALAtrexate with methotrexate or PEMEtrexed.

---

**Uses**

Treatment of relapsed or refractory peripheral T-cell lymphoma (PTCL). **OFF-LABEL:** Treatment of relapsed/refractory cutaneous T-cell lymphoma.

**Precautions**

**Contraindications:** Hypersensitivity to PRALAtrexate. **Cautions:** Moderate to severe renal impairment, hepatic impairment. Avoid use in end-stage renal disease.

**Action**

Folate analogue metabolic inhibitor that competes with enzymes necessary for
tumor cell reproduction. Inhibits DNA, RNA, protein synthesis. **Therapeutic Effect:** Inhibits tumor growth.

**Pharmacokinetics**

Protein binding: 67%. Partially excreted in urine. **Half-life:** 12–18 hrs.

**Lifespan considerations**

**Pregnancy/Lactation:** May cause fetal harm. Unknown if drug is distributed in breast milk. **Children:** Safety and efficacy not established. **Elderly:** No age-related precautions noted.

**Interactions**

**DRUG:** NSAIDs (e.g., ibuprofen, ketorolac, naproxen), probenecid, trimethoprim/sulfamethoxazole may delay clearance, increase concentration. **HERBAL:** *Echinacea* may decrease concentration/effects. **FOOD:** None known. **LAB VALUES:** May decrease RBC, WBC, Hgb, Hct, platelet count, serum potassium. May increase serum ALT, AST.

**Availability (Rx)**

**Injection Solution:** 20 mg/mL.

**Administration/handling**

- **Alert** May be carcinogenic, mutagenic, teratogenic. Handle with extreme care during preparation/administration. Wear gloves when preparing solution. If powder or solution comes in contact with skin, wash immediately, thoroughly with soap, water.
- **Alert** Pt should begin taking oral folic acid (1 mg) daily starting 10 days prior to first IV PRALAtrexate dose and continue for 30 days after last dose. Pt should also receive vitamin B₁₂ (1 mg) IM injection no more than 10 wks prior to first IV PRALAtrexate dose and every 8–10 wks thereafter.

**IV**

**Reconstitution**
• Withdraw calculated dose into syringe for immediate use.
• Intended for single use only.
• Do not dilute.

Rate of Administration
• Administer as IV push over 3–5 min into IV infusion of 0.9% NaCl.

Storage
• Refrigerate vials until use, protect from light. Stable at room temperature for 72 hrs.
• Discard vial if solution is discolored (solution should appear clear to yellow) or particulate matter is present.

IV incompatibilities
Do not mix with any other medication.

Indications/routes/dosage

Alert Prior to any dose, mucositis should be no higher than CTCAE grade 1, platelets 100,000 cells/mm³ or greater for first dose and 50,000 cells/mm³ or greater for subsequent doses, and absolute neutrophil count (ANC) 1,000 cells/mm³ or greater.

Refractory/Relapsed Peripheral T-Cell Lymphoma
IV: ADULTS, ELDERLY: 30 mg/m² administered once wkly for 6 wks in 7-wk cycles. Dose may be decreased to 20 mg/m² to manage adverse reactions. Continue until disease progression or unacceptable toxicity.

Dosage in Renal Impairment
Monitor for toxicities. Avoid use in end-stage renal disease.

Dosage in Hepatic Impairment
CTCAE Grade 3: Withhold dose; decrease to 20 mg/m² when grade 2 or less.
CTCAE Grade 4: Discontinue.

Side effects
Common (70%–36%): Mucositis, nausea, fatigue. Frequent (34%–10%):
Constipation/diarrhea, pyrexia, edema, cough, epistaxis, vomiting, dyspnea, anorexia, rash, throat/abdominal/back pain, night sweats, asthenia, tachycardia, upper respiratory infection.

**Adverse effects/toxic reactions**

Hematologic toxicity, resulting from blood dyscrasias, may manifest as thrombocytopenia (41% of pts), anemia (34% of pts), neutropenia (24% of pts), leukopenia (11% of pts). High potential for development of mucositis (70% of pts). Mucositis is less severe when folic acid, vitamin B\textsubscript{12} therapy is ongoing. Sepsis, pyrexia, febrile neutropenia, dehydration have occurred. Overdosage requires general supportive care. Prompt administration of leucovorin should be considered in case of overdose, based on mechanism of action of PRALAtrexate.

**Nursing considerations**

**Baseline assessment**

Evaluate baseline CBC with differential, renal function, LFT, serum potassium level. Question for possibility of pregnancy before initiating therapy. Assess baseline vital signs, temperature. Antiemetics before and during therapy may alleviate nausea/vomiting. Initiate folic acid, vitamin B\textsubscript{12} administration prior to and throughout therapy.

**Intervention/evaluation**

Prior to any dose: mucositis should be grade 1 or less. Platelet count 100,000 cells/mm\textsuperscript{3} or greater for first dose (50,000 cells/mm\textsuperscript{3} or greater for all subsequent doses). Absolute neutrophil count (ANC) 1,000 cells/mm\textsuperscript{3} or greater. Assess for signs of mucositis (oropharyngeal ulcers, oral/throat pain, local infection). Monitor for signs of hematologic toxicity, sepsis (fever, signs of local infection, altered CBC results). Monitor hepatic/renal function. Monitor for hypokalemia (muscle cramps, weakness, EKG changes).

**Patient/family teaching**

• Explain importance of folic acid, vitamin B\textsubscript{12} therapy to reduce adverse effects.
• Maintain strict oral hygiene.
• Do not have immunizations without physician’s approval (drug lowers body’s resistance).
• Avoid crowds, those with infection.
• Promptly report fever, sore throat, signs of local infection, unusual bruising/bleeding from any site.
• Use nonhormonal contraception.
• Report persistent nausea/vomiting.

pramipexole
pram-i-pex-ole
Apo-Pramipexole
Mirapex
Mirapex ER

**CLASSIFICATION**
PHARMACOTHERAPEUTIC: Dopamine receptor agonist.
CLINICAL: Antiparkinson agent.

Do not confuse Mirapex with Mifeprex or MiraLax.

**Uses**

**Mirapex:** Treatment of Parkinson’s disease, moderate to severe primary restless legs syndrome. **Mirapex ER:** Treatment of Parkinson’s disease. **OFF-LABEL:** (Immediate-Release): Depression (due to bipolar disorder), fibromyalgia.

**Precautions**

**Contraindications:** Hypersensitivity to pramipexole. **Cautions:** History of orthostatic hypotension, pts at risk for hypotension, syncope, hallucinations, renal impairment (extended release not recommended with CrCl less than 30 mL/min), concomitant use of CNS depressants, preexisting dyskinesia, elderly pts.

**Action**
Stimulates DOPamine receptors in striatum and substantia nigra. **Therapeutic Effect:** Relieves signs/symptoms of Parkinson’s disease. Improves motor function.

**Pharmacokinetics**

Rapidly, extensively absorbed after PO administration. Protein binding: 15%. Widely distributed. Steady-state concentrations achieved within 2 days. Primarily excreted in urine. Not removed by hemodialysis. **Half-life:** 8 hrs (12 hrs in pts older than 65 yrs).

**Lifespan considerations**

**Pregnancy/Lactation:** Unknown if drug is distributed in breast milk. **Children:** Safety and efficacy not established. **Elderly:** Increased risk of hallucinations.

**Interactions**

**DRUG:** May increase plasma concentrations of carbidopa, levodopa. **HERBAL:** Gotu kola, kava kava, St. John’s wort, SAMe, valerian may increase CNS depression, risk of serotonin syndrome. **FOOD:** All foods delay peak drug plasma levels by 1 hr (extent of absorption not affected). **LAB VALUES:** None significant.

**Availability (Rx)**

**Tablets:** 0.125 mg, 0.25 mg, 0.5 mg, 0.75 mg, 1 mg, 1.5 mg. **Tablets (Extended-Release [Mirapex ER]):** 0.375 mg, 0.75 mg, 1.5 mg, 2.25 mg, 3 mg, 3.75 mg, 4.5 mg.

**Administration/handling**

**PO (Mirapex)**

• Give without regard to food.

**PO (Mirapex ER)**

• Give once daily, without regard to food.
• Give whole; do not break, crush, dissolve, or divide tablets.

**Indications/routes/dosage**

**Parkinson’s Disease**

**PO:** *(Immediate-Release):** ADULTS, ELDERLY: Initially, 0.125 mg 3 times/day. Increase no more frequently than every 5–7 days. **Maintenance:** 0.5–1.5 mg 3 times/day. *(Extended-Release):* Initially, 0.375 mg once daily. May increase to 0.75 mg, then by 0.75-mg increments no more frequently than 5–7 days. **Maximum:** 4.5 mg once daily. **Note:** May switch overnight from immediate-release to extended-release at same daily dose.

**Restless Legs Syndrome**

**PO:** ADULTS, ELDERLY: *(Immediate-Release):* Initially, 0.125 mg once daily 2–3 hrs before bedtime. May increase to 0.25 mg after 4–7 days, then to 0.5 mg after 4–7 days (interval is 14 days in pts with renal impairment). **Maximum:** 0.5 mg/day.

**Dosage in Renal Impairment**

Dosage and frequency are modified based on creatinine clearance.

**(Parkinson’s Disease)**

**Immediate-Release**

<table>
<thead>
<tr>
<th>Creatinine Clearance</th>
<th>Initial Dosage</th>
<th>Maximum Dosage</th>
</tr>
</thead>
<tbody>
<tr>
<td>30–50 mL/min</td>
<td>0.125 mg twice daily</td>

<td>1.5 mg once daily</td>
</tr>
</tbody>
</table>

**Extended-Release**

**CrCl 30–50 mL/min:** Initially, 0.375 mg every other day. May increase by 0.375 mg/day in 7 days or longer. **Maximum:** 2.25 mg once daily. **CrCl less than 30 mL/min:** Not recommended.

**Restless Legs Syndrome**
No dose adjustment.

**Dosage in Hepatic Impairment**

No dose adjustment.

**Side effects**

**Frequent:** Early Parkinson’s disease (28%–10%): Nausea, asthenia, dizziness, drowsiness, insomnia, constipation. **Advanced Parkinson’s disease (53%–17%):** Orthostatic hypotension, extrapyramidal reactions, insomnia, dizziness, hallucinations. **Occasional:** Early Parkinson’s disease (5%–2%): Edema, malaise, confusion, amnesia, akathisia, anorexia, dysphagia, peripheral edema, vision changes, impotence. **Advanced Parkinson’s disease (10%–7%):** Asthenia, drowsiness, confusion, constipation, abnormal gait, dry mouth. **Rare:** Advanced Parkinson’s disease (6%–2%): General edema, malaise, angina, amnesia, tremor, urinary frequency/incontinence, dyspnea, rhinitis, vision changes. **Restless legs syndrome:** Frequent (16%): Headache, nausea. **Occasional (13%–9%):** Insomnia, fatigue. **Rare (6%–3%):** Drowsiness, constipation, diarrhea, dry mouth.

**Adverse effects/toxic reactions**

Vascular disease, atrial fibrillation, arrhythmias, pulmonary embolism, impulsive/compulsive behavior (pathological gambling, hypersexuality, binge eating) have been reported.

**Nursing considerations**

**Baseline assessment**

**Parkinson’s disease:** Assess for tremor, muscle weakness and rigidity, ataxia. **Restless legs syndrome:** Assess frequency of symptoms, sleep pattern.

**Intervention/evaluation**

Assess for clinical improvement. Assist with ambulation if dizziness occurs. Assess for constipation; encourage fiber, fluids, exercise.
Patient/family teaching

- Inform pt that hallucinations may occur, esp. in the elderly.
- Go from lying to standing slowly.
- Avoid tasks that require alertness, motor skills until response to drug is established.
- If nausea occurs, take medication with food.
- Avoid abrupt withdrawal.
- Avoid alcohol.
- Report new or increased impulsive/compulsive behaviors (e.g., gambling, sexual urges, compulsive eating or buying).

**pramlintide**

**pram-lin-tide**

**SymlinPen 60**

**SymlinPen 120**

**CLASSIFICATION**

**PHARMACOTHERAPEUTIC**: Amylinomimetic.

**CLINICAL**: Antidiabetic agent.

- **BLACK BOX ALERT** Increased risk of severe hypoglycemia; usually occurs within 3 hrs of injection. Coadministration with insulin may increase incidence.

**Uses**

Adjunctive treatment in pts with type 1 or type 2 diabetes who use mealtime insulin therapy and who have failed to achieve desired glucose control despite optimal insulin therapy.

**Precautions**

**Contraindications**: Hypersensitivity to pramlintide. Diagnosed gastroparesis, hypoglycemia unawareness. **Cautions**: Coadministration with insulin may induce severe hypoglycemia (usually within 3 hrs following administration); concurrent use of other glucose-lowering agents may increase risk of
hypoglycemia. History of nausea, visual or dexterity impairment, poor compliance with insulin monitoring or current insulin therapy, pts with hemoglobin A₁c greater than 9%, pts with conditions or taking concurrent medications likely to impair gastric motility (e.g., anticholinergics), pts requiring medication to stimulate gastric emptying.

**Action**

Synthetic analogue of amylin. Cosecreted with insulin by pancreatic beta cells, reduces postprandial glucose increases by slowing gastric emptying time, reducing postprandial glucagon secretion, reducing caloric intake through centrally mediated appetite suppression. **Therapeutic Effect:** Improves glycemic control by reducing postprandial glucose concentrations in pts with type 1, type 2 diabetes mellitus.

**Pharmacokinetics**

<table>

</tbody>
</table>

Metabolized primarily by kidneys. Protein binding: 60%. Excreted in urine. **Half-life:** 48 min.

**Lifespan considerations**

**Pregnancy/Lactation:** Unknown if distributed in breast milk. **Children:** Safety and efficacy not established. **Elderly:** No age-related precautions noted.

**Interactions**

**DRUG:** Anticholinergics (e.g., dicyclomine, glycopyrrolate, scopolamine) may cause additive impairment of gastric motility. **HERBAL:** Garlic may increase hypoglycemia. **FOOD:** Ethanol may increase risk of hypoglycemia. **LAB VALUES:** None significant.

**Availability (Rx)**

**Injection, Solution (SymlinPen 120):** Delivers fixed doses of 120 mcg. **(SymlinPen 60):** Delivers fixed doses of 60 mcg.
Administration/handling

SQ
- Administer immediately before each major meal (350 or more kcal or containing 30 g or more carbohydrate).
- Give in abdomen or thigh; do not give in arm (variable absorption).
- Injection site should be distinct from insulin injection site.
- Rotation of injection sites is essential.
- Use U-100 insulin syringe for accuracy.
- Always give pramlintide and insulin as separate injections.

Storage
- Store unopened vials in refrigerator.
- Discard if freezing occurs.
- Vials that have been opened (punctured) may be stored in refrigerator or kept at room temperature for up to 30 days.

Indications/routes/dosage

**Alert** Initially, current insulin dosage in all pts with type 1, type 2 diabetes mellitus should be reduced by 50%. This includes preprandial, rapid-acting, short-acting, fixed-mixed insulins. Oral medications should be given 1 hr before or 2 hrs after pramlintide.

**Type 1 Diabetes Mellitus**

**SQ: ADULTS, ELDERLY:** Initially, 15 mcg immediately before each major meal. Titrate in 15-mcg increments every 3 days (if no significant nausea occurs) to target dose of 30–60 mcg.

**Type 2 Diabetes Mellitus**

**SQ: ADULTS, ELDERLY:** Initially, 60 mcg immediately before each major meal. After 3–7 days, increase to 120 mcg if no significant nausea occurs (if nausea occurs at 120-mcg dose, reduce to 60 mcg).

**Dosage in Renal/Hepatic Impairment**

No dose adjustment.
Side effects

**TYPE 1 DIABETES MELLITUS**

*Frequent (48%):* Nausea. *Occasional (17%–11%):* Anorexia, vomiting. *Rare (7%–5%):* Fatigue, arthralgia, allergic reaction, dizziness.

**TYPE 2 DIABETES MELLITUS**

*Frequent (28%):* Nausea. *Occasional (13%–8%):* Headache, anorexia, vomiting, abdominal pain. *Rare (7%–5%):* Fatigue, dizziness, cough, pharyngitis.

Adverse effects/toxic reactions

Overdose produces severe nausea, vomiting, diarrhea, vasodilation, dizziness. No hypoglycemia was reported. Increased risk of severe hypoglycemia when given concurrently with nontitrated insulin.

Nursing considerations

**Baseline assessment**

Check serum glucose concentration before administration, both before and after meals and at bedtime. Discuss lifestyle to determine extent of learning, emotional needs. Ensure follow-up instruction if pt, family does not thoroughly understand diabetes management, glucose testing technique.

**Intervention/evaluation**

Risk for hypoglycemia occurs within first 3 hrs following drug administration if given concurrently with insulin. Assess for hypoglycemia (diaphoresis, tremors, dizziness, anxiety, headache, tachycardia, numbness in mouth, hunger, diplopia, difficulty concentrating). Be alert to conditions that alter glucose requirements (fever, increased activity, stress, surgical procedures).

**Patient/family teaching**

• Diabetes mellitus requires lifelong control.
• Prescribed diet, exercise are principal parts of treatment; do not skip/delay meals.
• Continue to adhere to dietary instructions, regular exercise program, regular
testing of serum glucose.

- When taking combination drug therapy, have source of glucose available to treat symptoms of low blood sugar.

### prasugrel

**pra-soo-grel**

**Effient**

**CLASSIFICATION**

**PHARMACOTHERAPEUTIC**: Thienopyridine derivative inhibitor.

**CLINICAL**: Antiplatelet agent.

■ **BLACK BOX ALERT** ■ Serious, sometimes fatal, hemorrhage may occur.

Do not confuse Effient with Effexor, or prasugrel with praziquantel.

### Uses

Reduction of thrombotic cardiovascular events (MI, CVA, stent thrombosis) in pts with acute coronary syndrome (unstable angina, non–ST-segment elevation MI, ST-segment MI) who are to be managed with percutaneous coronary intervention (PCI). **OFF-LABEL**: Initial treatment of unstable angina, STEMI in pts undergoing PCI with allergy or major GI intolerance to aspirin.

### Precautions

**Contraindications**: Hypersensitivity to prasugrel. Active bleeding, prior transient ischemic attack (TIA), CVA. **Cautions**: Pts who undergo coronary artery bypass graft (CABG) after receiving prasugrel, pts at risk for bleeding (age 75 yrs or older, body weight less than 60 kg, recent trauma/surgery, recent GI bleeding or active peptic ulcer disease, severe hepatic impairment).

### Action

Inhibits binding of the enzyme adenosine phosphate (ADP) to its platelet receptor and subsequent ADP-mediated activation of a glycoprotein complex. **Therapeutic Effect**: Inhibits platelet aggregation.
Pharmacokinetics
Rapidly absorbed, with peak concentration occurring 30 min following administration. Metabolized in liver. Protein binding: 98%. Excreted in urine (68%), feces (27%). Half-life: 7 hrs.

Lifespan considerations
Pregnancy/Lactation: Unknown if drug crosses placenta or is distributed in breast milk. Children: Safety and efficacy not established. Elderly: May have increased risk for intracranial hemorrhage; caution advised in pts 75 yrs and older.

Interactions
DRUG: Aspirin, NSAIDs (e.g., ibuprofen, ketorolac, naproxen), warfarin may increase risk of bleeding. HERBAL: Cat’s claw, dong quai, evening primrose, feverfew, garlic, ginger, ginseng, green tea, horse chestnut, red clover may have additive platelet effects. Ginkgo biloba may increase risk of bleeding. FOOD: None known. LAB VALUES: May decrease Hgb, Hct, WBC, platelet count. May increase bleeding time, serum cholesterol, ALT, AST.

Availability (Rx)
Tablets: 5 mg, 10 mg.

Administration/handling

PO
• Give without regard to food.
• Do not crush tablet.

Indications/routes/dosage

Acute Coronary Syndrome
Consider 5 mg once daily for pts weighing less than 60 kg. Not recommended in pts 75 yrs and older.
**PO: ADULTS, ELDERLY:** Initially, 60-mg loading dose, then 10 mg once daily (in combination with aspirin) for at least 12 mos.

**Dosage in Renal/Hepatic Impairment**
No dose adjustment.

**Side effects**

**Occasional (8%–4%):** Hypertension, minor bleeding, headache, back pain, dyspnea, nausea, dizziness. **Rare (less than 4%):** Cough, hypotension, fatigue, noncardiac chest pain, bradycardia, rash, pyrexia, peripheral edema, extremity pain, diarrhea.

**Adverse effects/toxic reactions**

Major bleeding (intracranial hemorrhage, epistaxis, GI bleeding, hemoptysis, SQ hematoma, postprocedural hemorrhage, retroperitoneal hemorrhage, retinal hemorrhage) has been reported. Severe thrombocytopenia, anemia, abnormal hepatic function, anaphylactic reaction, angioedema, atrial fibrillation occur rarely. Overdosage may require platelet transfusion to restore clotting ability.

**Nursing considerations**

**Baseline assessment**
Obtain baseline vital signs, CBC, EKG, LFT. Question history of intracranial hemorrhage, GI bleeding, ulcers, recent surgery or trauma.

**Intervention/evaluation**
Monitor vital signs for changes in B/P, pulse. Assess for signs of unusual bleeding or hemorrhage, pain. Monitor platelet count, LFT, EKG for changes from baseline.

**Patient/family teaching**
• It may take longer to stop minor bleeding during drug therapy. Report unusual bleeding/bruising, blood noted in stool or urine, chest/back pain, extremity pain, symptoms of stroke.
- Monitor for dyspnea.
- Report fever, weakness, extreme skin paleness, purple skin patches, yellowing of skin or eyes, changes in mental status.
- Do not discontinue drug therapy without physician approval.
- Inform physicians, dentists before undergoing any invasive procedure or surgery.

**pravastatin**

pra-va-sta-tin

Apo-Pravastatin

Pravachol

### Fixed-Combination(s)

**Pravigard:** pravastatin/aspirin (anticoagulant): 20 mg/81 mg, 40 mg/81 mg, 80 mg/81 mg, 20 mg/325 mg, 40 mg/325 mg, 80 mg/325 mg.

**CLASSIFICATION**

**PHARMACOTHERAPEUTIC:** Hydroxymethylglutaryl CoA (HMG-CoA) reductase inhibitor.

**CLINICAL:** Anti-hyperlipidemic.

Do not confuse pravastatin with atorvastatin, lovastatin, nystatin, pitavastatin, or simvastatin, or Pravachol with Prevacid, Prinivil, or propranolol.

### Uses

Adjunct to diet in the treatment of primary hyperlipidemias and mixed dyslipidemias to reduce total cholesterol, LDL cholesterol, apolipoprotein B, triglycerides; increase HDL cholesterol. Reduces risk of MI, revascularization, and mortality in hypercholesterolemia without clinically evident CHD. Reduces mortality risk in pts with CHD. Reduces elevated triglycerides in hypertriglyceridemia. Treatment of heterozygous familial hypercholesterolemia in pediatric pts 8–18 yrs.

### Precautions

**Contraindications:** Hypersensitivity to pravastatin. Active hepatic disease or
unexplained, persistent elevations of LFT results. Pregnancy, breastfeeding. **Cautions:** History of hepatic disease, substantial alcohol consumption. Withholding/discontinuing pravastatin may be necessary when pt is at risk for renal failure secondary to rhabdomyolysis, elderly.

**Action**

Interferes with cholesterol biosynthesis by preventing conversion of HMG-CoA reductase to mevalonate, a precursor to cholesterol. **Therapeutic Effect:** Lowers LDL, VLDL cholesterol, plasma triglycerides; increases HDL.

**Pharmacokinetics**

Rapidly absorbed from GI tract. Protein binding: 50%. Metabolized in liver. Primarily excreted in feces via biliary system. Not removed by hemodialysis. **Half-life:** 2–3 hrs. (Half-life including all metabolites: 77 hrs.)

**Lifespan considerations**

**Pregnancy/Lactation:** Contraindicated in pregnancy (suppression of cholesterol biosynthesis may cause fetal toxicity) and lactation. Small amount is distributed in breast milk, but there is risk of serious adverse reactions in breastfeeding infants. Breastfeeding not recommended. **Children/Elderly:** No age-related precautions noted.

**Interactions**

**DRUG:** CycloSPORINE, clarithromycin, colchicine, erythromycin, gemfibrozil, immunosuppressants, niacin increase risk of myopathy, rhabdomyolysis. **HERBAL:** St. John’s wort may decrease concentration. **FOOD:** Red yeast rice contains 2.4 mg lovastatin per 600 mg rice. **LAB VALUES:** May increase serum creatine kinase (CK), transaminase.

**Availability (Rx)**

**Tablets:** 10 mg, 20 mg, 40 mg, 80 mg.

**Administration/handling**
PO
• Give without regard to meals.

Indications/routes/dosage

**Alert** Prior to initiating therapy, pt should be on standard cholesterol-lowering diet for 3–6 mos. Low-cholesterol diet should be continued throughout pravastatin therapy.

Hyperlipidemia, Prevention of Coronary/Cardiovascular Events

PO: ADULTS, ELDERLY: Initially, 40 mg/day. Titrate to desired response. Range: 10–80 mg/day.

Heterozygous Familial Hypercholesterolemia

PO: CHILDREN 14–18 YRS: 40 mg/day. CHILDREN 8–13 YRS: 20 mg/day.

**Dosage with Clarithromycin**

Maximum: 40 mg/day.

**Dosage with CycloSPORINE**

ADULTS, ELDERLY: Initially, 10 mg/day. Maximum: 20 mg/day.

Dosage in Renal Impairment

For adults, give 10 mg/day initially. Titrate to desired response.

Dosage in Hepatic Impairment

See contraindications.

Side effects

Pravastatin is generally well tolerated. Side effects are usually mild and transient. **Occasional (7%–4%):** Nausea, vomiting, diarrhea, constipation, abdominal pain, headache, rhinitis, rash, pruritus. **Rare (3%–2%):** Heartburn, myalgia, dizziness, cough, fatigue, flu-like symptoms, depression,
photosensitivity.

**Adverse effects/toxic reactions**

Potential for malignancy, cataracts. Hypersensitivity, myopathy occur rarely. Rhabdomyolysis has been reported.

**Nursing considerations**

**Baseline assessment**

Obtain dietary history, esp. fat consumption. Question for possibility of pregnancy before initiating therapy. Assess baseline serum lab results (cholesterol, triglycerides, LFT).

**Intervention/evaluation**

Monitor serum cholesterol, triglyceride lab results for therapeutic response. Monitor LFT, CPK. Monitor daily pattern of bowel activity, stool consistency. Assess for headache, dizziness (provide assistance as needed). Assess for rash, pruritus. Be alert for malaise, muscle cramping/weakness; if accompanied by fever, may require discontinuation of medication.

**Patient/family teaching**

- Follow special diet (important part of treatment).
- Periodic lab tests are essential part of therapy.
- Report promptly any muscle pain/weakness, esp. if accompanied by fever, malaise.
- Avoid tasks that require alertness, motor skills until response to drug is established (potential for dizziness).
- Use nonhormonal contraception.
- Avoid direct exposure to sunlight.

Fixed-Combination(s)

**Blephamide:** prednisoLONE/sulfacetamide (an anti-infective): 0.2%/10%.
**Vasocidin:** prednisoLONE/sulfacetamide: 0.25%/10%.

**CLASSIFICATION**
**PHARMACOTHERAPEUTIC:** Adrenal corticosteroid.
**CLINICAL:** Anti-inflammatory, immunosuppressant.

Do not confuse Pediapred with Pediazole, prednisoLONE with predniSONE or primidone, or Prelone with PROzac.

**Uses**

**Systemic:** Endocrine, rheumatic, hematologic disorders; collagen, respiratory, neoplastic, GI diseases; allergic states; acute or chronic solid organ rejection.

**Ophthalmic:** Treatment of conjunctivitis, corneal injury (from chemical/thermal burns, foreign body).

**Precautions**

**Contraindications:** Hypersensitivity to prednisoLONE. Acute superficial herpes simplex keratitis, systemic fungal infections, varicella, live or attenuated virus vaccines. **Cautions:** Hyperthyroidism, cirrhosis, ocular herpes simplex, respiratory tuberculosis, untreated systemic infections, renal/hepatic impairment, diabetes, cataracts, glaucoma, seizure disorder, peptic ulcer disease, osteoporosis, myasthenia gravis, hypertension, HF, ulcerative colitis, thromboembolic disorders, elderly pts.
**Action**

Inhibits accumulation of inflammatory cells at inflammation sites, phagocytosis, lysosomal enzyme release/synthesis, release of mediators of inflammation. **Therapeutic Effect:** Prevents/suppresses cell-mediated immune reactions. Decreases/prevents tissue response to inflammatory process.

**Pharmacokinetics**

Protein binding: 65%–91%. Metabolized in liver. Excreted in urine. **Half-life:** 3.6 hrs.

**Lifespan considerations**

**Pregnancy/Lactation:** Crosses placenta. Distributed in breast milk. Fetal cleft palate often occurs with chronic, first-trimester use. Breastfeeding not recommended. **Children:** Prolonged treatment or high dosages may decrease short-term growth rate, cortisol secretion. **Elderly:** May be more susceptible to developing hypertension or osteoporosis.

**Interactions**

**DRUG:** CYP3A4 inducers (e.g., carBAMazepine, phenytoin, rifAMPin) may decrease effects. **Live virus vaccines** increase vaccine side effects, potentiate virus replication, decrease pt’s antibody response to vaccine. May increase effect of **warfarin.** **HERBAL:** St. John’s **wort** may decrease concentration. **Cat’s claw, echinacea** have immunostimulant properties. **Echinacea** may decrease level/effects. **FOOD:** None known. **LAB VALUES:** May increase serum glucose, lipids, sodium, uric acid. May decrease serum calcium, WBC, hypothalamic pituitary adrenal (HPA) axis function, potassium.

**Availability (Rx)**

**Solution, Ophthalmic:** 1%. **Solution, Oral:** 15 mg/5 mL. **(Pediapred):** 5 mg/5 mL. **(Millipred):** 10 mg/5 mL. **(Veripred):** 20 mg/5 mL. **Suspension, Ophthalmic (Pred Forte):** 1%; **(Pred Mild):** 0.12%. **Syrup (Prelone):** 15 mg/5 mL. **Tablets:** 5 mg. **Tablets, Orally Disintegrating:** 10 mg, 15 mg, 30 mg.
Administration/handling

PO
• Give with food or fluids to decrease GI side effects.

Orally Disintegrating Tablets
• Do not break, crush, or divide tablets.
• Remove from blister just prior to giving; place on tongue.
• Pt may swallow whole or allow to dissolve in mouth with/without water.

Ophthalmic
• For ophthalmic solution, shake well before using.
• Instill drops into conjunctival sac, as prescribed.
• Avoid touching applicator tip to conjunctiva to avoid contamination.

Indications/routes/dosage

Usual Dosage
PO: ADULTS, ELDERLY: 5–60 mg/day in divided doses. CHILDREN: 0.05–2 mg/kg/day divided every 6–24 hrs.

Treatment of Conjunctivitis, Corneal Injury
Ophthalmic: ADULTS, ELDERLY, CHILDREN: 1–2 drops every hr during day and q2h during night. After response, decrease dosage to 1 drop q4h, then 1 drop 3–4 times/day.

Dosage in Renal/Hepatic Impairment
No dose adjustment.

Side effects
Frequent: Insomnia, heartburn, nervousness, abdominal distention, diaphoresis, acne, mood swings, increased appetite, facial flushing, delayed wound healing, increased susceptibility to infection, diarrhea, constipation. Occasional: Headache, edema, change in skin color, frequent urination. Rare: Tachycardia,
allergic reaction (rash, urticaria), psychological changes, hallucinations, depression. **Ophthalmic:** Stinging/burning, posterior subcapsular cataracts.

**Adverse effects/toxic reactions**

**Long-term therapy:** Hypocalcemia, hypokalemia, muscle wasting (esp. arms, legs), osteoporosis, spontaneous fractures, amenorrhea, cataracts, glaucoma, peptic ulcer, HF, immunosuppression. **Abrupt withdrawal following long-term therapy:** Anorexia, nausea, fever, headache, severe/sudden joint pain, rebound inflammation, fatigue, weakness, lethargy, dizziness, orthostatic hypotension. Sudden discontinuance may be fatal.

**Nursing considerations**

**Baseline assessment**

Question medical history as listed in Precautions. Obtain baselines for height, weight, B/P, serum glucose, electrolytes. Check results of initial tests (tuberculosis [TB] skin test, X-rays, EKG).

**Intervention/evaluation**

Monitor B/P, weight, serum electrolytes, glucose, results of bone mineral density test, height, weight in children. Be alert to infection (sore throat, fever, vague symptoms); assess oral cavity daily for signs of *Candida* infection. Monitor for symptoms of adrenal insufficiency, immunosuppression.

**Patient/family teaching**

- Report fever, sore throat, muscle aches, sudden weight gain, swelling, loss of appetite, fatigue.
- Avoid alcohol, limit caffeine.
- Maintain fastidious oral hygiene.
- Do not abruptly discontinue without physician’s approval.
- Avoid exposure to chickenpox, measles.
- Long-term use may significantly increase risk of serious infections.

predniSONE
pred-ni-sone
Apo-PredniSONE
PredniSONE Intensol
Rayos
Winpred

CLASSIFICATION
PHARMACOTHERAPEUTIC: Adrenal corticosteroid.
CLINICAL: Anti-inflammatory, immunosuppressant.
Do not confuse predniSONE with methylPREDNISolone, prazosin, prednisoLONE, PriLOSEC, primidone, or promethazine.

Uses
Substitution therapy in deficiency states: Acute or chronic adrenal insufficiency, congenital adrenal hyperplasia, adrenal insufficiency secondary to pituitary insufficiency. Nonendocrine disorders: Arthritis, rheumatic carditis; allergic, collagen, intestinal tract, multiple sclerosis exacerbations; liver, ocular, renal, skin diseases; bronchial asthma, cerebral edema, malignancies. OFF-LABEL: Prevention of postherpetic neuralgia, relief of acute pain in pts with herpes zoster, autoimmune hepatitis.

Precautions
Contraindications: Hypersensitivity to predniSONE. Acute superficial herpes simplex keratitis, systemic fungal infections, varicella, administration of live or attenuated virus vaccines. Cautions: Hyperthyroidism, cirrhosis, ocular herpes simplex, respiratory tuberculosis, untreated systemic infections, renal/hepatic impairment, following acute MI, diabetes, cataracts, glaucoma, seizures, peptic ulcer disease, osteoporosis, myasthenia gravis, hypertension, HF, ulcerative colitis, thromboembolic disorders, elderly.

Action
Inhibits accumulation of inflammatory cells at inflammation sites, phagocytosis, lysosomal enzyme release/synthesis, release of mediators of inflammation.
**Therapeutic Effect:** Prevents/suppresses cell-mediated immune reactions. Decreases/prevents tissue response to inflammatory process.

**Pharmacokinetics**
Well absorbed from GI tract. Protein binding: 70%–90%. Widely distributed. Metabolized in liver, converted to prednisolone. Primarily excreted in urine. Not removed by hemodialysis. **Half-life:** 2.5–3.5 hrs.

**Lifespan considerations**

**Pregnancy/Lactation:** Crosses placenta. Distributed in breast milk. Fetal cleft palate often occurs with chronic, first trimester use. Breastfeeding not recommended. **Children:** Prolonged treatment or high dosages may decrease short-term growth rate, cortisol secretion. **Elderly:** May be more susceptible to developing hypertension or osteoporosis.

**Interactions**

**DRUG:** CYP3A4 inducers (e.g., carbamazepine, phenytoin, rifampin) may decrease effects. **Live virus vaccines** may increase vaccine side effects, potentiate virus replication, decrease pt’s antibody response to vaccine. May increase effect of warfarin. **HERBAL:** St. John’s wort may decrease concentration. Cat’s claw, echinacea have immunostimulant properties. **FOOD:** None known. **LAB VALUES:** May increase serum glucose, lipids, sodium, uric acid. May decrease serum calcium, potassium, WBC, hypothalamic pituitary adrenal (HPA) axis function.

**Availability (Rx)**

- **Solution, Oral:** 1 mg/mL. **Solution, Oral Concentrate (Prednisolone Intensol):** 5 mg/mL. **Tablets:** 1 mg, 2.5 mg, 5 mg, 10 mg, 20 mg, 50 mg.
- **Tablet: (Delayed-Release [Rayos]):** 1 mg, 2 mg, 5 mg.

**Administration/handling**

- **PO**
  - Give with food or fluids to decrease GI side effects.
• Give single doses before 9 AM, multiple doses at evenly spaced intervals.
• Give delayed-release tablet whole; do not break, crush, dissolve, or divide.

**Indications/routes/dosage**

*Note:* Dose dependent upon condition treated, pt response rather than by rigid adherence to age, weight, or body surface area.

**Usual Dosage**

**PO:** **ADULTS, ELDERLY:** 5–60 mg/day in divided doses. **CHILDREN:** 0.05–2 mg/kg/day in 1–4 divided doses.

**Dosage in Renal/Hepatic Impairment**

No dose adjustment.

**Side effects**

**Frequent:** Insomnia, heartburn, nervousness, abdominal distention, diaphoresis, acne, mood swings, increased appetite, facial flushing, delayed wound healing, increased susceptibility to infection, diarrhea, constipation. **Occasional:** Headache, edema, change in skin color, frequent urination. **Rare:** Tachycardia, allergic reaction (rash, urticaria), psychological changes, hallucinations, depression.

**Adverse effects/toxic reactions**

**Long-term therapy:** Muscle wasting (esp. in arms, legs), osteoporosis, spontaneous fractures, amenorrhea, cataracts, glaucoma, peptic ulcer, HF. **Abrupt withdrawal following long-term therapy:** Anorexia, nausea, fever, headache, rebound inflammation, fatigue, weakness, lethargy, dizziness, orthostatic hypotension. Sudden discontinuance may be fatal.

**Nursing considerations**

**Baseline assessment**

Question medical history as listed in Precautions. Obtain baselines for height,
weight, B/P, serum glucose, electrolytes. Check results of initial tests (tuberculosis [TB] skin test, X-rays, EKG).

Intervention/evaluation
Monitor B/P, serum electrolytes, glucose, results of bone mineral density test, height, weight in children. Be alert to infection (sore throat, fever, vague symptoms); assess oral cavity daily for signs of *Candida* infection. Monitor for symptoms of adrenal insufficiency, immunosuppression.

Patient/family teaching
• Report fever, sore throat, muscle aches, sudden weight gain, swelling, loss of appetite, or fatigue.
• Avoid alcohol, minimize use of caffeine.
• Maintain fastidious oral hygiene.
• Do not abruptly discontinue without physician’s approval.
• Avoid exposure to chickenpox, measles.
• Long-term use may significantly increase risk of serious infections.

**pregabalin**
pre-*gab-a-lin
Apo-Pregabalin

**Lyrica CR**

CLASSIFICATION
PHARMACOTHERAPEUTIC: Antinociceptive agent.

CLINICAL: Anticonvulsant, antineuralgic, analgesic (Schedule V).

Uses

Precautions

Contraindications: Hypersensitivity to pregabalin. Cautions: HF, renal impairment, cardiovascular disease, diabetes, history of angioedema, pts at risk for suicide. Concurrent use of thiazolidine antidiabetics (e.g., Actos).

Action

Binds to calcium channel sites in CNS tissue, inhibiting excitatory neurotransmitter release. Exerts antinociceptive, anticonvulsant activity. Therapeutic Effect: Decreases symptoms of painful peripheral neuropathy; decreases frequency of partial seizures.

Pharmacokinetics

Lifespan considerations

Interactions

DRUG: Alcohol, CNS depressants (e.g., LORazepam, morphine, zolpidem) may increase sedative effect. HERBAL: Gotu kola, kava kava, St. John’s wort, valerian may increase CNS depression. FOOD: None known. LAB VALUES: May increase CPK. May cause mild PR interval prolongation. May decrease platelet count.

Availability (Rx)

Solution, Oral: 20 mg/mL.
Capsules (Lyrica): 25 mg, 50 mg, 75 mg, 100 mg, 150 mg, 200 mg, 225 mg, 300 mg.
Capsules (Lyrica CR): 82.5 mg, 165 mg, 330 mg.
Administration/handling

- Give without regard to food.
- Administer whole; do not break, crush, or open capsule.

Lyrica CR: Give once daily in evening. Discontinue gradually over at least one wk.

Indications/routes/dosage

Partial-Onset Seizures

PO: ADULTS, ELDERLY: Initially, 75 mg twice daily or 50 mg 3 times/day. May increase dose based on tolerability/effect. Maximum: 600 mg/day.

Neuropathic Pain (Diabetes-Associated)

PO: ADULTS, ELDERLY: Initially, 50 mg 3 times/day. May be increased within 1 wk based on tolerability/effect. Maximum: 300 mg/day in 3 divided doses.

PO: (Lyrica CR): ADULTS, ELDERLY: Initially, 165 mg once daily. May increase to 330 mg/day within 1 wk. Maximum: 330 mg/day.

Postherpetic Neuralgia, Neuropathic Pain Associated with Spinal Cord Injury

PO: ADULTS, ELDERLY: Initially, 75 mg twice daily or 50 mg 3 times/day. May increase to 300 mg/day within 1 wk. May further increase to 600 mg/day after 2–4 wks. Maximum: 600 mg/day.

PO: (Lyrica CR): ADULTS, ELDERLY: Initially, 165 mg once daily. May increase to 330 mg/day within 1 wk. May further increase to 660 mg once daily after 2–4 wks. Maximum: 330 mg/day.

Fibromyalgia

PO: ADULTS, ELDERLY: Initially, 75 mg twice daily. May increase to 150 mg twice daily within 1 wk. Maximum: 225 mg twice daily.

Dosage in Hepatic Impairment

No dose adjustment.

Side effects

**Frequent (32%–12%):** Dizziness, drowsiness, ataxia, peripheral edema. **Occasional (12%–5%):** Weight gain, blurred vision, diplopia, difficulty with concentration, attention, cognition; tremor, dry mouth, headache, constipation, asthenia. **Rare (4%–2%):** Abnormal gait, confusion, incoordination, twitching, flatulence, vomiting, edema, myopathy.

Adverse effects/toxic reactions

Abrupt withdrawal increases risk of seizure frequency in pts with seizure disorders; withdraw gradually over a minimum of 1 wk. May increase risk of suicidal thoughts and behavior.

Nursing considerations

Baseline assessment

**Seizure:** Review history of seizure disorder (type, onset, intensity, frequency, duration, LOC). **Pain:** Assess onset, type, location, and duration of pain.

Intervention/evaluation

**Patient/family teaching**

- Do not abruptly stop taking drug; seizure frequency may be increased.
- Avoid tasks that require alertness, motor skills until response to drug is established.
- Avoid alcohol.
- Carry identification card, bracelet to note seizure disorder, anticonvulsant therapy.

**Classifications**

- **CLASSIFICATION**
  - **PHARMACOTHERAPEUTIC:** Barbiturate.
  - **CLINICAL:** Anticonvulsant.

**Uses**

Management of partial seizures, generalized tonic-clonic (grand mal) seizures, focal seizures. **OFF-LABEL:** Treatment of essential tremor (familial tremor).

**Precautions**

**Contraindications:** Hypersensitivity to primidone, PHENobarbital; porphyria. **Cautions:** Renal/hepatic impairment, pulmonary insufficiency, elderly pts, debilitated pts, children, hypoadrenalism, pts at risk for suicidal thoughts/behavior, depression, history of drug abuse.

**Action**
Decreases neuron excitability. **Therapeutic Effect:** Reduces seizure activity.

**Pharmacokinetics**

Rapidly, usually completely absorbed following PO administration. Protein binding: 99%. Metabolized in liver to PHENobarbital. Minimal excretion in urine. **Half-life:** 3–6 hrs. (PHENobarbital: 2–5 days.)

**Lifespan considerations**

**Pregnancy/Lactation:** Crosses placenta; distributed in breast milk. **Children, Elderly:** May produce paradoxical excitement, restlessness.

**Interactions**

**DRUG:** Alcohol, other CNS depressants (e.g., LORazepam, morphine, zolpidem) may increase effects. **Valproic acid** increases concentration, risk of toxicity. **HERBAL:** **Evening primrose** may decrease seizure threshold. **Gotu kola, kava kava, St. John’s wort, valerian** may increase CNS depression. **FOOD:** None known. **LAB VALUES:** May decrease serum bilirubin. **Therapeutic serum level:** 4–12 mcg/mL; **toxic serum level:** greater than 12 mcg/mL.

**Availability (Rx)**

**Tablets:** 50 mg, 250 mg.

**Administration/handling**

**PO**

• Give with food to minimize GI effects.

**Indications/routes/dosage**

**Seizure Control**

**PO: ADULTS, ELDERLY, CHILDREN 8 YRS AND OLDER:** Initially, 100–125 mg/day at bedtime for days 1–3. **Days 4–6:** 100–125 mg twice daily. **Days**
7–9: 100–125 mg 3 times/day. **Usual dose:** 750–1,500 mg/day. **Maximum:** 2 g/day. **CHILDREN YOUNGER THAN 8 YRS:** Initially, 50 mg/day at bedtime for days 1–3. **Days 4–6:** 50 mg twice daily. **Days 7–9:** 100 mg twice daily. **Usual dose:** 10–25 mg/kg/day (375–750 mg) in 3–4 divided doses. **NEONATES:** 12–20 mg/kg/day in divided doses 2–4 times/day.

</table>

### Dosage in Hepatic Impairment

No dose adjustment.

### Side effects

**Frequent:** Ataxia, dizziness. **Occasional:** Anorexia, drowsiness, altered mental status, nausea, vomiting, paradoxical excitement. **Rare:** Rash.

### Adverse effects/toxic reactions

Abrupt withdrawal after prolonged therapy may produce effects ranging from markedly increased dreaming, nightmares, insomnia, tremor, diaphoresis, vomiting to hallucinations, delirium, seizures, status epilepticus. Skin eruptions may appear as hypersensitivity reaction. Blood dyscrasias, hepatic disease, hypocalcemia occur rarely. Overdose produces cold/clammy skin, hypothermia, severe CNS depression, followed by high fever, coma. May increase risk of suicidal thoughts and behavior.

### Nursing considerations

#### Baseline assessment

Review history of seizure disorder (intensity, frequency, duration, LOC).
Observe frequently for recurrence of seizure activity. Initiate seizure precautions.

**Intervention/evaluation**
Monitor for changes in behavior, depression, suicidal ideation. Monitor CBC, neurologic status (frequency, duration, severity of seizures). Monitor for **therapeutic serum level**: 4–12 mcg/mL; **toxic serum level**: more than 12 mcg/mL.

**Patient/family teaching**
• Do not abruptly discontinue medication after long-term use (may precipitate seizures).
• Strict maintenance of drug therapy is essential for seizure control.
• Avoid tasks that require alertness, motor skills until response to drug is established; drowsiness usually disappears during continued therapy.
• Slowly go from lying to standing.
• Avoid alcohol.
• Report depression, thoughts of suicide, unusual changes in behavior.

---

**prochlorperazine**
proe-klor-per-a-zeen
Apo-Prochlorperazine
Compazine
Compro

♦ **CLASSIFICATION**
PHARMACOTHERAPEUTIC: Phenothiazine.
CLINICAL: Antiemetic, first-generation (typical) antipsychotic.

■ **BLACK BOX ALERT** ■ Increased risk for death in elderly with dementia-related psychosis.

Do not confuse prochlorperazine with chlorproMAZINE.

---

**Uses**
Management of severe nausea/vomiting. Treatment of acute or chronic
psychosis, nonpsychotic anxiety. **OFF-LABEL:** Behavioral syndromes in dementia, psychosis/agitation related to Alzheimer’s dementia.

**Precautions**

**Contraindications:** Hypersensitivity to prochlorperazine. Coma or presence of large amounts of CNS depressants (e.g., alcohol, opioids). Use in children younger than 2 yrs or weighing less than 9 kg. Postoperative nausea/vomiting following pediatric surgery. **Cautions:** History of seizures, Parkinson’s disease, elderly, pts at risk for pneumonia, severe renal/hepatic impairment, decreased GI motility, urinary retention, visual problems, narrow-angle glaucoma, paralytic ileus, myasthenia gravis, cerebrovascular/cardiovascular disease.

**Action**

Acts centrally to inhibit/block DOPamine receptors in brain. **Therapeutic Effect:** Relieves nausea/vomiting.

**Pharmacokinetics**

*As an antiemetic.

**Lifespan considerations**

**Pregnancy/Lactation:** Crosses placenta. Distributed in breast milk. **Children:** Safety and efficacy not established in pts weighing less than 9 kg or younger than 2 yrs. **Elderly:** More susceptible to orthostatic hypotension, anticholinergic effects (e.g., dry mouth), sedation, extrapyramidal symptoms (EPS); lower dosage recommended.
Interactions

**DRUG:** Alcohol, other CNS depressants (e.g., LORazepam, morphine, zolpidem) may increase CNS, respiratory depression, hypotensive effects. Extrapyramidal symptom (EPS)–producing medications (e.g., haloperidol metoclopramide, SSRIs) may increase EPS. **Lithium** may decrease absorption, produce adverse neurologic effects. **MAOIs** (e.g., phenelzine, selegiline), tricyclic antidepressants (e.g., amitriptyline, doxepin) may increase anticholinergic, sedative effects. **HERBAL:** Dong quai, St. John’s wort may increase photosensitization. Gotu kola, kava kava, St. John’s wort, valerian may increase CNS depression. **FOOD:** None known. **LAB VALUES:** None significant.

Availability (Rx)

**Injection Solution:** 5 mg/mL. **Suppositories (Compro):** 25 mg. **Tablets:** 5 mg, 10 mg.

Administration/handling

**IV**

**Rate of Administration**
- May give by IV push slowly. Maximum rate: 5 mg/min.

**Storage**
- Store at room temperature.
- Protect from light.
- Clear or slightly yellow solutions may be used.

**IM**
- Inject deep IM into outer quadrant of buttocks.

**PO**
- Should be administered with food or water.

**Rectal**
- Moisten suppository with cold water before inserting well into rectum.
IV incompatibilities
Furosemide (Lasix), hydrocortisone, HYDROmorphine (Dilaudid), midazolam (Versed).

IV Compatibilities
Calcium gluconate, dexmedetomidine (Precedex), diphenhydramINE (Benadryl), fentaNYL, heparin, metoclopramide (Reglan), morphine, potassium chloride, promethazine (Phenergan), propofol (Diprivan).

Indications/routes/dosage

Nausea/Vomiting
PO: ADULTS, ELDERLY: 5–10 mg 3–4 times/day. Maximum: 40 mg/day. CHILDREN: GREATER THAN 39 KG: 5–10 mg q6–8h. Maximum: 40 mg/day. 19–39 KG: 2.5 mg q8h or 5 mg q12h. Maximum: 15 mg/day. 14–18 KG: 2.5 mg q8–12h. Maximum: 10 mg/day. 9–13 KG: 2.5 mg q12–24h. Maximum: 7.5 mg/day.
IV: ADULTS, ELDERLY: 2.5–10 mg. May repeat q3–4h. Maximum: 10 mg/dose or 40 mg/day.
IM: ADULTS, ELDERLY: 5–10 mg q3–4h. CHILDREN: 0.1–0.15 mg/kg/dose q8–12h. Maximum: 40 mg/day.
Rectal: ADULTS, ELDERLY: 25 mg twice daily.

Psychosis
PO: ADULTS, ELDERLY: 5–10 mg 3–4 times/day. Maximum: 150 mg/day. CHILDREN 2–12 YRS: 2.5 mg 2–3 times/day. Maximum daily dose: 25 mg for children 6–12 yrs; 20 mg for children 2–5 yrs.
IM: ADULTS, ELDERLY: 10–20 mg q4h. CHILDREN: 0.13 mg/kg/dose.

Nonpsychiatric Anxiety
PO: ADULTS, ELDERLY: 5 mg 3–4 times/day for up to 12 wks. Maximum: 20 mg/day.

Dosage in Renal/Hepatic Impairment
No dose adjustment.

**Side effects**

**Frequent:** Drowsiness, hypotension, dizziness, fainting (commonly occurring after first dose, occasionally after subsequent doses, rarely with oral form).

**Occasional:** Dry mouth, blurred vision, lethargy, constipation, diarrhea, myalgia, nasal congestion, peripheral edema, urinary retention.

**Adverse effects/toxic reactions**

Extrapyramidal symptoms (EPS) appear dose related and are divided into three categories: akathisia (e.g., inability to sit still, tapping of feet), parkinsonian symptoms (mask-like face, tremors, shuffling gait, hypersalivation), acute dystonias (torticollis [neck muscle spasm], opisthotonos [rigidity of back muscles], oculogyric crisis [rolling back of eyes]). Dystonic reaction may produce diaphoresis, pallor. Tardive dyskinesia (tongue protrusion, puffing of cheeks, puckering of mouth) occurs rarely and may be irreversible. Abrupt withdrawal after long-term therapy may precipitate nausea, vomiting, gastritis, dizziness, tremors. Blood dyscrasias, particularly agranulocytosis, mild leukopenia, may occur. May lower seizure threshold.

**Nursing considerations**

**Baseline assessment**

Avoid skin contact with solution (contact dermatitis). **Antiemetic:** Assess for dehydration (poor skin turgor, dry mucous membranes, longitudinal furrows in tongue). **Antipsychotic:** Assess behavior, appearance, emotional status, response to environment, speech pattern, thought content.

**Intervention/evaluation**

Monitor B/P for hypotension. Assess for EPS. Monitor CBC for blood dyscrasias. Monitor for fine tongue movement (may be early sign of tardive dyskinesia). Supervise suicidal-risk pt closely during early therapy (as depression lessens, energy level improves, increasing suicide potential). Assess for therapeutic response (interest in surroundings, improvement in self-care,
increased ability to concentrate, relaxed facial expression or relief of nausea, vomiting).

**Patient/family teaching**

- Limit caffeine.
- Avoid alcohol.
- Avoid tasks requiring alertness, motor skills until response to drug is established (may cause drowsiness, impairment).

<table>

**Fixed-Combination(s)**

**Phenergan with codeine:** promethazine/codeine (a cough suppressant): 6.25 mg/10 mg/5 mL. **Phenergan VC:** promethazine/phenylephrine (a vasoconstrictor): 6.25 mg/5 mg/5 mL. **Phenergan VC with codeine:** promethazine/phenylephrine/codeine: 6.25 mg/5 mg/10 mg/5 mL.

**CLASSIFICATION**

**PHARMACOTHERAPEUTIC:** Phenothiazine.

**CLINICAL:** Antihistamine (first generation), antiemetic, sedative-hypnotic.

**BLACK BOX ALERT**

Fatalities due to respiratory depression reported in children 2 yrs and younger. Severe tissue injury, including gangrene, may occur with intravenous injection (preferred route is deep intramuscular). Be alert for signs and symptoms of tissue injury including burning or pain at injection site, phlebitis, swelling, blistering. Risk reduced by diluting promethazine with 10–20 mL 0.9% NaCl or diluting in a minibag (piggyback); administer slowly over 10–15 min; use large veins or central venous site (no hand or wrist veins).

**Do not confuse Phenergan with phenelzine, or promethazine with chlorproMAZINE or predniSONE.**
Uses

Treatment of allergic conditions, motion sickness, nausea, vomiting. May be used as mild sedative. Adjunct to postoperative analgesia. **OFF-LABEL:** Nausea/vomiting related to pregnancy.

Precautions

**Contraindications:** Hypersensitivity to promethazine, other phenothiazines. Children 2 yrs and younger (may cause fatal respiratory depression), severe CNS depression, coma, treatment of lower respiratory tract symptoms including asthma. **Cautions:** Cardiovascular/hepatic or respiratory impairment, narrow-angle glaucoma, prostatic hypertrophy, GI/GU obstruction, urinary retention, visual problems, decreased GI motility, myasthenia gravis, Parkinson’s disease, elderly, bone marrow depression, asthma, peptic ulcer, history of seizures, sleep apnea, pts suspected of Reye’s syndrome.

Action

Block postsynaptic dopaminergic receptors; competes with histamine for histamine receptors; possesses muscarinic blocking effect. **Therapeutic Effect:** Prevents allergic responses mediated by histamine (urticaria, pruritus). Prevents, relieves nausea/vomiting. Produces mild sedative effect.

cesso Lifespan considerations
**Pregnancy/Lactation:** Readily crosses placenta. Unknown if drug is distributed in breast milk. May inhibit platelet aggregation in neonates if taken within 2 wks of birth. May produce jaundice, extrapyramidal symptoms (EPS) in neonates if taken during pregnancy. **Children:** May experience increased excitement. Not recommended for pts younger than 2 yrs. **Elderly:** More sensitive to dizziness, sedation, confusion, hypotension, hyperexcitability, anticholinergic effects (e.g., dry mouth).

---

**Interactions**

**DRUG:** Alcohol, CNS depressants (e.g., LORazepam, morphine, zolpidem) may increase CNS depressant effects. **Anticholinergics** (e.g., dicyclomine, glycopyrrolate, scopolamine) may increase anticholinergic effects. **MAOIs** (e.g., phenelzine, selegiline) may prolong, intensify anticholinergic, CNS depressant effects. **HERBAL:** Gotu kola, kava kava, St. John’s wort, valerian may increase CNS depression. **FOOD:** None known. **LAB VALUES:** May suppress wheal/flame reactions to antigen skin testing unless discontinued 4 days before testing.

---

**Availability (Rx)**

**Injection Solution:** 25 mg/mL, 50 mg/mL. **Solution, Oral:** 6.25 mg/5 mL. **Suppositories:** 12.5 mg, 25 mg, 50 mg. **Syrup:** 6.25 mg/5 mL. **Tablets:** 12.5 mg, 25 mg, 50 mg.

---

**Administration/handling**

- IM is preferred route; avoid IV if possible. Significant tissue necrosis may occur if given subcutaneously. Inadvertent intra-arterial injection may produce significant arteriospasm, resulting in severe circulation impairment.

---

**IV**

**Reconstitution**

- Dilute with 10–20 mL 0.9% NaCl or prepare minibag.

**Rate of Administration**

- Administer slowly over 10–15 min.
- Use large vein or central venous site (no hand or wrist veins).
- Too-rapid rate of infusion may result in transient fall in B/P, producing
orthostatic hypotension, reflex tachycardia, serious tissue injury.

**Storage**
- Store at room temperature.

**IM**
- Inject deep IM.

**PO**
- Give with food or fluids to reduce GI distress.
- Scored tablets may be crushed.

**Rectal**
- Refrigerate suppository.
- Moisten suppository with cold water before inserting well into rectum.

**IV incompatibilities**
Allopurinol (Aloprim), amphotericin B complex (Abelcet, AmBisome, Amphotec), heparin, ketorolac (Toradol), nalbuphine (Nubain), piperacillin and tazobactam (Zosyn).

**IV Compatibilities**
Dexmedetomidine (Precedex), diphenhydramINE (Benadryl), HYDROmorphine (Dilaudid), midazolam (Versed), morphine.

**Indications/routes/dosage**
- **Alert** Contraindicated in children 2 yrs and younger.

**Allergic Symptoms**
**PO, RECTAL: ADULTS, ELDERLY:** 6.25–12.5 mg 3 times/day plus 25 mg at bedtime. **CHILDREN:** 0.125 mg/kg/dose (**Maximum:** 12.5 mg) 4 times/day plus 0.5 mg/kg/dose (**Maximum:** 25 mg) at bedtime.
**IV, IM: ADULTS, ELDERLY:** 25 mg. May repeat in 2 hrs.
Motion Sickness

**PO, RECTAL: ADULTS, ELDERLY:** 25 mg 30–60 min before departure; may repeat in 8–12 hrs, then every morning on rising and before evening meal. **CHILDREN:** 0.5 mg/kg 30–60 min before departure; may repeat in 8–12 hrs, then every morning on rising and before evening meal. **Maximum:** 25 mg twice daily.

Prevention of Nausea/Vomiting

**PO, IV, IM, Rectal: ADULTS, ELDERLY:** 12.5–25 mg q4–6h as needed. **CHILDREN:** 0.25–1 mg/kg q4–6h as needed. **Maximum:** 25 mg/dose.

Sedative

**PO, IV, IM, Rectal: ADULTS, ELDERLY:** 25–50 mg/dose. **CHILDREN:** 12.5–25 mg/dose.

Dosage in Renal Impairment

No dose adjustment.

Dosage in Hepatic Impairment

Use caution.

Side effects

**Frequent:** Drowsiness; dry mouth, nose, throat; urinary retention; thickening of bronchial secretions. **Occasional:** Epigastric distress, flushing, visual disturbances, hearing disturbances, wheezing, paresthesia, diaphoresis, chills, disorientation, hypotension, confusion, syncope in elderly. **Rare:** Dizziness, urticaria, photosensitivity, nightmares.

Adverse effects/toxic reactions

Paradoxical reaction (particularly in children) manifested as excitation, anxiety, tremor, hyperactive reflexes, seizures. Long-term therapy may produce extrapyramidal symptoms (EPS) noted as dystonia (abnormal movements), pronounced motor restlessness (most frequently in children), parkinsonism (esp. noted in elderly). Blood dyscrasias, particularly agranulocytosis, occur rarely.
Nursing considerations

Baseline assessment
Assess allergy symptoms. Assess B/P, pulse for bradycardia, tachycardia if pt is given parenteral form. If used as antiemetic, assess for dehydration (poor skin turgor, dry mucous membranes, longitudinal furrows in tongue). Assess level of consciousness.

Intervention/evaluation
Monitor serum electrolytes in pts with severe vomiting. Assist with ambulation if drowsiness, dizziness occurs. Monitor for relief of nausea, vomiting, allergic symptoms.

Patient/family teaching
• Drowsiness, dry mouth may be expected response to drug.
• Avoid tasks that require alertness, motor skills until response to drug is established.
• Sugarless gum, sips of water may relieve dry mouth.
• Coffee, tea may help reduce drowsiness.
• Report visual disturbances, involuntary movements, restlessness.
• Avoid alcohol, other CNS depressants.
• Avoid prolonged exposure to sunlight.

propafenone
proe-paf-e-nown
Apo-Propafenone

Rythmol SR
CLASSIFICATION
PHARMACOTHERAPEUTIC: Class 1c antiarrhythmic.
CLINICAL: Antiarrhythmic.

BLACK BOX ALERT Mortality or nonfatal cardiac arrest rate (7.7% of pts) in asymptomatic non–life-threatening ventricular arrhythmia pts with recent MI (more than 6 days but less than 2 yrs prior) reported.
Uses

Immediate-Release: Treatment of life-threatening ventricular arrhythmias (e.g., sustained ventricular tachycardias). To prolong time to recurrence of paroxysmal atrial fibrillation/flutter (PAF) or paroxysmal supraventricular tachycardia (PSVT) in pts with disabling symptoms and without structural heart disease. Extended-Release: Prolong the time to recurrence of atrial fibrillation/flutter or paroxysmal supraventricular tachycardia in pts with disabling symptoms without structural heart disease. OFF-LABEL: Treatment following cardioversion of recent-onset atrial fibrillation; supraventricular tachycardia in pts with Wolff-Parkinson-White syndrome.

Precautions

Contraindications: Hypersensitivity to propafenone. Sinus bradycardia, bronchospastic disorders or severe obstructive pulmonary disease, cardiogenic shock, electrolyte imbalance, sinoatrial, AV, intraventricular impulse generation or conduction disorders (e.g., sick sinus syndrome, AV block) without pacemaker, uncontrolled HF, marked hypotension. Cautions: Renal/hepatic impairment, myasthenia gravis, concurrent use of other medications that prolong QT interval, hypokalemia, hypomagnesemia.

Action

Decreases fast sodium current in Purkinje/myocardial cells. Decreases excitability, automaticity; prolongs conduction velocity, refractory period. Therapeutic Effect: Suppresses arrhythmias.

Pharmacokinetics

Lifespan considerations

Pregnancy/Lactation: Crosses placenta, distributed in breast milk. Children: Safety and efficacy not established. Elderly: No age-related precautions noted.
Interactions

**DRUG:** Amiodarone may affect cardiac conduction, repolarization. May increase **digoxin** concentration. May increase effects of **warfarin.** CYP3A4 inhibitors (e.g., ketoconazole, erythromycin) may increase concentration/toxicity. **HERBAL:** St. John’s wort may decrease concentration/effect. **Ephedra** may worsen arrhythmias. **FOOD:** Grapefruit products may increase concentration. **LAB VALUES:** May cause EKG changes (e.g., QRS widening, PR interval prolongation), positive ANA titer.

Availability (Rx)

**Tablets (Rythmol):** 150 mg, 225 mg, 300 mg.

**Capsules (Extended-Release [Rythmol SR]):** 225 mg, 325 mg, 425 mg.

Administration/handling

**PO**

- May take without regard to meals.
- Give whole; do not break, crush, divide, or open capsules.

Indications/routes/dosage

**Ventricular Arrhythmias, PAT, PSVT**

**PO (Immediate-Release):** ADULTS, ELDERLY: Initially, 150 mg q8h. May increase at 3- to 4-day intervals to 225 mg q8h, then to 300 mg q8h. **Maximum:** 900 mg/day.

**Atrial Fibrillation (Prevention of Recurrence)**

**PO (Immediate-Release):** ADULTS, ELDERLY: Initially, 150 mg q8h. May increase at 3- to 4-day intervals to 225 mg q8h, then to 300 mg q8h. **Maximum:** 900 mg/day.  

**(Extended-Release):** ADULTS, ELDERLY: Initially, 225 mg q12h. May increase at 5-day intervals to 325 mg q12h. **Maximum:** 425 mg q12h.

Dosage in Renal Impairment
No dose adjustment.

**Dosage in Hepatic Impairment**
Use caution.

**Side effects**

**Frequent (13%–7%):** Dizziness, nausea, vomiting, altered taste, constipation.
**Occasional (6%–3%):** Headache, dyspnea, blurred vision, dyspepsia. **Rare (less than 2%):** Rash, weakness, dry mouth, diarrhea, edema, hot flashes.

**Adverse effects/toxic reactions**
May produce, worsen arrhythmias, HF. Overdose may produce hypotension, drowsiness, bradycardia, atrioventricular conduction disturbances.

**Nursing considerations**

**Baseline assessment**
Correct electrolyte imbalance before administering medication. Obtain baseline EKG. Screen for cardiac contraindications.

**Intervention/evaluation**
Assess pulse for quality, rhythm, rate. Monitor EKG for cardiac performance or changes, particularly widening of QRS, prolongation of PR interval. Question for visual disturbances, headache, GI upset. Monitor fluid, serum electrolyte levels. Monitor daily pattern of bowel activity, stool consistency. Assess for dizziness, unsteadiness. Monitor LFT. Monitor for therapeutic serum level (0.06–1 mcg/mL).

**Patient/family teaching**
• Compliance with therapy regimen is essential to control arrhythmias.
• Altered taste sensation may occur.
• Report headache, blurred vision.
• Avoid tasks that require alertness, motor skills until response to drug is established.
• Report chest pain, difficulty breathing, palpitations.

**propofol**  
proe-poe-fol  
**Diprivan**  
Fresenius Propoven

**CLASSIFICATION**  
PHARMACOTHERAPEUTIC: Rapid-acting general anesthetic.  
CLINICAL: Sedative-hypnotic.  
Do not confuse Diprivan with Diflucan or Ditropan, or propofol with fospropofol.

**Uses**
Induction/maintenance of anesthesia. Continuous sedation in intubated and respiratory controlled adult pts in ICU. **OFF-LABEL:** Postop antiemetic, refractory status epilepticus.

**Precautions**
**Contraindications:** Hypersensitivity to propofol, eggs, egg products, soybean or soy products. **Cautions:** Hemodynamically unstable pts, hypovolemia, severe cardiac/respiratory disease, elevated ICP, impaired cerebral circulation, preexisting pancreatitis, hyperlipidemia, history of epilepsy, seizure disorder, elderly pts, debilitated pts, pts allergic to peanuts.

**Action**
Causes CNS depression through agonist action of GABA receptors. **Therapeutic Effect:** Produces hypnosis rapidly.

**Pharmacokinetics**

<table>

Rapidly, extensively distributed. Protein binding: 97%–99%. Metabolized in

**Lifespan considerations**

**Pregnancy/Lactation:** Unknown if drug crosses placenta. Distributed in breast milk. Not recommended for obstetrics, breastfeeding mothers. **Children:** Safety and efficacy not established. FDA-approved for use in pts 2 mos and older. **Elderly:** No age-related precautions noted; lower dosages recommended.

**Interactions**

**DRUG:** Alcohol, CNS depressants (e.g., LORazepam, morphine, zolpidem) may increase CNS, respiratory depression, hypotensive effects. **Antihypertensive medications** (e.g., amLODIPine, lisinopril, valsartan) may increase hypotensive effects. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** May increase serum triglycerides.

**Availability (Rx)**

**Injection Emulsion:** 10 mg/mL.

**Administration/handling**

**IV**

**Alert** Do not give through same IV line with blood or plasma.

**Reconstitution**

- May give undiluted, or dilute only with D<sub>5</sub>W.
- Do not dilute to concentration less than 2 mg/mL (4 mL D<sub>5</sub>W to 1 mL propofol yields 2 mg/mL).

**Rate of Administration**

- Too-rapid IV administration may produce marked severe hypotension, respiratory depression, irregular muscular movements.
- Observe for signs of extravasation (pain, discolored skin patches, white or blue color to peripheral IV site area, delayed onset of drug action).

**Storage**

- Store at room temperature.
• Discard unused portions.
• Do not use if emulsion separates.
• Shake well before using.

**IV incompatibilities**

Amikacin (Amikin), amphotericin B complex (Abelcet, AmBisome, Amphotec), bretylium (Bretylol), calcium chloride, ciprofloxacin (Cipro), diazepam (Valium), digoxin (Lanoxin), DOXOrubicin (Adriamycin), gentamicin (Garamycin), methylPREDNISolone (Solu-Medrol), minocycline (Minocin), phenytoin (Dilantin), tobramycin (Nebcin), verapamil (Isoptin).

**IV Compatibilities**

Acyclovir (Zovirax), bumetanide (Bumex), calcium gluconate, cefTAZidime (Fortaz), dexmedetomidine (Precedex), DOBUTamine (Dobutrex), DOPamine (Intropin), enalapril (Vasotec), fentaNYL, heparin, insulin, labetalol (Normodyne, Trandate), lidocaine, LORazepam (Ativan), magnesium, milrinone (Primacor), nitroglycerin, norepinephrine (Levophed), potassium chloride, vancomycin (Vancocin).

**Indications/routes/dosage**

**Anesthesia**

**IV Infusion:** **ADULTS, ELDERLY:** Induction, 2–2.5 mg/kg (approximately 40 mg q10sec until onset of anesthesia). **Maintenance:** Initially, 100–200 mcg/kg/min or 6–12 mg/kg/hr for 10–15 min. Usual maintenance infusion: 50–100 mcg/kg/min or 3–6 mg/kg/hr. **CHILDREN 3–16 YRS:** Induction, 2.5–3.5 mg/kg over 20–30 sec, then infusion of 125–300 mcg/kg/min or 7.5–18 mg/kg/hr.

**Sedation in ICU**

**IV Infusion:** **ADULTS, ELDERLY:** Initially, 5 mcg/kg/min (0.3 mg/kg/hr); increase by increments of 5–10 mcg/kg/min (0.3–0.6 mg/kg/hr) q5–10 min until desired sedation level achieved. **Usual maintenance:** 5–50 mcg/kg/min (0.3–3 mg/kg/hr). Reduce dose after adequate sedation established, and adjust to
response. Daily interruption with retitration (sedation vacation) recommended to minimize prolonged sedative effects.

**Dosage in Renal/Hepatic Impairment**
No dose adjustment.

**Side effects**

**Frequent:** Involuntary muscle movements, apnea (common during induction; often lasts longer than 60 sec), hypotension, nausea, vomiting, IV site burning/stinging. **Occasional:** Twitching, thrashing, headache, dizziness, bradycardia, hypertension, fever, abdominal cramps, paresthesia, coldness, cough, hiccups, facial flushing, green-tinted urine. **Rare:** Rash, dry mouth, agitation, confusion, myalgia, thrombophlebitis.

**Adverse effects/toxic reactions**
Continuous infusion or repeated intermittent infusions of propofol may result in extreme drowsiness, respiratory depression, circulatory depression, delirium. Too-rapid IV administration may produce severe hypotension, respiratory depression, involuntary muscle movements. Pt may experience acute allergic reaction, characterized by abdominal pain, anxiety, restlessness, dyspnea, erythema, hypotension, pruritus, rhinitis, urticaria. May cause propofol infusion syndrome, a collection of metabolic disorders and organ system failures including metabolic acidosis, hyperkalemia, rhabdomyolysis, hepatomegaly; cardiac, renal failure.

**Nursing considerations**

**Baseline assessment**
Resuscitative equipment, suction, O₂ must be available. Obtain vital signs before administration.

**Intervention/evaluation**
Observe pt for signs of wakefulness, agitation. Monitor respiratory rate, B/P, heart rate, O₂ saturation, ABGs, depth of sedation, serum lipid, triglycerides (if
used longer than 24 hrs). May change urine color to green. If continuous high-dose infusions do not properly induce sedation, consider additional sedatives (e.g., opioids, hypnotics, benzodiazepines) to achieve desired response.

**propranolol**
proe-pran-oh-lol
Apo-Propranolol
Hemangeol
Inderal LA
Inderal XL
InnoPran XL

**Fixed-Combination(s)**

**Inderide**: propranolol/hydroCHLORothiazide (a diuretic): 40 mg/25 mg, 80 mg/25 mg. **Inderide LA**: propranolol/hydroCHLORothiazide (a diuretic): 80 mg/50 mg, 120 mg/50 mg, 160 mg/50 mg.

**CLASSIFICATION**

**PHARMACOTHERAPEUTIC**: Nonselective beta-adrenergic blocker.
**CLINICAL**: Antihypertensive, antianginal, antiarrhythmic, antimigraine.

■ **BLACK BOX ALERT** ■ Severe angina exacerbation, MI, ventricular arrhythmias may occur in angina pts after abrupt discontinuation; must taper gradually over 1–2 wks.

**Do not confuse Inderal LA with Adderall, Imdur, Isordil, or Toradol, or propranolol with Pravachol.**

**Uses**

Treatment of angina pectoris, supraventricular arrhythmias, essential tremors, hypertension, ventricular tachycardia, symptomatic treatment of obstructive hypertrophic cardiomyopathy, treatment of proliferating infantile hemangioma requiring systemic therapy, migraine headache prophylaxis, pheochromocytoma, prevention of MI. **Hemangeol**: Treatment of proliferating infantile hemangioma needing systemic therapy. **OFF-LABEL**: Treatment adjunct for anxiety, tremor
due to Parkinson’s disease, alcohol withdrawal, aggressive behavior, schizophrenia, antipsychotic-induced akathisia, variceal hemorrhage, acute panic.

Precautions

Contraindications: Hypersensitivity to propranolol. Bronchial asthma, severe sinus bradycardia, cardiogenic shock, sick sinus syndrome, heart block greater than first-degree (unless pt has functional pacemaker), uncompensated HF. Hemangeol (Additional): Premature infants with corrected age younger than 5 wks, infants weighing less than 2 kg; asthma, history of bronchospasm, bradycardia (less than 80 beats/min), B/P less than 50/30 mm Hg, pheochromocytoma. Caution: Diabetes, renal/hepatic impairment, Raynaud’s disease, hyperthyroidism, myasthenia gravis, psychiatric disease, bronchospastic disease, elderly pts, history of severe anaphylaxis to allergens.

Action

Blocks beta₁-, beta₂-adrenergic receptors. Therapeutic Effect: Slows heart rate; decreases B/P, myocardial contractility, myocardial oxygen demand.

Pharmacokinetics

Lifespan considerations

Pregnancy/Lactation: Crosses placenta. Distributed in breast milk. Avoid use during first trimester. May produce low-birth-weight infants, bradycardia, apnea, hypoglycemia, hypothermia during delivery. Children: No age-related precautions noted. Elderly: Age-related peripheral vascular disease may increase susceptibility to decreased peripheral circulation.
Interactions

DRUG: Diuretics (e.g., furosemide, HCTZ), other antihypertensives (e.g., amLODIPine, lisinopril, valsartan) may increase hypotensive effect. May mask symptoms of hypoglycemia, prolong hypoglycemic effect of insulin, oral hypoglycemics (e.g., glipiZIDE, metFORMIN). Digoxin may increase risk for bradycardia. NSAIDs (e.g., ibuprofen, ketorolac, naproxen) may decrease antihypertensive effect. HERBAL: Ephedra, ginger, licorice, ginseng, yohimbe may worsen hypertension. Licorice may increase water retention. Garlic, periwinkle have antihypertensive effects. FOOD: None known. LAB VALUES: May increase serum antinuclear antibody (ANA) titer, serum BUN, LDH, lipoprotein, alkaline phosphatase, potassium, uric acid, ALT, AST, triglycerides.

Availability (Rx)

Injection Solution: 1 mg/mL. Oral Solution: 20 mg/5 mL, 40 mg/5 mL. Oral Solution (Hemangeol): 4.28 mg/mL. Tablets: 10 mg, 20 mg, 40 mg, 60 mg, 80 mg. Capsules (Extended-Release [InnoPran XL]): 80 mg, 120 mg. Capsules (Extended-Release [InnoPran XL]): 80 mg, 120 mg. Capsules (Sustained-Release [Inderal LA]): 60 mg, 80 mg, 120 mg, 160 mg.

Administration/handling

IV

Reconstitution
• Give undiluted for IV push.
• For IV infusion, may dilute each 1 mg in 10 mL D₅W.

Rate of Administration
• Do not exceed 1 mg/min injection rate.
• For IV infusion, give over 30 min.

Storage
• Store at room temperature.
• Once diluted, stable for 24 hrs at room temperature.
PO
• May crush scored tablets.
• Do not break, crush, or open extended- or sustained-release capsules.
• Give immediate-release tablets on empty stomach.
• Give extended-release, sustained-release without regard to food.

■ IV incompatibilities
Amphotericin B complex (Abelcet, AmBisome, Amphotec).

■ IV Compatibilities
Alteplase (Activase), heparin, milrinone (Primacor), potassium chloride, propofol (Diprivan).

Indications/routes/dosage

Hypertension
PO: ADULTS, ELDERLY: (Immediate-Release): Initially, 40 mg twice daily. May increase dose q3–7 days. Usual dose: 120–240 mg/day in 2–3 divided doses. Maximum: 640 mg/day. CHILDREN: Initially, 1–2 mg/kg/day in 2–3 divided doses. May increase at 3- to 5-day intervals. Usual dose: 4 mg/kg/day. Maximum: 4 mg/kg/day up to 640 mg/day.

PO ADULTS, ELDERLY: (Sustained-Release):(Inderal LA): Initially, 80 mg once daily. Maintenance: 120–160 mg/day.
(Extended-Release): Initially, 80 mg at bedtime. May increase at 2- to 3-wk intervals. Maximum: 120 mg.

Angina
PO: ADULTS, ELDERLY: (Immediate-Release): 80–320 mg/day in 2–4 divided doses.

PO (Extended-Release): Initially, 80 mg/day. Maximum: 320 mg/day.

Arrhythmia
IV: ADULTS, ELDERLY: 1–3 mg. Repeat q2–5min up to total of 5 mg.
CHILDREN: 0.01–0.15 mg/kg. **Maximum:** Infants, 1 mg; children, 3 mg.

**PO: ADULTS, ELDERLY:** *(Immediate-Release):* 10–30 mg q6–8h or 10–40 mg 3–4 times/day. **CHILDREN:** Initially, 0.5–1 mg/kg/day in divided doses q6–8h. May increase q3days. Usual dosage: 2–6 mg/kg/day. **Maximum:** 16 mg/kg/day or 60 mg/day.

**Obstructive Hypertrophic Cardiomyopathy**

**PO: ADULTS, ELDERLY:** *(Immediate-Release):* 20–40 mg 3–4 times/day or 80–160 mg once daily as extended-release capsule.

**Adjunct to Alpha-Blocking Agents to Treat Pheochromocytoma**

**PO: ADULTS, ELDERLY:** 30–60 mg/day in divided doses.

**Migraine Headache**

**PO: ADULTS, ELDERLY:** *(Immediate-Release):* Initially, 80 mg/day in 3–4 divided doses or 80 mg once daily. May increase by 20–40 mg/dose q3–4wks up to 160–240 mg/day in divided doses. **CHILDREN WEIGHING 35 KG OR LESS:** 10–20 mg 3 times/day. **CHILDREN WEIGHING OVER 35 KG:** 20–40 mg 3 times/day.

*(Extended-Release):* *(Inderal LA):* **ADULTS, ELDERLY:** Initially, 80 mg daily. Effective range: 160–240 mg/day.

**Reduction of Cardiovascular Mortality, Reinfarction in Pts with Previous MI**

**PO: ADULTS, ELDERLY:** *(Immediate-Release):* Initially, 40 mg 3 times/day. Range: 180–240 mg/day in 3–4 divided doses.

**Essential Tremor**

**PO: ADULTS, ELDERLY:** Initially, 40 mg twice daily increased up to 120–320 mg/day in 3 divided doses.

**Infantile Hemangioma**

**Note:** Separate doses by at least 9 hrs during or after feeding.

**PO: INFANTS 5 WKS TO 5 MOS:** Initially, 0.15 mL/kg (0.6 mg/kg) twice daily. After 1 wk, increase to 0.3 mL/kg (1.1 mg/kg) twice daily. After 2 wks,
increase to maintenance dose of 0.4 mL/kg (1.7 mg/kg) twice daily. Maintain dose for 6 months. Readjust dose as weight increases.

**Dosage in Renal/Hepatic Impairment**
Use caution.

**Side effects**

**Frequent:** Diminished sexual function, drowsiness, difficulty sleeping, unusual fatigue/weakness. **Occasional:** Bradycardia, depression, sensation of coldness in extremities, diarrhea, constipation, anxiety, nasal congestion, nausea, vomiting. **Rare:** Altered taste, dry eyes, pruritus, paresthesia.

**Adverse effects/toxic reactions**
Overdose may produce profound bradycardia, hypotension. Abrupt withdrawal may result in diaphoresis, palpitations, headache, tremulousness. May precipitate HF, MI in pts with cardiac disease, thyroid storm in pts with thyrotoxicosis, peripheral ischemia in pts with existing peripheral vascular disease. Hypoglycemia may occur in pts with previously controlled diabetes. **Antidote:** Glucagon (see Appendix J for dosage).

**Nursing considerations**

**Baseline assessment**
Assess baseline renal function, LFT. Assess B/P, apical pulse immediately before administering drug (if pulse is 60/min or less or systolic B/P is less than 90 mm Hg, withhold medication, contact physician). **Angina:** Record onset, quality, radiation, location, intensity, duration of anginal pain, precipitating factors (exertion, emotional stress).

**Intervention/evaluation**
Assess pulse for quality, regularity, bradycardia. Monitor EKG for cardiac arrhythmias. Assess fingers for color, numbness (Raynaud’s). Assess for evidence of HF (dyspnea [particularly on exertion or lying down], night cough, peripheral edema, distended neck veins). Monitor I&O (increase in weight,
decrease in urinary output may indicate HF). Assess for rash, fatigue, behavioral changes. Therapeutic response time ranges from a few days to several wks. Measure B/P near end of dosing interval (determines if B/P is controlled throughout day).

**Patient/family teaching**

- Do not abruptly discontinue medication.
- Compliance with therapy regimen is essential to control hypertension, arrhythmia, anginal pain.
- To avoid hypotensive effect, slowly go from lying to standing.
- Avoid tasks that require alertness, motor skills until response to drug is established.
- Report excessively slow pulse rate (less than 50 beats/min), peripheral numbness, dizziness.
- Do not use nasal decongestants, OTC cold preparations (stimulants) without physician approval.
- Restrict salt, alcohol intake.

---

**propylthiouracil**

proe-pil-thye-oh-ure-a-sil

Propyl-Thyracil

♦**CLASSIFICATION**

PHARMACOTHERAPEUTIC: Thiourea derivative.

CLINICAL: Antithyroid agent.

♦ **BLACK BOX ALERT**  ■ May cause severe hepatic injury, acute hepatic failure, death.

Do not confuse propylthiouracil with Purinethol.

---

**Uses**

Palliative treatment of hyperthyroidism; adjunct to ameliorate hyperthyroidism in preparation for surgical treatment, radioactive iodine therapy. **OFF-LABEL:** Management of thyrotoxic crises, Graves’ disease, thyroid storm.
Precautions

Contraindications: Hypersensitivity to propylthiouracil. Cautions: In combination with other agranulocytosis-inducing drugs.

Action

Blocks conversion of thyroxine to triiodothyronine in peripheral tissues. Therapeutic Effect: Inhibits synthesis of thyroid hormone.

Pharmacokinetics

Interactions

DRUG: May increase concentration of digoxin (as pt becomes euthyroid). May increase effect of oral anticoagulants (e.g., apixaban, warfarin). HERBAL: None significant. FOOD: None known. LAB VALUES: May increase LDH, serum alkaline phosphatase, bilirubin, ALT, AST, prothrombin time.

Availability (Rx)

Tablets: 50 mg.

Administration/handling

PO

• Give with food.

Indications/routes/dosage

Hyperthyroidism

PO: ADULTS, ELDERLY: Initially, 300–400 mg/day (ELDERLY: 150–300 mg/day) in divided doses q8h. Maintenance: 100–150 mg/day in divided doses q8–12h.
Dosage in Renal/Hepatic Impairment
No dose adjustment.

Side effects
Frequent: Urticaria, rash, pruritus, nausea, skin pigmentation, hair loss, headache, paresthesia. Occasional: Drowsiness, lymphadenopathy, vertigo. Rare: Drug fever, lupus-like syndrome.

Adverse effects/toxic reactions
Agranulocytosis (may occur as long as 4 mos after therapy), pancytopenia, fatal hepatitis have occurred.

Nursing considerations

Baseline assessment
Obtain baseline weight, pulse. Obtain baseline T<sub>3</sub>, T<sub>4</sub>, TSH level, LFT.

Intervention/evaluation
Monitor pulse, weight daily. Check for skin eruptions, pruritus, swollen lymph glands. Be alert for signs, symptoms of hepatic injury, hepatitis (nausea, vomiting, drowsiness, jaundice). Monitor hematology results for bone marrow suppression; observe for signs of infection, bleeding.

Patient/family teaching
• Space doses evenly around the clock.
• Take resting pulse daily.
• Report pulse rate less than 60 beats/min.
• Seafood, iodine products may be restricted.
• Report fever, sore throat, yellowing of skin/eyes, unusual bleeding/bruising immediately.
• Report sudden or continuous weight gain, cold intolerance, depression.

pyrazinamide
### Fixed-Combination(s)

**Rifater:** pyrazinamide/isoniazid/rifAMPin (an antitubercular): 300 mg/50 mg/120 mg.

#### CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Synthetic pyrazine analogue.  
**CLINICAL:** Antitubercular.

### Uses

Treatment of clinical tuberculosis in conjunction with other antitubercular agents.

### Precautions

**Contraindications:** Hypersensitivity to pyrazinamide. Acute gout, severe hepatic dysfunction.  
**Cautions:** Diabetes, porphyria, renal impairment, history of gout, history of alcoholism, concurrent medication associated with hepatotoxicity.

### Action

Exact mechanism unknown. May disrupt *Mycobacterium tuberculosis* membrane transport.  
**Therapeutic Effect:** Bacteriostatic or bactericidal, depending on drug concentration at infection site, susceptibility of infecting bacteria.

### Pharmacokinetics

Well absorbed from GI tract. Protein binding: 5%–10%. Widely distributed. Metabolized in liver. Excreted in urine.  
**Half-life:** 9–10 hrs.

---

**Lifespan considerations**
Pregnancy/Lactation: Unknown if drug crosses placenta or is distributed in breast milk. Children: Safety and efficacy not established. Elderly: No age-related precautions noted.

Interactions

**DRUG:** None significant. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** May increase serum ALT, AST, uric acid.

Availability (Rx)

Tablets: 500 mg.

Indications/routes/dosage

Tuberculosis (in Combination With Other Antituberculars)

**PO: ADULTS:** Based on lean body weight. **40–55 KG:** 1,000 mg daily; **56–75 KG:** 1,500 mg daily; **76–90 KG:** 2,000 mg (maximum dose regardless of weight). **CHILDREN:** 30–40 mg/kg/dose once daily. **Maximum:** 2 g/day.

Dosage in Renal/Hepatic Impairment

**CrCl less than 30 mL/min or receiving HD:** 25–35 mg/kg/dose 3 times/wk (give after dialysis). Contraindicated in severe hepatic impairment.

Side effects

**Frequent:** Arthralgia, myalgia (usually mild, self-limited). **Rare:** Hypersensitivity reaction (rash, pruritus, urticaria), photosensitivity, gouty arthritis.

Adverse effects/toxic reactions

Hepatotoxicity, gouty arthritis, thrombocytopenia, anemia occur rarely.

Nursing considerations
Baseline assessment
Question for hypersensitivity to pyrazinamide, isoniazid, ethionamide, niacin. Ensure collection of specimens for culture, sensitivity. Obtain CBC, LFT, serum uric acid levels.

Intervention/evaluation
Monitor LFT results; be alert for hepatic reactions: jaundice, malaise, fever, abdominal (RUQ) tenderness, anorexia, nausea, vomiting (stop drug, notify physician promptly). Check serum uric acid levels; assess for hot, painful, swollen joints, esp. big toe, ankle, knee (gout). Evaluate serum blood glucose levels, diabetic status carefully (pyrazinamide makes management difficult). Assess for rash, skin eruptions. Monitor CBC for thrombocytopenia, anemia.

Patient/family teaching
• Do not skip doses; complete full length of therapy (may be mos or yrs).
• Office visits, lab tests are essential part of treatment.
• Take with food to reduce GI upset.
• Avoid excessive exposure to sun, ultraviolet light until photosensitivity is determined.
• Report any new symptom, immediately for jaundice (yellowing sclera of eyes/skin); unusual fatigue; fever; loss of appetite; hot, painful, swollen joints.

pyridostigmine
peer-id-oh-stig-meen
Mestinon
Mestinon SR
Regonol
◆CLASSIFICATION
PHARMACOTHERAPEUTIC: Anticholinesterase inhibitor.
CLINICAL: Cholinergic muscle stimulant.
Do not confuse pyridostigmine with physostigmine, or Regonol with Reglan or Renagel.
Uses

Improvement of muscle strength in control of myasthenia gravis, reversal of effects of nondepolarizing neuromuscular blocking agents after surgery.

Precautions

Contraindications: Hypersensitivity to pyridostigmine. Mechanical GI/urinary tract obstruction. Cautions: Bronchial asthma, COPD, bradycardia, seizure disorder, hyperthyroidism, cardiac arrhythmias, peptic ulcer, renal impairment.

Action

Prevents destruction of acetylcholine by inhibiting the enzyme acetylcholinesterase, enhancing impulse transmission across myoneural junction. Therapeutic Effect: Produces miosis; increases intestinal, skeletal muscle tone; stimulates salivary, sweat gland secretions.

Pharmacokinetics

Lifespan considerations

Pregnancy/Lactation: Unknown if drug crosses placenta or is distributed in breast milk. Children: Safety and efficacy not established. Elderly: No age-related precautions noted.

Interactions

DRUG: Antagonizes effects of neuromuscular blockers (e.g., succinylcholine, vecuronium). Anticholinergics (e.g., dicyclomine, glycopyrrolate, scopolamine) prevent, reverse effects. Cholinesterase inhibitors (e.g., donepezil, tacrine) may increase risk of toxicity. HERBAL: None significant. FOOD: None known. LAB VALUES: None significant.

Availability (Rx)
Injection Solution (Regonol): 5 mg/mL. Syrup (Mestinon): 60 mg/5 mL.
Tablets (Mestinon): 60 mg.
Tablets (Extended-Release [Mestinon Timespan]): 180 mg.

Administration/handling

**IV, IM**

- Give large parenteral doses concurrently with 0.6–1.2 mg atropine sulfate IV to minimize side effects.

**PO**

- Give with food, milk.
- Tablets may be crushed. Do not chew, crush extended-release tablets (may be broken).
- Give larger dose at times of increased fatigue (e.g., for those with difficulty in chewing, 30–45 min before meals).

**IV incompatibilities**

Do not mix with any other medications.

**Indications/routes/dosage**

**Note:** Highly individualized dosing ranges.

**Myasthenia Gravis**

**PO:** **ADULTS, ELDERLY:** *(Immediate-Release):* Initially, 60 mg 3 times/day. Dosage increased at 48-hr intervals. **Maintenance:** 60 mg–1.5 g/day divided into 5–6 doses/day. (Usual dose: 600 mg/day.) **CHILDREN:** Initially, 1 mg/kg/dose q4–6h. **Maximum:** 7 mg/kg/24 hr divided into 5–6 doses. Usual dose: 600 mg/day.

**PO (Extended-Release):** **ADULTS, ELDERLY:** 180–540 mg 1–2 times/day with at least a 6-hr interval between doses.

**IV, IM:** **ADULTS, ELDERLY:** 2 mg or 1/30th of oral dose q2–3h. **CHILDREN:** 0.05–0.15 mg/kg/dose. **Maximum single dose:** 10 mg.
Dosage in Renal/Hepatic Impairment

No dose adjustment.

Side effects

**Frequent:** Miosis, increased GI/skeletal muscle tone, bradycardia, constriction of bronchi/ureters, diaphoresis, increased salivation. **Occasional:** Headache, rash, temporary decrease in diastolic B/P with mild reflex tachycardia, short periods of atrial fibrillation (in hyperthyroid pts), marked drop in B/P (in hypertensive pts).

Adverse effects/toxic reactions

Overdose may produce cholinergic crisis, manifested as increasingly severe descending muscle weakness (appears first in muscles involving chewing, swallowing, followed by muscle weakness of shoulder girdle, upper extremities), respiratory muscle paralysis, followed by pelvis girdle/leg muscle paralysis. Requires withdrawal of all cholinergic drugs and immediate use of 1–4 mg atropine sulfate IV for adults, 0.01 mg/kg for infants and children younger than 12 yrs.

Nursing considerations

Baseline assessment

Larger doses should be given at time of greatest fatigue. Assess muscle strength before testing for diagnosis of myasthenia gravis and following drug administration. Avoid large doses in pts with megacolon, reduced GI motility.

Intervention/evaluation

Have facial tissues readily available at pt’s bedside. Monitor respirations closely during myasthenia gravis testing or if dosage is increased. Assess diligently for cholinergic reaction, bradycardia in myasthenic pt in crisis. Coordinate dosage time with periods of fatigue and increased/decreased muscle strength. Monitor for therapeutic response to medication (increased muscle strength, decreased fatigue, improved chewing/swallowing functions).
Patient/family teaching

- Report nausea, vomiting, diarrhea, diaphoresis, profuse salivary secretions, palpitations, muscle weakness, severe abdominal pain, difficulty breathing.

<table>
<thead>
<tr>
<th>pyridoxine (vitamin B&lt;sub&gt;6&lt;/sub&gt;)</th>
</tr>
</thead>
<tbody>
<tr>
<td>peer-i-dox-een</td>
</tr>
<tr>
<td>Pyri-500</td>
</tr>
</tbody>
</table>

▶ CLASSIFICATION
PHARMACOTHERAPEUTIC: Water-soluble vitamin.
CLINICAL: Vitamin deficiency supplement.
Do not confuse pyridoxine with PARoxetine, pralidoxime, or Pyridium.

Uses

Prevention/treatment of vitamin B<sub>6</sub> deficiency. OFF-LABEL: Neurological toxicities (e.g., seizure, coma) associated with isoniazid overdose. Nausea and vomiting of pregnancy.

Precautions

Contraindications: Hypersensitivity to pyridoxine. Cautions: Impaired renal function, neonates.

Action

Coenzyme for various metabolic functions, including metabolism of proteins, carbohydrates, fats. Aids in breakdown of glycogen and in synthesis of gamma-aminobutyric acid (GABA) in CNS. Therapeutic Effect: Prevents pyridoxine deficiency. Increases excretion of certain drugs (e.g., isoniazid) that are pyridoxine antagonists.

Pharmacokinetics

Lifespan considerations

Pregnancy/Lactation: Crosses placenta. Distributed in breast milk. High dosages in utero may produce seizures in neonates. Children/Elderly: No age-related precautions noted.

Interactions

DRUG: Decreases effects of levodopa. HERBAL: None significant. FOOD: None known. LAB VALUES: None significant.

Availability (OTC)

Capsules: 250 mg. Injection Solution: 100 mg/mL. Tablets: 25 mg, 50 mg, 100 mg, 250 mg. Tablet, Extended-Release: 200 mg.

Administration/handling

Give PO unless nausea, vomiting, malabsorption occurs. Avoid IV use in cardiac pts.

IV

• Give undiluted or may be added to IV solutions and given as infusion.

PO

• Give without regard to food.

IV incompatibilities

Do not mix with any other medications.

Indications/routes/dosage

Pyridoxine Deficiency

PO/IM/IV: ADULTS, ELDERLY: 10–20 mg/day for 3 wks, followed by oral therapy up to 600 mg/day.
Side effects

Occasional: Stinging at IM injection site. Rare: Headache, nausea, drowsiness, sensory neuropathy (paresthesia, unstable gait, clumsiness of hands) with high doses.

Adverse effects/toxic reactions

Long-term megadoses (2–6 g for longer than 2 mos) may produce sensory neuropathy (reduced deep tendon reflexes, profound impairment of sense of position in distal limbs, gradual sensory ataxia). Toxic symptoms subside when drug is discontinued. Seizures have occurred after IV megadoses.

Nursing considerations

Intervention/evaluation

Observe for improvement of deficiency symptoms, glossitis. Evaluate for nutritional adequacy.

Patient/family teaching

• Discomfort may occur with IM injection.
• Consume foods rich in pyridoxine (legumes, soybeans, eggs, sunflower seeds, hazelnuts, organ meats, tuna, shrimp, carrots, avocados, bananas, wheat germ, bran).

Canadian trade name

Non-Crushable Drug

High Alert drug

underlined – top prescribed drug
QUEtiapine  
kwet-eye-a-peen  
Apo-QUEtiapine

SEROquel  
SEROquel XR

CLASSIFICATION  
PHARMACOTHERAPEUTIC: Dibenzapine derivative. 
CLINICAL: Second-generation (atypical) antipsychotic.

BLACK BOX ALERT  
Increased risk of suicidal ideation and behavior in children, adolescents, young adults 18–24 yrs with major depressive disorder, other psychiatric disorders. Elderly with dementia-related psychosis are at increased risk for death.

Do not confuse QUEtiapine with OLANZapine, or SEROquel with SINEquan.

Uses

Precautions

**Contraindications:** Hypersensitivity to QUEtiapine. **Cautions:** Renal/hepatic impairment, preexisting abnormal lipid profile, pts at risk for aspiration pneumonia, cardiovascular disease (e.g., HF, history of MI), cerebrovascular disease, dehydration, hypovolemia, history of drug abuse/dependence, seizure disorder, hypothyroidism, pts at risk for suicide, Parkinson’s disease, decreased GI motility, urinary retention, narrow-angle glaucoma, diabetes, visual problems, elderly, pts at risk for orthostatic hypotension. Avoid use in pts at risk for torsades de pointes (hypokalemia, hypomagnesemia, history of cardiac arrhythmias, congenital long QT syndrome, concurrent medications that prolong QT interval).

Action

Antagonizes DOPamine, serotonin, histamine, alpha₁-adrenergic receptors. **Therapeutic Effect:** Diminishes symptoms associated with schizophrenia/bipolar disorders.

Pharmacokinetics

Rapidly absorbed. Protein binding: 83%. Widely distributed in tissues; CNS concentration exceeds plasma concentration. Metabolized in liver. Primarily excreted in urine. **Half-life:** 6 hrs.

ษ Lifespan considerations

**Pregnancy/Lactation:** Unknown if drug is distributed in breast milk. Not recommended for breastfeeding mothers. **Children:** Safety and efficacy not established in children less than 10 yrs of age (bipolar mania) or less than 13 yrs of age (schizophrenia). **Elderly:** No age-related precautions noted, but lower initial and target dosages may be necessary.

Interactions

**DRUG:** Medications prolonging QT interval (e.g., amiodarone, citalopram, dasatinib, haloperidol, levoFLOXacin, ondansetron) may increase risk of QT prolongation. **Alcohol, other CNS depressants** (e.g., LORazepam, morphine,
zolpidem) may increase CNS depression. May increase hypotensive effects of antihypertensives. CYP3A4 inducers (e.g., phenytoin) may increase clearance. CYP3A4 inhibitors (e.g., clarithromycin, erythromycin, fluconazole, itraconazole) may increase effects. HERBAL: St. John’s wort may decrease concentration. Gotu kola, kava kava, St. John’s wort, valerian may increase CNS depression. FOOD: None known. LAB VALUES: May decrease total free thyroxine (T₄) serum levels. May increase serum cholesterol, triglycerides, ALT, AST, WBC, GGT. May produce false-positive pregnancy test result.

Availability (Rx)

Tablets: 25 mg, 50 mg, 100 mg, 200 mg, 300 mg, 400 mg.

Tablets, Extended-Release: 50 mg, 150 mg, 200 mg, 300 mg, 400 mg.

Administration/handling

PO

• Give immediate-release tablets without regard to food.
• Do not break, crush, dissolve, or divide extended-release tablets.
• Extended-release tablets should be given without regard to food or with a light meal in evening.

Indications/routes/dosage

Note:

• When restarting pts who have been off QUEtiapine for less than 1 wk, titration is not required and maintenance dose can be reinstated.
• When restarting pts who have been off QUEtiapine for longer than 1 wk, follow initial titration schedule.
• When discontinuing, gradual tapering recommended to avoid withdrawal symptoms and minimize risk of relapse.

Schizophrenia

PO: (Immediate-Release): ADULTS, ELDERLY: Initially, 25 mg twice daily,
then increase in 25–50-mg increments divided 2–3 times/day on the second and third days, up to 300–400 mg/day in 2–3 divided doses by the fourth day. Further adjustments of 25–50 mg twice daily may be made at intervals of 2 days or longer. **Maintenance:** 150–750 mg/day (adults); 50–200 mg/day (elderly). **(Extended-Release):** Initially, 300 mg/day. May increase at intervals as short as 1 day up to 300 mg/day. Range: 400–800 mg/day. **(Immediate-Release):**

CHILDREN 13 YRS AND OLDER: Initially, 25 mg twice daily on day 1, 50 mg twice daily on day 2, then increase by 100 mg/day to target dose of 400 mg twice daily on day 5. May further increase to 800 mg/day in increments of 100 mg or less daily. Range: 400–800 mg/day. **Maximum:** 800 mg. Total dose in 3 divided doses. **(Extended-Release):** Initially, 50 mg once daily on day 1, 100 mg on day 2, until 400 mg once daily is reached on day 5. Range: 400–800 mg/day. **Maximum:** 800 mg/day.

**Mania in Bipolar Disorder**

**PO:** **(Immediate-Release):** ADULTS, ELDERLY: Initially, 50 mg twice daily for 1 day. May increase in increments of 100 mg/day to 200 mg twice daily on day 4. May further increase in increments of 200 mg/day to 800 mg/day on day 6. Range: 400–800 mg/day. **(Extended-Release):** Initially, 300 mg on day 1 in the evening; 600 mg on day 2 and adjust between 400–800 mg/day thereafter. **(Immediate-Release):** CHILDREN 10 YRS AND OLDER: 25 mg twice daily on day 1, 50 mg twice daily on day 2, then increase by 100 mg/day until target dose of 400 mg/day reached on day 5. May increase up to 600 mg/day. Range: 400–600 mg/day. **(Extended-Release):** 50 mg on day 1; 100 mg on day 2; further increases of 100 mg/day until 400 mg once daily is reached on day 4; Usual range: 400–600 mg once daily.

**Depression in Bipolar Disorder**

**PO:** **(Immediate-Release):** ADULTS, ELDERLY: Initially, 50 mg/day on day 1, increase to 100 mg/day on day 2, then increase by 100 mg/day up to target dose of 300 mg/day. **(Extended-Release):** Initially, 50 mg on day 1 in the evening, 100 mg on day 2, 200 mg on day 3, 300 mg on day 4 and thereafter.

**Adjunctive Therapy in MDD**

**PO:** ADULTS, ELDERLY: **(Extended-Release):** Initially, 50 mg on days 1 and 2; then 150 mg on days 3 and 4; then 150–300 mg/day thereafter.
Dosage in Hepatic Impairment

(Immediate-Release): Initially, 25 mg/day. Increase by 25–50 mg/day to effective dose.
(Extended-Release): Initially, 50 mg/day, increase by 50 mg/day until effective dose.

Dosage in Renal Impairment

No dose adjustment.

Side effects

Frequent (19%–10%): Headache, drowsiness, dizziness. Occasional (9%–3%): Constipation, orthostatic hypotension, tachycardia, dry mouth, dyspepsia, rash, asthenia, abdominal pain, rhinitis. Rare (2%): Back pain, fever, weight gain.

Adverse effects/toxic reactions

Overdose may produce heart block, hypotension, hypokalemia, tachycardia.

Nursing considerations

Baseline assessment

Assess behavior, appearance, emotional status, response to environment, speech pattern, thought content. Obtain baseline CBC, hepatic enzyme levels before initiating treatment and periodically thereafter. Question medical history as listed in Precautions.

Intervention/evaluation

Monitor mental status, onset of extrapyramidal symptoms. Assist with ambulation if dizziness occurs. Supervise suicidal-risk pt closely during early therapy (as psychosis, depression lessens, energy level improves, increasing suicide potential). Monitor B/P for hypotension, lipid profile, blood glucose, CBC, or worsening depression, unusual behavior. Assess pulse for tachycardia (esp. with rapid increase in dosage). Monitor daily pattern of bowel activity,
stool consistency. Assess for therapeutic response (improved thought content, increased ability to concentrate, improvement in self-care). Eye exam to detect cataract formation should be obtained q6mos during treatment.

**Patient/ family teaching**

- Avoid exposure to extreme heat.
- Drink fluids often, esp. during physical activity.
- Take medication as ordered; do not stop taking or increase dosage.
- Drowsiness generally subsides during continued therapy.
- Avoid tasks that require alertness, motor skills until response to drug is established.
- Avoid alcohol.
- Slowly go from lying to standing.
- Report suicidal ideation, unusual changes in behavior.

| quinapril |
| kwin-a-pril |
| **Accupril** |
| **Apo-Quinapril** |

**Fixed-Combination(s)**

**Accuretic**: quinapril/hydroCHLORothiazide (a diuretic): 10 mg/12.5 mg, 20 mg/12.5 mg, 20 mg/25 mg.

**CLASSIFICATION**

**PHARMACOTHERAPEUTIC**: Angiotensin-converting enzyme (ACE) inhibitor.

**CLINICAL**: Antihypertensive.

- **BLACK BOX ALERT** - May cause fetal injury, mortality. Discontinue as soon as possible once pregnancy detected.

**Do not confuse Accupril with Accolate, Accutane, Aciphex, or Monopril.**

**Uses**
Treatment of hypertension. Used alone or in combination with other antihypertensives. Adjunctive therapy in management of HF. OFF-LABEL: Treatment of pediatric hypertension.

Precautions

Contraindications: Hypersensitivity to quinapril. History of angioedema from previous treatment with ACE inhibitors, concomitant use with aliskiren in pts with diabetes. Cautions: Renal impairment, hypertrophic cardiomyopathy with outflow tract obstruction, major surgery, HF, hypovolemia, unstented bilateral renal artery stenosis, hyperkalemia, concurrent potassium supplements, severe aortic stenosis, ischemic heart disease, cerebrovascular disease.

Action

Suppresses renin-angiotensin-aldosterone system, preventing conversion of angiotensin I to angiotensin II, a potent vasoconstrictor; may inhibit angiotensin II at local vascular renal sites. Therapeutic Effect: Reduces peripheral arterial resistance, B/P, pulmonary capillary wedge pressure; improves cardiac output.

Pharmacokinetics

Lifespan considerations

Pregnancy/Lactation: Crosses placenta. Unknown if distributed in breast milk. May cause fetal, neonatal mortality or morbidity. Children: Safety and efficacy not established. Elderly: May be more sensitive to hypotensive effects.

Interactions

DRUG: Alcohol, antihypertensives (e.g., amLODIPine, lisinopril,
valsartan), diuretics (e.g., furosemide, HCTZ) may increase effects. May increase concentration, risk of toxicity of lithium. NSAIDs (e.g., ibuprofen, ketorolac, naproxen) may decrease effects. Potassium-sparing diuretics (e.g., spironolactone, triamterene), potassium supplements may cause hyperkalemia. HERBAL: Black cohosh, periwinkle may increase antihypertensive effect. Ginseng, yohimbe, licorice may worsen hypertension. FOOD: None known. LAB VALUES: May increase serum BUN, alkaline phosphatase, bilirubin, creatinine, potassium, ALT, AST. May decrease serum sodium. May cause positive antinuclear antibody (ANA) titer.

**Availability (Rx)**

**Tablets:** 5 mg, 10 mg, 20 mg, 40 mg.

**Administration/handling**

**PO**

• Give without regard to food.
• Tablets may be crushed.

**Indications/routes/dosage**

**Hypertension (Monotherapy)**

**PO:** **ADULTS:** Initially, 10–20 mg/day. May adjust dosage at intervals of at least 2 wks or longer. **Maintenance:** 10–40 mg once daily. **ELDERLY:** Initially, 10 mg once daily. Titrate to optimal response.

**Hypertension (Combination Diuretic Therapy)**

**PO:** **ADULTS, ELDERLY:** Initially, 5 mg/day titrated to pt’s needs.

**Adjunct to Manage HF**

**PO:** **ADULTS, ELDERLY:** Initially, 5 mg twice daily. Titrate at wkly intervals to 20–40 mg/day in 2 divided doses. Target dose: 20 mg twice daily.

**Dosage in Renal Impairment**

**Dosage in Hepatic Impairment**

No dose adjustment.

**Side effects**

Frequent (7%–5%): Headache, dizziness. Occasional (4%–2%): Fatigue, vomiting, nausea, hypotension, chest pain, cough, syncope. Rare (less than 2%): Diarrhea, cough, dyspnea, rash, palpitations, impotence, insomnia, drowsiness, malaise.

**Adverse effects/toxic reactions**

Excessive hypotension ("first-dose syncope") may occur in pts with HF, those who are severely salt/volume depleted. Angioedema, hyperkalemia occur rarely. Agranulocytosis, neutropenia may be noted in those with collagen vascular disease (scleroderma, systemic lupus erythematosus), renal impairment. Nephrotic syndrome may be noted in those with history of renal disease.

**Nursing considerations**

**Baseline assessment**

Obtain B/P immediately before each dose in addition to regular monitoring (be alert to fluctuations). Renal function tests should be performed before beginning
therapy. In pts with prior renal disease, urine test for protein by dipstick method should be made with first urine of day before beginning therapy and periodically thereafter. In pts with renal impairment, autoimmune disease, or taking drugs that affect leukocytes or immune response, CBC, differential count should be performed before beginning therapy and q2wks for 3 mos, then periodically thereafter.

**Intervention/evaluation**

Monitor B/P (if excessive reduction in B/P occurs, place pt in supine position with legs slightly elevated), renal function, serum potassium, WBC. Assist with ambulation if dizziness occurs. Question for evidence of headache. Noncola carbonated beverage, unsalted crackers, dry toast may relieve nausea.

**Patient/ family teaching**

- Go slowly from lying to standing.
- Full therapeutic effect may take 1–2 wks.
- Report any sign of infection (sore throat, fever).
- Skipping doses or voluntarily discontinuing drug may produce severe rebound hypertension.
- Avoid tasks that require alertness, motor skills until response to drug is established.
- Avoid alcohol.

*Canadian trade name*

underlined underlined – top prescribed drug
**CLASSIFICATION**
**PHARMACOTHERAPEUTIC:** Proton pump inhibitor.
**CLINICAL:** Gastric acid inhibitor.

Do not confuse Aciphex with Accupril or Aricept, or RABEprazole with ARIPiprazole, lansoprazole, omeprazole, or raloxifene.

**Uses**

**Precautions**
**Contraindications:** Hypersensitivity to RABEprazole, other proton pump inhibitors (e.g., omeprazole). Concurrent use with rilpivirine-containing products. **Cautions:** Severe hepatic impairment, osteoporosis.
**Action**
Suppresses gastric acid secretion by inhibiting \( H^+/K^+ \)-ATP pump. **Therapeutic Effect:** Increases gastric pH, reducing gastric acid production.

**Pharmacokinetics**
Rapidly absorbed from GI tract after passing through stomach relatively intact as delayed-release tablet. Protein binding: 96%. Metabolized in liver. Primarily excreted in urine. **Half-life:** 1–2 hrs (increased with hepatic impairment).

**Lifespan considerations**
**Pregnancy/Lactation:** Unknown if drug crosses placenta or is distributed in breast milk. **Children:** Safety and efficacy not established. **Elderly:** No age-related precautions noted.

**Interactions**
**DRUG:** May increase concentration/effects of cycloSPORINE, warfarin. May decrease concentration of ketoconazole, clopidogrel, atazanavir. **HERBAL:** St. John’s wort may decrease concentration/effects. **FOOD:** None known. **LAB VALUES:** May increase serum ALT, AST, thyroid-stimulating hormone (TSH).

**Availability (Rx)**
- Tablets (Delayed-Release): 20 mg. **Capsule, Sprinkle:** 5 mg, 10 mg.

**Administration/handling**
- **PO**
  - May give without regard to meals; best taken after breakfast.
  - Do not break, crush, dissolve, or divide tablet; give whole.
- **Sprinkle**
• May give with antacid.
• Administer 30 min before a meal.
• Open capsule, sprinkle on soft food. Take within 15 min of preparation.
• Do not chew, crush.

Indications/routes/dosage

GERD (Erosive or Ulcerative)
PO: ADULTS, ELDERLY: 20 mg/day for 4–8 wks. If inadequate response, may repeat for additional 8 wks. Maintenance: 20 mg/day.

Short-Term Treatment of Symptomatic GERD
PO: ADULTS, ELDERLY, CHILDREN 12 YRS AND OLDER: 20 mg/day for 4 wks. If inadequate response, may repeat additional 4 wks. CHILDREN, 1–11 YRS (15 KG OR GREATER): 10 mg once daily for up to 12 wks. (LESS THAN 15 KG): 5 mg once daily for up to 12 wks; may increase to 10 mg once daily.

Duodenal Ulcer
PO: ADULTS, ELDERLY: 20 mg/day after morning meal for 4 wks.

Pathologic Hypersecretory Conditions
PO: ADULTS, ELDERLY: Initially, 60 mg once daily. May increase to 60 mg twice daily.

H. Pylori Infection
PO: ADULTS, ELDERLY: 20 mg twice daily for 10–14 days (given with amoxicillin 1,000 mg and clarithromycin 500 mg).

Dosage in Renal Impairment
No dose adjustment.

Dosage in Hepatic Impairment
Mild to moderate impairment: No dose adjustment. Severe impairment: Use
caution.

**Side effects**

**Rare (Less Than 2%):** Headache, nausea, dizziness, rash, diarrhea, malaise.

**Adverse effects/toxic reactions**

Hyperglycemia, hypokalemia, hyponatremia, hyperlipemia occur rarely. May increase risk of bone fractures, *C. difficile*-associated colitis.

**Nursing considerations**

**Baseline assessment**

Question history of GI disease, ulcers, GERD.

**Intervention/evaluation**

Evaluate for therapeutic response (relief of GI symptoms). Question if GI discomfort, nausea, diarrhea, headache occurs. Assess skin for evidence of rash. Observe for evidence of dizziness; utilize appropriate safety precautions.

**Patient/family teaching**

- Swallow tablets whole; do not break, chew, dissolve, or divide tablets.
- Report headache.

---

**raloxifene**

ra-lox-i-feen

**Evista**

Apo-Raloxifene

◆ **CLASSIFICATION**

**PHARMACOTHERAPEUTIC:** Selective estrogen receptor modulator.

**CLINICAL:** Osteoporosis preventive.

- **BLACK BOX ALERT** Increases risk of deep vein thrombosis, pulmonary embolism. Women with coronary heart disease or pts at risk for
coronary events are at increased risk for death due to stroke.

Do not confuse Evista with AVINza.

**Uses**

Prevention/treatment of osteoporosis in postmenopausal women. Reduces risk of invasive breast cancer in postmenopausal women with osteoporosis and postmenopausal women at high risk for invasive breast cancer.

**Precautions**

**Contraindications:** Hypersensitivity to raloxifene. Active or history of venous thromboembolic events, such as deep vein thrombosis (DVT), pulmonary embolism, retinal vein thrombosis; women who are or may become pregnant, breastfeeding. **Cautions:** Cardiovascular disease, renal/hepatic impairment, risk for venous thromboembolism, unexplained uterine bleeding, elevated triglycerides in response to oral estrogen therapy.

**Action**

Selective estrogen receptor modulator (SERM) that binds to estrogen receptors, increasing bone mineral density. Blocks estrogen effects in breast/uterus. **Therapeutic Effect:** Reduces bone resorption, increases bone mineral density, reduces incidence of fractures.

**Pharmacokinetics**

Rapidly absorbed after PO administration. Protein binding: 95%. Metabolized in liver. Excreted primarily in feces. Unknown if removed by hemodialysis. **Half-life:** 27.7–32.5 hrs.

**Lifespan considerations**

**Pregnancy/Lactation:** Unknown if distributed in breast milk. Contraindicated in pregnancy, breastfeeding. **Children:** Not used in this population. **Elderly:** No age-related precautions noted.
Interactions

**DRUG:** Cholestyramine reduces peak levels, extent of absorption. Do not use concurrently with hormone replacement therapy, systemic estrogen. May decrease effect of warfarin (decreases INR). **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** May lower serum total cholesterol, LDL. May decrease platelet count, serum inorganic phosphate, albumin, calcium, protein.

Availability (Rx)

**Tablets:** 60 mg.

Administration/handling

**PO**

- Give without regard to meals.

Indications/routes/dosage

**Note:** Discontinue at least 72 hrs prior to and during prolonged immobilization (may increase risk for DVT/PE).

**Prophylaxis/Treatment of Osteoporosis, Breast Cancer Risk Reduction**

**PO:** **ADULTS, ELDERLY:** 60 mg/day.

Dosage in Renal/Hepatic Impairment

No dose adjustment.

Side effects

**Frequent (25%–10%):** Hot flashes, flu-like symptoms, arthralgia, sinusitis. **Occasional (9%–5%):** Weight gain, nausea, myalgia, pharyngitis, cough, dyspepsia, leg cramps, rash, depression. **Rare (4%–3%):** Vaginitis, UTI, peripheral edema, flatulence, vomiting, fever, migraine, diaphoresis.
Adverse effects/toxic reactions

Pneumonia, gastroenteritis, chest pain, vaginal bleeding, breast pain occur rarely.

Nursing considerations

Baseline assessment

Question history of thrombosis (CVA, DVT, PE). Question for possibility of pregnancy. Drug should be discontinued 72 hrs before and during prolonged immobilization (postop recovery, prolonged bed rest). Therapy may be resumed only after pt is fully ambulatory. Determine serum total, LDL cholesterol before therapy and routinely thereafter.

Intervention/evaluation

Monitor serum total cholesterol, total calcium, inorganic phosphate, total protein, albumin, bone mineral density, platelet count. Diligently monitor for CVA (aphasia, blindness, confusion, paresthesia, hemiparesis, syncope), DVT (arm/leg pain, swelling), pulmonary embolism (chest pain, dyspnea, hypoxia, tachycardia).

Patient/family teaching

• Avoid prolonged restriction of movement during travel (increased risk of venous thromboembolic events).
• Take supplemental calcium, vitamin D if daily dietary intake is inadequate.
• Engage in regular weight-bearing exercise.
• Modify, discontinue habits of cigarette smoking, alcohol consumption.
• Report symptoms of DVT (swelling, pain, hot feeling in the arms or legs), lung embolism (difficulty breathing, chest pain, rapid heart rate), stroke (blindness, confusion, difficulty speaking, one-sided weakness, passing out).

**raltegravir**

`ral-teg-ra-veer`

**Isentress**

_CLASSIFICATION_

PHARMACOTHERAPEUTIC: Integrase inhibitor.

CLINICAL: Antiviral.
**Uses**

Treatment of HIV-1 infection in adults and children 4 wks and older and weighing at least 3 kg. Used in combination with at least two other antiretroviral agents. **OFF-LABEL:** Postexposure prophylaxis for occupational exposure to HIV.

**Precautions**

**Contraindications:** Hypersensitivity to raltegravir. **Cautions:** Elderly, pts at risk for creatine kinase (CK) elevations and/or skeletal muscle abnormalities.

**Action**

Inhibits activity of HIV-1 integrase, an enzyme that incorporates viral DNA into host cell. **Therapeutic Effect:** Prevents integration and replication of viral HIV-1.

**Pharmacokinetics**

Variably absorbed following PO administration. Protein binding: 83%. Metabolized in liver. Excreted in feces (51%), urine (32%). **Half-life:** 9 hrs.

**Lifespan considerations**

**Pregnancy/Lactation:** May cross placenta. Breastfeeding not recommended. **Children:** Safety and efficacy not established in pts younger than 4 weeks. **Elderly:** Age-related hepatic, renal, cardiac impairment requires strict monitoring.

**Interactions**

**DRUG:** Proton pump inhibitors (e.g., omeprazole, pantoprazole) may increase concentration. Aluminum, magnesium salts, rifAMPin may decrease levels/effect. **HERBAL:** St. John’swort may decrease concentration/effects. **FOOD:** None known. **LAB VALUES:** May increase serum glucose, bilirubin, aminotransferase, alkaline phosphatase, amylase, lipase, creatine kinase. May
decrease lymphocytes, neutrophils (ANC), Hgb, platelets.

**Availability (Rx)**

Packet, Oral: 100 mg. Tablets, Chewable: 25 mg, 100 mg. Tablets, Film-Coated: 400 mg, 600 mg.

**Administration/handling**

**PO**
- Give without regard to food.
- Do not break, crush, dissolve, or divide film-coated tablets.
- Chewable tablets may be chewed or taken whole.
- **Oral Packet:** Mix with 5 mL water to provide a concentration of 20 mg/mL. Once mixed, measure dose with oral syringe. Give within 30 min of mixing.

**Indications/routes/dosage**

**HIV Infection**

**PO:** **ADULTS, ELDERLY, CHILDREN 12 YRS AND OLDER:** 400 mg twice daily. Dosage increased to 800 mg twice daily when given with rifAMPin.

**CHILDREN 2–11 YRS (CHEWABLE TABLETS) 40 KG OR GREATER:** 300 mg twice daily. **28–39 KG:** 200 mg twice daily. **20–27 KG:** 150 mg twice daily. **14–19 KG:** 100 mg twice daily. **11–13 KG:** 75 mg twice daily. **CHILDREN weighing 3–19 kg (ORAL PACKET):** **14–19 KG:** 100 mg twice daily. **11–13 KG:** 80 mg twice daily. **8–10 KG:** 60 mg twice daily. **6–7 KG:** 40 mg twice daily. **4–5 KG:** 30 mg twice daily. **3–4 KG:** 20 mg twice daily.

**Dosage in Renal/Hepatic Impairment**

No dose adjustment.

**Side effects**

**Frequent (17%–10%):** Diarrhea, nausea, headache. **Occasional (5%):** Fever. **Rare (2%–1%):** Vomiting, abdominal pain, fatigue, dizziness.
Adverse effects/toxic reactions

Hypersensitivity reactions, anemia, neutropenia, MI, gastritis, hepatitis, herpes simplex, toxic nephropathy, renal failure, chronic renal failure, renal tubular necrosis occur rarely.

Nursing considerations

Baseline assessment

Obtain baseline CBC, BMP, LFT, CD4 count, viral load prior to initiation and at periodic intervals during therapy. Offer emotional support. Obtain medication history.

Intervention/evaluation

Patient/family teaching

• Report fever, abdominal pain, yellowing of skin/eyes, dark urine.
• Avoid tasks that require alertness, motor skills until response to drug is established.
• Raltegravir is not a cure for HIV infection, nor does it reduce risk of transmission to others.
• Pt may continue to experience illnesses, including opportunistic infections.

ramelteon

ra-mel-tee-on

Rozerem

CLASSIFICATION

PHARMACOTHERAPEUTIC: Melatonin receptor agonist.
CLINICAL: Hypnotic.

Do not confuse ramelteon with Remeron, or Rozerem with Razadyne or Remeron.
Uses
Treatment of insomnia in pts who experience difficulty with sleep onset.

Precautions

**Contraindications:** Hypersensitivity to ramelteon. Concurrent fluvoxamine therapy, history of angioedema with previous ramelteon therapy. **Cautions:** Depression, other psychiatric conditions, alcohol consumption, other CNS depressants, moderate hepatic impairment, severe sleep apnea, COPD; concomitant strong CYP1A2 inhibitors (e.g., fluvoxamine).

Action
Selectively targets melatonin receptors thought to be involved in maintenance of circadian rhythm underlying normal sleep-wake cycle. **Therapeutic Effect:** Prevents insomnia characterized by difficulty with sleep onset.

Pharmacokinetics
Rapidly absorbed following PO administration. Protein binding: 82%. Substantial tissue distribution. Metabolized in liver. Excreted in urine (84%), feces (4%). **Half-life:** 2–5 hrs.

Life Span Considerations

**Pregnancy/Lactation:** Unknown if distributed in breast milk. Breastfeeding not recommended. **Children:** Safety and efficacy not established. **Elderly:** Age-related hepatic impairment may require dosage adjustment.

Interactions

**DRUG:** Concurrent use with alcohol may produce additive effect. Fluconazole, ketoconazole may increase serum concentration/effects. Donepezil, doxepin, fluvoxamine may cause marked increase in serum level, toxicity. RifAMPin may decrease serum level, effects. **HERBAL:** Gotu kola, kava kava, St. John’s wort, valerian may increase CNS depression. **FOOD:** Onset of action may be reduced if taken with or immediately after a high-fat meal. **LAB VALUES:** May decrease serum cortisol.
Availability (Rx)

 Tablets, Film-Coated: 8 mg (Rozerem).

Administration/handling

PO
- Administer within 30 min before bedtime.
- Do not give with, or immediately following, a high-fat meal.
- Do not break, crush, dissolve, or divide tablet.

Indications/routes/dosage

Insomnia
PO: ADULTS, ELDERLY: 8 mg 30 min before bedtime.

Dosage in Renal Impairment
No dose adjustment.

Dosage in Hepatic Impairment
Mild to moderate impairment: No dose adjustment. Severe impairment: Not recommended.

Side effects
Frequent (7%–5%): Headache, dizziness, drowsiness (expected effect).
Occasional (4%–3%): Fatigue, nausea, exacerbated insomnia. Rare (2%): Diarrhea, myalgia, depression, altered taste, arthralgia.

Adverse effects/toxic reactions
May affect reproductive hormones in adults (decreased testosterone levels, increased prolactin levels), resulting in unexplained amenorrhea, galactorrhea, decreased libido, impaired fertility. Complex sleep-related behavior may occur.
Nursing considerations

Baseline assessment
Assess B/P, pulse, respirations. Raise bed rails, provide call light. Provide environment conducive to sleep (quiet environment, low/no lighting, TV off).

Intervention/evaluation

Patient/family teaching
• Take within 30 min before going to bed; confine activities to those necessary to prepare for bed.
• Avoid tasks that require alertness, motor skills until response to drug is established.
• Avoid alcohol.
• Do not take medication with or immediately after a high-fat meal.

| ramipril |
| ram-i-pril |
| **Altace** |
| Apo-Ramipril |

CLASSIFICATION
PHARMACOTHERAPEUTIC: Angiotensin-converting enzyme (ACE) inhibitor.
CLINICAL: Antihypertensive.

■ BLACK BOX ALERT ■ May cause fetal injury, mortality. Discontinue as soon as possible once pregnancy is detected.

Do not confuse Altace with alteplase, Amaryl, or Artane, or ramipril with enalapril or Monopril.

Uses
Treatment of hypertension. Used alone or in combination with other antihypertensives. Treatment of HF following MI. Reduce risk of heart attack, stroke in pts at increased risk of developing major cardiovascular events. **OFF-LABEL:** HF. Delay progression of nephropathy, reduce risks of cardiovascular events in hypertensive pts with type 1 or type 2 diabetes.

### Precautions

**Contraindications:** Hypersensitivity to ramipril, other ACE inhibitors. History of ACE inhibitor–induced angioedema, concomitant use with aliskiren in pts with diabetes. **Cautions:** Renal impairment; elderly pts; collagen vascular disease; hyperkalemia; hypertrophic cardiomyopathy with outflow tract obstruction; unstented unilateral, bilateral renal artery stenosis; severe aortic stenosis; before, during, or immediately after major surgery; concomitant potassium supplements.

### Action

Suppresses renin-angiotensin-aldosterone system. Blocks conversion of angiotensin I to angiotensin II, increases plasma renin activity, decreases aldosterone secretion. **Therapeutic Effect:** Reduces peripheral arterial resistance, decreasing B/P.

### Pharmacokinetics

<table>
<thead>
<tr>
<th>Route</th>
<th>Onset</th>
<th>Peak</th>
<th>Duration</th>
</tr>
</thead>
<tbody>
<tr>
<td>PO</td>
<td>1–2 hrs</td>
<td>3–6 hrs</td>
<td>24 hrs</td>
</tr>
</tbody>
</table>

Well absorbed from GI tract. Protein binding: 73%. Metabolized in liver. Primarily excreted in urine. Not removed by hemodialysis. **Half-life:** 5.1 hrs.

### Lifespan considerations

**Pregnancy/Lactation:** Crosses placenta. Distributed in breast milk. May cause fetal or neonatal mortality or morbidity. **Children:** Safety and efficacy not established. **Elderly:** May be more sensitive to hypotensive effects.

### Interactions
DRUG: Alcohol, antihypertensives (e.g., amLODIPine, lisinopril, valsartan), diuretics (e.g., furosemide, HCTZ) may increase effects. May increase lithium concentration, risk of toxicity. NSAIDs may decrease effects. Potassium-sparing diuretics (e.g., spironolactone, triamterene), potassium supplements may cause hyperkalemia. HERBAL: Black cohosh, periwinkle may increase antihypertensive effect. Ginseng, ginger, licorice, yohimbe may worsen hypertension. FOOD: None known. LAB VALUES: May increase serum BUN, alkaline phosphatase, bilirubin, creatinine, potassium, ALT, AST. May decrease serum sodium. May cause positive antinuclear antibody (ANA) titer.

Availability (Rx)

Capsules: 1.25 mg, 2.5 mg, 5 mg, 10 mg.

Administration/handling

PO
• Give without regard to food.
• May mix with water, apple juice/sauce.

Indications/routes/dosage

Hypertension (Monotherapy)
PO: ADULTS, ELDERLY: Initially, 2.5 mg/day. Titrate to desired effect. Usual dose: 5–10 mg/day.

Hypertension (in Combination with Other Antihypertensives)
PO: ADULTS, ELDERLY: Initially, 1.25 mg daily. Titrate to desired response.

HF Following MI
PO: ADULTS, ELDERLY: Initially, 1.25–2.5 mg twice daily. Continue for 1 wk, then titrate upward q3wks to target dose of 5 mg twice daily.

Risk Reduction for MI/Stroke
PO: ADULTS, ELDERLY: Initially, 2.5 mg/day for 7 days, then 5 mg/day for 21 days, then 10 mg/day as a single dose (or in divided doses in hypertensive or recent post-MI pts).

Dosage in Renal Impairment
CrCl equal to or less than 40 mL/min: 25% of normal dose.

Renal Failure and Hypertension
Initially, 1.25 mg/day titrated upward. Maximum: 5 mg/day.
Renal Failure and HF: Initially, 1.25 mg/day, titrated up to 2.5 mg twice daily.

Dosage in Hepatic Impairment
No dose adjustment. Discontinue for jaundice or marked elevation of hepatic enzymes.

Side effects
Frequent (12%–5%): Cough, headache. Occasional (4%–2%): Dizziness, fatigue, nausea, asthenia. Rare (Less Than 2%): Palpitations, insomnia, nervousness, malaise, abdominal pain, myalgia.

Adverse effects/toxic reactions
Excessive hypotension ("first-dose syncope") may occur in pts with HF, severely salt or volume depleted. Angioedema, hyperkalemia occur rarely. Agranulocytosis, neutropenia may be noted in pts with collagen vascular disease (scleroderma, systemic lupus erythematous), renal impairment. Nephrotic syndrome may be noted in those with history of renal disease. May cause angioedema of the face, neck, throat, tongue. Cholestatic jaundice, fulminant hepatic necrosis may occur.

Nursing considerations
Baseline assessment
Obtain B/P immediately before each dose, in addition to regular monitoring (be alert to fluctuations). If excessive reduction in B/P occurs, place pt in supine
position with legs elevated. Renal function tests should be performed before beginning therapy. Question history of hypersensitivity reaction, angioedema.

Intervention/evaluation

In pts with prior renal disease, urine test for protein (by dipstick method) should be made with first urine of day before beginning therapy and periodically thereafter. In pts with renal impairment, autoimmune disease, or taking drugs that affect leukocytes or immune response, CBC, differential count should be performed before beginning therapy and q2wks for 3 mos periodically thereafter. Monitor B/P, renal function, serum potassium, WBC. Assess for cough (frequent effect). Assist with ambulation if dizziness occurs. Assess lung sounds for rales, wheezing in pts with HF. Monitor urinalysis for proteinuria. Monitor serum potassium in pts on concurrent diuretic therapy.

Patient/family teaching

• Do not discontinue medication without physician’s approval.
• Slowly go from lying to standing to minimize hypotensive effect.
• Report palpitations, cough, chest pain.
• Dizziness may occur in first few days.
• Avoid tasks that require alertness, motor skills until response to drug is established.
• Avoid alcohol.
• Report swelling of the face, lips, or tongue.

ramucirumab
ra-mue-sir-ue-mab
Cyramza

CLASSIFICATION
PHARMACOTHERAPEUTIC: Vascular endothelial growth factor 2 antagonist.
CLINICAL: Antineoplastic.

BLACK BOX ALERT ■ May increase risk of severe, and sometimes fatal, hemorrhagic events. Permanently discontinue if severe bleeding occurs.
Do not confuse ramucirumab with ranibizumab.

**Uses**

As a single agent or in combination with PACLItaxel, for treatment of advanced or metastatic gastric or gastroesophageal junction adenocarcinoma with disease progression on or after prior fluoropyrimidine- or platinum-containing chemotherapy. In combination with DOCEtaxel, for treatment of metastatic non–small cell lung cancer (NSCLC) with disease progression on or after platinum-based chemotherapy. In combination with FOLFIRI, for treatment of metastatic colorectal cancer with disease progression on or after therapy with bevacizumab, oxaliplatin, and a fluoropyrimidine.

**Precautions**

**Contraindications:** Hypersensitivity to ramucirumab. **Cautions:** History of arterial/venous thromboembolism (e.g., MI, cardiac arrest, CVA, cerebral ischemia), hepatic cirrhosis, electrolyte imbalance, hypertension, GI bleeding/perforation, chronic/unhealed wounds; baseline neutropenia, thrombocytopenia.

**Action**

Binds vascular endothelial growth factor (VEGF) receptor 2 and blocks binding of VEGF ligands, VEGF-A, VEGF-C, and VEGF-D. **Therapeutic Effect:** Inhibits/reduces tumor vascularity and growth.

**Pharmacokinetics**

Metabolism not specified. Elimination not specified.

**Lifespan considerations**

**Pregnancy/Lactation:** May cause fetal harm. Contraception recommended during treatment and up to 3 mos after discontinuation. Must either discontinue drug or discontinue breastfeeding. Unknown if distributed in breast milk. **Children:** Safety and efficacy not established. **Elderly:** No age-related precautions noted.
Interactions

**DRUG:** None known (no studies conducted). **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** May increase urine protein. May decrease neutrophils, serum sodium.

Availability (Rx)

**Injection Solution:** 100 mg/10 mL, 500 mg/50 mL.

Administration/handling

.GetMapping("IV");

- Do not administer IV push or bolus.
- Recommend premedication with IV histamine H₁ antagonist (e.g., diphenhydramine) prior to each infusion. Pts with prior grade 1 or grade 2 infusion reaction should also be premedicated with dexamethasone (or equivalent) and acetaminophen prior to each infusion.
- Thoroughly flush IV with 0.9% NaCl upon infusion completion.

Reconstitution

- Calculate dose, required solution volume, and number of vials needed using weight in kg.
- Vials contain either 100 mg/10 mL or 500 mL/50 mL at concentration of 10 mg/mL.
- Visually inspect for particulate matter. Discard if particulate matter or discoloration observed.
- Using 250 mL 0.9% NaCl bag, withdraw and discard a volume equal to the total calculated volume of solution.
- Slowly add required dose to diluent bag for final volume of 250 mL. Gently invert bag to mix; do not shake.

Rate of Administration

- Infuse over 60 min using 0.22-micron in-line filter via dedicated line.

Storage

- Refrigerate vials in original carton until time of use.
- Do not freeze.
- Diluted solution may be refrigerated up to 24 hrs or stored at room temperature for up to 4 hrs.
• Protect from light.

⚠️ IV incompatibilities

Do not dilute in dextrose-containing fluids or infuse concomitantly with other electrolytes or medications.

Indications/routes/dosage

Gastric or Gastroesophageal Junction Cancer

**IV: ADULTS, ELDERLY:** 8 mg/kg every 14 days, either as a single agent or in combination with PACLtaxel. Continue until disease progression or unacceptable toxicity.

NSCLC

**IV: ADULTS, ELDERLY:** 10 mg/kg on day 1 of a 21-day cycle in combination with DOCEtaxel. Continue until disease progression or unacceptable toxicity.

Colorectal Cancer

**IV: ADULTS, ELDERLY:** 8 mg/kg q2wks, in combination with FOLFIRI (irinotecan, leucovorin, 5-fluorouracil). Continue until disease progression or unacceptable toxicity.

Dose Modification

Based on Common Terminology Criteria for Adverse Events (CTCAE).

**Infusion-related reaction:** Reduce infusion rate by 50% for grade 1 or grade 2 reaction. Permanently discontinue for grade 3 or grade 4 reaction.

**Severe hypertension:** Interrupt treatment until controlled with medical management. Permanently discontinue for severe hypertension that is not controlled with antihypertensive therapy.

**Proteinuria:** Interrupt treatment for urine protein level greater than or equal to 2 g/24 hrs. Restart treatment at reduced dose of 6 mg/kg every 14 days once urine protein level returns to less than 2 g/24 hrs. If level greater than or equal 2 g/24 hrs reoccurs, interrupt treatment and reduce dose to 5 mg/kg every 14 days once level returns to less than 2 g/24 hrs. Permanently discontinue for urine protein level...
level greater than 3 g/24 hrs or in the setting of nephrotic syndrome.

**Wound healing complications:** Interrupt treatment prior to scheduled surgery until wound is fully healed.

**Arterial thromboembolic events, GI perforation, or grade 3 or grade 4 bleeding:** Permanently discontinue.

**Dosage in Renal Impairment**
No dose adjustment.

**Dosage in Hepatic Impairment**
**Mild to moderate impairment:** No dose adjustment. **Severe impairment:** Use caution.

**Side effects**
**Occasional (16%–9%):** Hypertension, diarrhea, headache.
**Ramucirumab plus PACLitaxel: Frequent (57%–20%):** Fatigue, diarrhea, peripheral edema, hypertension, stomatitis.

**Adverse effects/toxic reactions**
Severe, and sometimes fatal, hemorrhagic events including GI bleeding occurred in 3.4% of pts receiving single agent and in 4.3% of pts receiving combo therapy. GI perforations occurred in 0.7% of pts receiving single agent and in 1.2% of pts receiving combo therapy. Thromboembolic events including arterial thromboembolism, CVA, MI reported in 1.7% of pts. Severe hypertension occurred in 8% of pts receiving single agent and in 15% of pts receiving combo therapy despite medical management. Severe infusion-related reactions such as back pain/spasms, bronchospasm, chest pain, chills, dyspnea, flushing, hypotension, hypoxia, paresthesia, rigors/tremors, supraventricular tachycardia, wheezing occurred in 16% of pts. May cause ineffective wound healing or wound dehiscence requiring medical intervention. Reversible posterior leukoencephalopathy syndrome (RPLS) reported in less than 1% of pts. Proteinuria may indicate nephrotic syndrome. Clinical deterioration of hepatic cirrhosis, manifested by new-onset or worsening encephalopathy, ascites, or hepatorenal syndrome, was reported in pts receiving single agent. Other adverse reactions include epistaxis, intestinal obstruction, neutropenia, severe rash,
thrombocytopenia. Immunogenicity (anti-ramucirumab antibodies) occurred in 6% of pts.

Nursing considerations

Baseline assessment

Intervention/evaluation
Monitor CBC, electrolytes, urinalysis, urine protein. Routinely assess vital signs and report hypertension. Persistent diastolic hypertension may indicate hypertensive emergency. Obtain EKG for arrhythmia, chest pain, palpitation. Consider RPLS in pts with altered mental status, confusion, headache, seizure, visual disturbances. Encourage PO intake. Screen for GI bleeding, GI perforation. Notify physician if any CTCAE toxicities occur (see Appendix M). Monitor for hypersensitivity reaction. Once infusion is completed, IV access must be flushed with NS.

Patient/family teaching
• Blood levels will be routinely monitored.
• Treatment may cause severe allergic reaction or infusion-related reaction.
• Avoid pregnancy; treatment may cause birth defects or miscarriage. Do not breastfeed. Contraception should be taken during treatment and up to 3 mos after discontinuation.
• Neurologic changes, including altered mental status, headache, seizures, trouble speaking, may indicate high blood pressure crisis or life-threatening brain swelling.
• Immediately report abdominal pain, GI bleeding, vomiting blood.
• Therapy may cause severe blood-clotting events such as heart attack or stroke.
ra-nit-i-deen
Apo-RaNITIdine
Deprizine FusePaq
Zantac
Zantac-75
Zantac-150 Maximum Strength

**CLASSIFICATION**
PHARMACOTHERAPEUTIC: Histamine H\(_2\)-receptor antagonist.
CLINICAL: Antiulcer.

*Do not confuse raNITIdine with amantadine or riMANTAidine, or Zantac with Xanax, Ziac, Zofran, or ZyrTEC.*

**Uses**

**Precautions**

**Contraindications:** Hypersensitivity to raNITIdine. **OTC:** Do not use if trouble or pain when swallowing food, vomiting with blood, or bloody or black stool is present. Do not use 150 mg with kidney disease (unless medically advised). **Cautions:** Renal/hepatic impairment, elderly pts, history of acute porphyria.

**Action**
Inhibits histamine action at histamine H\(_2\)-receptors of gastric parietal cells. **Therapeutic Effect:** Inhibits gastric acid secretion. Reduces gastric volume, hydrogen ion concentration.
**Pharmacokinetics**

Rapidly absorbed from GI tract. Protein binding: 15%. Widely distributed. Metabolized in liver. Primarily excreted in urine. Not removed by hemodialysis. **Half-life:** PO: 2.5 hrs; IV: 2–2.5 hrs (increased with renal impairment).

**Lifespan considerations**

**Pregnancy/Lactation:** Unknown if drug crosses placenta or is distributed in breast milk. **Children:** No age-related precautions noted. **Elderly:** Confusion more likely with hepatic/renal impairment.

**Interactions**

**DRUG:** Magnesium or aluminum antacids may decrease absorption. May decrease absorption of atazanavir, itraconazole, ketoconazole. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** Interferes with skin tests using allergen extracts. May increase serum ALT, AST, GGT, creatinine.

**Availability (Rx)**

**Capsules:** 150 mg, 300 mg. **Injection Solution:** 25 mg/mL. **Syrup:** 15 mg/mL. **Tablets:** 75 mg, 150 mg, 300 mg.

**Administration/handling**

**IV**

**Reconstitution**

- For IV push, dilute each 50 mg with 20 mL 0.9% NaCl, D₅W.
- For intermittent IV infusion (piggyback), dilute each 50 mg with 0.9% NaCl, D₅W to a maximum concentration of 0.5 mg/mL.
- For IV infusion, dilute with 0.9% NaCl, D₅W to a maximum concentration of 2.5 mg/mL.

**Rate of Administration**

- Administer IV push over minimum of 5 min (prevents arrhythmias, hypotension).
- Infuse IV piggyback over 15–20 min.
- Infuse IV infusion over 24 hrs.
**Storage**

- IV solutions appear clear, colorless to yellow (slight darkening does not affect potency).
- IV infusion (piggyback) is stable for 48 hrs at room temperature (discard if discolored or precipitate forms).

**IM**

- May be given undiluted.
- Give deep IM into large muscle mass.

**PO**

- Give without regard to meals (best given with meals or at bedtime).
- Do not administer within 1 hr of magnesium- or aluminum-containing antacids (decreases absorption).

**IV incompatibilities**

Amphotericin B complex (Abelcet, AmBisome, Amphotec).

**IV Compatibilities**

Dexmedetomidine (Precedex), diltiaZEM (Cardizem), DOBUTamine (Dobutrex), DOPamine (Intropin), heparin, HYDROmorphine (Dilaudid), insulin, lidocaine, LORazepam (Ativan), morphine, norepinephrine (Levophed), potassium chloride, propofol (Diprivan).

**Indications/routes/dosage**

**Duodenal Ulcer**

**PO:** ADULTS, ELDERLY: **Treatment:** 150 mg twice daily or 300 mg once daily. **Maintenance:** 150 mg once daily at bedtime. **CHILDREN 1 MO TO 16 YRS:** **Treatment:** 4–8 mg/kg/day in 2 divided doses. **Maximum:** 300 mg. **Maintenance:** 2–4 mg/kg/day once daily. **Maximum:** 150 mg/day.

**Gastric Ulcer (Benign)**

**PO:** ADULTS, ELDERLY: **Treatment:** 150 mg 2 times/day. **Maintenance:**
150 mg once daily at bedtime. **CHILDREN 1 MO–16 YRS:** Treatment: 4–8 mg/kg/day in 2 divided doses. **Maximum:** 300 mg/day. **Maintenance:** 2–4 mg/kg/day once daily. **Maximum (healing):** 150 mg/day.

**Hypersecretory Conditions**

**PO:** **ADULTS, ELDERLY:** 150 mg twice daily up to 6 g/day. **IV Infusion:** 6.25 mg/hr.

**GERD**

**PO:** **ADULTS, ELDERLY:** 150 mg twice daily. **CHILDREN 1 MO TO 16 YRS:** 5–10 mg/kg/day in 2 divided doses. **Maximum:** 300 mg/day.

**Erosive Esophagitis**

**PO:** **ADULTS, ELDERLY:** Treatment: 150 mg 4 times/day. **Maintenance:** 150 mg twice daily. **CHILDREN 1 MO TO 16 YRS:** Treatment: 5–10 mg/kg/day in 2 divided doses. **Maximum:** 600 mg/day.

**Prevention of Heartburn (OTC)**

**PO:** **ADULTS, ELDERLY, CHILDREN 12 YRS AND OLDER:** 75–150 mg 30–60 min before eating or drinking beverages that cause heartburn. **Maximum:** 2 doses/day. Do not use more than 14 days.

**Usual Parenteral Dosage**

**IV:** **ADULTS, ELDERLY:** 50 mg q6–8h. **CHILDREN:** 2–4 mg/kg/day in divided doses q6–8h. **Maximum:** 50 mg/dose. **IV Infusion:** 6.25 mg/hr.

**Usual Neonatal Dosage**

**PO:** **NEONATES:** 2 mg/kg/dose q8h.

**IV:** **NEONATES:** Initially, 1.5 mg/kg/dose, then 1.5–2 mg/kg/day in divided doses q8h.

**IV Infusion:** **NEONATES:** Loading dose: 1.5 mg/kg, then 1–2 mg/kg/day (0.04–0.08 mg/kg/hr).

**Dosage in Renal Impairment**

**CrCl less than 50 mL/min:** Give 150 mg PO q24h or 50 mg IV q18–24h.
Dosage in Hepatic Impairment
No dose adjustment.

Side effects
**Occasional (2%)**: Diarrhea. **Rare (1%)**: Constipation, headache (may be severe).

Adverse effects/toxic reactions
Reversible hepatitis, blood dyscrasias occur rarely.

Nursing considerations

**Baseline assessment**
Obtain history of epigastric/abdominal pain.

**Intervention/evaluation**
Assess mental status in elderly. Question present abdominal pain, GI distress.

**Patient/family teaching**
- Smoking decreases effectiveness of medication.
- Do not take medicine within 1 hr of magnesium- or aluminum-containing antacids.
- Transient burning/pruritus may occur with IV administration.
- Report headache.
- Avoid alcohol, aspirin.

---

**ranolazine**
ra-noe-la-zeen

**Ranexa**

**CLASSIFICATION**
PHARMACOTHERAPEUTIC: Sodium current inhibitor.
CLINICAL: Antianginal, anti-ischemic.
Do not confuse Ranexa with CeleXA.
**Uses**

Treatment of chronic angina.

**Precautions**

**Contraindications:** Hypersensitivity to ranolazine. Hepatic cirrhosis, concurrent use of strong CYP3A inhibitors (e.g., rifAMPin, carBAMazepine) or CYP3A inducers (e.g., ketoconazole, itraconazole, fluconazole, clarithromycin, erythromycin). **Cautions:** Renal/hepatic impairment. Preexisting QT prolongation, concurrent use with medications known to prolong QT interval, pts 75 yrs of age or older, hypokalemia, hypomagnesemia.

**Action**

Inhibits inward current of sodium channel during cardiac repolarization, thereby reducing calcium influx. Decreased influx of calcium reduces ventricular tension, myocardial oxygen demand. Does not reduce heart rate, B/P. **Therapeutic Effect:** Exerts antianginal, anti-ischemic effects on cardiac tissue.

**Pharmacokinetics**

Absorption highly variable. Peak plasma concentration: 2–5 hrs. Rapidly, extensively metabolized in intestine, liver. Protein binding: 62%. Excreted in urine (75%), feces (25%). **Half-life:** 7 hrs.

**Lifespan considerations**

**Pregnancy/Lactation:** Unknown if drug crosses placenta or is distributed in breast milk. **Children:** Safety and efficacy not established. **Elderly:** No age-related precautions noted.

**Interactions**

**DRUG:** See contraindications. DiltiaZEM, verapamil may increase serum concentration. May increase concentration of cycloSPORINE, digoxin, simvastatin, sirolimus, tacrolimus. Antiarrhythmic agents, dofetilide,
quiNiDine, sotalol, thioridazine, ziprasidone may increase risk of QT prolongation. HERBAL: St. John’s wort may decrease concentration/effects. FOOD: Grapefruit products may increase plasma concentration, risk of QT prolongation. LAB VALUES: May slightly elevate serum BUN, creatinine.

**Availability (Rx)**

**Tablets (Extended-Release):** 500 mg, 1,000 mg.

**Administration/handling**

**PO**

- May give without regard to food.
- Do not break, crush, dissolve, or divide extended-release tablets.

**Indications/routes/dosage**

**Chronic Angina**

**PO: ADULTS, ELDERLY:** Initially, 500 mg twice daily. May increase to 1,000 mg twice daily, based on clinical response. Dose should not exceed 500 mg twice daily when used concurrently with moderate CYP3A inhibitors (e.g., diltiaZEM, verapamil).

**Dosage in Renal/Hepatic Impairment**

No dose adjustment (discontinue if acute renal failure develops). Contraindicated in pts with cirrhosis.

**Side effects**

**Occasional (6%–4%):** Dizziness, headache, constipation, nausea. **Rare (2%–1%):** Peripheral edema, abdominal pain, dry mouth, vomiting, tinnitus, vertigo, palpitations.

**Adverse effects/toxic reactions**

Overdose manifested as confusion, diplopia, dizziness, paresthesia, syncope.
Nursing considerations

Baseline assessment
Receive full medication history and screen for contraindications. Question history of hepatic impairment, long QT syndrome. Record onset, type (sharp, dull, squeezing), radiation, location, intensity, duration of anginal pain, precipitating factors (exertion, emotional stress). Obtain baseline EKG.

Intervention/evaluation

Patient/family teaching
• Avoid grapefruit products.
• Do not chew, crush, dissolve, or divide extended-release tablets.
• Avoid tasks requiring alertness, motor skills until response to drug is established.

rasagiline
ra-sa-ji-leen
Azilect
Apo-Rasagiline

CLASSIFICATION
PHARMACOTHERAPEUTIC: MAOI.
CLINICAL: Antiparkinson agent.
Do not confuse Azilect with Aricept.

Uses
Treatment of signs/symptoms of Parkinson’s disease as initial monotherapy or as adjunct therapy with or without levodopa.

Precautions
Contraindications: Hypersensitivity to rasagiline. Concurrent use with methadone, traMADol, meperidine, MAOIs within 14 days of rasagiline, cyclobenzaprine, dextromethorphan, or St. John’s wort. Cautions: Hepatic impairment (avoid use in moderate to severe impairment); cardiovascular, cerebrovascular disease, pts with hypotension. Avoid foods high in tyramine. Do not use within 5 wks of stopping FLUoxetine; do not start tricyclic, SSRI, or SNRI within 2 wks of stopping rasagiline. History of major psychotic disorder.

Action
Inhibits monoamine oxidase type B, an enzyme that plays a major role in catabolism of DOPamine. Inhibition of DOPamine depletion reduces symptomatic motor deficits of Parkinson’s disease. Therapeutic Effect: Reduces symptoms of Parkinson’s disease, appears to delay disease progression.

Pharmacokinetics
Rapidly absorbed following PO administration. Protein binding: 88%–94%. Metabolized in liver. Excreted in urine (62%), feces (7%). Half-life: 1.3–3 hrs.

Lifespan considerations
Pregnancy/Lactation: Unknown if distributed in breast milk. Children: Safety and efficacy not established. Elderly: No age-related precautions noted.

Interactions
DRUG: Amphetamines, other MAOIs (e.g., phenelzine, selegiline), sympathomimetics (e.g., DOPamine, phenylephrine, pseudoephedrine) may cause hypertensive crisis. Anorexiants (e.g., dexfenfluramine, fenfluramine, sibutramine), CNS stimulants (e.g., methylphenidate), cyclobenzaprine, dextromethorphan, meperidine, methadone, mirtazapine, serotonin or norepinephrine reuptake inhibitors (e.g., citalopram, sertraline, venlafaxine), sibutramine, traMADol, traZODone, tricyclic antidepressants (e.g., amitriptyline, doxepin), venlafaxine may cause serotonin syndrome. May increase risk of atomoxetine, buPROPion toxicity. Ciprofloxacin, entacapone, tolcapone may increase concentration (reduced dosage recommended). Levodopa may cause hypertensive/hypotensive reaction. HERBAL: Kava
kava, SAMe, St. John’s wort, valerian may increase risk of serotonin syndrome, excessive sedation. **FOOD:** Caffeine, foods/beverages containing tyramine may result in hypertensive reaction, hypertensive crisis. **LAB VALUES:** May increase serum alkaline phosphatase, bilirubin, ALT, AST. May cause leukopenia.

### Availability (Rx)
**Tablets:** 0.5 mg, 1 mg.

### Administration/handling
**PO**
- Give without regard to food.
- Avoid food, beverages containing tyramine (e.g., cheese, sour cream, yogurt, pickled herring, liver, figs, raisins, bananas, avocados, soy sauce, broad beans, yeast extracts, meat tenderizers, red wine, beer), excessive amounts of caffeine (e.g., coffee, tea).

### Indications/routes/dosage

**When used in combination with levodopa, dosage reduction of levodopa should be considered.**

#### Parkinson’s Disease
**PO:** ADULTS, ELDERLY, MONOTHERAPY, ADJUNCTIVE THERAPY WITHOUT LEVODOPA: 1 mg once daily.
**PO:** ADULTS, ELDERLY, ADJUNCTIVE THERAPY WITH LEVODOPA: Initially, 0.5 mg once daily. If therapeutic response is not achieved, dose may be increased to 1 mg once daily. **ADJUNCTIVE THERAPY WITHOUT LEVODOPA:** 1 mg once daily.

### Dose Modification
**Concomitant use of CYP1A2 inhibitors, ciprofloxacin:** 0.5 mg once daily.

### Dosage in Hepatic Impairment
Mild impairment: 0.5 mg once daily. Moderate to severe impairment: Not recommended.

Dosage in Renal Impairment
No dose adjustment.

Side effects
Frequent (14%–12%): Headache, nausea. Occasional (9%–5%): Orthostatic hypotension, weight loss, dyspepsia, dry mouth, arthralgia, depression, hallucinations, constipation. Rare (4%–2%): Fever, vertigo, ecchymosis, rhinitis, neck pain, arthritis, paresthesia.

Adverse effects/toxic reactions
Increase in dyskinesia (impaired voluntary movement), dystonia (impaired muscular tone) occurs in 18% of pts, angina occurs in 9%. Gastroenteritis, conjunctivitis occur rarely (3% of pts).

Nursing considerations

Baseline assessment
Obtain baseline LFT, blood pressure. Receive full medication history and screen for interactions. Question history of severe hepatic impairment, cardiovascular disease.

Intervention/evaluation
Give with food if nausea occurs. Monitor B/P. Instruct pt to slowly go from lying to standing to prevent orthostatic hypotension. Assess for clinical reversal of symptoms (improvement of tremor of head/hands at rest, mask-like facial expression, shuffling gait, muscular rigidity). If hallucinations or dyskinesia occurs, symptoms may be eliminated if levodopa dosage is reduced. Hallucinations generally are accompanied by confusion and, to a lesser extent, insomnia.

Patient/family teaching
• Orthostatic hypotension may occur more frequently during initial therapy.
• Avoid tasks that require alertness, motor skills until response to drug is established.
• Hallucinations may occur (more so in the elderly with Parkinson’s disease), typically within first 2 wks of therapy.
• Avoid foods that contain tyramine (cheese, sour cream, beer, wine, pickled herring, liver, figs, raisins, bananas, avocados, soy sauce, yeast extracts, yogurt, papaya, broad beans, meat tenderizers), excessive amounts of caffeine (coffee, tea, chocolate), OTC preparations for hay fever, colds, weight reduction (may produce significant rise in B/P).
• Do not take any newly prescribed medications unless approved by prescriber who originally started therapy.

---

**rasburicase**

**elas-bure-i-kase**

**Elitek**

**Fasturtec**

**CLASSIFICATION**

**PHARMACOTHERAPEUTIC**: Urate-oxidase inhibitor.

**CLINICAL**: Anti hyperuricemic.

■ **BLACK BOX ALERT** ■ Severe hypersensitivity reactions including anaphylaxis reported. May cause severe hemolysis in pts with glucose-6-phosphate dehydrogenase (G6PD) deficiency. Screen pts at high risk for G6PD (African or Mediterranean descent) prior to therapy. Methemoglobinemia has been reported. Blood samples left at room temperature may interfere with uric acid measurements. Must collect blood samples in prechilled tubes containing heparin and immediately immerse in ice water bath. Assay plasma samples within 4 hrs of collection. Elitek enzymatically degrades uric acid in blood samples left at room temperature.

---

**Uses**

Initial management of uric acid levels in pts with leukemia, lymphoma, and solid tumor malignancies who are receiving chemotherapy expected to result in tumor
lysis and subsequent elevation of plasma uric acid.

**Precautions**

**Contraindications:** History of anaphylaxis or severe hypersensitivity to rasburicase. Prior drug reaction including hypersensitivity reactions, hemolysis, methemoglobinemia; G6PD deficiency. **Cautions:** Pts at high risk for G6PD deficiency (e.g., African, Mediterranean, or Southeast Asian descent).

**Action**

Catalyzes enzymatic oxidation of poorly soluble uric acid into soluble, inactive metabolites by converting uric acid into allantoin. Does not inhibit formation of uric acid. **Therapeutic Effect:** Decreases uric acid levels.

**Pharmacokinetics**

**Half-life:** 16–23 hrs.

**Lifespan considerations**

**Pregnancy/Lactation:** Unknown if distributed in breast milk. Unknown if crosses placenta. May cause fetal harm. **Children/Elderly:** No age-related precautions noted.

**Interactions**

**DRUG:** None significant. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** May increase serum bilirubin, ALT. May decrease serum phosphate.

**Availability (Rx)**

**Injection, Powder for Reconstitution:** 1.5 mg/vial, 7.5 mg/vial.

**Administration/handling**

-basket
**Reconstitution**
- Must use diluent provided in carton.
- Reconstitute 1.5-mg vial with 1 mL of diluent or 7.5-mg vial with 5 mL of diluent to provide concentration of 1.5 mg/mL.
- Gently swirl to mix. Do not shake.
- Inspect for particulate matter or discoloration.
- Inject calculated dose into appropriate volume of 0.9% NaCl to achieve a final volume of 50 mL.

**Rate of Administration**
- Infuse over 30 min.
- Do not use filter during reconstitution or infusion.

**Storage**
- Refrigerate solution until time of use.
- Discard after 24 hrs following reconstitution.

**IV incompatibilities**
Do not mix with other IV medications.

**Indications/routes/dosage**

**Note:** Indicated only for a single course of treatment.

**Management of Hyperuricemia**

**IV: ADULTS, ELDERLY, CHILDREN:** 0.2 mg/kg once daily up to 5 days.

**Dosage in Renal/Hepatic Impairment**
No dose adjustment.

**Side effects**

**Frequent (50%–46%):** Vomiting, fever. **Occasional (27%–13%):** Nausea, headache, abdominal pain, constipation, diarrhea, mucositis, rash.

**Adverse effects/toxic reactions**
Hypersensitivity reactions occurred in 4.3% of pts including injection irritation,
peripheral edema, urticaria, pruritus. Anaphylaxis, hemolysis, methemoglobinemia occurred in less than 1%. Pulmonary hemorrhage, respiratory failure, supraventricular arrhythmias, ischemic coronary artery disorders, sepsis, abdominal, gastrointestinal infections occurred in greater than 2% of pts. Clinical tumor lysis syndrome (TLS), manifested by hyperuricemia, hyperkalemia, hyperphosphatemia, seizure, increased serum creatinine, renal failure reported in 3% of pts. Anti-rasburicase antibodies reported.

Nursing considerations

Baseline assessment
Obtain CBC, BMP, LFT, serum phosphate, uric acid level; urine pregnancy if applicable. Question for history of prior hypersensitivity reactions. Assess G6PD deficiency risk in potential candidates.

Intervention/evaluation

Patient/family teaching
• Report any allergic reaction, bronchospasm, chest pain or tightness, cough, difficulty breathing, dizziness, fainting, rash, or itching.

regorafenib
re-goe-raf-e-nib
Stivarga
CLASSIFICATION
PHARMACOTHERAPEUTIC: Multikinase inhibitor.
CLINICAL: Antineoplastic.
BLACK BOX ALERT • Severe, sometimes fatal, hepatotoxicity
reported. Monitor hepatic function prior to and during treatment. Interrupt, reduce, or discontinue therapy if hepatotoxicity or hepatocellular necrosis occurs.

**Uses**

Treatment of metastatic colorectal cancer in pts who have been previously treated with fluoropyrimidine/oxaliplatin/irinotecan-based chemotherapy, anti-VEGF or anti-EGFR therapy. Locally advanced, unresectable or metastatic GI stromal tumor previously treated with imatinib and SUNITinib. Treatment of hepatocellular carcinoma (HCC) previously treated with sorafenib.

**Precautions**

**Contraindications:** Hypersensitivity to regorafenib. **Cautions:** Mild to moderate hepatic impairment (not recommended with severe hepatic impairment), hypertension (not recommended with severe or uncontrolled hypertension), recent surgical/dental procedures, chronic open wounds/ulcers, hemoptysis, concomitant warfarin therapy, cardiovascular disease, recent MI.

**Action**

Inhibits tyrosine kinase activity involved with tumor angiogenesis, oncogenesis, and maintenance of tumor microenvironment. **Therapeutic Effect:** Inhibits colorectal tumor cell growth and metastasis.

**Pharmacokinetics**

Readily absorbed following PO administration. Metabolized in liver. Protein binding: 99.5%. Peak plasma concentration: 4 hrs. Excreted in feces (71%), urine (19%). **Half-life:** 28 hrs (Range: 14–58 hrs).

**Lifespan considerations**

**Pregnancy/Lactation:** May cause fetal harm. Not recommended in nursing mothers. Unknown if distributed in breast milk. Contraception recommended during treatment and up to 2 mos after discontinuation of therapy. **Children:**
Safety and efficacy not established in pts younger than 18 yrs. Elderly: No age-related precautions noted.

**Interactions**

**DRUG:** Strong CYP3A4 inducers (e.g., carbamazepine, phenytoin) may decrease concentration/effects. Strong CYP3A4 inhibitors (e.g., clarithromycin, ketoconazole) may increase concentration/effects.  
**HERBAL:** St. John’s wort may decrease concentration/effects. **FOOD:** Grapefruit products may increase concentration/effects. **High-fat meal** may increase absorption/concentration. **LAB VALUES:** May decrease lymphocytes, neutrophils, platelets, serum calcium, phosphorus, potassium, sodium. May increase serum bilirubin, ALT, AST, lipase, amylase, INR, urine protein.

**Availability (Rx)**

*[Image]* Tablets: 40 mg.

**Administration/handling**

**PO**

- Take at same time each day with low-fat (less than 30%) breakfast.  
- Give whole; do not break, crush, dissolve, or divide tablet.

**Indications/routes/dosage**

**Metastatic Colorectal Cancer, GI Stromal Tumor, Hepatocellular carcinoma**

**PO:** **ADULTS/ELDERLY:** 160 mg once daily for first 21 days of each 28-day cycle. Continue until disease progression or unacceptable toxicity.

**Dosage Modification**

*Symptomatic Hypertension, Toxic Skin Reactions, Severe Side Effects (Grades 3–4)*

**PO:** **ADULTS/ELDERLY:** Reduce dose to 120 mg once daily. If recovery does
not occur within 7 days (despite dose reduction), interrupt treatment for minimum of 7 days and reassess. If recovery does not occur after interruption, reduce dose to 80 mg once daily; Discontinue for any of the following: intolerance of 80-mg dose; serum ALT or AST greater than 20 times upper limit of normal (ULN); serum ALT/AST greater than 3 times ULN and bilirubin greater than 2 times ULN; recurrent serum ALT/AST greater than 5 times ULN despite dose of 120 mg; recovery failure of grade 3 or 4 side effects, toxic skin reaction.

**Dosage in Renal Impairment**
No dose adjustment.

**Dosage in Hepatic Impairment**
*Mild to moderate impairment:* No dose adjustment. *Severe impairment:* Not recommended.

**Side effects**

**Frequent (64%–26%):** Asthenia/fatigue, anorexia, diarrhea, mucositis, weight loss, hypertension, dysphonia, generalized pain, fever, rash. **Occasional (10%–5%):** Headache, alopecia, dysgeusia, musculoskeletal stiffness, dry mouth. **Rare (2% or Less):** Tremor, gastric reflux.

**Adverse effects/toxic reactions**
May cause GI perforation, GI fistula formation. Hemorrhaging of respiratory, GI, genitourinary tracts reported in 21% of pts. Hypertension (30% of pts) may lead to hypertensive crisis. May cause ineffective wound healing or wound dehiscence requiring medical intervention. Palmar-planter erythrodysesthesi syndrome (PPES), a chemotherapy-induced skin condition that presents with redness, swelling, numbness, skin sloughing of hands, feet (45% of pts). Reversible posterior leukoencephalopathy syndrome (RPLS) reported in less than 1% of pts. May induce cardiac ischemia and/or MI. Severe, sometimes fatal, hepatotoxicity including hepatocellular necrosis reported in less than 1%. Various, unspecified infections reported in 31% of pts (most likely due to neutropenia).
Nursing considerations

Baseline assessment

Intervention/evaluation
Monitor B/P, CBC, electrolytes, urinalysis. Monitor LFT q2wks for 2 mos, then monthly; or every wk if elevated. Persistent diastolic hypertension may indicate hypertensive emergency. Obtain EKG for palpitation, chest pain, hypokalemia, hyperkalemia, hypocalcemia, bradycardia, ventricular arrhythmias. Reverse posterior leukoencephalopathy syndrome (RPLS) should be considered in pts with seizure, headache, visual disturbances, altered mental status, malignant hypertension. Assess hydration status. Encourage PO intake. Immediately report any hemorrhaging, bloody stools, hematuria, abdominal pain, hemoptysis (may indicate GI perforation/fistula formation).

Patient/family teaching
• Blood levels will be routinely monitored.
• Avoid pregnancy. Contraception should be practiced during treatment and up to 2 mos after last dose.
• Report any yellowing of skin or eyes, abdominal pain, bruising, black/tarry stools, dark urine, decreased urine output, skin changes.
• Report neurologic changes including confusion, seizures, vision loss, high blood pressure crisis (may indicate RPLS).
• Do not take herbal products.
• Notify physician before any planned surgical/dental procedures.
• Do not ingest grapefruit products.
• Take with low-fat food only.
• Drink liquids often if diarrhea occurs (may lead to dehydration).
• Immediately report bleeding of any kind.
• Swallow tablet whole; do not chew, crush, dissolve, or divide.

**repaglinide**
re- **pag-**li-nide
Apo-Repaglinide
GlucoNorm
Prandin

**Fixed-Combination(s)**
**Prandimet:** repaglinide/metFORMIN (an antidiabetic): 1 mg/500 mg, 2 mg/500 mg.

**CLASSIFICATION**
**PHARMACOTHERAPEUTIC:** Meglitinide analogue.
**CLINICAL:** Antidiabetic agent.

Do not confuse Prandin with Avandia.

**Uses**
Adjunct to diet and exercise to lower serum glucose in pts with type 2 diabetes. Used as monotherapy or in combination with metFORMIN, pioglitazone, rosiglitazone.

**Precautions**
**Contraindications:** Hypersensitivity to repaglinide. Diabetic ketoacidosis (with or without coma), type 1 diabetes, concurrent gemfibrozil therapy. **Cautions:** Hepatic/renal impairment, elderly pts, malnourished pts, adrenal/pituitary dysfunction.

**Action**
Stimulates release of insulin from beta cells of pancreas by depolarizing beta cells, leading to opening of calcium channels. Resulting calcium influx induces insulin secretion. **Therapeutic Effect:** Lowers serum glucose concentration.
Pharmacokinetics
Rapidly, completely absorbed from GI tract. Protein binding: 98%. Metabolized in liver. Excreted in feces (90%), urine (8%). Unknown if removed by hemodialysis. **Half-life:** 1 hr.

*Lifespan considerations*

**Pregnancy/Lactation:** Unknown if drug is distributed in breast milk. **Children:** Safety and efficacy not established. **Elderly:** No age-related precautions noted, but hypoglycemia may be more difficult to recognize.

**Interactions**

**DRUG:** CYP3A4 inhibitors (e.g., ketoconazole, erythromycin), CYP2C8 inhibitors (e.g., gemfibrozil) may increase concentration/toxicity. CYP3A4 inducers (e.g., carBAMazepine, rifAMPin) may decrease effects. Beta blockers (e.g., carvedilol, metoprolol), NSAIDs (e.g., ibuprofen, ketorolac, naproxen) may increase hypoglycemic effect. **HERBAL:** St. John’s wort may decrease concentration. **Garlic, ginger, ginseng** may cause hypoglycemia. **FOOD:** Food decreases concentration. **LAB VALUES:** Serum alkaline phosphatase, ALT, AST may be elevated.

**Availability (Rx)**

**Tablets:** 0.5 mg, 1 mg, 2 mg.

**Administration/handling**

**PO**

- Ideally, give within 15 min of a meal but may be given immediately before a meal to as long as 30 min before a meal.

**Indications/routes/dosage**

**Diabetes Mellitus**

**PO:** ADULTS, ELDERLY: (Pts not previously treated or whose Hgb A1c is
less than 8%): 0.5 mg before each meal. **(Pts previously treated whose Hgb A1c is greater than 8%):** 1–2 mg before each meal. May adjust dose by at least 1-wk intervals. Range: 0.5–4 mg 2–4 times/day. **Maximum:** 16 mg/day.

**Dosage in Renal Impairment**

**CrCl 20–40 mL/min:** Initially, 0.5 mg with meals, titrate carefully.

**Dosage in Hepatic Impairment**

Use caution.

**Side effects**

**Frequent (10%–6%):** Upper respiratory tract infection, headache, rhinitis, bronchitis, back pain. **Occasional (5%–3%):** Diarrhea, dyspepsia, sinusitis, nausea, arthralgia, UTI. **Rare (2%):** Constipation, vomiting, paresthesia, allergy.

**Adverse effects/toxic reactions**

Hypoglycemia occurs in 16% of pts. Chest pain occurs rarely.

**Nursing considerations**

**Baseline assessment**

Check fasting serum glucose, glycosylated Hgb A1c levels periodically to determine minimum effective dose.

**Intervention/evaluation**

Monitor fasting serum glucose, glycosylated Hgb A1c levels, food intake. Assess for hypoglycemia (cool/wet skin, tremors, dizziness, anxiety, headache, tachycardia, numbness in mouth, hunger, diplopia), hyperglycemia (polyuria, polyphagia, polydipsia, nausea, vomiting, dim vision, fatigue, deep or rapid breathing). Be alert to conditions that alter glucose requirements (fever, increased activity/stress, surgical procedures). Ensure follow-up instruction if pt, family do not thoroughly understand diabetes management, glucose-testing technique. At least 1 wk should elapse to assess response to drug before new dosage adjustment is made.
Patient/family teaching

- Diabetes requires lifelong control.
- Prescribed diet, exercise are principal parts of treatment; do not skip, delay meals.
- Continue to adhere to dietary instructions, regular exercise program, regular testing of urine or serum glucose.
- When taking combination drug therapy with a sulfonylurea or insulin, have source of glucose available to treat symptoms of low blood sugar.

Cinqair

**CLASSIFICATION**

**PHARMACOTHERAPEUTIC:** Interleukin-5 receptor antagonist.

Monoclonal antibody.

**CLINICAL:** Antiasthmatic.

Do not confuse reslizumab with certolizumab, daclizumab, ecilizumab, efalizumab, mepolizumab, natalizumab, omalizumab, pembrolizumab, tocilizumab, or vedolizumab, or Cinqair with Cinryze, Cinolar, Cinobac, Sinemet, Singulair, or SINEquian.

Uses

Add-on maintenance treatment of pts with severe asthma, aged 18 yrs and older, and with an eosinophil phenotype.

Precautions

**Contraindications:** Hypersensitivity to reslizumab. **Cautions:** History of helminth (parasite) infection; long-term use of corticosteroids. Not indicated for treatment of other eosinophilic conditions; relief of acute bronchospasm, status asthmaticus, exercise-induced bronchospasm. History of anaphylaxis.

Action

Exact mechanism unknown. Inhibits signaling of interleukin-5 cytokine,
reducing production and survival of eosinophils responsible for asthmatic inflammation and pathogenesis. **Therapeutic Effect:** Prevents inflammatory process. Decreases number of asthma exacerbations.

**Pharmacokinetics**

Widely distributed. Degraded into small peptides and amino acids via proteolytic enzymes. Peak plasma concentration: reached by end of infusion. Excretion not specified. **Half-life:** 24 days.

**Lifespan considerations**

**Pregnancy/Lactation:** Unknown if distributed in breast milk. However, human immunoglobulin G (IgG) is present in breast milk and is known to cross placenta. **Children:** Safety and efficacy not established in pts younger than 18 yrs. **Elderly:** No age-related precautions noted.

**Interactions**

**DRUG:** None known. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** May increase creatine phosphokinase (CPK).

**Availability (Rx)**

**Injection Solution:** 100 mg/10 mL (10 mg/mL).

**Administration/handling**

**IV**

**Preparation**

- Allow vial to warm to room temperature.
- Visually inspect for particulate matter or discoloration. Solution should appear clear to slightly opalescent, colorless to pale yellow.
- Proteinaceous particles may be present.
- Air bubbles are expected and allowed.
- Do not use if solution is cloudy or discolored or if foreign particles are observed.
- Do not shake.
• Withdraw proper dose volume from vial and dilute in 50 mL 0.9% NaCl bag.
• Gently invert to mix. Do not shake (may cause foaming/precipitate formation).
• Infuse via dedicated line.
• After infusion is complete, flush IV line with 0.9% NaCl.

**Rate of Administration**
• Infuse over 20–50 mins (depending on total volume of infusion), using an in-line, low protein-binding filter (pore size: 0.2 micron).

**Storage**
• Refrigerate unused vials.
• Do not freeze.
• Diluted solution may be refrigerated or stored at room temperature for up to 16 hrs.
• If refrigerated, allow diluted solution to warm to room temperature before use.
• Protect from light.

**IV incompatibilities**
Do not mix or infuse with other medications.

**Indications/routes/dosage**

**Asthma (Severe)**
**IV: ADULTS, ELDERLY:** 3 mg/kg once q4wks.

**Dosage in Renal/Hepatic Impairment**
Not specified; use caution.

**Side effects**

**Rare (3%–1%):** Oropharyngeal pain, myalgia.

**Adverse effects/toxic reactions**
Life-threatening anaphylaxis reported in less than 1% of pts. Hypersensitivity reactions including bronchospasm, dyspnea, hypoxia, rash, urticaria, vomiting usually occurred during infusion or within 20 mins after completion. Less than
1% of pts reported at least one malignant neoplasm within 6 mos of initiation. Unknown if treatment will influence the immunologic response to helminth (parasite) infection. Immunogenicity (auto-reslizumab antibodies) reported in 5% of pts.

**Nursing considerations**

**Baseline assessment**

Obtain serum CPK. Verify presence of eosinophil phenotype. Question history of hypersensitivity reaction. Therapy should be administered in a health care setting by medical professionals who are trained and prepared to readily manage anaphylaxis. Have anaphylactic medications (e.g., antihistamine, bronchodilator, corticosteroid, EPINEPHrine, H₂ receptor antagonist), intubation kit, supplemental oxygen readily available before initiation. Inhaled or systemic corticosteroids should not be suddenly discontinued upon initiation. Corticosteroids that are not gradually reduced may cause withdrawal symptoms or unmask conditions that were originally suppressed with corticosteroid therapy. Pts with preexisting helminth infection should be treated prior to initiation.

**Intervention/evaluation**

Obtain serum CPK in pts complaining of myalgia. Diligently observe for hypersensitivity/anaphylactic reaction during infusion and directly after completion. If anaphylaxis occurs, discontinue infusion and provide immediate resuscitation support. Early detection is vital. Assess rate, depth, rhythm of respirations, oxygen saturation for therapeutic effectiveness. Assess lungs for wheezing, rales. Obtain pulmonary function test to assess disease improvement. Interrupt or discontinue therapy if helminth infection occurs, if worsening of asthma-related symptoms occurs (esp. in pts tapering off corticosteroids). Monitor for increased use of rescue inhalers; may indicate deterioration of asthma. Monitor for primary malignancies.

**Patient/family teaching**

- Treatment may cause life-threatening anaphylaxis. Immediately report allergic reactions such as difficulty breathing, hives, itching, low blood pressure, rash,
swelling of the face or tongue, sudden coughing, vomiting, wheezing during infusion or immediately after infusion.
• Therapy not indicated for relief of acute asthma or bronchospasm.
• Have a rescue inhaler readily available.
• Increased use of rescue inhalers may indicate worsening of asthma.
• Seek medical attention if asthma symptoms worsen or remain uncontrolled.
• Do not stop corticosteroid therapy unless directed by prescriber.
• Treatment may increase risk of new cancers or alter the body’s immune response to parasite infections.

ribavirin
rye-ba-\textit{vye}\textendash rin
Copegus
Rebetol
Ribasphere
Virazole

Fixed-Combination(s)
With interferon alfa-2b (Rebetron). Individually packaged.

\textbf{CLASSIFICATION}
\textbf{PHARMACOTHERAPEUTIC}: Synthetic nucleoside.
\textbf{CLINICAL}: Antiviral.

\textbf{BLACK BOX ALERT} Significant teratogenic/embryocidal effects. Hemolytic anemia is significant toxicity, usually occurring within 1–2 wks. May worsen cardiac disease and lead to fatal or nonfatal MI. Inhalation may interfere with safe and effective assisted ventilation. Monotherapy not effective for chronic hepatitis C virus infection.

\textit{Do not confuse ribavirin with riboflavin, rifAMPin, or Robaxin.}

Uses

\textbf{Inhalation}: Treatment of respiratory syncytial virus (RSV) infections (esp. in
pts with underlying compromising conditions such as chronic lung disorders, congenital heart disease, recent transplant recipients). **Capsule/tablet/oral solution:** Treatment of chronic hepatitis C virus infection in pts with compensated hepatic disease in combination with other medications.

**Precautions**

**Contraindications:** Hypersensitivity to ribavirin. **(Additional) Inhalation:** Women who are pregnant or may become pregnant. **Oral formulations:** Hemoglobinopathies (e.g., sickle cell anemia), men whose female partner is pregnant, women of childbearing age who are pregnant or may become pregnant. Concomitant use of didanosine. **Ribasphere, Rebetol only:** CrCl less than 50 mL/min. **Cautions: Inhalation:** Pts requiring assisted ventilation, COPD, asthma. **PO:** Cardiac or pulmonary disease, elderly pts, history of psychiatric disorders, renal impairment, pts with sarcoidosis, pts with baseline risk of severe anemia.

**Action**

Inhibits replication of viral RNA, DNA, influenza virus RNA polymerase activity; interferes with expression of messenger RNA. **Therapeutic Effect:** Inhibits viral protein synthesis.

**Pharmacokinetics**

**Lifespan considerations**

**Pregnancy/Lactation:** Contraindicated in pregnancy. Females and males with females partners of reproductive potential must use 2 forms of effective contraception during treatment and for at least 6 mos after discontinuation. Unknown if excreted in breast milk. **Children/Elderly:** No age-related precautions noted.
Interactions

DRUG: Didanosine may increase risk of pancreatitis, peripheral neuropathy. May decrease effects of didanosine. Nucleoside analogues (e.g., adefovir, didanosine, lamivudine, stavudine, zalcitabine, zidovudine) may increase risk of lactic acidosis. HERBAL: None significant. FOOD: None known. LAB VALUES: None significant.

Availability (Rx)

Capsules (Rebetol, Ribasphere): 200 mg. Powder for Solution, Nebulization (Virazole): 6 g. Solution, Oral (Rebetol): 40 mg/mL. Tablet (Copegus): 200 mg. (Ribasphere): 200 mg, 400 mg, 600 mg.

Administration/handling

PO

• Capsules may be taken without regard to food.
• Do not break, crush, or open capsules.
• Use oral solution in children 5 yrs or younger, those 47 kg or less, or those unable to swallow.
• Give capsules with food when combined with peginterferon alfa-2b.
• Tablets should be given with food.

Inhalation

• May be given via nasal or oral inhalation.
• Solution appears clear, colorless; is stable for 24 hrs at room temperature.
• Discard solution for nebulization after 24 hrs.
• Discard if discolored or cloudy.
• Add 50–100 mL Sterile Water for Injection or Inhalation to 6-g vial.
• Transfer to a flask, serving as reservoir for aerosol generator.
• Further dilute to final volume of 300 mL, giving solution concentration of 20 mg/mL.
• Use only aerosol generator available from manufacturer of drug.
• Do not give concomitantly with other drug solutions for nebulization.
• Discard reservoir solution when fluid levels are low and at least q24h.
• Only experienced personnel should administer drug.
Indications/routes/dosage

Note: Combination therapy with peg-interferon alone is not recommended in HCV guidelines.

Chronic Hepatitis C Virus Infection

Rebetol, Ribasphere (Oral Capsule or Solution) (In Combination with Peginterferon alfa-2b)

PO: ADULTS, ELDERLY WEIGHING MORE THAN 105 KG: 1,400 mg daily (600 mg in morning, 800 mg in evening); (WEIGHING 81–105 KG): 1,200 mg daily (600 mg in morning and evening); (WEIGHING 66–80 KG): 1,000 mg daily (400 mg in morning, 600 mg in evening); (WEIGHING LESS THAN 66 KG): 800 mg daily (400 mg in morning and evening). CHILDREN 3 YRS OR OLDER WEIGHING MORE THAN 73 KG: 1,200 mg daily (600 mg in morning and evening); (WEIGHING 60–73 KG): 1,000 mg daily (400 mg in morning, 600 mg in evening; (WEIGHING 47–59 KG): 800 mg daily (400 mg in morning and evening); (WEIGHING LESS THAN 47 KG): 15 mg/kg/day in 2 divided doses as oral solution.

Rebetol, Ribasphere (Oral Capsule/Solution) (in Combination with Interferon alfa-2b)

PO: ADULTS, ELDERLY WEIGHING MORE THAN 75 KG: 1,200 mg daily (600 mg in morning and evening); (WEIGHING 75 KG OR LESS): 1,000 mg daily (400 mg in morning, 600 mg in evening).

Copegus, Ribasphere (Oral Tablet) (in Combination with Peginterferon alfa-2b)

PO: ADULTS, ELDERLY: Genotype 1, 4 (weighing more than 75 kg): 1,200 mg daily (600 mg in morning and evening); (weighing 75 kg or less): 1,000 mg daily (400 mg in morning, 600 mg in evening). Duration: 48 wks. Genotype 2, 3: 800 mg daily (400 mg in morning and evening). Duration: 24 wks. CHILDREN 5 YRS AND OLDER WEIGHING 75 KG OR GREATER: 1,200 mg daily (600 mg in morning and evening); (WEIGHING 60–74 KG): 1,000 mg daily (400 mg in morning, 600 mg in evening); (WEIGHING 47–59 KG): 800 mg daily (400 mg in morning and evening); (WEIGHING 34–46 KG): 600 mg daily (200 mg in morning, 400 mg in evening); (WEIGHING 23–33 KG): 400 mg daily (200 mg in morning and evening). Duration: 24 wks for genotypes 2, 3; 48 wks for genotypes 1, 4.
Dosage in Renal Impairment

Rebetol Capsules/Oral Solution; Ribisphere Capsules
ADULTS: CrCl less than 50 mL/min: Contraindicated. CHILDREN: Serum creatinine more than 2 mg/dL: Discontinue treatment.

Ribisphere Tablets
ADULTS: CrCl less than 50 mL/min: Not recommended.

Copegus Tablets
CrCl 30–50 mL/min: Alternate 200 mg and 400 mg every other day. CrCl less than 30 mL/min, end-stage renal disease: 200 mg once daily.

Dosage in Hepatic Impairment
Contraindicated.

Severe Lower Respiratory Tract Infection Caused by Respiratory Syncytial Virus (RSV)
Inhalation: CHILDREN, INFANTS: Use with Viratek small-particle aerosol generator at concentration of 20 mg/mL (6 g reconstituted with 300 mL Sterile Water for Injection) over 12–18 hrs/day for 3–7 days.

Side effects
Frequent (greater than 10%): Hemolytic anemia, dizziness, headache, fatigue, fever, insomnia, irritability, depression, emotional lability, impaired concentration, alopecia, rash, pruritus, nausea, anorexia, dyspepsia, vomiting, decreased hemoglobin, hemolysis, arthralgia, musculoskeletal pain, dyspnea, sinusitis, flu-like symptoms. Occasional (10%–1%): Nervousness, altered taste, weakness.

Adverse effects/toxic reactions
Cardiac arrest, apnea, ventilator dependence, bacterial pneumonia, pneumonia, pneumothorax occur rarely. If treatment exceeds 7 days, anemia may occur.

Nursing considerations
Baseline assessment
Obtain sputum specimens before giving first dose or at least during first 24 hrs of therapy. Assess respiratory status for baseline. **PO:** Obtain CBC with differential, pretreatment and monthly pregnancy test for women of childbearing age.

**Intervention/evaluation**
Monitor Hgb, Hct, platelets, LFT, I&O, fluid balance carefully. Check hematology reports for anemia due to reticulocytosis when therapy exceeds 7 days. For ventilator-assisted pts, watch for "rainout" in tubing and empty frequently; be alert to impaired ventilation/gas exchange due to drug precipitate. Assess skin for rash. Monitor B/P, respirations; assess lung sounds.

**Patient/family teaching**
- Report immediately any difficulty breathing, itching/swelling/redness of eyes, severe abdominal pain, bloody diarrhea, unusual bleeding/bruising.
- Female pts should take measures to avoid pregnancy.
- Male pts must use condoms during sexual activity.

**ribociclib**
rye-boe-sye-klib
Kisqali

**CLASSIFICATION**
PHARMACOTHERAPEUTIC: Cyclin-dependent kinase inhibitor. CLINICAL: Antineoplastic.

*Do not confuse ribociclib with palbociclib or riboflavin.*

**Uses**
Used in combination with an aromatase inhibitor as initial endocrine-based therapy for treatment of postmenopausal women with hormone receptor-positive, human epidermal growth factor receptor 2 (HER2)-negative advanced or metastatic breast cancer.

**Precautions**
Contraindications: Hypersensitivity to ribociclib. Cautions: Baseline hematologic cytopenias (anemia, thrombocytopenia, lymphopenia, neutropenia); electrolyte imbalance (correct abnormality prior to treatment), hepatic impairment, Avoid concomitant use of strong CYP3A inhibitors, strong CYP3A inducers, QTc interval–prolonging medications. Avoid use in pts with or at risk for QTc prolongation (e.g., congenital long QT syndrome, hypokalemia, hypomagnesemia; uncontrolled, significant cardiac disease including MI, HF, unstable angina, bradyarrhythmias).

Action
Blocks retinoblastoma protein phosphorylation and prevents progression through cell cycle, resulting in arrest of G1 phase. Therapeutic Effect: Inhibits tumor growth.

Pharmacokinetics

Lifespan considerations
Pregnancy/Lactation: Indicated for postmenopausal women; however, may cause fetal harm/malformations when used during pregnancy. Females of reproductive potential should use effective contraception during treatment and for up to 3 wks after discontinuation. Unknown if distributed in breast milk. Breastfeeding not recommended during treatment and for up to 3 wks after discontinuation. Children: Safety and efficacy not established. Elderly: No age-related precautions noted.

Interactions
DRUG: Strong CYP3A inhibitors (e.g., clarithromycin, ketoconazole, ritonavir) may increase concentration/effect; avoid use. Strong CYP3A inducers (e.g., carBAMazepine, phenytoin, rifAMPin) may decrease concentration/effect; avoid use. QT interval–prolonging medications (e.g., amiodarone, azithromycin, ceritinib, haloperidol, moxifloxacín) may
increase risk of QT interval prolongation, torsades de pointes. May increase concentration/effect of **aprepitant, bosutinib, budesonide, naloxegol, neratinib, olapanib, pimozone**. May decrease effect of **BCG vaccine**. May increase adverse effects/toxicity of **natalizumab, pimecrolimus, tacrolimus**. May decrease effect, increase toxicity of live vaccines. **HERBAL**: Echinacea, St. John’s wort may decrease concentration/effect. **FOOD**: Grapefruit products, pomegranate may increase concentration/effect. **LAB VALUES**: May increase serum ALT, AST, bilirubin. May decrease ANC, Hgb, lymphocytes, leukocytes, neutrophils, platelets; serum potassium, phosphate.

**Availability (Rx)**

**Tablets**: 200 mg. Blister pack: (14 tablets, 21 tablets).

**Administration/handling**

**PO**

• Give with or without food.
• Swallow whole. Do not crush, chew, or split (do not take broken or cracked tablets). If a dose is missed or vomiting occurs after administration, do not give extra dose. Administer next dose at regularly scheduled time.

**Indications/Routes/Dosage**

**Breast Cancer**

**PO**: **ADULTS, ELDERLY**: 600 mg once daily for 21 days, followed by 7 days off treatment of 28-day cycle. Use in combination with letrozole 2.5 mg once daily during 28-day cycle.

**Dose Reduction for Adverse Events**

**Starting dose**: 600 mg/day. **First dose reduction**: 400 mg/day. **Second dose reduction**: 200 mg/day. **Unable to tolerate 200 mg/day**: Permanently discontinue.

**Dose Modification**
Hepatotoxicity (During Treatment)

Note: Defined as hepatotoxicity without total bilirubin greater than 2 times upper limit of normal (ULN). If serum ALT, AST elevation greater than 3 times ULN with total bilirubin greater than 2 times ULN, permanently discontinue.  

**CTCAE grade 1 serum ALT, AST elevation (up to 3 times ULN):** No dose adjustment.  

**CTCAE grade 2 serum ALT, AST elevation (greater than 3–5 times ULN) with baseline at less than grade 2:** Withhold treatment until recovery to less than or equal to baseline grade, then resume at same dose level. If baseline at grade 2, do not withhold treatment. If grade 2 serum ALT, AST elevation recurs, then resume at reduced dose level.  

**CTCAE grade 3 serum ALT, AST elevation (greater than 5–20 times ULN):** Withhold treatment until recovery to less than or equal to baseline grade, then resume at reduced dose level. If grade 3 serum ALT, AST elevation recurs, permanently discontinue.  

**CTCAE grade 4 serum ALT, AST elevation (greater than 20 times ULN):** Permanently discontinue.

Hematologic

**CTCAE grade 1 or 2 neutropenia (ANC 1000 cells/mm$^3$ to less than the lower limit of normal):** No dose adjustment.  

**CTCAE grade 3 neutropenia (ANC 500 to less than 1000 cells/mm$^3$):** Withhold treatment until recovery to grade 2 or less, then resume at same dose level. If grade 3 neutropenia recurs, withhold treatment until recovery to grade 2 or less, then resume at reduced dose level.  

**CTCAE grade 3 febrile neutropenia:** Withhold treatment until recovery to grade 2 or less, then resume at reduced dose level.  

**Grade 4 neutropenia (ANC less than 500 cells/mm$^3$):** Withhold treatment until recovery to grade 2 or less, then resume at reduced dose level.

QTc Interval Prolongation

**QTc interval prolongation greater than 480 msec:** Withhold treatment until resolved to less than 481 msec, then resume at same dose level. If QTc interval prolongation greater than 480 msec recurs, withhold treatment until resolved to less than 481 msec, then resume at reduced dose level.  

**QTc interval prolongation greater than 500 msec:** Withhold treatment if QTc interval prolongation greater than 500 msec on at least two separate EKGs (within same visit). If QTc interval prolongation resolves to less than 481 msec after withholding treatment, resume at reduced dose level.
prolongation greater than 500 msec (or greater than 60 msec from baseline) with torsades de pointes, polymorphic ventricular tachycardia, unexplained syncope, symptoms of serious arrhythmia: Permanently discontinue.

Other Toxicities

Any other CTCAE grade 1 or 2 toxicities: No dose adjustment. Any other CTCAE grade 3 toxicities: Withhold treatment until resolved to grade 1 or 0, then resume at same dose level. If grade 3 toxicities recur, resume at reduced dose level. Any other CTCAE grade 4 toxicities: Permanently discontinue.

Concomitant Use of Strong CYP3A Inhibitors

Reduce initial dose to 400 mg once daily if strong CYP3A inhibitor cannot be discontinued. If CYP3A inhibitor is discontinued, increase ribociclib dose (after at least 5 half-lives of CYP3A inhibitor have elapsed) to the dose used prior to initiating strong CYP3A inhibitor.

Dosage in Renal Impairment

Not specified; use caution.

Dosage in Hepatic Impairment

Mild impairment: No dose adjustment. Moderate to severe impairment: Reduce starting dose to 400 mg once daily.

Side Effects

Frequent (52%–17%): Nausea, fatigue, diarrhea, alopecia, vomiting, constipation, headache, back pain, decreased appetite, rash. Occasional (14%–11%): Pruritus, pyrexia, insomnia, dyspnea, stomatitis, peripheral edema, abdominal pain.

Adverse Effects/Toxic Reactions

Anemia, leukopenia, lymphopenia, neutropenia, thrombocytopenia are expected responses to therapy, but more severe reactions, including febrile neutropenia, may be life threatening. CTCAE grade 3 or 4 neutropenia reported in 60% of pts. Severe hepatotoxicity reported in 10% of pts. QTc interval prolongation,
infections including UTI may occur.

**Nursing Considerations**

**Baseline Assessment**
Obtain ANC, CBC, BMP, LFT, serum phosphate; vital signs, weight. Obtain EKG (note QTc interval). Initiate treatment only in pts with QTc interval less than 450 msec. Obtain pregnancy test in females of reproductive potential. Question plans of breastfeeding. Question history of cardiac disease, cardiac conduction disorders, hepatic impairment. Receive full medication history including herbal products and screen for interactions. Screen for risk of bleeding, QTc interval prolongation, active infection. Obtain dietary consult. Offer emotional support.

**Intervention/Evaluation**
Monitor ANC, CBC for myelosuppression; LFT for hepatotoxicity q2wks for the first 2 cycles, then prior to each subsequent cycle, then as clinically indicated. Monitor BMP, serum phosphate for electrolyte imbalance; consider correcting imbalances, esp. hypokalemia, hypomagnesemia (due to increased risk of cardiac arrhythmias, torsades de pointes). Obtain repeat EKG on day 14 of the first cycle and at the beginning of the second cycle, or more frequently if QTc interval prolongation occurs. Monitor daily pattern of bowel activity, stool consistency. Assess skin for rash, lesions. Monitor weight, I&O.

**Patient/Family Teaching**
- Treatment may depress your immune system and reduce your ability to fight infection. Report symptoms of infection such as body aches, burning with urination, chills, cough, fatigue, fever. Avoid those with active infection.
- Report symptoms of bone marrow depression such as bruising, fatigue, fever, shortness of breath, weight loss; bleeding easily, bloody urine or stool.
- Do not take newly prescribed medications unless approved by the prescriber who originally started treatment.
- Report liver problems such as bruising, confusion, amber or dark-colored urine; right upper abdominal pain, yellowing of the skin or eyes; heart arrhythmias (chest pain, difficulty breathing, palpitations, passing out).
- Therapy indicated for postmenopausal women; however, birth defects may
occur when used during pregnancy. Females of childbearing potential should use effective contraception during treatment and for at least 3 wks after final dose.

- Do not breastfeed during treatment and for up to 3 wks after final dose.
- Do not ingest grapefruit products, Seville oranges, starfruit, pomegranate, herbal supplements.
- Report planned surgical/dental procedures.
- Immediately report bleeding of any kind.

**Uses**

Prevention of disseminated *Mycobacterium avium* complex (MAC) disease in those with advanced HIV infection. **OFF-LABEL:** Part of multidrug regimen for treatment of MAC. Alternative to rifAMPin as prophylaxis for latent tuberculosis infection, part of multidrug regimen for treatment of active tuberculosis infection.

**Precautions**

**Contraindications:** Hypersensitivity to rifabutin, other rifamycins (e.g., rifAMPin). **Cautions:** Severe renal impairment. Avoid use in renal/hepatic impairment; do not give for MAC prophylaxis in pts with active TB.

**Action**

Inhibits DNA-dependent RNA polymerase. **Therapeutic Effect:** Prevents MAC disease.

**Pharmacokinetics**
Readily absorbed from GI tract. Protein binding: 85%. Widely distributed. Crosses blood-brain barrier. Extensive intracellular tissue uptake. Metabolized in liver. Excreted in urine (53%), feces (30%). Unknown if removed by hemodialysis. **Half-life:** 16–69 hrs.

**Lifespan considerations**

**Pregnancy/Lactation:** Unknown if drug crosses placenta or is distributed in breast milk. **Children/Elderly:** No age-related precautions noted.

**Interactions**

**DRUG:** May decrease effectiveness of oral contraceptives, clarithromycin, itraconazole. May decrease concentration/effects of non-nucleoside reverse transcriptase inhibitors (e.g., delavirdine, efavirenz, nevirapine), protease inhibitors (e.g., amprenavir, indinavir, ritonavir, saquinavir). **HERBAL:** None significant. **FOOD:** High-fat meals may delay absorption. **LAB VALUES:** May increase serum alkaline phosphatase, ALT, AST.

**Availability (Rx)**

**Capsules:** 150 mg.

**Administration/handling**

**PO**

• May take with meals to reduce nausea/vomiting.

**Indications/routes/dosage**

**Prevention of MAC (Advanced HIV Infection)**

**PO:** **ADULTS, ELDERLY:** 300 mg once daily or 150 mg twice daily to reduce gastrointestinal upset. **CHILDREN, INFANTS:** 5 mg/kg once daily. **Maximum:** 300 mg once daily.

**Dosage in Renal Impairment**
**CrCl less than 30 mL/min:** Reduce dosage by 50%.

**Dosage in Hepatic Impairment**
No dose adjustment.

### Side effects

**Frequent (30%):** Red-orange or red-brown discoloration of urine, feces, saliva, skin, sputum, sweat, tears. **Occasional (11%–3%):** Rash, nausea, abdominal pain, diarrhea, dyspepsia, belching, headache, altered taste, uveitis, corneal deposits. **Rare (Less Than 2%):** Anorexia, flatulence, fever, myalgia, vomiting, insomnia.

### Adverse effects/toxic reactions

Hepatitis, anemia, thrombocytopenia, neutropenia occur rarely. May cause uveitis, *C. difficile*–associated diarrhea.

### Nursing considerations

#### Baseline assessment

Obtain chest X-ray; sputum, blood cultures. Biopsy of suspicious node(s) must be done to rule out active tuberculosis. Obtain baseline CBC, serum hepatic function tests.

#### Intervention/evaluation

Monitor serum LFT, platelet count, Hgb, Hct. Avoid IM injections, rectal temperatures, other traumas that may induce bleeding. Check temperature; notify physician of flu-like syndrome, rash, GI intolerance. Monitor bowel pattern, stool consistency.

#### Patient/family teaching

- Urine, feces, saliva, sputum, perspiration, tears, skin may be discolored brown-orange.
- Soft contact lenses may be permanently discolored.
- Rifabutin may decrease efficacy of oral contraceptives; nonhormonal methods
should be considered.
• Avoid crowds, those with infection.
• Report flu-like symptoms, nausea, vomiting, dark urine, unusual bruising/bleeding from any site, any visual disturbances, diarrhea.

**Uses**

In combination with other antitubercular agents for initial treatment, retreatment of active tuberculosis. Eliminates meningococci from nasopharynx of asymptomatic carriers. **OFF-LABEL:** Prophylaxis of *H. influenzae* type B infection, *Legionella* pneumonia, serious infections caused by *Staphylococcus* spp. (in combination with other agents). Treatment of prosthetic joint infection.

**Precautions**

**Contraindications:** Concomitant therapy with atazanavir, darunavir, fosamprenavir, saquinavir, ritonavir, tipranavir; hypersensitivity to rifAMPin, other rifamycins. **Cautions:** Hepatic impairment, active or treated alcoholism, porphyria. Concurrent medications associated with hepatotoxicity.
**Action**
Interferes with bacterial RNA synthesis by binding to DNA-dependent RNA polymerase, preventing attachment to DNA, thereby blocking RNA transcription. **Therapeutic Effect:** Bactericidal in susceptible microorganisms.

**Pharmacokinetics**
Well absorbed from GI tract (food delays absorption). Protein binding: 80%. Widely distributed. Metabolized in liver. Primarily eliminated by biliary system. Not removed by hemodialysis. **Half-life:** 3–5 hrs (increased in hepatic impairment).

**Lifespan considerations**

**Pregnancy/Lactation:** Crosses placenta. Distributed in breast milk. **Children/Elderly:** No age-related precautions noted.

**Interactions**
**DRUG:** Alcohol, hepatotoxic medications (e.g., acetaminophen, isoniazid, methotrexate, ketoconazole), ritonavir, saquinavir may increase risk of hepatotoxicity. May decrease effects of digoxin, disopyramide, fluconazole, methadone, mexiletine, oral anticoagulants (e.g., apixaban, warfarin), oral antidiabetics (e.g., glipiZIDE, metFORMIN), oral contraceptives, tacrolimus, tricyclic antidepressants, phenytoin, quINIDine, tocainide, verapamil. **HERBAL:** St. John’s wort may decrease concentration. **FOOD:** Food decreases extent of absorption. **LAB VALUES:** May increase serum alkaline phosphatase, bilirubin, uric acid, ALT, AST.

**Availability (Rx)**
**Capsules (Rifadin):** 150 mg, 300 mg. **Injection, Powder for Reconstitution:** 600 mg.

**Administration/handling**

**IV**
Reconstitution
• Reconstitute 600-mg vial with 10 mL Sterile Water for Injection to provide concentration of 60 mg/mL.
• Withdraw desired dose and further dilute with 0.9% NaCl or D₅W to concentration not to exceed 6 mg/mL.

Rate of Administration
• For IV infusion only. Avoid IM, SQ administration.
• Avoid extravasation (local irritation, inflammation).
• Infuse over 30 min to 3 hrs.

Storage
• Reconstituted vial is stable for 24 hrs.
• Once reconstituted vial is further diluted, it is stable for 4 hrs in D₅W or 24 hrs in 0.9% NaCl.

PO
• Preferably give 1 hr before or 2 hrs following meals with 8 oz of water (may give with food to decrease GI upset; will delay absorption).
• For pts unable to swallow capsules, contents may be mixed with applesauce, jelly.
• Administer at least 1 hr before antacids, esp. those containing aluminum.

IV incompatibility
DiltiaZEM (Cardizem).

IV compatibility
D₅W if infused within 4 hrs (risk of precipitation beyond this time period).

Indications/routes/dosage

Tuberculosis
Note: A four-drug regimen (ethambutol, isoniazid, pyrazinamide, rifampin) is preferred for initial, empiric treatment.
PO, IV: ADULTS, ELDERLY: 10 mg/kg/day. Maximum: 600 mg/day. CHILDREN: 10–20 mg/kg/day usually as a single dose. Maximum: 600
mg/day.

**Meningococcal Carrier**

**PO, IV:** ADULTS, ELDERLY: 600 mg twice daily for 2 days. **PO ONLY:** CHILDREN 1 MO AND OLDER: 10 mg/kg/dose q12h for 2 days. **Maximum:** 600 mg/dose. CHILDREN YOUNGER THAN 1 MO: 5 mg/kg/dose q12h for 2 days.

**Dosage in Renal/Hepatic Impairment**

No dose adjustment.

**Side effects**

**Frequent:** Red-orange or red-brown discoloration of urine, feces, saliva, skin, sputum, sweat, tears. **Occasional (5%–3%):** Hypersensitivity reaction (flushing, pruritus, rash). **Rare (2%–1%):** Diarrhea, dyspepsia, nausea, oral candida (sore mouth, tongue).

**Adverse effects/toxic reactions**

Hepatotoxicity (risk is increased when rifAMPin is taken with isoniazid), hepatitis, blood dyscrasias, Stevens-Johnson syndrome, antibiotic-associated colitis occur rarely.

**Nursing considerations**

**Baseline assessment**

Obtain CBC, renal function test, LFT. Screen for concomitant medications known to cause hepatotoxicity. Question for hypersensitivity to rifAMPin, rifamycins. Ensure collection of diagnostic specimens.

**Intervention/evaluation**

Assess IV site at least hourly during infusion; restart at another site at the first sign of irritation or inflammation. Monitor LFT, assess for hepatitis: jaundice, anorexia, nausea, vomiting, fatigue, weakness (hold rifAMPin, inform physician at once). Report hypersensitivity reactions promptly: any type of skin eruption,
pruritus, flu-like syndrome with high dosage. Monitor daily pattern of bowel activity, stool consistency (potential for antibiotic-associated colitis). Monitor CBC results for blood dyscrasias; be alert for infection (fever, sore throat), unusual bruising/bleeding, unusual fatigue/weakness.

**Patient/family teaching**

- Preferably take on empty stomach with 8 oz of water 1 hr before or 2 hrs after meal (with food if GI upset).
- Avoid alcohol.
- Do not take any other medications without consulting physician, including antacids; must take rifAMP in at least 1 hr before antacid.
- Urine, feces, sputum, sweat, tears may become red-orange; soft contact lenses may be permanently stained.
- Report any new symptom immediately such as yellow eyes/skin, fatigue, weakness, nausea/vomiting, sore throat, fever, flu, unusual bruising/bleeding.
- If taking oral contraceptives, check with physician (reliability may be affected).

| rifAXIMin  
| rif-ax-i-min  
| Xifaxan  
| Zaxine  

**CLASSIFICATION**

PHARMACOTHERAPEUTIC: Anti-infective.
CLINICAL: Site-specific antibiotic.

Do not confuse rifAXIMin with rifAMP in.

**Uses**

**Precautions**
**Contraindications:** Hypersensitivity to rifAXIMin, other rifamycin antibiotics. 
**Cautions:** Severe hepatic impairment.

**Action**
Inhibits bacterial RNA synthesis by binding to a subunit of bacterial DNA-dependent RNA polymerase. **Therapeutic Effect:** Bactericidal.

**Pharmacokinetics**
Less than 0.4% absorbed after PO administration. Primarily excreted in feces. 
**Half-life:** 5.85 hrs.

**Lifespan considerations**

- **Pregnancy/Lactation:** Unknown if drug is distributed in breast milk. 
  **Children:** Safety and efficacy not established in pts younger than 12 yrs for traveler’s diarrhea; younger than 18 yrs for IBS-D. 
  **Elderly:** No age-related precautions noted.

**Interactions**

- **DRUG:** None significant. 
  **HERBAL:** None significant. 
  **FOOD:** None known. 
  **LAB VALUES:** None significant.

**Availability (Rx)**

- **Tablets:** 200 mg, 550 mg.

**Administration/handling**

**PO**
- Give without regard to food. 
- Do not break, crush, dissolve, or divide film-coated tablets.

**Indications/routes/dosage**
Traveler’s Diarrhea
PO: ADULTS, ELDERLY, CHILDREN 12 YRS AND OLDER: 200 mg 3 times/day for 3 days.

Hepatic Encephalopathy
PO: ADULTS, ELDERLY: 550 mg 2 times/day.

IBS-D
PO: ADULTS, ELDERLY: 550 mg 3 times/day for 14 days. May repeat up to 2 times if symptoms recur.

Dosage in Renal/Hepatic Impairment
No dose adjustment.

Side effects
Occasional (11%–5%): Flatulence, headache, abdominal discomfort, rectal tenesmus, defecation urgency, nausea. Rare (4%–2%): Constipation, fever, vomiting.

Adverse effects/toxic reactions
Hypersensitivity reaction, superinfection occur rarely.

Nursing considerations

Baseline assessment
Check baseline hydration status: skin turgor, mucous membranes for dryness, urinary status. Assess stool frequency, consistency.

Intervention/evaluation
Patient/family teaching

• Report if diarrhea worsens or if blood occurs in stool, fever develops within 48 hrs.

<table>
<thead>
<tr>
<th>rilpivirine</th>
<th>ril-pi-vir-een</th>
</tr>
</thead>
<tbody>
<tr>
<td>Edurant</td>
<td></td>
</tr>
</tbody>
</table>

Fixed-Combination(s)

**Complera:** rilpivirine/emtricitabine (an antiretroviral)/tenofovir (TDF) (an antiretroviral): 25 mg/200 mg/300 mg. **Odefsey:** rilpivirine/emtricitabine/tenofovir (TAF): 25 mg/200 mg/25 mg.

**CLASSIFICATION**

**PHARMACOTHERAPEUTIC:** Non-nucleoside reverse transcriptase inhibitor.

**CLINICAL:** Antiretroviral.

Do not confuse rilpivirine with delavirdine, etravirine, or nevirapine.

Uses

Used in combination with at least two other antiretroviral agents for treatment of HIV-1 infection in treatment-naive pts with HIV-1 RNA 100,000 copies/mL or less.

Precautions

**Contraindications:** Hypersensitivity to rilpivirine. Concurrent use of carBAMazepine, dexamethasone (greater than 1 dose), OXcarbazepine, PHENobarbital, phenytoin, proton pump inhibitors (see drug classification), rifabutin, rifAMPin, rifapentine, St. John’s wort. **Cautions:** Severe depressive disorders, medications that increase risk of prolongation of QT interval (torsades de pointes), hypokalemia, hypomagnesemia, pts with significant transaminase elevations, hepatitis B or C virus infection. Not for treatment-experienced pts.
**Action**

Inhibits HIV-1 replication by binding to HIV-1 reverse transcriptase. **Therapeutic Effect:** Interferes with HIV replication, slowing progression of HIV infection.

**Pharmacokinetics**

Readily absorbed after PO administration. Peak concentration: 4–5 hrs. Protein binding: 99.7%. Metabolized in liver. Excreted primarily in feces. **Half-life:** 50 hrs.

**Lifespan considerations**

**Pregnancy/Lactation:** Unknown if distributed in breast milk. HIV-infected mothers should not breastfeed infants due to risk of postnatal HIV transmission. **Children:** Safety and efficacy not established. **Elderly:** Caution due to higher risk of impaired renal/hepatic function.

**Interactions**

**DRUG:** CYP3A4 inducers (e.g., carBAMazaine, PHENobarbital, phenytoin, proton pump inhibitors, rifabutin, rifAMPin) may significantly decrease effectiveness. Antacids, H₂-receptor antagonists (e.g., cimetidine, famotidine) may decrease plasma concentration. CYP3A4 inhibitors (e.g., clarithromycin, ketoconazole, verapamil) may increase plasma concentration.

**HERBAL:** St. John’s wort may decrease concentration/effects.

**FOOD:** Grapefruit products may increase potential for torsades de pointes.

**LAB VALUES:** May increase serum creatinine, ALT, AST, bilirubin, cholesterol, triglycerides.

**Availability (Rx)**

**Tablets:** 25 mg.

**Administration/handling**

PO
Give with a meal. Administer antacids 2 hrs before or 4 hrs after rilpivirine; 
H₂-receptor antagonist 12 hrs before or 4 hrs after rilpivirine.

**Indications/routes/dosage**

**HIV Infection (in Combination with Other Antiretrovirals)**

**PO: ADULTS, ELDERLY, CHILDREN 12 YRS AND OLDER AND 35 KG OR GREATER:** 25 mg once daily with a meal. With rifabutin: increase to 50 mg once daily.

**Dosage in Renal/Hepatic Impairment**

No dose adjustment. Use caution with severe renal impairment.

**Side effects**

Occasional (3%): Headache, insomnia, rash. Rare (1%): Nausea, vomiting, abdominal pain, fatigue, dizziness, abnormal dreams.

**Adverse effects/toxic reactions**

Psychiatric disorders including depression, dysphoria, altered mood, suicidal ideation reported in 3% of pts. May prolong QT interval. May develop redistribution/accumulation of body fat (lipodystrophy) or immune reconstitution syndrome.

**Nursing considerations**

**Baseline assessment**

Obtain CBC, BMP, EKG, LFT, lipid panel, CD4 count, viral load. Receive full medication history including herbal products. Question for history of prolonged QT interval, torsades de pointes, psychiatric disorder.

**Intervention/evaluation**

Closely monitor for evidence of rash. Monitor CBC, renal function, LFT.
Patient/family teaching

- Offer emotional support.
- Take with food (optimizes absorption).
- Report any signs of depression, thoughts of suicide, decreased urine output, abdominal pain, yellowing of skin, darkened urine, clay-colored stools, chest tightness, difficulty breathing, palpitations.
- Report any newly prescribed medications.
- Rilpivirine does not cure HIV infection nor reduce risk of transmission to others.
- Continue to practice safe sex with barrier methods or practice abstinence.

risedronate
ris-**ed**-roe-nate

**Actonel**
Atelvia
Apo-Risedronate

Fixed-Combination(s)

**Actonel with Calcium:** risedronate/calcium: 35 mg/6 × 500 mg.

**CLASSIFICATION**

**PHARMACOTHERAPEUTIC:** Bisphosphonate.

**CLINICAL:** Calcium regulator.

*Do not confuse Actonel with Actos, or risedronate with alendronate.*

Uses

Precautions

**Contraindications:** Hypersensitivity to risedronate, other bisphosphonates (e.g.,
alendronate); inability to stand or sit upright for at least 30 min; abnormalities of esophagus that delay esophageal emptying. **Cautions:** GI diseases (duodenitis, dysphagia, esophagitis, gastritis, ulcers [drug may exacerbate these conditions]), severe renal impairment (CrCl less than 30 mL/min), hypocalcemia.

**Action**

Inhibits bone resorption by action on osteoclasts or osteoclast precursors. **Therapeutic Effect:** Decreases bone resorption (indirectly increases bone mineral density). **Paget’s Disease:** Inhibition of bone resorption causes a decrease (but more normal architecture) in bone formation.

**Pharmacokinetics**

Rapidly absorbed. Bioavailability decreased when administered with food. Protein binding: 24%. Not metabolized. Excreted unchanged in urine, feces. Not removed by hemodialysis. **Half-life:** 1.5 hrs (initial); 480 hrs (terminal).

**Lifespan considerations**

**Pregnancy/Lactation:** Unknown if distributed in breast milk. **Children:** Not indicated for use in this pt population. **Elderly:** No age-related precautions noted.

**Interactions**

**DRUG:** Antacids containing aluminum, calcium, magnesium; vitamin D may decrease absorption (avoid administration within 30 min of risedronate). **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** None significant.

**Availability (Rx)**

**Tablets:** 5 mg, 30 mg, 35 mg, 150 mg. **Tablets, Delayed-Release:** 35 mg.

**Administration/handling**
PO

Actonel:
• Administer 30–60 min before any food, drink, other oral medications to avoid interference with absorption.
• Give on empty stomach with full glass of plain water (not mineral water).
• Pt must avoid lying down for at least 30 min after swallowing tablet (assists with delivery to stomach, reduces risk of esophageal irritation).
• Give whole; do not break, crush, dissolve, or divide tablet.

Atelvia:
• Take in morning immediately following breakfast with at least 4 oz water.
• Remain upright for 30 min after taking dose.

Indications/routes/dosage

Paget’s Disease
PO: (Actonel): ADULTS, ELDERLY: 30 mg/day for 2 mos. Retreatment may occur after 2-mo post-treatment observation period.

Prophylaxis, Treatment of Postmenopausal Osteoporosis
PO: (Actonel): ADULTS, ELDERLY: 5 mg/day or 35 mg once wkly or 150 mg once monthly.

Treatment of Postmenopausal Osteoporosis
PO: (Atelvia): ADULTS, ELDERLY: 35 mg once wkly.

Treatment of Male Osteoporosis
PO: (Actonel): ADULTS, ELDERLY: 35 mg once wkly.

Glucocorticoid-Induced Osteoporosis
PO: (Actonel): ADULTS, ELDERLY: 5 mg/day.

Dosage in Renal Impairment
Not recommended with CrCl less than 30 mL/min.

**Dosage in Hepatic Impairment**
No dose adjustment.

**Side effects**

**Frequent (30%):** Arthralgia. **Occasional (12%–8%):** Rash, diarrhea, constipation, nausea, abdominal pain, dyspepsia, flu-like symptoms, peripheral edema. **Rare (5%–3%):** Bone pain, sinusitis, asthenia, dry eye, tinnitus.

**Adverse effects/toxic reactions**
Overdose produces hypocalcemia, hypophosphatemia, significant GI disturbances, osteonecrosis of jaw.

**Nursing considerations**

**Baseline assessment**
Assess symptoms of Paget’s disease (bone pain, bone deformities). Hypocalcemia, vitamin D deficiency must be corrected before therapy begins. Obtain baseline laboratory studies, esp. serum electrolytes, renal function. Verify pt is able to stand or sit upright for at least 30 min.

**Intervention/evaluation**
Check serum electrolytes (esp. calcium, ionized calcium, phosphorus, alkaline phosphatase levels). Monitor I&O, BUN, creatinine in pts with renal impairment.

**Patient/family teaching**
• Expected benefits occur only when medication is taken with full glass (6–8 oz) of plain water first thing in the morning and at least 30 min before first food, beverage, medication of the day. Any other beverage (mineral water, orange juice, coffee) significantly reduces absorption of medication.
• Do not lie down for at least 30 min after taking medication (potentiates delivery to stomach, reduces risk of esophageal irritation).
• Report swallowing difficulties, pain when swallowing, chest pain, new/worsening heartburn.
• Consider weight-bearing exercises; modify behavioral factors (cigarette smoking, alcohol consumption).
• Report jaw pain, incapacitating bone, joint, or muscle pain.

**CLASSIFICATION**

**PHARMACOTHERAPEUTIC:** Benzisoxazole derivative.

**CLINICAL:** Second-generation (atypical) antipsychotic.

■ **BLACK BOX ALERT** ■ Increased risk of mortality in elderly pts with dementia-related psychosis, mainly due to pneumonia, HF.

Do not confuse RisperDAL with Restoril, or risperiDONE with rOPINIRole.

**Uses**

**Precautions**
**Contraindications:** Hypersensitivity to risperiDONE. **Cautions:** Renal/hepatic impairment, seizure disorder, cardiac disease, recent MI, breast cancer or other prolactin-dependent tumors, suicidal pts, pts at risk for aspiration pneumonia. Parkinson’s disease, pts at risk for orthostatic hypotension, elderly pts, diabetes, decreased GI motility, urinary retention, BPH, xerostomia, visual problems, pts exposed to temperature extremes, preexisting myelosuppression, narrow-angle glaucoma; pts with high risk of suicide.

**Action**

May antagonize DOPamine, serotonin receptors in both CNS and periphery. **Therapeutic Effect:** Suppresses psychotic behavior.

**Pharmacokinetics**

Well absorbed from GI tract; unaffected by food. Protein binding: 90%. Metabolized in liver. Primarily excreted in urine. **Half-life:** 3–20 hrs; metabolite, 21–30 hrs (increased in elderly). **Injection:** 3–6 days.

**Lifespan considerations**

**Pregnancy/Lactation:** Unknown if drug crosses placenta or is distributed in breast milk. Breastfeeding not recommended. **Children:** Safety and efficacy not established in children younger than 13 yrs for schizophrenia, 10 yrs for bipolar mania, and 5 yrs for autistic disorder. **Elderly:** More susceptible to postural hypotension. Age-related renal/hepatic impairment may require dosage adjustment.

**Interactions**

**DRUG:** Alcohol, other CNS depressants (e.g., LORazepam, morphine, zolpidem) may increase CNS depression. **CarBA Mazepine** may decrease concentration. May decrease effects of **DOPamine agonists**, levodopa. **PARoxetine**, **FLUoxetine** may increase concentration, risk of extrapyramidal symptoms (EPS). **Antihypertensives** (e.g., amLODIPine, lisinopril, valsartan), beta blockers (e.g., carvedilol, metoprolol), calcium channel blockers (e.g., diltiaZEM, verapamil), diuretics (e.g., furosemide, HCTZ), doxepin, pramipexole, prazosin, **sildenafil** may increase hypotensive effect.
HERBAL: Gotu kola, kava kava, St. John’s wort, valerian may increase CNS depression. **FOOD:** None known. **LAB VALUES:** May increase serum prolactin, glucose, AST, ALT. May cause EKG changes.

**Availability (Rx)**

**Injection, Powder for Reconstitution (RisperDAL Consta):** 12.5 mg, 25 mg, 37.5 mg, 50 mg. **Oral Solution (RisperDAL):** 1 mg/mL. **Tablets (RisperDAL):** 0.25 mg, 0.5 mg, 1 mg, 2 mg, 3 mg, 4 mg. **Tablets (Orally Disintegrating [RisperDAL M-Tabs, RisperiDONE M-Tab]):** 0.25 mg, 0.5 mg, 1 mg, 2 mg, 3 mg, 4 mg.

**Administration/handling**

⚠️ Do not administer via IV route.

**IM**

**Reconstitution**
- Use only diluent and needle supplied in dose pack.
- Prepare suspension according to manufacturer’s directions.
- May be given up to 6 hrs after reconstitution, but immediate administration is recommended.
- If 2 min pass between reconstitution and injection, shake upright vial vigorously back and forth to resuspend solution.

**Rate of Administration**
- Inject IM into upper outer quadrant of gluteus maximus or into deltoid muscle in upper arm.

**Storage**
- Store at room temperature.

**PO**

- Give without regard to food.
- May mix oral solution with water, coffee, orange juice, low-fat milk. Do not mix with cola, tea.

**Orally Disintegrating Tablet**
- Remove from blister pack immediately before administration.
• Using gloves, place immediately on tongue.
• Tablet dissolves in seconds.
• Pt may swallow with or without liquid.
• Do not split or chew.

**Indications/routes/dosage**

**Schizophrenia**

**PO: ADULTS:** Initially, 1 mg twice daily. May increase gradually (1–2 mg/day at intervals of at least 24 hrs) to target dose of 6 mg/day. Range: 4–8 mg/day. **Maintenance:** Target dose of 4 mg once daily (range: 2–8 mg/day). **ELDERLY:** Initially, 0.5 mg twice daily. May increase slowly at increments of no more than 0.5 mg twice daily. Range: 2–6 mg/day. **CHILDREN 13–17 YRS:** Initially, 0.5 mg/day (as single daily dose). May increase by 0.5–1 mg/day at intervals of greater than 24 hrs to recommended dose of 3 mg/day.

**IM: ADULTS, ELDERLY:** Initially, 12.5–25 mg q2wks. **Maximum:** 50 mg q2wks. Dosage adjustments should not be made more frequently than every 4 wks.

**Bipolar Mania**

**PO: ADULTS, ELDERLY:** Initially, 2–3 mg as a single daily dose. May increase by 1 mg/day at 24-hr intervals. Range: 1–6 mg/day.

**PO: CHILDREN 10–17 YRS:** Initially, 0.5 mg/day. May increase by 0.5 mg/day at intervals of greater than 24 hrs to recommended dose of 2.5 mg/day.

**IM: ADULTS, ELDERLY:** 25 mg q2wks. **Maximum:** 50 mg q2wks. Dosage adjustments should not be made more frequently than every 4 wks.

**Autism**

**CHILDREN 5 YRS AND OLDER WEIGHING MORE THAN 19 KG:** Initially, 0.5 mg/day. May increase to 1 mg after 4 days. May further increase dose by 0.5 mg/day in greater than 2-wk intervals. Range: 0.5–3 mg/day.

**CHILDREN 5 YRS AND OLDER WEIGHING 15–19 KG:** Initially, 0.25 mg/day. May increase to 0.5 mg/day after 4 days. May further increase dose by 0.25 mg/day in greater than 2-wk intervals. Range: 0.5–3 mg/day.
Dosage in Renal/Hepatic Impairment

**Mild to moderate impairment:** No dose adjustment. **Severe impairment:** Initial dosage for adults, elderly pts is 0.5 mg twice daily. Dosage is titrated slowly to desired effect.

**Side effects**

**Frequent (26%–13%):** Agitation, anxiety, insomnia, headache, constipation. **Occasional (10%–4%):** Dyspepsia, rhinitis, drowsiness, dizziness, nausea, vomiting, rash, abdominal pain, dry skin, tachycardia. **Rare (3%–2%):** Visual disturbances, fever, back pain, pharyngitis, cough, arthralgia, angina, aggressive behavior, orthostatic hypotension, breast swelling.

**Adverse effects/toxic reactions**

Rare reactions include tardive dyskinesia (characterized by tongue protrusion, puffing of the cheeks, chewing or puckering of mouth), neuroleptic malignant syndrome (hyperpyrexia, muscle rigidity, altered mental status, irregular pulse or B/P, tachycardia, diaphoresis, cardiac arrhythmias, rhabdomyolysis, acute renal failure). Hyperglycemia, life-threatening events such as ketoacidosis and hyperosmolar coma, death have been reported.

**Nursing considerations**

**Baseline assessment**

Renal function test, LFT should be performed before therapy begins. Assess behavior, appearance, emotional status, response to environment, speech pattern, thought content, baseline weight. Obtain fasting serum glucose, CBC.

**Intervention/evaluation**

Monitor B/P, heart rate, weight, LFT, EKG. Monitor for fine tongue movement (may be first sign of tardive dyskinesia, which may be irreversible). Monitor for suicidal ideation. Assess for therapeutic response (greater interest in surroundings, improved self-care, increased ability to concentrate, relaxed facial expression). Monitor for potential neuroleptic malignant syndrome: fever, muscle rigidity, irregular B/P or pulse, altered mental status. Monitor fasting
serum glucose periodically during therapy.

**Patient/family teaching**

- Avoid tasks that may require alertness, motor skills until response to drug is established (may cause dizziness/drowsiness).
- Avoid alcohol.
- Go from lying to standing slowly.
- Report trembling in fingers, altered gait, unusual muscular/skeletal movements, palpitations, severe dizziness/fainting, swelling/pain in breasts, visual changes, rash, difficulty breathing.

---

**Ritonavir**  
*rit-oh-na-veer*  
**Norvir**

**CLASSIFICATION**  
**PHARMACOTHERAPEUTIC:** Protease inhibitor.  
**CLINICAL:** Antiviral.

- **BLACK BOX ALERT** Concurrent use with other medications (nonsedating antihistamines, sedative hypnotics, antiarrhythmics, ergot alkaloids) may result in potentially serious, life-threatening events.

Do not confuse Norvir with Norvasc, or ritonavir with Retrovir.

---

**Uses**

Treatment of HIV infection in combination with other antiretroviral agents. May be used as "booster" for other protease inhibitors.

**Precautions**

**Contraindications:** Hypersensitivity to ritonavir. Due to potential serious and/or life-threatening drug interactions (e.g., arrhythmias, hematologic abnormalities, seizures), the following medications should not be given concomitantly with ritonavir: alfuzosin, amiodarone, colchicine (pts with renal/hepatic impairment), dihydroergotamine, ergotamine, dronedarone, ergonovine, flecainide, lovastatin,
lurasidone, methylergonovine, midazolam (oral), pimozide, propafenone, quiNIDine, sildenafil (when used for pulmonary arterial hypertension), simvastatin, St. John’s wort, triazolam, voriconazole (when ritonavir dose 800 mg or greater/day). **Cautions:** Hepatic impairment, cardiomyopathy, ischemic heart disease, preexisting cardiac conduction abnormalities, structural heart disease, pts with increased triglycerides, hemophilia A and B, diabetes, hepatitis B or C virus infection, medications that prolong PR interval, diabetes.

**Action**

Inhibits HIV-1 and HIV-2 proteases, rendering these enzymes incapable of processing polypeptide precursors, leading to production of noninfectious, immature HIV particles. **Therapeutic Effect:** Slows HIV replication, reducing progression of HIV infection.

**Pharmacokinetics**

Well absorbed (absorption increased with food). Protein binding: 98%–99%. Metabolized in liver. Primarily excreted in feces. Unknown if removed by hemodialysis. **Half-life:** 2.7–5 hrs.

**Lifespan considerations**

**Pregnancy/Lactation:** Breastfeeding not recommended (possibility of HIV transmission). **Children:** No age-related precautions noted in pts older than 1 month. **Elderly:** None known.

**Interactions**

**DRUG:** See contraindications. May increase concentration of clarithromycin, fluticasone, ketoconazole, protease inhibitors, sildenafil, statins. May decrease concentration/effects of methadone, phenytoin, warfarin. RifAMPin may decrease concentration/effects. **HERBAL:** St. John’s wort may decrease concentration/effects. **FOOD:** None known. **LAB VALUES:** May increase serum creatine kinase (CK), GGT, triglycerides, uric acid, ALT, AST, glucose. May decrease Hgb, Hct, WBC, neutrophils.

**Availability (Rx)**
Capsules: 100 mg. Oral Solution: 80 mg/mL.
Tablets: 100 mg.

Administration/handling

PO
• Store capsules in refrigerator. Store tablets, oral solution at room temperature.
• Protect from light.
• Give without regard to meals (preferably give with food).
• Give tablets whole; do not break, crush, dissolve, or divide.
• May improve taste of oral solution by mixing with chocolate milk, Ensure, Advera, Boost within 1 hr of dosing.

Indications/routes/dosage

Note: Not recommended as primary protease inhibitor in any regimen.

Treatment of HIV Infection
PO: ADULTS, CHILDREN 12 YRS AND OLDER: 600 mg twice daily. If nausea occurs at this dosage, decrease dose to 300 mg twice daily for 1 day, then increase by 100 mg twice daily every 2–3 days to recommended dose of 600 mg twice daily. CHILDREN 1 MO–11 YRS: Initially, 250 mg/m²/dose twice daily. Increase by 50 mg/m²/dose q2–3days up to 350–400 mg/m²/dose. Maximum: 600 mg/dose twice daily.

Booster Therapy
PO: ADULTS, ELDERLY: 100–400 mg/day (usually as 100–200 mg 1–2 times/day.)

Dosage in Renal Impairment
No dose adjustment.

Dosage in Hepatic Impairment
Mild to moderate impairment: No dose adjustment. Severe impairment: Not recommended.
Side effects

**Frequent:** GI disturbances (abdominal pain, anorexia, diarrhea, nausea, vomiting), circumoral and peripheral paresthesia, altered taste, headache, dizziness, fatigue, asthenia. **Occasional:** Allergic reaction, flu-like symptoms, hypotension. **Rare:** Hyperglycemia.

Adverse effects/toxic reactions

Hepatitis, pancreatitis occur rarely. May cause new-onset diabetes.

Nursing considerations

**Baseline assessment**

Pts beginning combination therapy with ritonavir and nucleosides may promote GI tolerance by beginning ritonavir alone, then subsequently adding nucleosides before completing 2 wks of ritonavir monotherapy. Obtain baseline laboratory testing, esp. LFT, triglycerides before beginning ritonavir therapy and at periodic intervals during therapy. Offer emotional support. Obtain full medication history and screen for contraindications/interactions.

**Intervention/evaluation**

Closely monitor for evidence of GI disturbances, neurologic abnormalities (particularly paresthesia). Monitor LFT, serum glucose, CD4 cell count, plasma levels of HIV RNA.

**Patient/family teaching**

• Continue therapy for full length of treatment.
• Doses should be evenly spaced.
• Ritonavir is not a cure for HIV infection, nor does it reduce risk of transmission to others.
• Pts may continue to acquire illnesses associated with advanced HIV infection.
• If possible, take ritonavir with food.
• Taste of solution may be improved when mixed with chocolate milk, Ensure, Advera, Boost.
• Report increased thirst, frequent urination, nausea, vomiting, abdominal pain.
riTUXimab
ri-tux-i-mab

Rituxan

CLASSIFICATION
PHARMACOTHERAPEUTIC: Monoclonal antibody.
CLINICAL: Disease-modifying antirheumatic drug (DMARD), antineoplastic.

BLACK BOX ALERT
Profound, occasionally fatal infusion-related reactions reported during first 30–120 min of first infusion. Tumor lysis syndrome leading to acute renal failure may occur 12–24 hrs following first dose. Severe, sometimes fatal, mucocutaneous reactions resulting in multifocal leukoencephalopathy (PML) and death reported.

Do not confuse Rituxan with Remicade, or riTUXimab with bevacizumab or inFLIXimab, brentuximab, ruxolitinib.

Uses
Treatment of CD20-positive non-Hodgkin’s lymphomas (NHL): Relapsed or refractory, low-grade, or follicular B-cell NHL; follicular B-cell NHL (previously untreated); nonprogressive, low-grade B-cell NHL; diffuse large B-cell NHL, previously untreated. Treatment of CD20-positive chronic lymphocytic leukemia (CLL). Treatment of moderate to severe active rheumatoid arthritis (RA) in combination with methotrexate. Treatment of granulomatosis with polyangiitis (GPA). Treatment of microscopic polyangiitis (MPA). OFF-LABEL: Treatment of autoimmune hemolytic anemia, chronic immune thrombocytopenic purpura (ITP), systemic autoimmune disease (other than rheumatoid arthritis), Burkitt’s lymphoma, CNS lymphoma, Hodgkin’s lymphoma.

Precautions
Contraindications: Hypersensitivity to riTUXimab, murine proteins. Cautions: Pts at risk for tumor lysis syndrome. Cardiac disease, elderly pts, pulmonary disease, renal impairment, severe active infection; history of hepatitis B virus
infection.

**Action**

Binds to CD20, the antigen found on surface of B lymphocytes, B-cell non-Hodgkin’s lymphoma (NHL). Activates B-cell cytotoxicity. **Therapeutic Effect:** Produces cytotoxicity, reduces tumor size. Signs/symptoms of rheumatoid arthritis are reduced; structural damage delayed.

**Pharmacokinetics**

Rapidly depletes B cells. **Half-life:** 59.8 hrs after first infusion, 174 hrs after fourth infusion.

**Lifespan considerations**

**Pregnancy/Lactation:** Has potential to cause fetal B-cell depletion. Unknown if distributed in breast milk. Female pts of reproductive potential should use effective contraception during treatment and up to 12 mos after discontinuation. **Children:** Safety and efficacy not established. **Elderly:** Increased risk of cardiac/pulmonary adverse reactions.

**Interactions**

**DRUG:** Denosumab, tacrolimus may increase risk of adverse effects. May increase toxic effects of abatacept, belimumab, clozapine, leflunomide, natalizumab. Roflumilast may increase immunosuppressive effect. May increase immunosuppressive effect of deferiprone, fingolimod, tofacitinib. May decrease concentration/effect of nivolumab, sipuleucel-T. Trastuzumab may increase neutropenic effect. May decrease therapeutic effect of vaccines; increase risk of adverse effect of live vaccines. **HERBAL:** Echinacea may decrease therapeutic effect. **FOOD:** None known. **LAB VALUES:** May increase creatinine, LDH. May decrease Hgb, Hct, neutrophils, platelets, B-cell counts, immunoglobulin concentrations. May diminish diagnostic effect of *Coccidioides immitis* skin test.

**Availability (Rx)**
Injection Solution: 10 mg/mL (10 mL, 50 mL).

Administration/handling

**IV**

Do not give by IV push or bolus.

Reconstitution

- Dilute with 0.9% NaCl or D₅W to provide final concentration of 1–4 mg/mL into infusion bag.

Rate of Administration

- Initially infuse at rate of 50 mg/hr. If no hypersensitivity or infusion-related reaction, may increase infusion rate in 50 mg/hr increments q30min to maximum 400 mg/hr.
- Subsequent infusion can be given at 100 mg/hr and increased by 100 mg/hr increments q30min to maximum 400 mg/hr.

Storage

- Refrigerate vials.
- Diluted solution is stable for 24 hrs if refrigerated or at room temperature.

**IV incompatibilities**

Do not mix with any other medications.

Indications/routes/dosage

**Note:** Refer to specific protocols.

NHL (Relapsed/Refractory, Low-Grade or Follicular CD20-Positive B-cell)

**IV: ADULTS:** 375 mg/m² wkly for 4 or 8 doses.

NHL (Diffuse Large B-cell)

**IV: ADULTS:** 375 mg/m² on day 1 of each cycle up to 8 doses.

NHL (Follicular, CD20-Positive, B-cell, Previously Untreated)

**IV: ADULTS:** 375 mg/m² on day 1 of each cycle up to 8 doses. Maintenance
(single agent): 375 mg/m² q8 wks for 12 doses.

NHL (Nonprogressive, CD20-Positive, B-cell Following 6–8 Cycles of Cyclophosphamide, VinCRISTine, and PrednisoLONE [CVP Therapy])
**IV: ADULTS:** 375 mg/m² once wkly for 4 doses q6mos. **Maximum:** 16 doses.

NHL (Combination with Ibritumomab)
**IV: ADULTS:** 250 mg/m² day 1; repeat in 7–9 days with ibritumomab.

Rheumatoid Arthritis
**IV: ADULTS:** 1,000 mg every 2 wks times 2 doses in combination with methotrexate. May repeat course q24 wks (if needed, no sooner than 16 wks).

CLL
**IV: ADULTS:** 375 mg/m² in first cycle (on day prior to fludarabine/cyclophosphamide) and 500 mg/m² on day 1 in cycles 2–6, administered every 28 days.

GPA, MPA
**IV: ADULTS:** 375 mg/m² once wkly for 4 wks (in combination with methylPREDNISolone IV for 1–3 days, then daily prednisONE).

Dosage in Renal/Hepatic Impairment
No dose adjustment.

**Side effects**
**Frequent (49%–10%):** Fever, chills, nausea, asthenia, headache, angioedema, hypotension, rash/pruritus. **Occasional (Less Than 10%):** Myalgia, dizziness, weakness, abdominal pain, throat irritation, vomiting, neutropenia, rhinitis, bronchospasm, urticaria.

**Adverse effects/toxic reactions**
Hypersensitivity reaction produces hypotension, bronchospasm, angioedema. Arrhythmias may occur, particularly in pts with history of preexisting cardiac conditions.

**Nursing considerations**

**Baseline assessment**

Pretreatment with acetaminophen and diphenhydrAMINE before each infusion may prevent infusion-related effects. CBC should be obtained at regular intervals during therapy.

**Intervention/evaluation**

Monitor CBC, renal function, LFT. Diligently monitor for tumor lysis syndrome in pts with high tumor burden. Monitor for an infusion-related symptoms complex consisting mainly of fever, chills, rigors that generally occurs within 30 min–2 hrs of beginning first infusion. Slowing infusion resolves symptoms.

**Patient/family teaching**

- Report fever, sore throat, abdominal pain, yellowing of eyes/skin, unusual bruising/bleeding.

---

**rivaroxaban**

*rye-va-rox-a-ban*

**Xarelto**

**CLASSIFICATION**

**PHARMACOTHERAPEUTIC**: Factor Xa inhibitor.

**CLINICAL**: Anticoagulant.

- **BLACK BOX ALERT** Epidural/spinal hematomas may occur in pts receiving neuraxial anesthesia or spinal puncture, resulting in long-term or permanent paralysis. Factors increasing risk of epidural/spinal hematoma include indwelling epidural catheters, concomitant drugs such as NSAIDs, platelet inhibitors, other anticoagulants; history of traumatic or repeated spinal or epidural punctures, history of spinal deformity or spinal surgery. Monitor for signs and symptoms of neurologic impairment. Consider benefits and risks before neuraxial intervention in anticoagulated pts or
planned thromboprophylaxis. Increased risk of stroke may occur in pts with atrial fibrillation when discontinuing for reasons other than bleeding.

Do not confuse rivaroxaban with argatroban.

Uses

Precautions
Contraindications: Hypersensitivity to rivaroxaban. Active major bleeding. 
Cautions: Renal/hepatic impairment, pts at increased risk of bleeding (e.g., thrombocytopenia, stroke, severe uncontrolled hypertension), elderly pts; avoid use with heparin, low molecular weight heparin (LMWH), aspirin, warfarin, NSAIDs. Pts with prosthetic heart valves or significant rheumatic heart disease.

Action
Selectively blocks active site of factor Xa, a key factor in the intrinsic and extrinsic pathway of blood coagulation cascade. Inhibits platelet activation and fibrin clot formation. Therapeutic Effect: Inhibits blood coagulation.

Pharmacokinetics

Life span considerations
Pregnancy/Lactation: Crosses placenta. Use during pregnancy should be avoided. Unknown if excreted in breast milk. Children: Safety and efficacy not
established. **Elderly:** May be at increased risk for bleeding due to age-related renal impairment. Use caution.

### Interactions

**DRUG:** CYP3A4 inhibitors (e.g., ketoconazole, clarithromycin, ritonavir) may increase concentration, risk of bleeding. **Anticoagulants** (e.g., heparin, warfarin), **antiplatelets** (e.g., aspirin, clopidogrel), **NSAIDs** (e.g., ibuprofen, ketorolac, naproxen) may increase bleeding risk. **HERBAL:** St. John’s wort may decrease effect. **FOOD:** Grapefruit products may increase risk of bleeding. **LAB VALUES:** May decrease platelets. May increase serum ALT, AST, bilirubin.

### Availability (Rx)

**Tablets:** 10 mg, 15 mg, 20 mg.

### Administration/handling

**PO**

- Administer doses of 15 mg or greater with food; doses of 10 mg/day may be given without regard to food.
- **DVT prophylaxis** (knee, hip): Give without regard to meals.
- **Nonvalvular atrial fibrillation:** Give with evening meal.

### Indications/routes/dosage

**Note:** Avoid in pts with BMI greater than 40 kg/m² or weight greater than 120 kg due to lack of clinical data in this population.

**DVT Prophylaxis, Knee Replacement**

**PO:** **ADULTS:** 10 mg daily for minimum 10–14 days up to 35 days. Initiate at least 6–10 hrs after surgery once hemostasis established. **CrCl less than 30 mL/min:** Avoid use.

**DVT Prophylaxis, Hip Replacement**
**PO: ADULTS:** 10 mg daily for 10–14 days (minimum) up to 35 days. Initiate at least 6–10 hrs after surgery once hemostasis established. **CrCl less than 30 mL/min:** Avoid use.

**Nonvalvular Atrial Fibrillation**

**PO: ADULTS:** **CrCl greater than 50 mL/min:** 20 mg daily. **CrCl 15–50 mL/min:** 15 mg daily. **CrCl less than 15 mL/min:** Avoid use.

**Treatment of DVT/PE**

**PO: ADULTS, ELDERLY:** 15 mg twice daily for 3 wks, then 20 mg once daily.

**Reduce Risk of DVT/PE (After 6 mos Treatment)**

**PO: ADULTS, ELDERLY:** 10 mg once daily up to 6–12 mos.

**Dosage in Renal Impairment**

**CrCl less than 30 mL/min:** Avoid use in DVT/PE, postoperative thromboprophylaxis. **Nonvalvular atrial fibrillation:** **CrCl 15–50 mL/min:** 15 mg once daily with evening meal. **CrCl less than 15 mL/min:** Avoid use.

**Dosage in Hepatic Impairment**

**Mild impairment:** No dose adjustment. **Moderate to severe impairment:** Avoid use.

**Side effects**

**Rare (3%–1%):** Wound secretion/oozing, extremity pain, muscle spasm, syncope, pruritus.

**Adverse effects/toxic reactions**

Increased risk of bleeding/hemorrhagic events including retroperitoneal hemorrhage, cerebral hemorrhage, subdural hematoma, epidural/spinal hematoma (esp. with epidural catheters, spinal trauma). Serious reactions including jaundice, cholestasis, cytoytic hepatitis, Stevens-Johnson syndrome, hypersensitivity reaction, anaphylaxis reported.
Nursing considerations

Baseline assessment
Obtain CBC, serum chemistries, PT/INR, vital signs, urine pregnancy if applicable. Obtain EKG for pts with a history of atrial fibrillation. Question for history of bleeding disorders, recent surgery, spinal punctures, intracranial hemorrhage, bleeding ulcers, open wounds, anemia, renal/hepatic impairment. Receive full medication history including herbal products.

Intervention/evaluation
Monitor CBC, serum chemistries, renal function, occult urine/stool. Be alert for complaints of abdominal/back pain, headache, confusion, weakness, vision change (may indicate hemorrhage). Question for increased menstrual bleeding/discharge. Assess peripheral pulses; skin for ecchymosis, petechiae. Check for excessive bleeding from minor cuts, scratches. Assess urine output for hematuria. Immediately report suspected pregnancy.

Patient/family teaching
• Do not take/discontinue any medication except on advice of physician.
• Avoid alcohol, aspirin, NSAIDs.
• Consult physician before surgery, dental work.
• Use electric razor, soft toothbrush to prevent bleeding.
• Report any unusual bleeding/bruising, spinal/epidural hematomas (e.g., tingling, numbness, muscular weakness).
• Report if pregnant or planning to become pregnant.
• Avoid grapefruit products.

rivastigmine
triv-a-stig-meen
Apo-Rivastigmine
Exelon
Novo-Rivastigmine

CLASSIFICATION
PHARMACOTHERAPEUTIC: Acetylcholinesterase inhibitor.
**CLINICAL:** Anti-Alzheimer’s dementia agent.

**Uses**
Treatment of mild to severe dementia of Alzheimer’s or mild to moderate dementia of Parkinson’s disease. **OFF-LABEL:** Lewy body dementia.

**Precautions**
**Contraindications:** Hypersensitivity to rivastigmine, other carbamate derivatives (e.g., neostigmine), history of application site reactions with rivastigmine patch. **Cautions:** Peptic ulcer disease, concurrent use of NSAIDs, sick sinus syndrome, bradycardia or supraventricular conduction defects, urinary obstruction, seizure disorders, asthma, COPD, pts with body weight less than 50 kg.

**Action**
Increases acetylcholine in CNS by inhibiting hydrolysis by cholinesterase. **Therapeutic Effect:** Slows progression of symptoms of Alzheimer’s disease, dementia of Parkinson’s disease.

**Pharmacokinetics**
Rapidly, completely absorbed. Protein binding: 40%. Widely distributed throughout body. Rapidly, extensively metabolized. Primarily excreted in urine. **Half-life:** 1.5 hrs.

**Lifespan considerations**
**Pregnancy/Lactation:** Unknown if distributed in breast milk. **Children:** Not indicated for use in this pt population. **Elderly:** No age-related precautions noted.

**Interactions**
**DRUG:** May interfere with anticholinergics (e.g., dicyclomine, glycopyrrolate, scopolamine) effects. May have additive effect with
bethanechol. NSAIDs may increase GI effects, irritation. HERBAL: Ginkgo biloba may increase cholinergic effects. FOOD: None known. LAB VALUES: None significant.

Availability (Rx)

Solution, Oral: 2 mg/mL. Transdermal Patch: 4.6 mg/24 hrs, 9.5 mg/24 hrs, 13.3 mg/24 hrs. Capsules: 1.5 mg, 3 mg, 4.5 mg, 6 mg.

Administration/handling

PO
• Give morning and evening doses with food.
• Give capsule whole.
• Oral Solution: May swallow directly from syringe or mixed with water, soda, or cold fruit juice. Stir well; use within 4 hrs of mixing.

Transdermal Patch
• May apply the day following the last oral dose.
• Apply to upper or lower back, upper arm, or chest.
• Avoid reapplication to same spot of skin for 14 days.
• Do not apply to red, irritated, or broken skin.
• Avoid eye contact.
• After removal, fold patch to press adhesive together and discard.

Indications/routes/dosage

Alzheimer’s Dementia (Mild to Moderate)
PO: ADULTS, ELDERLY: Initially, 1.5 mg twice daily. May increase at intervals of at least 2 wks to 3 mg twice daily, then 4.5 mg twice daily, and finally 6 mg twice daily. Maximum: 6 mg twice daily. Transdermal: Initially, 4.6 mg/24 hrs. May increase at intervals of at least 4 wks to 9.5 mg/24 hrs and then to 13.3 mg/24 hrs.
Alzheimer’s Dementia (Severe)

**Transdermal:** **ADULTS, ELDERLY:** Initially, 4.6 mg/24 hrs. May increase at intervals of at least 4 wks to 9.5 mg/24 hrs and then to 13.3 mg/24 hrs.

Parkinson’s Dementia

**PO:** **ADULTS, ELDERLY:** Initially, 1.5 mg twice daily. May increase at intervals of at least 4 wks to 3 mg twice daily, then 4.5 mg twice daily, and finally 6 mg twice daily. **Maximum:** 6 mg twice daily. **Transdermal Dosage: Note:** Initially, 4.6 mg/24 hrs. May increase after 4 wks to 9.5 mg/24 hrs and then to 13.3 mg/24 hrs.

**Dosage in Renal Impairment**

No dose adjustment.

**Dosage in Hepatic Impairment**

**Oral:** No dose adjustment. **Transdermal:** Maximum dose: 4.6 mg/24 hrs.

**Side effects**

**Frequent (47%–17%):** Nausea, vomiting, dizziness, diarrhea, headache, anorexia. **Occasional (13%–6%):** Abdominal pain, insomnia, dyspepsia (heartburn, indigestion, epigastric pain), confusion, UTI, depression. **Rare (5%–3%):** Anxiety, drowsiness, constipation, malaise, hallucinations, tremor, flatulence, rhinitis, hypertension, flu-like symptoms, weight loss, syncope.

**Adverse effects/toxic reactions**

Overdose can produce cholinergic crisis, characterized by severe nausea/vomiting, increased salivation, diaphoresis, bradycardia, hypotension, respiratory depression, seizures.

**Nursing considerations**

**Baseline assessment**

Obtain baseline vital signs. Assess history for peptic ulcer, urinary obstruction,
asthma, COPD, cardiac disease. Assess cognitive, behavioral, functional deficits.

**Intervention/evaluation**
Monitor for cholinergic reaction: GI discomfort/cramping, feeling of facial warmth, excessive salivation, diaphoresis, lacrimation, pallor, urinary urgency, dizziness. Monitor for nausea, diarrhea, headache, insomnia.

**Patient/ family teaching**
- Take with meals (at breakfast, dinner).
- Swallow capsule whole. Do not break, chew, or divide capsules.
- Report nausea, vomiting, diarrhea, diaphoresis, increased salivary secretions, severe abdominal pain, dizziness.

</table>

**CLASSIFICATION**

**PHARMACOTHERAPEUTIC**: Serotonin 5-HT₁ receptor agonist.

**CLINICAL**: Antimigraine.

**Uses**
Treatment of acute migraine headache with or without aura.

**Precautions**

**Contraindications**: Hypersensitivity to rizatriptan. Basilar or hemiplegic migraine, history of stroke or transient ischemic attack; severe cardiovascular disease, coronary artery vasospasm, peripheral vascular disease, ischemic bowel disease, uncontrolled hypertension, use within 24 hrs of ergotamine-containing preparations or another serotonin receptor agonist, MAOI use within 14 days.
**Cautions:** Mild to moderate renal/hepatic impairment, dialysis pts, elderly pts, pt profile suggesting cardiovascular risks (e.g., hypertension, diabetes, hypercholesterolemia).

**Action**
Binds selectively to serotonin 5-HT$_1$ receptors in cranial arteries producing vasoconstriction. **Therapeutic Effect:** Relieves migraine headache.

**Pharmacokinetics**
Well absorbed after PO administration. Protein binding: 14%. Crosses blood-brain barrier. Metabolized by liver. Excreted primarily in urine (82%), feces (12%). **Half-life:** 2–3 hrs.

**Lifespan considerations**

**Pregnancy/Lactation:** Unknown if drug is distributed in breast milk. **Children:** Safety and efficacy not established. **Elderly:** No age-related precautions noted.

**Interactions**
**DRUG:** Ergotamine-containing medications may produce vasospastic reaction. **FLUoxetine, fluvoxamine, PARoxetine, sertraline** may produce hyperreflexia, incoordination, weakness. **MAOIs (e.g., phenelzine, selegiline), propranolol** may dramatically increase concentration (avoid concurrent use). **HERBAL:** None significant. **FOOD:** All foods delay peak drug concentration by 1 hr. **LAB VALUES:** None significant.

**Availability (Rx)**
**Tablets (Maxalt):** 5 mg, 10 mg. **Tablets (Orally Disintegrating [Maxalt-MLT]):** 5 mg, 10 mg.

**Administration/handling**

**PO**
• Orally disintegrating tablet is packaged in individual aluminum pouch.
• Open packet with dry hands.
• Place tablet onto tongue, allow to dissolve, swallow with saliva. Administration with water is not necessary.

**Indications/routes/dosage**

**Acute Migraine Headache**

**PO: ADULTS OLDER THAN 18 YRS, ELDERLY:** 5–10 mg. If significant improvement is not attained, dose may be repeated after 2 hrs. **Maximum:** 30 mg/24 hrs. (Use 5 mg/dose in pts taking propranolol with maximum of 15 mg/24 hrs.) **CHILDREN 6–17 YRS WEIGHING 40 KG OR GREATER:** 10 mg as single dose. (Maximum 5 mg as single dose with propranolol.)  **WEIGHING LESS THAN 40 KG:** 5 mg as a single dose. (Not recommended if taking propranolol.)

**Dosage in Renal/Hepatic Impairment**

No dose adjustment.

**Side effects**

**Frequent (9%–7%):** Dizziness, drowsiness, paresthesia, fatigue.  **Occasional (6%–3%):** Nausea, chest pressure, dry mouth.  **Rare (2%):** Headache; neck, throat, jaw pressure; photosensitivity.

**Adverse effects/toxic reactions**

Cardiac reactions (ischemia, coronary artery vasospasm, MI), noncardiac vasospasm-related reactions (hemorrhage, CVA) occur rarely, particularly in pts with hypertension, diabetes, strong family history of coronary artery disease, obesity, smokers, males older than 40 yrs, postmenopausal women.

**Nursing considerations**

**Baseline assessment**

Question for history of peripheral vascular disease, renal/hepatic impairment.
Question pt regarding onset, location, duration of migraine, possible precipitating symptoms.

**Intervention/evaluation**

Monitor for evidence of dizziness. Assess for photophobia, phonophobia (sound sensitivity, nausea, vomiting), relief of migraine headache.

**Patient/family teaching**

- Take single dose as soon as symptoms of an actual migraine headache appear.
- Medication is intended to relieve migraine, not to prevent or reduce number of attacks.
- Avoid tasks that require alertness, motor skills until response to drug is established.
- Report immediately if palpitations, pain/tightness in chest/throat, pain/weakness of extremities occurs.
- Do not remove orally disintegrating tablet from blister pack until just before dosing.
- Use protective measures against exposure to UV light, sunlight (sunscreen, protective clothing).

---

**roflumilast**

roe-floo-mi-last

**Daliresp**

**Daxas**

♦ **CLASSIFICATION**

**PHARMACOTHERAPEUTIC:** Phosphodiesterase 4 (PDE4) inhibitor.

**CLINICAL:** Anti-COPD agent.

---

**Uses**

Adjunct to bronchodilator therapy for maintenance treatment of severe COPD associated with chronic bronchitis and history of exacerbations.

**Precautions**
**Contraindications:** Hypersensitivity to roflumilast. Moderate to severe hepatic impairment. **Cautions:** Mild hepatic impairment, history of depression, suicidal ideation. Not indicated as bronchodilator or for relief of acute bronchospasm.

**Action**

Selectively inhibits PDE4, causing an accumulation of cyclic AMP within inflammatory/structural cells necessary in pathogenesis of COPD. Produces anti-inflammatory effects. **Therapeutic Effect:** Reduces risk of exacerbation of COPD/chronic bronchitis.

**Pharmacokinetics**

Readily absorbed after PO administration. Maximum plasma concentration: 0.5–2 hrs. Protein binding: 99%. Metabolized in liver. Primarily excreted in urine (70%). **Half-life:** 17 hrs.

**Lifespan considerations**

**Pregnancy/Lactation:** Unknown if distributed in breast milk. Not recommended for nursing mothers. **Children:** Safety and efficacy not established. **Elderly:** No age-related precautions noted.

**Interactions**

**DRUG:** CYP3A4 inducers (e.g., carBAMazepine, phenytoin, rifAMPin) may decrease efficacy. CYP3A4 inhibitors (e.g., erythromycin, ketoconazole) may increase concentration. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** None significant.

**Availability (Rx)**

**Tablets:** 500 mcg.

**Administration/handling**

**PO**

- Give without regard to food.
Indications/routes/dosage

Adjunct in Severe COPD
PO: ADULTS, ELDERLY: 500 mcg once daily.

Dosage in Renal Impairment
No dose adjustment.

Dosage in Hepatic Impairment
Mild impairment: No dose adjustment. Moderate to severe impairment: Contraindicated.

Side effects
Occasional (10%–4%): Diarrhea, nausea, headache. Rare (3%–2%): Back pain, flu-like symptoms, insomnia, dizziness, decreased appetite, vomiting, abdominal pain, rhinitis, muscle spasm, tremor, dyspepsia.

Adverse effects/toxic reactions
Psychiatric events including worsening depression, suicidal ideation, anxiety reported in less than 2% of pts. Moderate to severe weight loss may result in discontinuation.

Nursing considerations

Baseline assessment
Assess vital signs, O₂ saturation, lung sounds, body weight. Question for history of depression, anxiety, suicidal ideation, dehydration, COPD, hepatic impairment. Assess plans for breastfeeding. Obtain full medication history.

Intervention/evaluation
Monitor vital signs, O₂ saturation, mental status, body weight. Assess for dehydration if diarrhea occurs (skin turgor, mucous membranes, decreased urine output, dizziness, dry mouth).
**Patient/family teaching**

- Report changes in mood or behavior, thoughts of suicide, insomnia, anxiety.
- Report any weight loss.
- Increase fluid intake if dehydration is suspected.
- Worsening cough, fever, difficulty breathing may indicate exacerbation/infection.
- Immediately report if pregnancy is suspected.

---

**rolapitant**

roe-la-pi-tant

**Varubi**

**CLASSIFICATION**

**PHARMACOTHERAPEUTIC:** Substance P/neurokinin (P/NK) receptor antagonist.

**CLINICAL:** Antinausea, antiemetic.

*Do not confuse rolapitant with aprepitant, fosaprepitant.*

---

**Uses**

Prevention of delayed nausea and vomiting associated with initial and repeat courses of emetogenic cancer chemotherapy, including, but not limited to, highly emetogenic chemotherapy, in combination with other antiemetic agents.

---

**Precautions**

**Contraindications:** Hypersensitivity to rolapitant. Concomitant use of thioridazine. **Cautions:** Mild to moderate hepatic impairment, pts at risk for QT interval prolongation or ventricular arrhythmia (congenital long QT syndrome, medications that prolong QT interval, hypokalemia, hypomagnesemia). Not recommended in severe hepatic impairment.

---

**Action**

Antagonizes human substance P/NK₁ receptors. **Therapeutic Effect:** Decreases nausea and vomiting associated with chemotherapy.
Pharmacokinetics

Readily absorbed. Widely distributed. Metabolized in liver. Protein binding: greater than 99%. Peak plasma concentration: 4 hrs. Excreted in urine (14%), feces (73%). **Half-life**: 158 hrs.

*Lifespan considerations*

**Pregnancy/Lactation**: Safety and efficacy not established during pregnancy. Unknown if distributed in breast milk. **Children**: Safety and efficacy not established. **Elderly**: No age-related precautions noted.

Interactions

**DRUG**: Thioridazine may increase risk of torsades de pointes, QT internal prolongation (contraindicated). **Strong CYP3A inducers** (e.g., rifAMPin) may decrease concentration/effect. May increase concentration/effect of **BCRP substrates** (e.g., methotrexate, rosuvastatin), CYP2D6 substrates (e.g., pimozide), P-gp substrates (e.g., digoxin). QT interval–prolonging medications (e.g., amiodarone, azithromycin, ceritinib, haloperidol, moxifloxacin) may increase risk of QT interval prolongation, cardiac arrhythmias. **HERBAL**: St. John’s wort may decrease concentration/effect. **FOOD**: None significant. **LAB VALUES**: May decrease Hct, Hgb, neutrophils, RBC.

Availability (Rx)

Emulsion, IV: 166.5 mg/92.5 ml. Tablets: 90 mg.

Administration/handling

**IV**

**Rate of Administration**
- Infuse over 30 minutes. Do not dilute.
- Solution is compatible with 0.9% NaCl, D5W or Lactated Ringers via Y-site.

**Storage**
- Store at room temperature.
PO

• Administer approx. 1–2 hrs prior to chemotherapy.
• Give without regard to meals. Administer prior to initiation of each chemotherapy cycle at no less than 2-wk intervals.

Indications/routes/dosage

Chemotherapy-Associated Nausea/Vomiting

PO: ADULTS, ELDERLY: 180 mg once on day 1 (in combination with dexamethasone and a 5-HT₃ receptor antagonist). Do not give rolapitant at intervals of less than 2 wks.  IV: ADULTS, ELDERLY: 166.5 mg given within 2 hrs prior to initiation of chemotherapy on day 1.

Dosage in Renal Impairment

Mild to moderate impairment: No dose adjustment. Severe impairment: Not specified; use caution.

Dosage in Hepatic Impairment

Mild to moderate impairment: No dose adjustment. Severe impairment: Treatment not recommended.

Side effects

Occasional (9%–6%): Decreased appetite, hiccups, dizziness. Rare (4%–3%): Abdominal pain.

Adverse effects/toxic reactions

Torsades de pointes, QT prolongation reported in pts taking thioridazine concomitantly; avoid use. Baseline electrolyte imbalance may increase risk of arrhythmias.

Nursing considerations
Baseline assessment

Intervention/evaluation

Periodically monitor CBC, BMP. Monitor hydration, nutritional status, I&O. Correct electrolyte imbalances prior to each dose. If CYP2D6 substrate medications cannot be withheld, diligently monitor for QT interval prolongation, ventricular arrhythmias. Assist with ambulation if dizziness occurs. Assess for anemia-related symptoms.

Patient/family teaching

• Therapy may alter effectiveness of other drugs. Do not take any newly prescribed medications unless approved by doctor who originally started treatment.
• Report symptoms of arrhythmias such as chest pain, dizziness, fainting, fatigue, palpitations, shortness of breath.
• Do not take herbal products or ingest grapefruit products.
• Report persistent nausea, vomiting despite treatment.

| romiDEPsin |
| roe-mi-dep-sin |
| Istodax |

Uses

Treatment of refractory cutaneous T-cell lymphoma (CTCL) or refractory peripheral T-cell lymphoma (PTCL).
Precautions

Contraindications: Hypersensitivity to romiDEPsin. Caution: Moderate or severe hepatic impairment, end-stage renal impairment, preexisting cardiac disease, pts with QT interval prolongation, concomitant administration of medications prolonging QT interval, hypokalemia, hypomagnesemia. Avoid concomitant strong CYP3A4 inhibitors/inducers; caution with moderate CYP3A4 inhibitors or P-glycoprotein inhibitors.

Action

Inhibits histone deacetylase resulting in acetyl group accumulation, which alters chromatin structure, terminating cell growth. Therapeutic Effect: Induces cell-cycle arrest, cell death.

Pharmacokinetics

Extensively metabolized. Protein binding: 92%–94%. Half-life: 3 hrs.

Lifespan considerations

Pregnancy/Lactation: May cause fetal harm. Unknown if distributed in breast milk. Children: Safety and efficacy not established. Elderly: No age-related precautions noted.

Interactions

DRUG: Coumarin-derivative anticoagulants prolong PT, INR. Strong CYP3A4 inhibitors (e.g., clarithromycin, itraconazole, ritonavir) may increase concentration. Potent CYP3A4 inducers (e.g., carBAMazepine, PHENobarbital, rifabutin, rifAMPin) may decrease concentration. QT interval–prolonging medications (e.g., amiodarone, azithromycin, ceritinib, haloperidol, moxifloxacin) may increase risk of QT interval prolongation, cardiac arrhythmias. HERBAL: St. John’s wort may increase metabolism and decrease concentration. FOOD: Grapefruit products may increase concentration/effects. LAB VALUES: May decrease Hgb, Hct, WBC count, platelets, serum magnesium, calcium, potassium, sodium, albumin, phosphates. May increase serum glucose, ALT, AST, uric acid. May alter serum magnesium.
Availability (Rx)

Injection, Powder for Reconstitution, 2-Vial Kit: 10 mg.

Administration/handling

Reconstitution
• Reconstitute powder with 2 mL of supplied diluent (80% propylene glycol, 20% dehydrated alcohol).
• Swirl contents gently to dissolve powder.
• Reconstituted solution provides 5 mg/mL. Further dilute in 500 mL 0.9% NaCl.

Rate of Administration
• Infuse over 4 hrs.

Storage
• Reconstituted solution is stable for at least 24 hrs at room temperature.
• Solution appears clear, colorless. Discard if precipitate is present or solution is discolored.

Indications/routes/dosage

CTCL, PTCL

IV: ADULTS, ELDERLY: 14 mg/m² administered over 4 hrs on days 1, 8, and 15 of a 28-day cycle. Repeat cycles every 28 days if pt continues to benefit from and tolerates therapy.

Dose Modification

Hematologic Toxicity
Grade 3 or 4 neutropenia or thrombocytopenia: Delay treatment until ANC 1,500 cells/mm³ or more and/or platelets 75,000 cells/mm³ or more (or baseline), then resume at 14 mg/m².
Grade 4 neutropenia or thrombocytopenia requiring platelet transfusion: Delay treatment until recovered to grade 1 or 0 (or baseline), then permanently reduce dose to 10 mg/m².

Nonhematologic Toxicity (Excluding Alopecia)
Grade 2 or 3 toxicity: Delay treatment until recovered to grade 1 or 0 (or baseline); may restart at 14 mg/m².
Grade 4, recurrent grade 3 toxicity: Delay treatment until recovered to grade 1
or 0 (or baseline), then permanently reduce dose to 10 mg/m².

**Recurrent grade 3 or 4 toxicity (with dose reduction):** Permanently discontinue.

**Dosage in Renal Impairment**
No dose adjustment. Use caution in end-stage-renal disease.

**Dosage in Hepatic Impairment**
**Mild impairment:** No dose adjustment. **Moderate to severe impairment:** Use caution.

**Side effects**
**Frequent (57%–23%):** Nausea, fatigue, vomiting, anorexia. **Occasional (20%–7%):** Diarrhea, fever, distorted sense of taste, constipation, hypotension, pruritus. **Rare (4%–2%):** Dermatitis, T-wave and ST-wave changes on EKG.

**Adverse effects/toxic reactions**
Infection (47% of pts), including sepsis, arrhythmias, acute respiratory distress syndrome, acute renal failure. Anemia occurs in 19% of pts, thrombocytopenia in 17% of pts, neutropenia in 11% of pts.

**Nursing considerations**

**Baseline assessment**
Provide emotional support. Baseline CBC, BMP, LFT, PT/INR, serum magnesium, ionized calcium; capillary blood glucose; EKG should be obtained prior to therapy at baseline and routinely thereafter. Inform women of childbearing potential of risk to fetus if pregnancy occurs.

**Intervention/evaluation**
Calculate daily absolute neutrophil count (ANC). Closely monitor hematologic, chemistry parameters, EKG. Diligently monitor for infection. Provide antiemetics to control nausea/vomiting.
Patient/family teaching

- Diarrhea may cause dehydration, electrolyte depletion.
- Do not have immunizations without physician’s approval (lowers body’s resistance).
- Avoid contact with those who recently received live virus vaccine.
- Avoid crowds, those with infection.
- May reduce effectiveness of estrogen-containing contraceptives.
- Report excessive nausea or vomiting, palpitations, chest pain, shortness of breath. Seek immediate medical attention if unusual bleeding occurs.

romiPLOStim
roe-my-e-ploe-stim

Nplate

CLASSIFICATION
PHARMACOTHERAPEUTIC: Recombinant fusion protein, thrombopoietin receptor agonist.
CLINICAL: Hematologic agent.

Do not confuse romiPLOStim with romiDEPsin.

Uses

Treatment of thrombocytopenia in pts with chronic immune (idiopathic) thrombocytopenic purpura (ITP) who have had an insufficient response to corticosteroids, immunoglobulins, or splenectomy.

Precautions

Contraindications: Hypersensitivity to romiPLOStim. Cautions: Myelodysplastic syndrome, hematologic malignancy, hepatic impairment, history of cerebrovascular disease, concurrent anticoagulants or antiplatelet medication.

Action

Binds and activates thrombopoietin (TPO) receptors on hematopoietic cells. Therapeutic Effect: Increases platelet production.
Pharmacokinetics

Concentration is dependent on dose and baseline platelet count. Peak concentration occurs in 7–50 hrs (median, 14 hrs). **Half-life:** 1–34 days (median, 3.5 days).

Lifespan considerations

**Pregnancy/Lactation:** Studies suggest drug crosses placenta, is distributed in breast milk. **Children:** Safety and efficacy not established in pts younger than 18 yrs. **Elderly:** Age-related renal, hepatic, cardiac abnormalities may require dosage adjustment.

Interactions

**DRUG:** Anticoagulants (e.g., apixaban, heparin, warfarin), antiplatelets (e.g., aspirin, clopidogrel) may increase risk of bleeding. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** Increases platelet count.

Availability (Rx)

**Injection, Powder for Reconstitution:** 250-mcg, 500-mcg single-use vial.

Administration/handling

- Use syringe with 0.01-mL graduations for reconstitution.

SQ

**Reconstitution**
- Reconstitute 0.72 mL Sterile Water for Injection to 250-mcg single-use vial for final concentration of 500 mcg/mL.
- Reconstitute 1.2 mL Sterile Water for Injection to 500-mcg single-use vial for final concentration of 500 mcg/mL.
- Gently swirl and invert vial to reconstitute; do not shake.
- Dissolution takes less than 2 min.
- Inject at abdomen, thigh, upper arm.
- Do not inject at sites that are bruised, red, tender, or indurated.

**Storage**
- Refrigerate unreconstituted vial.
• Reconstituted solution can be kept at room temperature or refrigerated for up to 24 hrs.
• Protect reconstituted solution from light.
• Do not use if discolored or particulate is present.
• Discard unused portion.

Indications/routes/dosage

Thrombocytopenia

SQ: ADULTS, ELDERLY: Initially, 1 mcg/kg once wkly based on actual body weight. Adjust wkly doses by increments of 1 mcg/kg to achieve platelet count 50,000/mm$^3$ or greater and reduce risk of bleeding. Maximum: 10 mcg/kg wkly.

Dosage Adjustments

<table>
<thead>
<tr>
<th>Platelet Count</th>
<th>Dose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Less than 50,000/mm$^3$</td>
<td>Increase by 1 mcg/kg</td>
</tr>
<tr>
<td>Greater than 200,000/mm$^3$ for 2 consecutive wks</td>
<td>Reduce by 1 mcg/kg</td>
</tr>
<tr>
<td>Greater than 400,000/mm$^3$</td>
<td>Hold dose</td>
</tr>
</tbody>
</table>

Dosage in Renal/Hepatic Impairment

No dose adjustment.

Side effects

Frequent (35%–26%): Headache, arthralgia. Occasional (17%–6%): Dizziness, insomnia, myalgia, extremity pain, abdominal pain, shoulder pain, paresthesia, dyspepsia.

Adverse effects/toxic reactions

Reticulin fiber deposits within the bone marrow, progressing to bone marrow fibrosis may occur. Worsening thrombocytopenia may be noted. Discontinuation of therapy may result in thrombocytopenia of greater severity than baseline, increasing risk of bleeding. Thromboembolic effects may occur. Increases risk of hematologic malignancies.
Nursing considerations

**Baseline assessment**
Establish baseline CBC with differential prior to initiation, wkly during therapy and for 2 wks following discontinuation. Assess extent of RBC, WBC abnormalities. Question medical history as listed in Precautions.

**Intervention/evaluation**
Monitor CBC with differential wkly during dose adjustment phase and then monthly following establishment of a stable dose.

**Patient/family teaching**
- Report if bruising, bleeding occur.
- Essential to receive drug therapy at scheduled times or risk of bleeding may occur.

---

**Classifications**

**CLASSIFICATION**
PHARMACOTHERAPEUTIC: DOPamine agonist.
CLINICAL: Antiparkinson agent.

Do not confuse rOPINIRole with RisperDAL or risperiDONE.

---

**Uses**
Treatment of signs/symptoms of idiopathic Parkinson’s disease. **Immediate-release only:** Treatment of moderate to severe primary restless legs syndrome (RLS).

**Precautions**

**Contraindications:** Hypersensitivity to rOPINIRole. **Cautions:** History of
orthostatic hypotension, cardiovascular or cerebrovascular disease, syncope, hallucinations (esp. in elderly pts), concurrent use of CNS depressants, preexisting dyskinesia, hepatic or severe renal dysfunction (end-stage renal disease [ESRD]), major psychotic disorder, elderly pts.

**Action**

Stimulates postsynaptic DOPamine receptors in caudate putamen in the brain. **Therapeutic Effect:** Relieves signs/symptoms of Parkinson’s disease.

**Pharmacokinetics**

Rapidly absorbed after PO administration. Protein binding: 40%. Widely distributed. Extensively metabolized. Steady-state concentrations achieved within 2 days. Excreted in urine. Unknown if removed by hemodialysis. **Half-life:** 6 hrs.

**Lifespan considerations**

**Pregnancy/Lactation:** Distributed in breast milk. Drug activity possible in breastfeeding infant. **Children:** Safety and efficacy not established. **Elderly:** No age-related precautions noted, but hallucinations may occur more frequently.

**Interactions**

**DRUG:** Ciprofloxacin may increase concentration. **Alcohol, CNS depressants** (e.g., LORazepam, morphine, zolpidem) may increase CNS depressant effects. **HERBAL:** Gotu kola, kava kava, St. John’s Wort, valerian may increase CNS depression. **FOOD:** All foods delay peak plasma levels by 1 hr but do not affect drug absorption. **LAB VALUES:** May increase serum alkaline phosphatase.

**Availability (Rx)**

**Tablets:** 0.25 mg, 0.5 mg, 1 mg, 2 mg, 3 mg, 4 mg, 5 mg.

**Tablets, Extended-Release:** 2 mg, 4 mg, 6 mg, 8 mg, 12 mg.

**Administration/handling**
PO
• May give without regard to meals.
• Do not break, crush, dissolve, or divide extended-release tablets.

Indications/routes/dosage

Parkinson’s Disease

**PO: (Immediate-Release):** **ADULTS, ELDERLY:** Initially, 0.25 mg 3 times/day based on individual pt response. Dosage should be titrated with wkly increments as noted:

- **Week 1:** 0.25 mg 3 times/day; total daily dose: 0.75 mg.
- **Week 2:** 0.5 mg 3 times/day; total daily dose: 1.5 mg.
- **Week 3:** 0.75 mg 3 times/day; total daily dose: 2.25 mg.
- **Week 4:** 1 mg 3 times/day; total daily dose: 3 mg.

After week 4, may increase dose by 1.5 mg/day on wkly basis up to dose of 9 mg/day. May then further increase by 3 mg/day on wkly basis up to total dose of 24 mg/day (ESRD: 18 mg).

**(Extended-Release):** Initially, 2 mg once daily for 1–2 wks. May increase by 2 mg/day at 1 wk or longer interval. **Maximum:** 24 mg/day. ESRD: 18 mg.

Discontinuation Taper
Gradually taper over 7 days as follows: Decrease frequency from 3 times/day to twice daily for 4 days, then decrease from twice daily to once daily for remaining 3 days.

Restless Legs Syndrome

**PO: (Immediate-Release):** **ADULTS, ELDERLY:** 0.25 mg for days 1 and 2. May increase to 0.5 mg for days 3–7 and after 7 days to 1 mg daily. May further titrate upward in 0.5-mg increments q7days until reaching daily dose of 3 mg during week 6. Daily dose may be increased to maximum of 4 mg beginning week 7. Give all doses 1–3 hrs before bedtime. ESRD: 3 mg maximum.

Dosage in Renal/Hepatic Impairment
No dose adjustment. Use caution with severe renal impairment. Titrate cautiously in pts with hepatic impairment.
Side effects

**Frequent (60%–40%):** Nausea, dizziness, extreme drowsiness. **Occasional (12%–5%):** Syncope, vomiting, fatigue, viral infection, dyspepsia, diaphoresis, asthenia, orthostatic hypotension, abdominal discomfort, pharyngitis, abnormal vision, dry mouth, hypertension, hallucinations, confusion. **Rare (Less Than 4%):** Anorexia, peripheral edema, memory loss, rhinitis, sinusitis, palpitations, impotence.

Adverse effects/toxic reactions

Dyskinesia, impulsive/compulsive behavior (pathologic gambling, hypersexuality, binge eating) occur rarely.

Nursing considerations

**Baseline assessment**

**Parkinson’s disease:** Assess signs/symptoms (e.g., tremor, gait). **Restless legs syndrome:** Assess frequency of symptoms, sleep pattern.

**Intervention/evaluation**

Assess for clinical improvement, clinical reversal of symptoms (improvement of tremors of head/hands at rest, mask-like facial expression, shuffling gait, muscular rigidity). Assist with ambulation if dizziness occurs. Monitor B/P, daytime alertness.

**Patient/family teaching**

- Drowsiness, dizziness may be an initial response to drug.
- Postural hypotension may occur more frequently during initial therapy. Slowly go from lying to standing.
- Avoid tasks that require alertness, motor skills until response to drug is established.
- If nausea occurs, take medication with food.
- Hallucinations may occur, more so in the elderly than in younger pts with Parkinson’s disease.
- Report occurrence of falling asleep during activities of daily living, new or
worsening symptoms, changes in B/P, fainting, unusual urges.

• Avoid alcohol.

**Rosuvastatin**

*roe-soo-va-sta-tin*

*Apo-Rosuvastatin*  

**Crestor**

CLASSIFICATION  

PHARMACOTHERAPEUTIC: HMG-CoA reductase inhibitor.  

CLINICAL: Antihyperlipidemic.  

Do not confuse rosuvastatin with atorvastatin, lovastatin, nystatin, pitavastatin, or simvastatin.

**Uses**

Adjunct to diet therapy in pts with primary hyperlipidemia and mixed dyslipidemia; to decrease elevated total, LDL cholesterol, serum triglyceride levels; increases HDL. Adjunct to diet to slow progression of atherosclerosis in pts with elevated cholesterol. Treatment of primary dysbetalipoproteinemia, homozygous familial hypercholesterolemia (FH). Treatment of pts ages 10–17 yrs with heterozygous familial hypercholesterolemia (HeFH) to reduce elevated total cholesterol, LDL cholesterol, and apolipoprotein B. Primary prevention of cardiovascular disease (risk reduction of MI, stroke, arterial revascularization) without clinically evident CAD, but with multiple risk factors.

**Precautions**

Contraindications: Hypersensitivity to rosuvastatin. Active hepatic disease, breastfeeding, pregnancy, unexplained, persistent elevations of hepatic enzymes.  

Cautions: Anticoagulant therapy, hepatic impairment, substantial alcohol consumption, elective major surgery, renal impairment, acute renal failure, uncontrolled hypothyroidism, elderly pts.

**Action**

Interferes with cholesterol biosynthesis by inhibiting conversion of the enzyme
HMG-CoA to mevalonate, a precursor to cholesterol. **Therapeutic Effect:** Decreases LDL, VLDL, plasma triglyceride levels; increases HDL concentration.

**Pharmacokinetics**

Protein binding: 88%. Minimal hepatic metabolism. Primarily excreted in feces. **Half-life:** 19 hrs (increased in severe renal dysfunction).

**Lifespan considerations**

**Pregnancy/Lactation:** Contraindicated in pregnancy (suppression of cholesterol biosynthesis may cause fetal toxicity), lactation. Risk of serious adverse reactions in breastfeeding infants. **Children:** Safety and efficacy not established in children younger than 7 yrs. **Elderly:** No age-related precautions noted.

**Interactions**

**DRUG:** Aluminum- and magnesium-containing antacids may decrease concentration/effects. Increased risk of myopathy with **cycloSPORINE, fibrate, gemfibrozil, niacin.** May increase concentrations of **estradiol, ethinyl, norgestrel.** Enhances anticoagulant effect of **warfarin.** **HERBAL:** None significant. **FOOD:** **Red yeast rice** contains 2.4 mg **lovastatin** per 600 mg rice. **LAB VALUES:** May increase serum alkaline phosphatase, bilirubin, creatinine phosphokinase, glucose, transaminases. May produce hematuria, proteinuria.

**Availability (Rx)**

**Tablets:** 5 mg, 10 mg, 20 mg, 40 mg.

**Administration/handling**

**PO**

- Give without regard to meals. May give at any time of day.

**Indications/routes/dosage**
Hyperlipidemia, Dyslipidemia, Atherosclerosis, Dysbetalipoproteinemia, Primary Prevention of Cardiovascular Disease

PO: ADULTS, ELDERLY: Usual starting dosage is 10 mg/day, with adjustments based on lipid levels; monitor q2–4wks until desired level is achieved. Lower starting dose of 5 mg is recommended in pts of Asian ancestry. Maximum: 40 mg/day. Range: 5–40 mg/day.

FH
PO: ADULTS, ELDERLY: Initially, 20 mg/day. Range: 5–40 mg/day. Maximum: 40 mg/day. CHILDREN 7 YRS AND OLDER: 20 mg once daily.

HeFH

Concurrent CycloSPORINE Use
PO: ADULTS, ELDERLY: 5 mg/day maximum.

Concurrent Gemfibrozil, Atazanavir/Ritonavir, Lopinavir/Ritonavir or Simeprevir Therapy
PO: ADULTS, ELDERLY: Initially, 5 mg/day. 10 mg/day maximum.

Dosage in Renal Impairment (CrCl Less Than 30 mL/min)
PO: ADULTS, ELDERLY: 5 mg/day; do not exceed 10 mg/day.

Dosage in Hepatic Impairment
Contraindicated in active in liver disease.

Side effects
Generally well tolerated. Side effects are usually mild, transient. Occasional (9%–3%): Pharyngitis, headache, diarrhea, dyspepsia, nausea, depression. Rare (Less Than 3%): Myalgia, asthenia, back pain.
Adverse effects/toxic reactions
Potential for ocular lens opacities. Hypersensitivity reaction, hepatitis, rhabdomyolysis occur rarely.

Nursing considerations

Baseline assessment
Obtain dietary history, esp. fat consumption. Question for possibility of pregnancy. Assess baseline lab results: serum cholesterol, triglycerides, LFT.

Intervention/evaluation
Monitor serum cholesterol, HDL, LDL, triglycerides for therapeutic response. Lipid levels should be monitored within 2–4 wks of initiation of therapy or change in dosage. Monitor LFT at 12 wks following initiation of therapy, at any elevation of dose, and periodically (e.g., semiannually) thereafter. Monitor CPK if myopathy is suspected. Monitor daily pattern of bowel activity, stool consistency. Assess for headache, sore throat. Be alert for myalgia, weakness.

Patient/family teaching
• Use appropriate contraceptive measures.
• Periodic lab tests are essential part of therapy.
• Maintain appropriate diet (important part of treatment).
• Report unexplained muscle pain, tenderness, weakness, esp. if associated with fever, malaise.

rucaparib
roo-kap-a-rib
Rubraca
CLASSIFICATION
PHARMACOTHERAPEUTIC: Poly (ADP-ribose) polymerase (PARP) inhibitor.
CLINICAL: Antineoplastic.
Do not confuse rucaparib with nertinib, niraparib, olaparib.
**Uses**

Treatment of deleterious germline and/or somatic BRCA mutation–associated (detected by FDA-approved test) advanced ovarian cancer in pts who have been treated with two or more lines of chemotherapy.

**Precautions**

**Contraindications:** Hypersensitivity to rucaparib. **Cautions:** Baseline hematologic cytopenias (anemia, neutropenia, thrombocytopenia, lymphocytopenia).

**Action**

Inhibits poly (ADP-ribose) polymerase (PARP) enzymes (involved in DNA transcription, cell-cycle regulation, and DNA repair). By inhibiting PARP, may cause PARP DNA complexes resulting in DNA damage and cellular death. **Therapeutic Effect:** Inhibits tumor cell growth and metastasis.

**Pharmacokinetics**

Widely distributed. Metabolized in liver. Protein binding: 70%. Peak plasma concentration: 1.9 hrs. Excretion not specified. **Half-life:** 17–19 hrs.

**Lifespan considerations**

**Pregnancy/Lactation:** Avoid pregnancy; may cause fetal harm. Females of reproductive potential should use effective contraception during treatment and up to 6 mos after discontinuation. Unknown if distributed in breast milk. Breastfeeding not recommended during treatment and for at least 2 wks after discontinuation. **Children:** Safety and efficacy not established. **Elderly:** No age-related precautions noted.

**Interactions**

**DRUG:** May decrease effect of BCG vaccine. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** May increase serum ALT, AST, cholesterol, creatinine. May decrease ANC, Hgb, absolute lymphocyte count, platelets.
Availability (Rx)

Tablets: 200 mg, 250 mg, 300 mg.

Administration/handling

PO
• Give with or without food.
• If a dose is missed or vomiting occurs after administration, do not give extra dose. Administer next dose at regularly scheduled time.

Indications/Routes/Dosage

Note: Administer only to pts with deleterious germline and/or somatic BRCA mutation.

Ovarian Cancer

PO: ADULTS, ELDERLY: 600 mg twice daily about 12 hrs apart. Continue until disease progression or unacceptable toxicity.

Dose Reduction Schedule

Starting dose: 600 mg twice daily. First dose reduction: 500 mg twice daily. Second dose reduction: 400 mg twice daily. Third dose reduction: 300 mg twice daily.

Dose Modification

Adverse Events, Non-Hematologic Toxicity
Either withhold treatment or reduce dosage per dose reduction schedule.

Hematologic Toxicity
Withhold treatment until improved to CTCAE grade 1 or 0 and investigate cause. If myelodysplastic syndrome or acute myeloid leukemia confirmed, permanently discontinue.

Dosage in Renal Impairment
Mild to moderate impairment: No dose adjustment. Severe impairment, ESRD: Not specified; use caution.

Dosage in Hepatic Impairment
Mild impairment: No dose adjustment. Moderate to severe impairment: Not specified; use caution.

Side Effects
Frequent (77%–21%): Nausea, asthenia, fatigue, vomiting, constipation, dysgeusia, decreased appetite, diarrhea, abdominal pain, dyspnea. Occasional (17%–9%): Dizziness, rash, pyrexia, photosensitivity reaction, pruritus.

Adverse Effects/Toxic Reactions
Anemia, lymphopenia, neutropenia, thrombocytopenia are expected responses to therapy. Myelodysplastic syndrome/acute myeloid leukemia reported in less than 1% of pts. Infections including nasopharyngitis, pharyngitis, upper respiratory tract infection occurred in 43% of pts. Febrile neutropenia reported in less than 1% of pts. Palmar-plantar erythrodysesthesia syndrome (PPES), a chemotherapy-induced skin condition, that presents with redness, swelling, numbness, skin sloughing of the hands and feet, was reported in 2% of pts.

Nursing Considerations
Baseline Assessment
Obtain baseline CBC, vital signs, weight. Do not initiate therapy until pts have recovered from hematologic toxicities caused by previous chemotherapy. Obtain pregnancy test in females of reproductive potential. Question plans of breastfeeding. Question history of hepatic/renal impairment, hypercholesterolemia. Screen for risk of bleeding, active infection. Offer emotional support.

Intervention/Evaluation
Monitor CBC monthly; serum cholesterol, creatinine periodically. For prolonged hematologic toxicities caused by other chemotherapies, monitor CBC weekly
until recovery. If hematologic levels have not recovered to CTCAE grade 1 or 0 after 4 wks, consider hematology consultation for further investigations including bone marrow analysis, blood sample for cytogenetics. Diligently monitor for infection. Monitor for myelodysplastic syndrome, acute myeloid leukemia. Assess skin for rash, lesions, sloughing. Monitor for decreased urine output, renal dysfunction.

**Patient/Family Teaching**

- Treatment may depress your immune system response and reduce your ability to fight infection. Report symptoms of infection such as body aches, chills, cough, fatigue, fever. Avoid those with active infection.
- Report bleeding or bruising easily, bloody urine or stool, frequent infections, fatigue, shortness of breath, weakness, weight loss; may indicate acute bone marrow depression or acute leukemia.
- Avoid pregnancy; treatment may cause birth defects. Females of childbearing potential should use effective contraception during treatment and for at least 6 mos after last dose.
- Do not breastfeed during treatment and for at least 2 wks after final dose.
- Do not take herbal supplements.
- Report planned surgical/dental procedures.

**rufinamide**

rue-fin-a-myde

**Banzel**

CLASSIFICATION

PHARMACOTHERAPEUTIC: Triazole derivative.

CLINICAL: Anticonvulsant.

**Uses**

Adjunctive therapy in treatment of seizures associated with Lennox-Gastaut syndrome in adults and children 1 yr and older.

**Precautions**

**Contraindications:** Hypersensitivity to rufinamide. Familial short QT
syndrome. **Cautions:** Other drugs that shorten QT interval, clinical depression, pts at high risk for suicide, mild to moderate hepatic impairment (not recommended in pts with severe hepatic impairment), concurrent use with hormonal contraceptives.

**Action**

Modulates activity of sodium channels. Prolongs inactive state of the sodium channel in cortical neurons, limits sustained repetitive firing of sodium-dependent action potential, inhibiting excitatory neurotransmitter release. **Therapeutic Effect:** Decreases frequency/severity of seizure activity.

**Pharmacokinetics**

Well absorbed following PO administration. Protein binding: 34%. Extensively metabolized via hydrolysis. Excreted primarily in urine. **Half-life:** 6–10 hrs.

**Lifespan considerations**

**Pregnancy/Lactation:** May produce fetal skeletal abnormalities. May be distributed in breast milk. **Children:** Safety and efficacy not established in pts younger than 4 yrs. **Elderly:** Age-related renal, hepatic, or cardiac impairment may require initiation of therapy at low end of dosing range.

**Interactions**

**DRUG:** May increase concentration of PHENobarbital, phenytoin. May decrease concentration of carBAMazepine, lamoTRigine. **Valproate** may increase concentration. May decrease effects of estradiol, norethindrone. **Alcohol, CNS depressants (e.g., LORazepam, morphine, zolpidem)** may increase CNS depressant effect. **HERBAL:** Evening primrose may decrease seizure threshold. **FOOD:** None known. **LAB VALUES:** May decrease WBC count.

**Availability (Rx)**

**Oral Suspension:** 40 mg/mL. **Tablets, Film-Coated:** 200 mg, 400 mg.
Administration/handling

PO

• Give with food.
• Film-coated tablets may be cut or crushed for dosing flexibility.
• Shake oral suspension well before each dose; use bottle adapter and dosing syringes provided.

Indications/routes/dosage

Lennox-Gastaut Seizures

PO: ADULTS, ELDERLY: Initially, 400–800 mg/day, given in 2 equally divided doses. Dose should be increased by 400–800 mg/day every 2 days. Maximum: 3,200 mg/day, administered in 2 equally divided doses.

CHILDREN 1 YR AND OLDER: Treatment should be initiated at a daily dose of 10 mg/kg/day, given in 2 equally divided doses. Increase by 10-mg/kg increments every other day to a target dose of 45 mg/kg/day or 3,200 mg/day, whichever is less, administered in 2 equally divided doses.

Dosage in Renal Impairment

No dose adjustment.

Dosage in Hepatic Impairment

Mild to moderate impairment: Use caution. Severe impairment: Not recommended.

Side effects

CHILDREN: Frequent (27%–11%): Headache, dizziness, fatigue, nausea, drowsiness, diplopia. Occasional (6%–4%): Tremor, nystagmus, blurred vision, vomiting. Rare (3%): Ataxia, upper abdominal pain, anxiety, constipation, dyspepsia, back pain, gait disturbance, vertigo.

ADULTS: Frequent (17%–7%): Lethargy, vomiting, headache, fatigue, dizziness, nausea. Occasional (5%–4%): Influenza, nasopharyngitis, anorexia, rash, ataxia, diplopia. Rare (3%): Bronchitis, sinusitis, psychomotor
hyperactivity, upper abdominal pain, aggression, ear infection, inattention, pruritus.

**Adverse effects/toxic reactions**

Suicidal ideation or behavior occurs rarely, noted as early as 1 wk after initiation of therapy and persisting for at least 24 wks. Shortening of the QT interval (up to 20 msec), hypersensitivity reaction (rash, fever, urticaria) have been noted. Abrupt withdrawal may precipitate seizure, status epilepticus.

**Nursing considerations**

**Baseline assessment**

Review history of seizure disorder (intensity, frequency, duration, level of consciousness). Obtain baseline EKG. Initiate seizure precautions.

**Intervention/evaluation**

**Patient/family teaching**

- Do not abruptly withdraw medication (may precipitate seizures).
- Avoid tasks that require alertness, motor skills until response to drug is established.
- Strict maintenance of drug therapy is essential for seizure control.
- Avoid alcohol.
- Female pts of childbearing age should be informed that concurrent use of rufinamide with hormonal contraceptives may render contraceptive less effective; nonhormonal forms of contraception are recommended.
- Be alert for any unusual changes in mood/behavior (may increase risk of suicidal ideation/behavior).
Jakafi

**CLASSIFICATION**
**PHARMACOTHERAPEUTIC**: Kinase inhibitor.
**CLINICAL**: Antineoplastic.

**Uses**
Treatment of intermediate or high-risk myelofibrosis, including primary myelofibrosis, post–polycythemia vera myelofibrosis, post–essential thrombocythemia myelofibrosis. Treatment of polycythemia vera.

**Precautions**

**Contraindications**: Hypersensitivity to ruxolitinib. **Cautions**: Pts at risk for developing bacterial, fungal, or viral infections, renal/hepatic impairment, concomitant use of strong CYP3A4 inhibitors, history of bradycardia, conduction disturbances, ischemic heart disease, HF.

**Action**
Inhibits Janus-associated kinases (JAKs) JAK1 and JAK2, which mediate the signaling of cytokines and growth factor important for hematopoiesis and immune function. **Therapeutic Effect**: Reduces symptoms of myelofibrosis, including enlarged spleen.

**Pharmacokinetics**
Rapidly absorbed after PO administration. Widely distributed. Protein binding: 97%. Metabolized in liver. Excreted in urine (74%), feces (22%). **Half-life**: 3–5 hrs.

**Lifespan considerations**

**Pregnancy/Lactation**: Unknown if distributed in breast milk. Not recommended in nursing mothers. Must either discontinue drug or discontinue breastfeeding. **Children**: Safety and efficacy not established. **Elderly**: No age-related
precautions noted.

**Interactions**

**DRUG:** Strong CYP3A4 inhibitors (e.g., clarithromycin, cycloSPORINE, HIV protease inhibitors, ketoconazole) may increase concentration/effects.

**HERBAL:** None known. **FOOD:** Grapefruit products may increase concentration. **LAB VALUES:** May decrease platelets, RBC, Hgb, Hct, WBC. May increase serum bilirubin, ALT, AST, cholesterol.

**Availability (Rx)**

**Tablets:** 5 mg, 10 mg, 15 mg, 20 mg, 25 mg.

**Administration/handling**

**PO**

• Give without regard to food.

**Feeding tube**

• Suspend tablet in 40 mL water and stir for 10 min.
• May administer suspension within 6 hrs after tablet has dispersed.
• Flush with 75 mL water after administration.

**Indications/routes/dosage**

**Myelofibrosis**

**PO:** **ADULTS:** 20 mg twice daily if platelets greater than 200,000 cells/mm³, or 15 mg twice daily if platelets 100,000–200,000 cells/mm³, or 5 mg twice daily if platelets 50,000 to less than 100,000 cells/mm³. Dose reduction based on platelet response. **Maximum:** 25 mg twice daily.

**Polycythemia Vera**

**PO:** **ADULTS, ELDERLY:** Initially, 10 mg bid. Doses titrated based on safety/efficacy.
**Dosage in Renal/Hepatic Impairment**

Initial dose 10 mg bid.

</table>

### Side effects

**Frequent (23%–14%):** Bruising, dizziness, vertigo, labyrinthitis, headache.

**Occasional (9%–7%):** Weight gain, flatulence.

### Adverse effects/toxic reactions

May cause severe thrombocytopenia (70% of pts), anemia (96% of pts), neutropenia (18% of pts), which may improve with reduced dose or by temporarily withholding regimen. Anemic pts may require blood transfusions. Increased risk of developing opportunistic bacterial, mycobacterial, fungal, viral infections including herpes zoster, urinary tract infection, urosepsis, renal infection, pyuria. Increased risk of bleeding disorders including ecchymosis, hematoma, injection site hematoma, periorbital hematoma, petechiae, purpura.

### Nursing considerations

#### Baseline assessment

Obtain CBC, serum chemistries, renal function, LFT, urinalysis, cholesterol level. Assess recent vaccinations status. Receive full medication history
including herbal products. Question for possibility of pregnancy, renal/hepatic impairment, HIV.

**Intervention/evaluation**

Monitor CBC (every 2–4 wks until doses stabilized), serum chemistries, renal function, LFT, cholesterol. Obtain urinalysis with reflex culture for suspected UTI. Routinely assess vital signs, I&O, breath sounds, gait. Monitor temperature; be alert for fever, infectious process. Avoid IM injections, rectal temperatures, other traumas that induce bleeding. Assess skin for petechiae, hematoma, purpura.

**Patient/family teaching**

- Report any new bruising/bleeding, bloody stools or urine, fever, chills, rash, painful urination, suspected infection, fatigue, shortness of breath.
- Do not breastfeed.
- Avoid grapefruit products.
- Open skin lesions, blisters may signal herpes infection.
- Blood work will be routinely monitored; if on dialysis, take only following dialysis.
**sacubitril-valsartan**
sak-ue-bi-tril

**Entresto**

**CLASSIFICATION**

**PHARMACOTHERAPEUTIC:** Combination of sacubitril, a neprilysin inhibitor, and valsartan, an angiotensin II receptor blocker.

**CLINICAL:** Reduces risk of complications in HF.

- **BLACK BOX ALERT**
  - May cause fetal harm, mortality. Discontinue as soon as pregnancy detected.

**Uses**

To reduce the risk of cardiovascular death and hospitalization in pts with chronic HF (NYHA class II-IV) and reduced ejection fraction.

**Precautions**

**Contraindications:** Hypersensitivity to sacubitril or valsartan; history of angioedema related to angiotensin-converting enzyme (ACE) inhibitor or angiotensin receptor blockers (ARB); concomitant use or within 36 hrs of ACE inhibitors; concomitant use of aliskiren in pts with diabetes. **Cautions:** Baseline anemia, dehydration, hypovolemia, sodium depletion; concomitant use of potassium-sparing diuretics or potassium supplements; hepatic/renal impairment; unstented bilateral/unilateral renal artery stenosis; significant aortic/mitral stenosis. Pts with orthostatic hypotension.
**Action**

Sacubitril inhibits neprilysin, increasing peptide levels that are degraded by neprilysin (e.g., natriuretic peptides).Valsartan directly antagonizes angiotensin II receptors; blocks vasoconstrictor, aldosterone secreting effects of angiotensin II, inhibiting binding of angiotensin II to AT₁ receptors. **Therapeutic Effect:** Decreases risk of mortality in pts with chronic HF; produces vasodilation; decreases peripheral resistance; decreases B/P.

**Pharmacokinetics**

Widely distributed. Sacubitril is converted by esterases; not significantly metabolized after conversion. Valsartan is minimally metabolized in liver. Protein binding (both): 94%–97%. Peak plasma concentration: sacubitril: 30 min, valsartan: 1.5 hrs. Steady-state concentration: 3 days. Excretion: sacubitril: urine (52%–68%), feces (37%–48%); valsartan: feces (86%), urine (13%). **Half-life:** sacubitril: 1.4 hrs; valsartan: 9.9 hrs.

**Lifespan considerations**

**Pregnancy/Lactation:** Avoid pregnancy; may cause fetal harm/mortality. Unknown if distributed in breast milk. Must either discontinue drug or discontinue breastfeeding. **Children:** Safety and efficacy not established. **Elderly:** No age-related precautions noted.

**Interactions**

**DRUG:** ACE inhibitors (e.g., enalapril, ramipril) may increase risk of angioedema (contraindicated). Potassium-sparing diuretics (e.g., spironolactone) may increase risk of hyperkalemia. NSAIDs (e.g., ibuprofen, naproxen) may worsen renal function. May increase concentration/effect of lithium. **HERBAL:** Ginger, ginseng, licorice may worsen hypertension. **FOOD:** None known. **LAB VALUES:** May increase serum BUN, creatinine, potassium. May decrease Hct, Hgb.

**Availability (Rx)**

**Fixed-dose Combination Tablets:** sacubitril/valsartan: 24 mg/26 mg, 49 mg/51
mg, 97 mg/103 mg.

Administration/handling

PO
• Give without regard to food.

Indications/routes/dosage

HF
Note: Allow a 36-hr washout period when switching from or to an ACE inhibitor. After initial dose, may double dose as tolerated q2–4wks to target dose of 97 mg/103 mg.

PO: ADULTS, ELDERLY: (Previously taking high dose of ACE inhibitor [greater than 10 mg enalapril or equivalent] or ARB [greater than 160 mg valsartan or equivalent]): Initially, 49 mg/51 mg twice daily. (Previously taking low dose of ACE inhibitor [10 mg or less of enalapril or equivalent] or ARB): 24 mg/26 mg twice daily. (Not currently taking an ACE inhibitor or ARB): 24 mg/26 mg twice daily.

Dosage in Renal Impairment

PO: ADULTS, ELDERLY: Mild to moderate impairment: No dose adjustment. Severe impairment: Initially, 24 mg/26 mg twice daily. Maintenance: May double each dose every 2–4 wks up to 97 mg/103 mg twice daily based on tolerability.

Dosage in Hepatic Impairment

PO: ADULTS, ELDERLY: Mild impairment: No dose adjustment. Moderate impairment: Initially, 24 mg/26 mg twice daily. Maintenance: May double each dose every 2–4 wks up to 97 mg/103 mg twice daily based on tolerability. Severe impairment: Treatment not recommended.

Side effects

Occasional (9%): Cough, dizziness.
Adverse effects/toxic reactions

Angioedema (less than 1% of pts), hypotension (18% of pts), orthostatic hypotension (2% of pts), impairment/decrease in renal function due to inhibition of renin-angiotensin-aldosterone system (5% of pts), elevation of serum creatinine greater than 50% from baseline (1.4% of pts), renal impairment including oliguria, azotemia, acute renal failure (5% of pts), hyperkalemia (12% of pts), serum potassium elevation greater than 5.5 mEq/L (4% of pts) have occurred.

Nursing considerations

Baseline assessment

Obtain baseline BMP; CBC in pts with baseline anemia. Obtain B/P, heart rate immediately before each dose, in addition to regular monitoring (be alert for fluctuations). Assess hydration status. Correct hydration/sodium depletion prior to initiation. Receive medication history and screen for interactions, esp. concomitant use of aliskiren, ACE inhibitors, ARBs, potassium-sparing diuretics, potassium supplements. Verify negative pregnancy status. Question history of hepatic/renal impairment, renal artery stenosis; angioedema, hypersensitivity reaction.

Intervention/evaluation

Monitor BMP, esp. serum BUN, creatinine, potassium. Monitor for hyperkalemia, hypotension. If hypotension occurs, place pt in supine position, feet slightly elevated; consider interrupting treatment or altering dose of diuretic, antihypertensive drugs and screen for dehydration/serum sodium depletion. If pt positive for dehydration, be cautious with PO/IV administration. Overhydration may exacerbate HF. Assist with ambulation if dizziness occurs. Monitor for hypersensitivity reaction, including angioedema. If angioedema occurs, interrupt treatment and institute therapy to protect airway patency.

Patient/family teaching

• Go slowly from lying to standing.
• Be cautious of fluid intake. Overhydration may lead to worsening of HF, while underhydration may lead to low blood pressure.
• Report urine changes such as darkened urine, decreased output.
• Immediately report allergic reactions such as difficulty breathing, itching, rash, tongue swelling; symptoms of high potassium levels such as extreme fatigue, muscle weakness, palpitations; suspected pregnancy.
• Do not breastfeed.
• Diuretics (water pills) may increase risk of low pressure or low potassium levels.

<table>
<thead>
<tr>
<th>safinamide</th>
</tr>
</thead>
<tbody>
<tr>
<td>sa-fin-a-mide</td>
</tr>
<tr>
<td>Xadago</td>
</tr>
</tbody>
</table>

CLASSIFICATION
PHARMACOTHERAPEUTIC: Monoamine oxidase type B (MAO-B) inhibitor.
CLINICAL: Antiparkinson agent.
Do not confuse safinamide with ethionamide, niacinamide, procainamide, pyrazinamide, or Xadago with Xanax, Xarelto, or Xalatan.

Uses
Adjunctive treatment to levodopa/carbidopa in pts with Parkinson’s disease experiencing "off" episodes. Not indicated as a monotherapy.

Precautions
Contraindications: Hypersensitivity to safinamide. Severe hepatic impairment. Concomitant use of other MAOIs, potent inhibitors of MAOI (e.g., linezolid), amphetamine (and derivatives), cyclobenzaprine, dextromethorphan, methylphenidate, opioid medications, St. John’s wort, selective serotonin-norepinephrine reuptake inhibitors (SNRIs), tricyclic or triazolopyridine antidepressants. Cautions: Ophthalmic disorders (e.g., any active retinopathy, history of retinal/macular degeneration, uveitis, inherited retinal conditions, history of hereditary retina disease, albinism, retinitis, pigmentosa); hypertension, psychiatric disorders (e.g., schizophrenia, bipolar disorder, psychosis); history of dyskinesia, pts with impulse control disorder; concomitant use of serotonergic drugs; moderate hepatic impairment.
Action

Exact mechanism in Parkinson’s disease unknown. Selectively inhibits MAO-B activity. Inhibits catabolism of dopamine, increasing dopamine levels and thereby increasing dopaminergic activity in the brain. **Therapeutic Effect:** Reduces effects of Parkinson’s disease.

Pharmacokinetics

Absorbed quickly. Widely distributed. Metabolized in liver by nonmicrosomal enzymatic activity. Protein binding: 88%. Peak plasma concentration: 2–3 hrs. Excreted primarily in urine (76%). **Half-life:** 20–26 hrs.

Lifespan considerations

**Pregnancy/Lactation:** Unknown if distributed in breast milk. Breastfeeding not recommended. **Children:** Safety and efficacy not established. **Elderly:** No age-related precautions noted.

Interactions

**DRUG:** Amphetamine (or derivatives), cyclobenzaprine, methylphenidate, isoniazid, IV methylene blue opioids (e.g., fentanyl, tramadol), linezolid, other MAOIs (e.g., phenelzine, selegiline), SNRIs (e.g., duloxetine, venlafaxine), tricyclic antidepressants (e.g., amitriptyline) may increase risk of serotonin syndrome, hypertensive crisis; use contraindicated. **Dextromethorphan** may increase risk of psychosis, abnormal behavior. **HERBAL:** St. John’s wort may increase risk of serotonin syndrome. **FOOD:** Foods/beverages that are high in tyramine (e.g., aged cheese, pickled herring, red wine) may cause release of norepinephrine, resulting in hypertension. **LAB VALUES:** May increase serum ALT, AST.

Availability (Rx)

**Tablets:** 50 mg, 100 mg.

Administration/handling
PO

• Give with or without food at the same time every day.
• If a dose is missed or vomiting occurs after administration, do not give extra dose. Administer next dose at regularly scheduled time.

Indications/Routes/Dosage

Parkinson’s Disease

PO: ADULTS, ELDERLY: 50 mg once daily. If response is inadequate, may increase to 100 mg once daily after 2 wks of treatment. (When discontinuing from 100 mg/day, decrease to 50 mg/day for 1 wk before discontinuing therapy to avoid risk of withdrawal-emergent hyperpyrexia and confusion.)

Dosage in Renal Impairment

Not specified; use caution.

Dosage in Hepatic Impairment

Mild impairment: No dose adjustment. Moderate impairment: Do not exceed maximum dose of 50 mg/day. Severe impairment: Treatment contraindicated. If hepatic impairment progresses from moderate to severe impairment, permanently discontinue.

Side Effects

Frequent (21%): Dyskinesia. Occasional (3%): Nausea. Rare (2% or less): Orthostatic hypotension, anxiety, cough, dyspepsia.

Adverse Effects/Toxic Reactions

Hypertension, worsening of hypertension, hypertensive crisis was reported. Life-threatening serotonin syndrome may include mental status changes (agitation, hallucinations, delirium, coma), autonomic instability (tachycardia, labile blood pressure, dizziness, sweating, flushing, hyperthermia), neuromuscular symptoms (tremor, rigidity, myoclonus [localized muscle twitching], hyperactive reflexes, incoordination). May cause sudden onset of sleep (without warning) during
normal daily activities or while driving, which may result in accidents, injury. Impulsive or compulsive behaviors including gambling, sexual urges, binge eating, intense urge to spend money have occurred. Neuroleptic malignant syndrome (hyperpyrexia, muscle rigidity, altered mental status, autonomic instability [irregular pulse or blood pressure, tachycardia, diaphoresis, and cardiac arrhythmia], elevated creatinine, phosphokinase, myoglobinuria [rhabdomyolysis], acute renal failure) may be associated with rapid dose reduction, withdrawal, changes that increase central dopaminergic tone. Hypersensitivity reactions (including angioedema), retinal degeneration, loss of photoreceptors, major psychotic episodes (psychosis, hallucinations), dyskinesia, falls were reported.

**Nursing Considerations**

**Baseline Assessment**
Obtain B/P. Assess symptoms of Parkinson’s disease (e.g., muscular rigidity, pen rolling motion, gait disturbance, tremors), emotional state. Receive full medication history and screen for contraindications/interactions. Question history of ocular disease (personal or family history), dyskinesia, compulsive/impulsive behavior, psychosis, falls. Due to risk of suddenly falling asleep, discuss avoidance of driving vehicles, operating machinery. Conduct baseline ophthalmologic exam, visual acuity. Initiate fall precautions.

**Intervention/Evaluation**

**Patient/Family Teaching**
- Therapy may cause sudden sleep without drowsiness or warning, which may cause accidents and injury. Avoid tasks that require alertness, motor skills until response to drug is established. Driving, operating machinery is extremely risky.
• Report symptoms of overproduction of serotonin including confusion, excessive talking, hallucinations, headache, hyperactivity, insomnia, racing thoughts, seizure activity, tremors; sexual dysfunction, fever.
• Rapid dose reduction or withdrawal may cause neuroleptic malignant syndrome (confusion, high fever, muscle rigidity, high or irregular B/P, heart arrhythmias), a life-threatening condition that can be confused with symptoms of severe infection.
• Report vision changes; impulsive binge eating, gambling, sexual urges, inability to stop spending money; swelling of the face, tongue, throat.
• Due to high risk of drug interactions, do not take newly prescribed medication, herbal supplements unless approved by prescriber who originally started treatment.
• Avoid foods high in tyramine (aged, cured, fermented, pickled, smoked food).

salmeterol
sal-met-er-all
Serevent Diskhaler Disk♦
Serevent Diskus

Fixed-Combination(s)

CLASSIFICATION
PHARMACOTHERAPEUTIC: Beta₂-adrenergic agonist (long-acting).
CLINICAL: Bronchodilator.

BLACK BOX ALERT
Long-acting beta₂-adrenergic agonists may increase risk of asthma-related deaths and asthma-related hospitalizations in pediatric and adolescent pts. Use only as adjuvant therapy.

Do not confuse salmeterol with Solu-Medrol, or Serevent with Atrovent, Combivent, Serentil, or Sinemet.

Uses
Prevention of exercise-induced bronchospasm, bronchospasm; maintenance treatment of asthma and prevention of bronchospasm in pts with reversible obstructive airway disease, including those with symptoms of nocturnal asthma. Long-term maintenance treatment of bronchospasm associated with COPD (including emphysema and chronic bronchitis).

Precautions

Contraindications: Hypersensitivity to salmeterol. Treatment of status asthmaticus, acute episodes of asthma or COPD. Use as monotherapy in treatment of asthma without concomitant long-term asthma control medication (e.g., inhaled corticosteroids). Cautions: Not for acute symptoms; may cause paradoxical bronchospasm, severe asthma. Cardiovascular disorders (coronary insufficiency, arrhythmias, hypertension), seizure disorders, diabetes, hyperthyroidism, hepatic impairment, hypokalemia.

Action

Stimulates beta₂-adrenergic receptors in lungs, resulting in relaxation of bronchial smooth muscle. Therapeutic Effect: Relieves bronchospasm, reducing airway resistance.

Pharmacokinetics

<table>
<thead>
<tr>

<td>12 hrs</td>
</tr>
</tbody>
</table>

Low systemic absorption; acts primarily in lungs. Protein binding: 95%. Metabolized in liver. Excreted in urine (25%), feces (60%). Half-life: 5.5 hrs.

Lifespan considerations

Pregnancy/Lactation: Unknown if distributed in breast milk. Children: No age-related precautions in pts older than 4 yrs. Elderly: Lower dosages may be needed (may be more susceptible to tachycardia, tremors).

Interactions
DRUG: Beta blockers (e.g., carvedilol, metoprolol) may reduce effect; may produce bronchospasm. CYP3A4 inhibitors (e.g., ketoconazole, protease inhibitors) may increase concentration, risk of QT prolongation. MAOIs (e.g., phenelzine, selegiline), tricyclic antidepressants (e.g., amitriptyline, doxepin) may increase concentration/effects (wait 14 days after stopping MAOIs, tricyclic antidepressants before starting salmeterol). HERBAL: None significant. FOOD: None known. LAB VALUES: May decrease serum potassium. May increase serum glucose.

Availability (Rx)

Powder for Oral Inhalation: 50 mcg/inhalation.

Administration/handling

Inhalation
• Do not shake or prime. Before inhaling the dose, breath out fully (do not exhale into Diskus device). Activate and use only in level horizontal position.
• Inhale quickly and deeply through Diskus.
• Hold breath as long as possible before exhaling slowly.
• Do not use a spacer or wash mouthpiece.

Indications/routes/dosage

Maintenance and Prevention Therapy for Asthma, Bronchospasm
Inhalation: (Diskus): ADULTS, ELDERLY, CHILDREN 4 YRS AND OLDER: 1 inhalation (50 mcg) q12h (used in combination with inhaled corticosteroids not as monotherapy).

Prevention of Exercise-Induced Bronchospasm
Inhalation: (Diskus): ADULTS, ELDERLY, CHILDREN 4 YRS AND OLDER: 1 inhalation at least 30 min before exercise. Additional doses should not be given for 12 hrs. Do not administer if already giving salmeterol twice daily.

Maintenance Therapy for COPD
Inhalation: *(Diskus):* **ADULTS, ELDERLY:** 1 inhalation (50 mcg) q12h.

**Dosage in Renal/Hepatic Impairment**
No dose adjustment.

**Side effects**

**Frequent (28%):** Headache. **Occasional (7%–3%):** Cough, tremor, dizziness, vertigo, throat dryness/irritation, pharyngitis. **Rare (Less Than 3%):** Palpitations, tachycardia, nausea, heartburn, GI distress, diarrhea.

**Adverse effects/toxic reactions**
May prolong QT interval (can precipitate ventricular arrhythmias). Hypokalemia, hyperglycemia may occur.

**Nursing considerations**

**Baseline assessment**
Question history of cardiac disease, hepatic impairment, seizure disorder. Screen for concomitant medications known to prolong QT interval. Assess lung sounds, vital signs.

**Intervention/evaluation**
Monitor rate, depth, rhythm, type of respiration; quality/rate of pulse, B/P. Assess lungs for wheezing, rales, rhonchi. Periodically evaluate serum potassium levels.

**Patient/family teaching**
• Not for relief of acute episodes.
• Keep canister at room temperature (cold decreases effects).
• Do not stop medication or exceed recommended dosage.
• Report chest pain, dizziness.
• Wait at least 1 full min before second inhalation.
• Administer dose 30–60 min before exercise when used to prevent exercise-induced bronchospasm.
• Avoid excessive use of caffeine derivatives (coffee, tea, colas, chocolate).

sargramostim
sar-gra-moe-stim

Leukine

CLASSIFICATION
PHARMACOTHERAPEUTIC: Colony-stimulating factor.
CLINICAL: Hematopoietic agent.
Do not confuse Leukine with leucovorin or Leukeran.

Uses

Acute Myelogenous Leukemia (AML: following induction chemotherapy): Shortens time to neutrophil recovery; reduces incidence of severe infections.
Bone Marrow Transplant (allogeneic or autologous): For graft failure, engraftment delay. Myeloid reconstitution following allogeneic or autologous bone marrow transplant. Peripheral stem cell transplant (allogeneic or autologous): Mobilizes hematopoietic progenitor cells. OFF-LABEL: Primary prophylaxis of neutropenia; treatment of radiation-induced myelosuppression.

Precautions

Contraindications: Hypersensitivity to sargramostim. Concurrent (24 hrs preceding or following) myelosuppressive chemotherapy or radiation, pts with excessive leukemic myeloid blasts in bone marrow or peripheral blood (greater than 10%), known hypersensitivity to yeast-derived products. Cautions: Preexisting HF, fluid retention, cardiovascular disease, pulmonary disease (hypoxia, pulmonary infiltrates), renal/hepatic impairment.

Action

Stimulates proliferation/differentiation and functional activity of eosinophils, monocytes, neutrophils, and macrophages. Therapeutic Effect: Assists bone marrow in making new WBCs, increases their chemotactic, antifungal, antiparasitic activity. Increases cytoneoplastic cells, activates neutrophils to inhibit tumor cell growth.
Pharmacokinetics

<table>
<thead>
<tr>
<th>Route</th>
<th>Onset</th>
<th>Peak</th>
<th>Duration</th>
</tr>
</thead>
<tbody>
<tr>
<td>IV (increase WBCs)</td>
<td>7–14 days</td>
<td>N/A</td>
<td>1 wk</td>

</tbody>
</table>

Detected in serum within 5 min after SQ administration. **Peak serum levels:** 1–3 hrs. **Half-life:** IV: 1 hr; SQ: 3 hrs.

**Lifespan considerations**

**Pregnancy/Lactation:** Unknown if drug crosses placenta or is distributed in breast milk. **Children:** Safety and efficacy not established. **Elderly:** No age-related precautions noted.

**Interactions**

**DRUG:** None significant. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** May increase serum ALT, AST, bilirubin, creatinine. May decrease serum albumin.

**Availability (Rx)**

**Injection, Powder for Reconstitution:** 250 mcg.

**Administration/handling**

**Subcutaneous**

May be given without further dilution.

**IV**

**Reconstitution**

- To 250-mcg vial, add 1 mL Sterile Water for Injection (preservative free) or Bacteriostatic Water for Injection. Direct diluent to side of vial, gently swirl contents to avoid foaming; do not shake or vigorously agitate.
- After reconstitution, further dilute in 25–50 mL 0.9% NaCl to a concentration of 10 mcg/mL or greater. If final concentration less than 10 mcg/mL, 1 mg of human albumin per 1 mL of 0.9% NaCl should be added to provide a final albumin concentration of 0.1% (e.g., 1 mL 5% albumin per 50 mL 0.9% NaCl).
Albumin is added before addition of sargramostim (prevents drug adsorption to components of drug delivery system).

**Rate of Administration**
- Give each single dose over 30 min, 2 hr, 6 hr, or continuous infusion.

**Storage**
- Refrigerate powder, reconstituted solution, diluted solution for injection.
- Do not shake.
- Reconstituted solutions are clear, colorless.
- Use within 6 hrs; discard unused portions.
- Use 1 dose per vial; do not reenter vial.

**IV incompatibilities**
Amphotericin B complex (Abelcet, AmBisome, Amphotec), ondansetron (Zofran).

**IV Compatibilities**
Dexamethasone (Decadron), diphenhydramine (Benadryl), famotidine (Pepcid), granisetron (Kytril), heparin, metoclopramide (Reglan), promethazine (Phenergan).

**Indications/routes/dosage**

**Neutrophil Recovery Following Chemotherapy in AML**

**IV Infusion: ADULTS 55 YRS OR OLDER:** 250 mcg/m²/day (as 4-hr infusion) starting approximately 4 days following completion of induction chemotherapy (if day 10 bone marrow is hypoplastic with less than 5% blasts). Continue until ANC is greater than 1,500 cells/mm³ for 3 consecutive days or a maximum of 42 days. If WBC greater than 50,000 cells/mm³ and/or ANC greater that 20,000 cells/mm³, interrupt treatment or reduce dose by 50%.

**Myeloid Recovery Following Bone Marrow Transplant (BMT)**

**IV Infusion: ADULTS, ELDERLY:** Usual parenteral dosage: 250 mcg/m²/day (as 2-hr infusion). Begin 2–4 hrs after autologous bone marrow infusion and not less than 24 hrs after last dose of chemotherapy or last radiation treatment, when
post marrow infusion ANC is less than 500/mm³. Continue until ANC greater than 1,500 cells/mm³ for 3 consecutive days. If WBC greater than 50,000/mm³ and/or ANC greater that 20,000/mm³, interrupt treatment or reduce dose by 50%. Discontinue if blast cells appear or underlying disease progresses.

**Bone Marrow Transplant Failure, Engraftment Delay**

**IV Infusion:** ADULTS, ELDERLY: 250 mcg/m²/day for 14 days. Infuse over 2 hrs. May repeat after 7 days off therapy if engraftment has not occurred. A third course with 500 mcg/m²/day for 14 days may be tried if engraftment still has not occurred.

**Stem Cell Transplant, Mobilization**

**IV, SQ:** ADULTS: 250 mcg/m²/day IV (as 24-hr infusion) or SQ once daily. Continue same dose throughout peripheral blood progenitor cell collection. If WBC greater than 50,000 cells/mm³, reduce dose by 50%.

**Stem Cell Transplant, Post-transplant**

**IV, SQ:** ADULTS, ELDERLY: 250 mcg/m²/day IV (as 24-hr infusion) or SQ once daily beginning immediately following infusion of progenitor cells. Continue until ANC greater than 1,500 cells/mm³ for 3 consecutive days.

**Dosage in Renal/Hepatic Impairment**

No dose adjustment.

**Side effects**

**Frequent:** GI disturbances (nausea, diarrhea, vomiting, stomatitis, anorexia, abdominal pain), arthralgia or myalgia, headache, malaise, rash, pruritus.

**Occasional:** Peripheral edema, weight gain, dyspnea, asthenia, fever, leukocytosis, capillary leak syndrome (fluid retention, irritation at local injection site, peripheral edema). **Rare:** Tachycardia, arrhythmias, thrombophlebitis.

**Adverse effects/toxic reactions**

Pleural/pericardial effusion occurs rarely after infusion.
Nursing considerations

Baseline assessment
Obtain CBC, BMP, LFT, vital signs. Question history of cardiac/pulmonary disease, renal/hepatic impairment.

Intervention/evaluation
Monitor CBC with differential, serum renal/hepatic function, pulmonary function, vital signs, weight. Monitor for supraventricular arrhythmias during administration (particularly in pts with history of cardiac arrhythmias). Assess closely for dyspnea during and immediately following infusion (particularly in pts with history of lung disease). If dyspnea occurs during infusion, cut infusion rate by half. If dyspnea continues, stop infusion immediately. If neutrophil count exceeds 20,000 cells/mm$^3$ or platelet count exceeds 500,000/mm$^3$, stop infusion or reduce dose by half, based on clinical condition of pt. Blood counts return to normal or baseline 3–7 days after discontinuation of therapy.

Patient/family teaching
• Report difficulty breathing, esp. during or immediately after infusion.
• May increase risk of cardiac arrhythmias; report dizziness, fainting, palpitations.
• Treatment may cause edema, fluid collection in the lungs or around the heart.

sarilumab
sar-il-ue-mab
Kevzara

CLASSIFICATION
PHARMACOTHERAPEUTIC: Interleukin-6 receptor antagonist. Monoclonal antibody.
CLINICAL: Antirheumatic, disease modifying.

■ BLACK BOX ALERT ■ Tuberculosis (TB), invasive fungal infections, other opportunistic infections leading to hospitalization and death were reported. Avoid use in pts with active infection. Withhold treatment until serious infection is controlled. Test for TB prior to and during treatment,
regardless of initial result; if positive, start treatment for TB prior to initiation.

Do not confuse sarilumab with adalimumab, avelumab, belimumab, brodalumab, dupilumab, ipilimumab, nivolumab, or panitumumab.

**Uses**

May use as monotherapy or in combination with non-biologic DMARDs (do not use in combination with biologic DMARDs). Treatment of adults with moderately to severely active rheumatoid arthritis who have had an inadequate response or intolerance to one or more DMARDs.

**Precautions**

**Contraindications:** Hypersensitivity to sarilumab. **Cautions:** Hyperlipidemia, hypertriglyceridemia, active hepatic disease or hepatic impairment; recent travel or residence in endemic TB or mycosis areas; history of chronic opportunistic infections (esp. bacterial, invasive fungal, mycobacterial, protozoal, viral, TB); conditions predisposing to infection (e.g., diabetes, immunocompromised pts, renal failure, open wounds); history of HIV, herpes zoster, hepatitis B virus (HBV) infection, malignancies; baseline neutropenia, thrombocytopenia; pts at risk for GI perforation (Crohn’s disease, diverticulitis, GI tract malignancies, peptic ulcers, peritoneal malignancies). Not recommended in pts with active infection, concomitant use of biological DMARDs; baseline ANC less than 2000 cells/mm$^3$, platelet count less than 150,000 cells/mm$^3$, serum ALT, AST above 1.5 times upper limit of normal (ULN).

**Action**

Binds to interleukin-6 (IL-6) receptor, inhibiting signaling of IL-6, a cytokine involved in inflammatory and immune responses. **Therapeutic Effect:** Reduces inflammation of RA.

**Pharmacokinetics**

Widely distributed. Peak plasma concentration: 2–4 days. Excretion (200 mg
dose): linear, non-saturable proteolytic pathway. (150 mg dose): Non-linear, saturable target medicated pathway. **Half-life:** Concentration dependent: 200 mg q2wks (up to 10 days); 150 mg q2wks (up to 8 days).

**Lifespan considerations**

**Pregnancy/Lactation:** Crosses the placental barrier, esp. during the third trimester. Unknown if distributed in breast milk; however, maternal immunoglobulin G (IgG) is present in breast milk. **Children:** Safety and efficacy not established. **Elderly:** Use caution (increased incidence of infections).

**Interactions**

**DRUG:** May decrease concentration/effect of atorvastatin, oral contraceptives. May decrease therapeutic effect of BCG vaccines; increase risk of adverse effects/toxic reactions of live vaccines, belimumab, natalizumab, pimecrolimus, tacrolimus. **HERBAL:** Echinacea may decrease effect. **FOOD:** None known. **LAB VALUES:** May increase serum ALT, AST, cholesterol, LDL, HDL, triglycerides. May decrease leukocytes, neutrophils, platelets.

**Availability (Rx)**

**Injection, Solution:** 150 mg/1.14 mL, 200 mg/1.14 mL.

**Administration/handling**

**Subcutaneous**

**Preparation**

- Remove prefilled syringe from refrigerator and allow solution to warm to room temperature (approx. 30 min) with needle cap intact.
- Visually inspect for particulate matter or discoloration. Solution should appear clear, colorless to slightly yellow in color. Do not use if solution is cloudy, discolored, or visible particles are observed.

**Administration**

- Insert needle subcutaneously into upper arms, outer thigh, or abdomen and inject solution.
- Do not inject into areas of active skin disease or injury such as sunburns, skin rashes, inflammation, skin infections, or active psoriasis.
• Do not administer IV or intramuscularly.
• Rotate injection sites.

Storage
• Refrigerate in original carton until time of use.
• Protect from light.
• May store at room temperature for up to 14 days. Once warmed to room temperature, do not place back into refrigerator.
• Do not freeze or expose to heating sources.
• Do not shake.

Indications/Routes/Dosage

Note: Do not initiate if ANC is less than 2,000 cells/mm$^3$; platelets less than 150,000 cells/mm$^3$; or serum ALT or AST greater than 1.5 times ULN.

Rheumatoid Arthritis
SQ: ADULTS, ELDERLY: 200 mg once q2wks.

Dose Modification

Neutropenia
ANC greater than 1000 cells/mm$^3$: No dose adjustment. ANC 500–1000 cells/mm$^3$: Withhold treatment until ANC greater than 1000 cells/mm$^3$, then resume at 150 mg once q2wks. May increase to 200 mg once q2wks as clinically indicated. ANC less than 500 cells/mm$^3$: Permanently discontinue.

Hepatotoxicity
Serum ALT elevation up to 3 times ULN: Consider modifying dose of concomitant DMARDs. Serum ALT elevation greater than 3–5 times ULN: Withhold treatment until serum ALT less than 3 times ULN, then resume at 150 mg once q2wks. May increase to 200 mg once q2wks as clinically indicated. Serum ALT elevation greater than 5 times ULN: Permanently discontinue.

Serious Infection
Withhold treatment until serious infection is controlled, then resume as clinically indicated.
**Thrombocytopenia**

**Platelet count 50,000–100,000 cells/mm$^3$:** Withhold treatment until platelet count greater than 100,000 cells/mm$^3$, then resume at 150 mg once q2wks. May increase to 200 mg once q2wks as clinically indicated. **Platelet count less than 50,000 cells/mm$^3$:** Permanently discontinue if confirmed by repeat testing.

**Dosage in Renal Impairment**

**Mild to moderate impairment:** No dose adjustment. **Severe impairment:** Not specified; use caution.

**Dosage in Hepatic Impairment**

Not specified; use caution.

**Side Effects**

**Rare (4%–2%):** Injection site reactions (pain, erythema, pruritus).

**Adverse Effects/Toxic Reactions**

Serious, sometimes fatal, infections including aspergillosis, candidiasis, cellulitis, Cryptococcus, histoplasmosis, pneumonia, sepsis, tuberculosis; bacterial, mycobacterial, invasive fungal, opportunistic, viral infections were reported. Nasopharyngitis, upper respiratory tract infections, urinary tract infections occurred in 2–4% of pts. Neutropenia may increase risk of serious infection. GI perforation may occur, esp. in pts with history of diverticulitis or concomitant use of NSAIDs, corticosteroids. May increase risk for new malignancies. Hypersensitivity reactions including rash, urticaria reported in less than 1% of pts. May increase risk of HBV reactivation, which may result in fulminant hepatitis, hepatic failure, death. Immunogenicity (auto-sarilumab antibodies) was reported.

**Nursing Considerations**

**Baseline Assessment**

Obtain CBC (note neutrophil, platelet count), LFT, lipid panel. Assess onset,
location, duration of pain, inflammation. Inspect appearance of affected joints for immobility, deformities. Pts should be evaluated for active tuberculosis and tested for latent infection prior to initiation and periodically during therapy. Induration of 5 mm or greater with tuberculin skin testing should be considered a positive test result when assessing if treatment for latent tuberculosis is necessary. Question history of chronic infections, opportunistic infections, herpes infection. Screen for active infection. Assess skin for open wounds. Question history of active hepatic disease, GI perforation, malignancies, HIV, HBV, hypersensitivity reactions. Receive full medication history and screen for interactions. Assess pt’s willingness to self-inject medication.

**Intervention/Evaluation**

Assess for therapeutic response: relief of pain, stiffness, swelling; increased joint mobility; reduced joint tenderness; improved grip strength. Monitor neutrophil count, platelet count, LFT 4–6 wks after initiation, then q3mos thereafter. Monitor lipid panel 4–6 wks after initiation, then q6mos thereafter. Monitor for symptoms of tuberculosis, including those who tested negative for latent tuberculosis infection prior to initiating therapy. Interrupt or discontinue treatment if serious infection, opportunistic infection, or sepsis occurs and initiate appropriate antimicrobial therapy. Closely monitor for HBV reactivation.

**Patient/Family Teaching**

- Treatment may depress your immune system and reduce your ability to fight infection. Report symptoms of infection such as body aches, burning with urination, chills, cough, fatigue, fever. Avoid those with active infection.
- Do not receive live vaccines.
- Expect frequent tuberculosis screening. Report travel plans to possible endemic areas.
- A health care provider will show you how to properly prepare and inject medication. You must demonstrate correct preparation and injection techniques before using medication at home.
- Report allergic reactions such as itching, hives, rash.
- Immediately report severe or persistent abdominal pain, bloody stool, fever; may indicate tear in GI tract.
- Treatment may cause reactivation of HBV, new cancers.
- Therapy may decrease platelet count, which may increase risk of bleeding.
Report liver problems such as bruising, confusion, amber or dark-colored urine; right upper abdominal pain; yellowing of the skin or eyes.

**SAXagliptin**

**sax-a-glip-tin**

**Onglyza**

**Fixed-Combination(s)**

**Kombiglyze XR:** SAXagliptin/metFORMIN (an antidiabetic): 2.5 mg/1,000 mg, 5 mg/500 mg, 5 mg/1,000 mg.

**CLASSIFICATION**

**PHARMACOTHERAPEUTIC:** DDP-4 inhibitor (gliptins).

**CLINICAL:** Antidiabetic agent.

Do not confuse SAXagliptin with SITagliptin or SUMAtriptan.

**Uses**

Adjunctive treatment to diet and exercise to improve glycemic control in pts with type 2 diabetes as monotherapy or in combination with other antidiabetic agents.

**Precautions**

**Contraindications:** Hypersensitivity to SAXagliptin. Type 1 diabetes, ketoacidosis. **Cautions:** Concurrent use of other glucose-lowering agents may increase risk of hypoglycemia, moderate to severe renal impairment, end-stage renal disease requiring hemodialysis, concurrent use of strong CYP3A4 inhibitors (e.g., clarithromycin).

**Action**

Slows the inactivation of incretin hormones by inhibiting DDP-4 enzyme. Incretin hormones increase insulin synthesis/release from pancreas and decrease glucagon secretion. **Therapeutic Effect:** Regulates glucose homeostasis.
Pharmacokinetics

<table>

<th>Route</th>
<th>Onset</th>
<th>Peak</th>
<th>Duration</th>
</tr>
</thead>
<tbody>
<tr>
<td>Oral</td>
<td>—</td>
<td>—</td>
<td>24 hrs</td>
</tr>
</tbody>
</table>

Rapidly absorbed following PO administration. Extensively metabolized. Excreted by both renal and hepatic pathways. **Half-life:** 2.5 hrs; metabolite, 3.1 hrs.

**Lifespan considerations**

**Pregnancy/Lactation:** Unknown if distributed in breast milk. **Children:** Safety and efficacy not established. **Elderly:** Age-related renal impairment may require dosage adjustment.

**Interactions**

**DRUG:** CYP3A4 inhibitors (e.g., clarithromycin, ketoconazole) may increase concentration. CYP3A4 inducers (e.g., carbAMazepine, phenytoin, rifampin) may decrease concentration. **HERBAL:** Herbal supplements that have hypoglycemic effects increase risk of hypoglycemia. **FOOD:** Grapefruit products may increase concentration. **LAB VALUES:** May slightly decrease WBCs, lymphocytes. May increase serum creatinine.

**Availability (Rx)**

**Tablets, Film-Coated:** 2.5 mg, 5 mg.

**Administration/handling**

**PO**

- May give without regard to food.
- Do not break, crush, dissolve, or divide film-coated tablets.

**Indications/routes/dosage**

**Type 2 Diabetes**
PO: ADULTS OVER 18 YRS, ELDERLY: 2.5 or 5 mg once daily. Concurrent Strong CYP3A4 Inhibitors (e.g., ketoconazole): 2.5 mg once daily. Hemodialysis: Give dose after dialysis.

Dosage in Renal Impairment
Mild impairment: No dose adjustment. Moderate to severe impairment: CrCl less than 50 mL/min: 2.5 mg once daily.

Dosage in Hepatic Impairment
No dose adjustment.

Side effects
Occasional (7%): Headache. Rare (3%–1%): Peripheral edema, sinusitis, abdominal pain, gastroenteritis, vomiting, rash.

Adverse effects/toxic reactions
Lymphopenia, rash occur rarely. Upper respiratory tract infection, urinary tract infection occur in approximately 7% of pts.

Nursing considerations

Baseline assessment
Check serum blood glucose before administration. Discuss lifestyle to determine extent of learning, emotional needs. Ensure follow-up instruction if pt or family does not thoroughly understand diabetes management or glucose-testing technique.

Intervention/evaluation
Assess for hypoglycemia (diaphoresis, tremors, dizziness, anxiety, headache, tachycardia, perioral numbness, hunger, diplopia, difficulty concentrating), hyperglycemia (polyuria, polyphagia, polydipsia, nausea, vomiting, dim vision, fatigue, deep, rapid breathing). Be alert to conditions that alter glucose requirements (fever, increased activity or stress, surgical procedures).
Patient/family teaching

• Diabetes requires lifelong control. Prescribed diet and exercise are principal parts of treatment; do not skip or delay meals.
• Continue to adhere to dietary instructions, regular exercise program, regular testing of blood glucose.
• When taking combination drug therapy or when glucose demands are altered (fever, infection, trauma, stress, heavy physical activity), have a source of glucose available to treat symptoms of hypoglycemia.

scopolamine
skoe-pol-a-meen
Trans-Derm Scop
Transderm-V

Fixed-Combination(s)

Donnatal: scopolamine/atropine (anticholinergic)/hyoscyamine (anticholinergic)/PHENobarbital (sedative): 0.0065 mg/0.0194 mg/0.1037 mg/16.2 mg.

◆CLASSIFICATION
PHARMACOTHERAPEUTIC: Anticholinergic.
CLINICAL: Antinausea, antiemetic.

Uses

Prevention of motion sickness, postop nausea/vomiting. OFF-LABEL: Breakthrough treatment of nausea/vomiting associated with chemotherapy.

Precautions

Contraindications: Hypersensitivity to scopolamine. Narrow-angle glaucoma.
Cautions: Hepatic/renal impairment, cardiac disease (hypertension, HF), seizure disorder, psychoses, coronary artery disease, prostatic hyperplasia, urinary retention, reflux esophagitis, ulcerative colitis, hyperthyroidism, GI obstruction, hiatal hernia, elderly pts.
Action
Competitively inhibits action of acetylcholine at muscarinic receptors. Reduces excitability of labyrinthine receptors, depressing conduction in vestibular cerebellar pathway. **Therapeutic Effect:** Prevents motion-induced nausea/vomiting.

◮ Lifespan considerations

**Pregnancy/Lactation:** Crosses placenta; unknown if distributed in breast milk. **Children:** May be more susceptible to adverse effects. **Elderly:** Dizziness, hallucinations, confusion may require dosage adjustment. Use caution.

Interactions

**DRUG:** Anticholinergics (e.g., dicyclomine, glycopyrrolate), antihistamines (e.g., diphenhydramine), tricyclic antidepressants (e.g., amitriptyline, doxepin) may increase anticholinergic effects. CNS depressants (e.g., LORazepam, morphine, zolpidem) may increase CNS depression. **HERBAL:** None significant. **FOOD:** Grapefruit products may increase concentration/effects. **LAB VALUES:** May interfere with gastric secretion test.

Availability (Rx)

**Transdermal System (Trans-Derm Scop):** 1.5 mg.

Administration/handling

**Transdermal**

- Apply patch to hairless area behind one ear.
- If dislodged or on for more than 72 hrs, replace with fresh patch.
- Do not cut/trim.
- Limit contact with water.

Indications/routes/dosage

**Prevention of Motion Sickness**
Transdermal: ADULTS: One system at least 4 hrs prior to exposure (best if 12 hrs before) and q72h as needed.

Postop Nausea/Vomiting
Transdermal: ADULTS, ELDERLY: 1 system no sooner than 1 hr before surgery and removed 24 hrs after surgery.

Dosage in Renal/Hepatic Impairment
No dose adjustment.

Side effects
Frequent (Greater Than 15%): Dry mouth, drowsiness, blurred vision. Rare (5%–1%): Dizziness, restlessness, hallucinations, confusion, difficulty urinating, rash.

Adverse effects/toxic reactions
None known.

Nursing considerations

Baseline assessment
Assess for use of other CNS depressants, drugs with anticholinergic action, history of narrow-angle glaucoma. Question medical history as listed in Precautions.

Intervention/evaluation
Monitor for dehydration. Observe for improvement of symptoms.

Patient/family teaching
• Avoid tasks requiring alertness, motor skills until response to drug is established (may cause drowsiness, disorientation, confusion).
• Use only 1 patch at a time; do not cut.
• Wash hands after administration.
secukinumab
sek-ue-kin-ue-mab
Cosentyx
Cosentyx Sensor Pen

CLASSIFICATION
PHARMACOTHERAPEUTIC: Human interleukin-17A antagonist.
CLINICAL: Antipsoriasis agent.

Do not confuse secukinumab with canakinumab, ranibizumab, trastuzumab, ustekinumab

Uses

Treatment of moderate to severe plaque psoriasis in adult pts who are candidates for systemic therapy or phototherapy, active psoriatic arthritis (PsA), active ankylosing spondylitis (AS).

Precautions

Contraindications: Hypersensitivity to secukinumab. Cautions: Elderly pts, active Crohn’s disease, HIV infection, concomitant immunosuppressants, conditions predisposing to infections (e.g., diabetes, renal failure, immunocompromised pts, open wounds), hypersensitivity to latex (injector pen/prefilled syringe), preexisting or recent-onset CNS demyelinating disorders (e.g., multiple sclerosis, polyneuropathy), pts with chronic or recurrent infection or who have been exposed to tuberculosis, hematologic cytopenias. Administration of live vaccines not recommended.

Action

Binds to and inhibits interaction of interleukin-17A receptor, a cytokine that is involved in inflammatory and immune response. May reduce epidermal neutrophils in psoriatic plaques. Therapeutic Effect: Alters biologic immune response; reduces inflammation.

Pharmacokinetics
Widely distributed. Degraded into small peptides and amino acids via catabolic pathway. Peak plasma concentration: 6 days. Steady state reached in 24 wks. Excretion not defined. **Half-life:** 22–31 days.

**Lifespan considerations**

**Pregnancy/Lactation:** Unknown if distributed in breast milk. **Children:** Safety and efficacy not established. **Elderly:** No age-related precautions noted.

**Interactions**

**DRUG:** May decrease efficacy/immune response of live vaccines; may increase risk of toxic effects of live vaccines. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** May significant.

**Availability (Rx)**

**Injector Pen:** 150 mg/mL solution. **Prefilled Syringe:** 150 mg/mL solution.

**Administration/handling**

**Subcutaneous**

**Injector Pen/Prefilled Syringe**

- Follow instructions for preparation according to manufacturer guidelines.

**Administration**

- Insert needle subcutaneously into upper arms, outer thigh, or abdomen and inject solution.
- Do not inject into areas of active skin disease or injury such as sunburns, skin rashes, inflammation, skin infections, or active psoriasis.
- Rotate injection sites.

**Storage**

- Refrigerate until time of use.
- Allow injector pen/prefilled syringe/vial to warm to room temperature before use (15–30 min). Do not freeze.

**Indications/routes/dosage**
**Plaque Psoriasis**

**SQ: ADULTS, ELDERLY:** 300 mg every wk for 5 wks, then 300 mg q4wks. Each 300-mg dose is given as 2 separate injections of 150 mg each.

**PsA, AS**

**Note:** With coexistent plaque psoriasis, use dose for plaque psoriasis.

**SQ: ADULTS, ELDERLY:** Initially, 150 mg at wks 0, 1, 2, 3, and 4, then q4wks or 150 mg q4wks. For PsA, may consider dose of 300 mg.

**Dosage in Renal/Hepatic Impairment**

Not studied; use caution.

**Side effects:**

**Rare (4%-1%):** Diarrhea, urticaria, rhinorrhea.

**Adverse effects/toxic reactions**

May increase risk of infection including tuberculosis. Infection processes including nasopharyngitis (11% of pts), upper respiratory tract infection (2.5% of pts), mucocutaneous infection with candida (1.2% of pts), rhinitis, pharyngitis, oral herpes (1% of pts) have occurred. May cause exacerbation of Crohn’s disease. Hypersensitivity reactions including anaphylaxis were reported. Immunogenicity (auto-secukinumab antibodies) occurred in less than 1% of pts.

**Nursing considerations**

**Baseline assessment**

Obtain baseline vital signs. Pts should be evaluated for active tuberculosis and tested for latent infection prior to initiating treatment and periodically during therapy. Induration of 5 mm or greater with tuberculin skin testing should be considered a positive test result when assessing if treatment for latent tuberculosis is necessary. Antifungal therapy should be considered for those who reside or travel to regions where mycoses are endemic. Do not initiate therapy during active infection. Question history of active Crohn’s disease, hepatitis B or
C virus infection, HIV infection, demyelinating disorders, cardiovascular disease; concomitant use of immunosuppressive agents.

**Intervention/evaluation**
Monitor for symptoms of tuberculosis, including those who tested negative for latent tuberculosis infection prior to initiating therapy. Interrupt or discontinue treatment if serious infection, opportunistic infection, or sepsis occurs, and initiate appropriate antimicrobial therapy. Monitor skin for disease improvement. Monitor for hypersensitivity reaction.

**Patient/family teaching**
- Treatment may lower your immune system response and reduce your ability to fight infection.
- Report symptoms of infection such as body aches, chills, cough, fatigue, fever.
- Do not receive live vaccines.
- Expect frequent tuberculosis screening.
- Report travel plans to possible endemic areas.
- Avoid those with active infection.
- Injector pen/prefilled syringe should not be used by pts with latex allergy.
- Immediately report itching, hive, rash, swelling of the face or tongue; may indicate allergic reaction.
- Treatment may cause worsening of Crohn’s disease.

| selegiline  |
| se-le-ji-leen |
| Apo-Selegiline |
| Eldepryl |
| Emsam |
| Zelapar |

**CLASSIFICATION**
PHARMACOTHERAPEUTIC: MAOI.
CLINICAL: Antiparkinson agent, antidepressant.

Do not confuse Eldepryl with Elavil or enalapril, selegiline with Salagen, sertraline, or Stelazine, or Zelapar with Zaleplon, Zemplar, or
ZyPREXA.

Uses

**Oral:** Adjunct to levodopa/carbidopa in treatment of Parkinson’s disease. **Transdermal:** Treatment of major depressive disorder (MDD). **OFF-LABEL:** Treatment of ADHD, early Parkinson’s disease.

Precautions

**Contraindications:** Hypersensitivity to selegiline. Concurrent use of meperidine. **Orally disintegrating tablet (additional):** Concurrent use of cyclobenzaprine, dextromethorphan, methadone, St. John’s wort, tramadol, oral selegiline, other MAOIs within 14 days of selegiline. **Transdermal (additional):** Pheochromocytoma; concurrent use of bupropion, SSRIs (e.g., fluoxetine), SNRIs (e.g., duloxetine), tricyclic antidepressants, buspirone, tramadol, methadone, dextromethorphan, St. John’s wort, mirtazapine, cyclobenzaprine, oral selegiline, other MAOIs, carBAMazepine, oxicarbazepine, sympathomimetics (e.g., amphetamines, cold products containing vasoconstrictors). Elective surgery requiring general anesthesia, local anesthesia containing sympathomimetics; foods high in tyramine content. **Cautions:** Renal/hepatic impairment, depression, elderly pts, major psychiatric disorder; pts at high risk of suicide; pts at high risk of hypotension (cerebrovascular disease, cardiovascular disease, hypovolemia).

Action

Irreversibly inhibits activity of monoamine oxidase type B (enzyme that breaks down DOPamine), thereby increasing dopaminergic action. **Therapeutic Effect:** Relieves signs/symptoms of Parkinson’s disease (tremor, akinesia, posture/equilibrium disorders, rigidity). Improves mood with MDD.

Pharmacokinetics

<table>
<thead>
<tr>
<th>Route</th>
<th>Onset</th>
<th>Peak</th>
<th>Duration</th>
</tr>
</thead>
<tbody>
<tr>
<td>PO</td>
<td>1 hr</td>
<td>—</td>
<td>24–72 hrs</td>
</tr>
</tbody>
</table>

Rapidly absorbed from GI tract. Crosses blood-brain barrier. Protein binding:
90%. Metabolized in liver. Primarily excreted in urine. **Half-life:** PO: 10 hrs. **Transdermal:** 18–25 hrs.

**Lifespan considerations**

**Pregnancy/Lactation:** Unknown if drug crosses placenta or is distributed in breast milk. **Children:** Safety and efficacy not established. **Elderly:** No age-related precautions noted.

**Interactions**

**DRUG:** FLUoxetine, fluvoxamine, PARoxetine, sertraline, venlafaxine may cause mania, serotonin syndrome (altered mental status, restlessness, diaphoresis, diarrhea, fever). **Meperidine** may cause serotonin syndrome reaction (e.g., excitation, diaphoresis, rigidity, hypertension/hypotension, coma, death). **Tricyclic antidepressants** (e.g., amitriptyline, doxepin) may cause diaphoresis, hypertension, syncope, altered mental status, hyperpyrexia, seizures, tremors (wait 14 days between stopping selegiline and starting tricyclic antidepressants). **HERBAL:** Kava kava, SAMe, St. John’s wort, valerian may increase risk of serotonin syndrome, excessive sedation. **FOOD:** Tyramine-rich foods may produce hypertensive reactions. **LAB VALUES:** None significant.

**Availability (Rx)**

**Capsules:** 5 mg. **Tablets:** 5 mg. **Tablets (Orally Disintegrating [Zelapar]):** 1.25 mg. **Transdermal (Emsam):** 6 mg/24 hrs, 9 mg/24 hrs, 12 mg/24 hrs.

**Administration/handling**

**PO**

• Give without regard to meals.
• Avoid tyramine-containing foods, large quantities of caffeine-containing beverages.

**PO (Orally Disintegrating Tablets)**

• Give in morning before breakfast and without liquid.
• Peel off backing with dry hands (do not push tablets through foil).
• Immediately place on top of tongue, allow to disintegrate.
• Avoid food, liquids for 5 min before and after taking selegiline.

Transdermal
• Apply to dry, intact skin on upper torso or thigh, outer surface of upper arm.
• Avoid exposure to external heat source.
• Normal exposure to water unlikely to affect adhesion.
• If patch becomes loose, press back into place. If patch falls of again, apply a new patch; follow same dose schedule.
• Rotate application sites.

Indications/routes/dosage

Adjunctive Treatment of Parkinson’s Disease
PO: ADULTS: (Eldepryl): 10 mg/day in divided doses, such as 5 mg at breakfast and lunch, given concomitantly with each dose of carbidopa and levodopa. ELDERLY: Initially, 5 mg in the morning. May increase up to 10 mg/day. ADULTS, ELDERLY: (Zelapar): Initially, 1.25 mg daily for at least 6 wks. May increase to maximum of 2.5 mg/day.

Major Depressive Disorder
Transdermal: ADULTS: Initially, 6 mg/24 hrs. May increase in 3 mg/24 hrs increments at minimum of 2 wks. Maximum: 12 mg/24 hrs. ELDERLY: 6 mg/24 hrs (maximum).

Dosage in Renal/Hepatic Impairment
Orally disintegrating tablet: Not recommended in severe impairment.
Oral: Use caution.
Transdermal: No dose adjustment.

Side effects
Frequent (10%–4%): Nausea, dizziness, light-headedness, syncope, abdominal discomfort. Occasional (3%–2%): Confusion, hallucinations, dry mouth, vivid dreams, dyskinesia. Rare (1%): Headache, myalgia, anxiety, diarrhea, insomnia.
Adverse effects/toxic reactions

Symptoms of overdose may vary from CNS depression (sedation, apnea, cardiovascular collapse, death) to severe paradoxical reactions (hallucinations, tremor, seizures). Impaired motor coordination, (loss of balance, blepharospasm, facial grimaces, feeling of heaviness in lower extremities), depression, nightmares, delusions, overstimulation, sleep disturbance, anger, hallucinations, confusion may occur.

Nursing considerations

Baseline assessment

Receive full medication history and screen for contraindications/interactions. Question medical history as listed in Precautions. Assess current state of mental health.

Intervention/evaluation

Be alert to neurologic effects (headache, lethargy, mental confusion, agitation). Monitor for evidence of dyskinesia (difficulty with movement). Assess for clinical reversal of symptoms (improvement of tremors of head/hands at rest, mask-like facial expression, shuffling gait, muscular rigidity). Monitor for unusual behavior, worsening depression, suicidal ideation, especially at initiation of therapy or with changes in dosage.

Patient/family teaching

• Tolerance to dizziness, light-headedness develops during therapy.
• To reduce hypotensive effect, slowly go from lying to standing.
• Avoid tasks that require alertness, motor skills until response to drug is established.
• Dry mouth, drowsiness, dizziness may be an expected response to drug.
• Avoid alcohol.
• Report worsening depression, unusual behavior, thoughts of suicide.
• Avoid tyramine-rich foods.
• Do not take newly prescribed medications unless approved by prescriber who originally started treatment.
• Do not take herbal supplements.
sertraline
ser-tra-leen
Apo-Sertraline
PMS-Sertraline
Zoloft

CLASSIFICATION
PHARMACOTHERAPEUTIC: Selective serotonin reuptake inhibitor.
CLINICAL: Antidepressant, anxiolytic, obsessive-compulsive disorder adjunct.

BLACK BOX ALERT
Increased risk of suicidal ideation and behavior in children, adolescents, young adults 18–24 yrs with major depressive disorder, other psychiatric disorders.

Do not confuse sertraline with selegiline, Serentil, or Serevent, or Zoloft with Zocor.

Uses
Treatment of major depressive disorders, panic disorder, obsessive-compulsive disorder (OCD), post-traumatic stress disorder (PTSD), premenstrual dysphoric disorder (PMDD), social anxiety disorder. OFF-LABEL: Eating disorders, bulimia nervosa, generalized anxiety disorder (GAD).

Precautions
Contraindications: Hypersensitivity to sertraline. MAOI use within 14 days (concurrently or within 14 days of stopping an MAOI or sertraline). Concurrent use of oral concentrate (contains alcohol) with disulfiram. Concurrent use with pimozide; initiation in pts treated with linezolid or methylene blue. Cautions: Seizure disorder, hepatic impairment, pts at risk for uric acid nephropathy, elderly pts, pts in third trimester of pregnancy, pts at high risk for suicide, family history of bipolar disorder or mania, pts with risk factors for QT prolongation (e.g., hypokalemia, hypomagnesemia), alcoholism. Pts in whom weight loss is undesirable.
**Action**

Blocks reuptake of the neurotransmitter serotonin at CNS neuronal presynaptic membranes, increasing availability at postsynaptic receptor sites. **Therapeutic Effect:** Relieves depression, reduces obsessive-compulsive behavior, decreases anxiety.

**Pharmacokinetics**

Incompletely, slowly absorbed from GI tract; food increases absorption. Protein binding: 98%. Widely distributed. Metabolized in liver. Excreted in urine (45%), feces (45%). Not removed by hemodialysis. **Half-life:** 26 hrs.

**Lifespan considerations**

**Pregnancy/Lactation:** Unknown if drug crosses placenta or is distributed in breast milk. **Children:** Children and adolescents are at increased risk for suicidal ideation and behavior or worsening of depression, esp. during the first few mos of therapy. **Elderly:** No age-related precautions noted, but lower initial dosages recommended.

**Interactions**

**DRUG:** Anticoagulants (e.g., heparin, rivaroxaban, warfarin), antiplatelets (e.g., aspirin, clopidogrel), NSAIDs (e.g., ibuprofen, ketorolac, naproxen), thrombolytics (e.g., alteplase) may increase risk of bleeding. May increase concentration, risk of toxicity of **highly protein-bound medications** (e.g., digoxin, warfarin). MAOIs (e.g., phenelzine, selegiline) may cause neuroleptic malignant syndrome, serotonin syndrome. Concomitant use of other serotonergic drugs (e.g., buspirone, carBAMazepine, fentanyl, linezolid, SNRIs [e.g., duloxetine, venlafaxine], triptans [e.g., sumatriptan]) may cause serotonin syndrome. May increase concentration, toxicity of **tricyclic antidepressants** (e.g., amitriptyline, doxepin). **HERBAL:** Gotu kola, kava kava, St. John’s wort, valerian may increase CNS depression. St. John’s wort may increase risk of serotonin syndrome. **FOOD:** None known. **LAB VALUES:** May increase total serum cholesterol, triglycerides, ALT, AST. May decrease serum uric acid.
Availability (Rx)

Oral Concentrate: 20 mg/mL. Tablets: 25 mg, 50 mg, 100 mg.

Administration/handling

PO

• Give with food, milk if GI distress occurs.
• Oral concentrate must be diluted before administration. Mix with 4 oz water, ginger ale, lemon/lime soda, or orange juice only. Give immediately after mixing.

Indications/routes/dosage

Depression

PO: ADULTS: Initially, 50 mg/day. May increase by 50 mg/day at 7-day intervals up to 200 mg/day. ELDERSLY: Initially, 25 mg/day. May increase by 25–50 mg/day at 7-day intervals up to 200 mg/day.

Obsessive-Compulsive Disorder (OCD)

PO: ADULTS, CHILDREN 13–17 YRS: Initially, 50 mg/day with morning or evening meal. May increase by 50 mg/day at 7-day intervals up to 200 mg/day. ELDERSLY, CHILDREN 6–12 YRS: Initially, 25 mg/day. May increase by 25–50 mg/day at 7-day intervals. Maximum: 200 mg/day.

Panic Disorder, Post-Traumatic Stress Disorder (PTSD), Social Anxiety Disorder (SAD)

PO: ADULTS, ELDERSLY: Initially, 25 mg/day. May increase by 50 mg/day at 7-day intervals. Range: 50–200 mg/day. Maximum: 200 mg/day.

Premenstrual Dysphoric Disorder (PMDD)

PO: ADULTS: Initially, 50 mg/day either daily throughout menstrual cycle or limited to luteal phase of menstrual cycle. May increase up to 150 mg/day per menstrual cycle in 50-mg increments when dosing throughout menstrual cycle or 100 mg/day when dosing during luteal phase only.
**Dosage in Renal Impairment**
No dose adjustment.

**Dosage in Hepatic Impairment**
Use caution.

**Side effects**

**Frequent (26%–12%)**: Headache, nausea, diarrhea, insomnia, drowsiness, dizziness, fatigue, rash, dry mouth. **Occasional (6%–4%)**: Anxiety, nervousness, agitation, tremor, dyspepsia, diaphoresis, vomiting, constipation, sexual dysfunction, visual disturbances, altered taste. **Rare (Less Than 3%)**: Flatulence, urinary frequency, paresthesia, hot flashes, chills.

**Adverse effects/toxic reactions**
Serotonin syndrome (seizures, arrhythmias, high fever), neuroleptic malignant syndrome (muscle rigidity, cognitive changes), suicidal ideation have occurred.

**Nursing considerations**

**Baseline assessment**
Assess appearance, behavior, speech patterns, level of interest, mood. For pts on long-term therapy, CBC, renal function, LFT should be performed periodically.

**Intervention/evaluation**
Assess mental status for depression, suicidal ideation (esp. at beginning of therapy or change in dosage), anxiety, social function, panic attack. Monitor daily pattern of bowel activity, stool consistency. Assist with ambulation if dizziness occurs.

**Patient/family teaching**
- Dry mouth may be relieved by sugarless gum, sips of water.
- Report headache, fatigue, tremor, sexual dysfunction.
- Avoid tasks that require alertness, motor skills until response to drug is
established (may cause dizziness, drowsiness).
• Take with food if nausea occurs.
• Inform physician if pregnancy occurs.
• Avoid alcohol.
• Do not take OTC medications without consulting physician.
• Report worsening of depression, suicidal ideation.

**sevelamer**
se-vel-a-mer

**Renagel**

**Renvela**

**CLASSIFICATION**

**PHARMACOTHERAPEUTIC:** Polymeric phosphate binder.

**CLINICAL:** Electrolyte modifier, antihyperphosphatemia agent.

Do not confuse Renagel with Reglan, Regonol, or Renvela, or sevelamer with Savella.

**Uses**
Reduction of serum phosphorus in pts with chronic renal disease on hemodialysis.

**Precautions**

**Contraindications:** Hypersensitivity to sevelamer. Bowel obstruction.
**Cautions:** Dysphagia, severe GI tract motility disorders, major GI tract surgery.

**Action**
Binds with dietary phosphorus in GI tract, allowing phosphorus to be eliminated through normal digestive process, decreasing serum phosphorus level.

**Therapeutic Effect:** Decreases incidence of hypercalcemic episodes in pts receiving calcium acetate treatment.

**Pharmacokinetics**
Not absorbed systemically. Unknown if removed by hemodialysis.
Lifespan considerations

Interactions

DRUG: May decrease concentration/effect of fluoroquinolones (e.g., levoFLOXacin). HERBAL: None significant. FOOD: May cause reduced absorption of vitamins D, E, K, folic acid. LAB VALUES: Expected to decrease serum phosphate.

Availability (Rx)

Powder for Oral Suspension (Renvela): 0.8 g/pack, 2.4 g/pack.
Tablets (Renagel): 400 mg, 800 mg. (Renvela): 800 mg.

Administration/handling

PO
• Give with meals.
• Space other medication by at least 1 hr before or 3 hrs after sevelamer.
• Give tablets whole; do not break, crush, dissolve, or divide.
• Oral Suspension: Mix 0.8 g with 30 mL water (2.4 g with 60 mL water). Stir vigorously to suspend (does not dissolve) just prior to drinking.

Indications/routes/dosage

Hyperphosphatemia
PO: ADULTS, ELDERLY: 800–1,600 mg with each meal, depending on severity of hyperphosphatemia (5.5–7.4 mg/dL: 800 mg 3 times/day; 7.5–8.9 mg/dL: 1,200–1,600 mg 3 times/day; 9 mg/dL or greater: 1,600 mg 3 times/day). Maintenance: Based on serum phosphorus concentrations. Goal range: 3.5–5.5 mg/dL.

**Dosage in Renal/Hepatic Impairment**

No dose adjustment.

**Side effects**

**Frequent (20%–11%):** Infection, pain, hypotension, diarrhea, dyspepsia, nausea, vomiting. **Occasional (10%–1%):** Headache, constipation, hypertension, increased cough.

**Adverse effects/toxic reactions**

Thrombosis occurs rarely.

**Nursing considerations**

**Baseline assessment**

Obtain baseline chemistries, esp serum calcium, phosphate; assess for bowel obstruction.

**Intervention/evaluation**

Monitor serum phosphate, bicarbonate, chloride, calcium.

**Patient/family teaching**

• Take with meals, swallow tablets whole; do not chew, crush, dissolve, or divide tablets.
• Report persistent headache, nausea, vomiting, diarrhea, hypotension.
CLASSIFICATION
PHARMACOTHERAPEUTIC: Protease inhibitor.
CLINICAL: Antiviral.

■ BLACK BOX ALERT ■ Test all pts for hepatitis B virus (HBV) infection prior to initiation. HBV reactivation was reported in HBV/HBC co-infected pts who were undergoing or had completed treatment with HCV direct-acting antivirals and were not receiving HBV antiviral therapy. HBV reactivation may cause fulminant hepatitis, hepatic failure, and death.

Do not confuse simeprevir with sofosbuvir.

Uses
Treatment of genotypes 1 and 4 chronic hepatitis C virus infection, in combination with other antihepaciviral therapy, in adults without cirrhosis or with compensated cirrhosis.

Precautions
Contraindications: Hypersensitivity to simeprevir. Pregnancy, male partners of pregnant women, breastfeeding, any contraindications to other antihepacivirals used in combination for treatment of chronic hepatitis C. Cautions: Pts of East Asian ancestry, sulfa allergy, or history of HIV, sun exposure, severe hepatic impairment. Latent or current HBV. Do not use as monotherapy. Combination with ribavirin is contraindicated with pregnancy. Avoid use in combination with peginterferon and ribavirin with decompensated cirrhosis.

Action
Inhibits hepatitis C virus (HCV) protease needed for cleavage of HCV-encoded polyproteins by binding to active serine protease sites. Therapeutic Effect: Inhibits viral replication of hepatitis C virus.

Pharmacokinetics
Well absorbed after PO administration. Metabolized in liver. Protein binding: 99.9%. Peak plasma concentration: 4–6 hrs. Excreted primarily in feces via
biliary route (91%). **Half-life:** 10–13 hrs.

**Lifespan considerations**

**Pregnancy/Lactation:** Strictly avoid pregnancy. May cause birth defects or fetal demise. Women of childbearing age must use two different forms of reliable birth control during treatment and for at least 6 mos after discontinuation. Do not initiate therapy until negative pregnancy test confirmed. Unknown if distributed in breast milk. Breastfeeding contraindicated. **Children:** Safety and efficacy not established. **Elderly:** No age-related precautions noted. **Race:** Pts of East Asian ancestry may have increased risk of adverse reactions due to increased drug exposure/sensitivity.

**Interactions**

**DRUG:** May increase concentration/effects of antiarrhythmics (e.g., amiodarone, quiNiDine), calcium channel blockers (e.g., felodipine, NIFEdipine), cycloSPORINE, digoxin, sedative/hypnotics (e.g., midazolam, triazolam), statins (e.g., atorvastatin, simvastatin), sildenafil, vardenafil. May decrease concentration/effects of sirolimus, tacrolimus. CYP3A4 inducers (e.g., carBAMazepine, rifAMPin) may decrease concentration/effects. CYP3A4 inhibitors (e.g., itraconazole, fluconazole, clarithromycin, ritonavir) may increase concentration/effects. **HERBAL:** St. John’s wort may decrease concentration/effects. **Milk thistle (Silybum marianum)** may increase concentration/effects. **FOOD:** None known. **LAB VALUES:** May increase serum alkaline phosphatase, bilirubin.

**Availability (Rx)**

**Capsules:** 150 mg.

**Administration/handling**

**PO**

- Administer with food.
- Administer capsule whole; do not break, crush, or open.
Indications/routes/dosage

**Alert:** Must use in combination with other antihepacivirals. Not recommended as monotherapy. Dose reduction of simeprevir not recommended. Combination therapy with peginterferon/ribavirin not recommended in HCV treatment guidelines.

**Chronic Hepatitis C Infection (with Peginterferon Alfa and Ribavirin)**

**PO:** **ADULTS/ELDERLY:** 150 mg daily with food for 12 wks (with peginterferon alfa and ribavirin).

**Treatment Naïve, Prior Relapsers (Including Cirrhosis):** Extend peginterferon alfa and ribavirin therapy for additional 12 wks after completing 12-wk triple therapy (24 wks total).

**Prior Nonresponders (Including Cirrhosis):** Extend peginterferon alfa and ribavirin therapy for additional 36 wks after completing 12-wk triple therapy (48 wks total).

**Chronic Hepatitis C Infection (with Sofosbuvir)**

**PO:** **ADULTS, ELDERLY:** (Treatment naïve or treatment experienced without cirrhosis): 150 mg daily with food for 12 wks. (Treatment naïve or treatment experienced with cirrhosis): 150 mg daily with food for 24 wks.

**Treatment Futility**

If HCV RNA viral load greater than or equal to 25 IU/mL at wk 4, discontinue simeprevir, peginterferon alfa, and ribavirin. If HCV RNA viral load greater than or equal to 25 IU/mL at wk 12 or 24, discontinue peginterferon alfa and ribavirin (simeprevir already completed at wk 12). Discontinue therapy if serious adverse effects occur.

**Dosage in Renal Impairment**

No dose adjustment.

**Dosage in Hepatic Impairment**

Not recommended in moderate to severe impairment.
Side effects

**Frequent** (28%–22%): Rash, pruritus, nausea. **Occasional** (16%–12%): Myalgia, dyspnea.

Adverse effects/toxic reactions

Increased risk of thromboembolic events associated with peginterferon alfa. Dermatologic events/photosensitivity including generalized rash, erythema, eczema, maculopapular rash, dermatitis, skin exfoliation, rash erythematous, urticaria, allergic dermatitis, cutaneous vasculitis, skin eruption, photodermatosis, sunburn reported. Mild to moderate dyspnea reported in 12% of pts.Pts of East Asian ancestry may have increased risk of photosensitivity.

Nursing considerations

**Baseline assessment**

**Intervention/evaluation**

**Patient/family teaching**

- Treatment must be used in combination with peginterferon, ribavirin. Inform
pts of side effects/contraindications of triple-medication regimen. Periodic lab
tests are an essential part of therapy.
• Report any newly prescribed medications.
• Do not take herbal products.
• Women of childbearing age must use two different forms of reliable birth
  control during treatment and for at least 6 mos after treatment. Do not
  breastfeeding.
• Notify physician if female partner becomes pregnant.
• Report difficulty breathing, weakness, dizziness, weight loss.
• Avoid alcohol.
• Take with meals. Do not use tanning beds. Limit sun exposure; use protective
  UV measures. Immediately report any changes to skin including rash, skin
  peeling, ulcers, or new moles/lesions.

simvastatin

Apo-Simvastatin

Zocor

Fixed-Combination(s)

Juvisync: simvastatin/SITagliptin (an antidiabetic agent): 10 mg/100 mg, 20
mg/100 mg, 40 mg/100 mg. Simcor: simvastatin/niacin (an antilipemic agent): 20
mg/500 mg, 40 mg/500 mg, 20 mg/750 mg, 20 mg/1,000 mg, 40 mg/1,000
mg. Vytorin: simvastatin/ezetimibe (a cholesterol absorption inhibitor): 10
mg/10 mg, 20 mg/10 mg, 40 mg/10 mg, 80 mg/10 mg.

CLASSIFICATION

PHARMACOTHERAPEUTIC: Hydroxymethylglutaryl-CoA (HMG-CoA)
reductase inhibitor.

CLINICAL: Antihyperlipidemic.

Do not confuse simvastatin with atorvastatin, lovastatin, nystatin,
pitavastatin, or pravastatin, or Zocor with Cozaar, Lipitor, Zoloft, or
ZyrTEC.

Uses
Secondary prevention of cardiovascular events in pts with hypercholesterolemia and coronary heart disease (CHD) or at high risk for CHD. Treatment of hyperlipidemias to reduce elevations in total serum cholesterol, LDL-C, apolipoprotein B, triglycerides, VLDL-C and increase HDL-C. Treatment of homozygous familial hypercholesterolemia. Treatment of heterozygous familial hypercholesterolemia in adolescents (10–17 yrs, females more than 1 yr postmenarche).

**Precautions**

**Contraindications:** Hypersensitivity to simvastatin. Active hepatic disease or unexplained, persistent elevations of hepatic function test results, pregnancy, breastfeeding, concurrent use of strong CYP3A4 inhibitors (e.g., clarithromycin, cycloSPORINE, gemfibrozil). **Cautions:** History of hepatic disease, diabetes, severe renal impairment, substantial alcohol consumption. Withholding or discontinuing simvastatin may be necessary when pt is at risk for renal failure secondary to rhabdomyolysis. Concomitant use of other medications associated with myopathy.

**Action**

Interferes with cholesterol biosynthesis by inhibiting conversion of the enzyme HMG-CoA to mevalonate. **Therapeutic Effect:** Decreases LDL, cholesterol, VLDL, triglyceride levels; increase in HDL concentration.

**Pharmacokinetics**

Well absorbed from GI tract. Protein binding: 95%. Metabolized in liver. Excreted in feces (60%), urine (13%). Unknown if removed by hemodialysis.

<table>
<thead>
<tr>
<th>Route</th>
<th>Onset</th>
<th>Peak</th>
<th>Duration</th>
</tr>
</thead>
<tbody>
<tr>
<td>PO (to reduce cholesterol)</td>
<td>3 days</td>
<td>14 days</td>
<td>N/A</td>
</tr>
</tbody>
</table>

**Lifespan considerations**

**Pregnancy/Lactation:** Contraindicated in pregnancy (suppression of cholesterol biosynthesis may cause fetal toxicity), lactation. Risk of serious adverse reactions in breastfeeding infants. **Children:** Safety and efficacy not established
in children less than 10 yrs of age or in premenarchal girls. **Elderly:** No age-related precautions noted.

**Interactions**

**DRUG:** CycloSPORINE, CYP3A4 inhibitors (e.g., ketoconazole, erythromycin), amiodarone, calcium channel blockers (e.g., diltiaZEM, verapamil), colchicine, fibrates, gemfibrozil, niacin, ranolazine may increase risk of acute renal failure, rhabdomyolysis. **HERBAL:** St. John’s wort may decrease concentration. **FOOD:** Grapefruit products may increase concentration, toxicity. **Red yeast rice** contains 2.4 mg **lovastatin** per 600 mg rice. **LAB VALUES:** May increase serum creatine kinase (CK), transaminase.

**Availability (Rx)**

**Tablets:** 5 mg, 10 mg, 20 mg, 40 mg, 80 mg.

**Administration/handling**

**PO**

• Give without regard to meals.

• Administer in evening for maximum efficacy.

**Indications/routes/dosage**

**Note:** Limit 80-mg dose to pts taking simvastatin longer than 12 mos without evidence of myopathy.

**Prevention of Cardiovascular Events**

**PO:** **ADULTS, ELDERLY:** 10–20 mg once daily. Range: 5–40 mg/day.

**Hyperlipidemias**

**PO:** **ADULTS, ELDERLY:** Initially, 10–20 mg once daily. **(Pts with CHD or CHD risk equivalents):** Initially, 40 mg/day. Range: 5–40 mg/day.

**Homozygous Familial Hypercholesterolemia**
PO: ADULTS, ELDERLY: 40 mg once daily in evening.

Heterozygous Familial Hypercholesterolemia
PO: CHILDREN 10–17 YRS: 10 mg once daily in evening. Range: 10–40 mg/day.

Dosing Adjustment with Medications
Cyclosporine, gemfibrozil: Do not exceed 10 mg/day. Amiodarone, amLODIPine, ranolazine: Do not exceed 20 mg/day. DiltiaZEM, dronedarone, verapamil: Do not exceed 10 mg/day. Lomitapide: Reduce simvastatin dose by 50% when initiating lomitapide. Do not exceed 20 mg/day.

Dosage in Renal Impairment
CrCl less than 30 mL/min: Initially, 5 mg/day.

Dosage in Hepatic Impairment
Contraindicated with active hepatic disease.

Side effects
Generally well tolerated. Side effects are usually mild and transient. **Occasional (3%–2%)**: Headache, abdominal pain/cramps, constipation, upper respiratory tract infection. **Rare (Less Than 2%)**: Diarrhea, flatulence, asthenia, nausea/vomiting, depression.

Adverse effects/toxic reactions
Potential for ocular lens opacities. Hypersensitivity reaction, hepatitis occur rarely. Myopathy (muscle pain, tenderness, weakness with elevated serum creatine kinase [CK], sometimes taking the form of rhabdomyolysis) has occurred.

Nursing considerations
Baseline assessment
Obtain dietary history, esp. fat consumption. Question for possibility of pregnancy before initiating therapy. Question for history of hypersensitivity to simvastatin. Assess baseline lab results: serum cholesterol, LDL, VLDL, HDL, triglycerides, LFT.

**Intervention/evaluation**

**Patient/family teaching**

- Use appropriate contraceptive measures.
- Periodic lab tests are essential part of therapy.
- Maintain appropriate diet. Avoid grapefruit products.
- Report unexplained muscle pain, tenderness, weakness.

### sirolimus

*si-roh-lim-us*

**Rapamune**

- **CLASSIFICATION**
  - PHARMACOTHERAPEUTIC: mTOR kinase inhibitor.
  - CLINICAL: Immunosuppressant.

- **BLACK BOX ALERT**
  - Increased susceptibility to infection and potential for development of lymphoma. Not recommended for liver or lung transplant pts. Use only by physicians experienced in immunosuppressive therapy and management of transplant pts.

**Do not confuse Rapamune with Rapaflo, or sirolimus with everolimus, pimecrolimus, tacrolimus, or temsirolimus.**

**Uses**

Prophylaxis of organ rejection in pts receiving renal transplant (in combination with cycloSPORINE and corticosteroids). Treatment of lymphangioleiomyomatosis. **OFF-LABEL:** Prophylaxis of organ rejection in

**Precautions**

**Contraindications:** Hypersensitivity to sirolimus. **Cautions:** Cardiovascular disease (HF, hypertension); pulmonary disease, hepatic impairment, renal impairment, hyperlipidemia, perioperative period due to increased chance of surgical complications from impaired wound and tissue healing. Concurrent use with medications that may alter renal function.

**Action**

Inhibits T-lymphocyte activation and proliferation in response to antigenic and cytokine stimulation, and inhibits antibody production. **Therapeutic Effect:** Inhibits acute rejection of allografts and prolongs graft survival.

**Pharmacokinetics**

Rapidly absorbed from GI tract. Protein binding: 92%. Extensively metabolized in liver. Primarily excreted in feces (91%). **Half-life:** 57–63 hrs.

**Lifespan considerations**

**Pregnancy/Lactation:** Unknown if drug crosses placenta or is distributed in breast milk. **Children:** Safety and efficacy not established in pts younger than 13 yrs. **Elderly:** No age-related precautions noted.

**Interactions**

**DRUG:** CYP3A4 inducers (e.g., carBAMazepine, rifabutin, rifAMPin) may decrease concentration/effects. CYP3A4 inhibitors (e.g., clarithromycin, erythromycin, itraconazole, verapamil) may increase concentration, toxicity. May increase concentration/effects of cycloSPORINE (take sirolimus 4 hrs after cycloSPORINE for renal transplant). **HERBAL:** St. John’s wort may decrease concentration. Cat’s claw, echinacea possess immunostimulant properties. Garlic, ginger, ginseng may increase hypoglycemia. **FOOD:** Grapefruit
products may increase risk of myelotoxicity, nephrotoxicity. **LAB VALUES:** May increase serum ALT, AST, alkaline phosphatase, LDH, BUN, creatinine, phosphate, cholesterol, triglycerides, creatinine. May alter WBC, serum glucose, calcium. May decrease Hgb, Hct.

**Availability (Rx)**

**Oral Solution:** 1 mg/mL.  
**Tablets:** 0.5 mg, 1 mg, 2 mg.

**Administration/handling**

- Doses should be taken 4 hrs after cycloSPORINE.
- Take consistently with or without food.
- Do not break, crush, dissolve, or divide tablets.
- Mix oral solution with only water or orange juice, stir vigorously, drink immediately.

**Indications/routes/dosage**

**Alert** Tablets and oral solution are not bioequivalent. (However, clinical equivalence shown at 2 mg dose.)

**Prevention of Organ Transplant Rejection (Low to Moderate Risk)**

**PO:** ADULTS, CHILDREN 13 YRS AND OLDER WEIGHING MORE THAN 40 KG: Loading dose: 6 mg on day 1. **Maintenance:** 2 mg/day.  
ADULTS, CHILDREN 13 YRS AND OLDER WEIGHING LESS THAN 40 KG: Loading dose: 3 mg/m² on day 1. **Maintenance:** 1 mg/m²/day.

**Prevention of Organ Transplant Rejection (High Risk)**

**PO:** ADULTS: Loading dose: Up to 15 mg on day 1. **Maintenance:** 5 mg/day. Obtain trough between 5–7 days. Continue therapy for 1 yr following transplantation. Further adjustments based on clinical status.

**Lymphangioleiomyomatosis**

**PO:** ADULTS, ELDERLY: Initially, 2 mg/day with dosage adjustment to
maintain concentration between 5–15 ng/mL.

**Dosage in Renal Impairment**
No dose adjustment.

**Dosage in Hepatic Impairment**
Loading dose: No change. **Maintenance dose:** Mild to moderate impairment: Reduce dose by 33%. Severe impairment: Reduce dose by 50%.

**Side effects**
**Occasional:** Hypercholesterolemia, hyperlipidemia, hypertension, rash. **High doses (5 mg/day):** Anemia, arthralgia, diarrhea, hypokalemia, peripheral edema, thrombocytopenia.

**Adverse effects/toxic reactions**
Hepatotoxicity occurs rarely. Skin carcinoma (including basal cell, squamous cell, melanoma) has been observed.

**Nursing considerations**

**Baseline assessment**
Obtain LFT. Assess for pregnancy, lactation. Question for medication usage (esp. cycloSPORINE, diltiaZEM, ketoconazole, rifAMPin). Determine if pt has chickenpox, herpes zoster, malignancy, infection.

**Intervention/evaluation**
Monitor serum renal function, LFT periodically. Monitor serum cholesterol, triglycerides, platelets; Hgb.

**Patient/family teaching**
- Avoid those with colds, other infections.
- Avoid grapefruit products.
- Avoid exposure to sunlight, artificial light sources.
• Strict monitoring is essential in identifying, preventing symptoms of organ rejection.
• Do not chew, crush, dissolve, or divide tablets.

**SITagliptin**
sit-a-glip-tin
Januvia

**Fixed-Combination(s)**

**Janumet, Janumet XR:** SITagliptin/metFORMIN (an antidiabetic): 50 mg/500 mg, 50 mg/1,000 mg. **Juvisync:** SITagliptin/simvastatin (an antilipidemic agent): 100 mg/10 mg, 100 mg/20 mg, 100 mg/40 mg.

**CLASSIFICATION**

**PHARMACOTHERAPEUTIC:** DPP-4 inhibitors (gliptins).

**CLINICAL:** Antidiabetic agent.

Do not confuse Januvia with Enjuvia, Jantoven, or Janumet, or SITagliptin with SAXagliptin or SUMAtriptan.

**Uses**

Adjunctive treatment to diet, exercise to improve glycemic control in pts with type 2 diabetes as monotherapy or in combination with other antidiabetic agents.

**Precautions**

**Contraindications:** Hypersensitivity to SITagliptin. **Cautions:** Type I diabetes, diabetic ketoacidosis, renal impairment, end-stage renal disease, history of pancreatitis, angioedema with other DPP-4 inhibitors. Concurrent use of other glucose-lowering agents may increase risk of hypoglycemia.

**Action**

Inhibits DPP-4 enzyme, causing prolonged active incretin levels. Incretin regulates glucose homeostasis. **Therapeutic Effect:** Regulates glucose homeostasis. Increases synthesis and release of insulin from pancreatic cells; lowers glucagon secretion from pancreas, decreases hepatic glucose production.
Pharmacokinetics

<table>
<thead>
<tr>
<th>Route</th>
<th>Onset</th>
<th>Peak</th>
<th>Duration</th>
</tr>
</thead>
<tbody>
<tr>
<td>PO</td>
<td>N/A</td>
<td>1–4 hrs</td>
<td>24 hrs</td>
</tr>
</tbody>
</table>

Rapidly absorbed. Protein binding: 38%. Excreted in urine (87%), feces (13%). Half-life: 12 hrs.

Lifespan considerations

Pregnancy/Lactation: Unknown if distributed in breast milk. Children: Safety and efficacy not established. Elderly: No age-related precautions noted.

Interactions

DRUG: None known. HERBAL: None significant. FOOD: None known. LAB VALUES: May slightly increase WBCs, particularly neutrophil count. May increase serum creatinine.

Availability (Rx)

Tablets (Film-Coated): 25 mg, 50 mg, 100 mg.

Administration/handling

PO

- May give without regard to food.
- Do not break, crush, dissolve, or divide film-coated tablets.

Indications/routes/dosage

Type 2 Diabetes

PO: ADULTS OVER 18 YRS, ELDERLY: 100 mg once daily.

Dosage in Renal Impairment

Moderate impairment: (CrCl equal to or greater than 30 mL/min to less than 50 mL/min): 50 mg once daily. Severe impairment: (CrCl less than 30 mL/min
or dialysis pt): 25 mg once daily.

**Dosage in Hepatic Impairment**
No dose adjustment.

**Side effects**

*Occasional (5% and greater):* Headache, nasopharyngitis. *Rare (3%–1%):* Diarrhea, abdominal pain, nausea.

**Adverse effects/toxic reactions**

Hypersensitivity reactions including angioedema, Stevens-Johnson syndrome reported. Acute pancreatitis occurs rarely.

**Nursing considerations**

**Baseline assessment**
Check serum glucose concentration before administration. Assess renal function. Discuss lifestyle to determine extent of learning, emotional needs. Ensure follow-up instruction if pt, family do not thoroughly understand diabetes management, glucose-testing technique.

**Intervention/evaluation**
Monitor serum glucose, Hgb A1c, BUN, creatinine. Assess for hypoglycemia (diaphoresis, tremor, dizziness, anxiety, headache, tachycardia, perioral numbness, hunger, diplopia, difficulty concentrating), hyperglycemia (polyuria, polyphagia, polydipsia, nausea, vomiting, dim vision, fatigue, deep, rapid breathing). Be alert to conditions that alter glucose requirements (fever, increased activity, stress, trauma, surgical procedures).

**Patient/family teaching**

- Diabetes requires lifelong control.
- Prescribed diet, exercise are principal part of treatment; do not skip, delay meals.
- Continue to adhere to dietary instructions, regular exercise program, regular
testing of serum glucose.
• When taking combination drug therapy or when glucose demands are altered (fever, infection, trauma, stress, heavy physical activity), have source of glucose available to treat symptoms of hypoglycemia.
• Report nausea, vomiting, anorexia, severe abdominal pain, pancreatitis.

**sodium bicarbonate**

soe-dee-um bye-kar-boe-nate

CLASSIFICATION

PHARMACOTHERAPEUTIC: Alkalinizing agent.

CLINICAL: Antacid electrolyte, urinary/systemic alkalinizer.

**Uses**

Management of metabolic acidosis, gastric hyperacidity. Alkalinization agent for urine; hyperkalemia treatment; management of overdose of tricyclic antidepressants and aspirin. **OFF-LABEL:** Prevention of contrast-induced nephropathy.

**Precautions**

**Action**

Dissociates to provide bicarbonate ion. **Therapeutic Effect:** Neutralizes hydrogen ion concentration, raises blood, urinary pH.

**Pharmacokinetics**

<table>
<thead>
<tr>

</tr>
</tbody>
</table>

Well absorbed following PO administration, sodium bicarbonate dissociates to
sodium and bicarbonate ions. With increased hydrogen ion concentrations, bicarbonate ions combine with hydrogen ions to form carbonic acid, which then dissociates to CO₂, which is excreted by the lungs. Plasma concentration regulated by kidney (ability to form, excrete bicarbonate).

Lifespan considerations

Pregnancy/Lactation: May produce hypernatremia, increase tendon reflexes in neonate or fetus whose mother is administered chronically high doses. May be distributed in breast milk. Children: No age-related precautions noted. Do not use as antacid in pts younger than 6 yrs. Elderly: Age-related renal impairment may require dosage adjustment.

Interactions

DRUG: May increase concentration, toxicity of quINIDine, quININE. May decrease effects of lithium. HERBAL: None significant. FOOD: Milk, other dairy products may result in milk-alkali syndrome. LAB VALUES: May increase serum, urinary pH.

Availability (Rx)

Injection Solution (Rx): 0.5 mEq/mL (4.2%), 1 mEq/mL (8.4%). Tablets (OTC): 325 mg, 650 mg.

Administration/handling

IV

For direct IV administration in neonates or infants, use 0.5 mEq/mL concentration.

Reconstitution

• May give undiluted.

Rate of Administration

• For IV push, give up to 1 mEq/kg over 1–3 min for cardiac arrest.
• For IV infusion, do not exceed rate of infusion of 1 mEq/kg/hr.
• For children younger than 2 yrs, premature infants, neonates, administer by slow infusion, up to 10 mEq/min.
Storage
• Store at room temperature.

PO
• Give 1–3 hrs after meals.

IV incompatibilities
Amiodarone (Cordarone), ascorbic acid, calcium chloride, diltiaZEM (Cardizem), DOBUTamine (Dobutrex), DOPamine (Intropin), HYDROmorphine (Dilaudid), magnesium sulfate, midazolam (Versed), norepinephrine (Levophed), ondansetron (Zofran).

IV Compatibilities
Dexmedetomidine (Precedex), furosemide (Lasix), heparin, insulin, lidocaine, mannitol, milrinone (Primacor), morphine, phenylephrine (Neo-Synephrine), potassium chloride, propofol (Diprivan), vancomycin (Vancocin).

Indications/routes/dosage
May give by IV push, IV infusion, or orally. Dose individualized based on severity of acidosis, laboratory values, pt age, weight, clinical conditions. Do not fully correct bicarbonate deficit during the first 24 hrs (may cause metabolic alkalosis).

Cardiac Arrest
Routine use not recommended.
IV: ADULTS, ELDERLY: Initially, 1 mEq/kg. May repeat with 0.5 mEq/kg in 10 min one time during continued cardiopulmonary arrest. Use in postresuscitation phase is based on arterial blood pH, partial pressure of carbon dioxide in arterial blood (PaCO₂), base deficit calculation. CHILDREN, INFANTS: Initially, 0.5–1 mEq/kg. Repeat in 10 min one time, or as indicated by pt’s acid-base status.

Metabolic Acidosis (Mild to Moderate)
IV: ADULTS, ELDERLY, CHILDREN: 2–5 mEq/kg over 4–8 hrs. May repeat based on acid-base status.

Prevention of Contrast-Induced Nephropathy
IV Infusion: ADULTS, ELDERLY: 154 mEq/L sodium bicarbonate in D₅W solution: 3 mL/kg/hr 1 hr immediately before contrast injection, then 1 mL/kg/hr during contrast exposure and for 6 hrs after procedure.

Metabolic Acidosis (Associated with Chronic Renal Failure)
PO: ADULTS, ELDERLY: Initially, 15.4–23.1 mEq/day in divided doses. Titrate to normal serum bicarbonate level of 23–29 mEq/L.

Renal Tubular Acidosis (Distal)
PO: ADULTS, ELDERLY: 0.5–2 mEq/kg/day in 4–6 divided doses. CHILDREN: 2–3 mEq/kg/day in divided doses.

Renal Tubular Acidosis (Proximal)
PO: ADULTS, ELDERLY, CHILDREN: 5–10 mEq/kg/day in divided doses. Maintenance dose to maintain serum bicarbonate in normal range.

Urine Alkalinization
PO: ADULTS, ELDERLY: Initially, 4 g, then 1–2 g q4h. Maximum: 16 g/day (8 g/day in adults older than 60 yrs). CHILDREN: 1–10 mEq/kg/day in divided doses q4–6h.

Antacid
PO: ADULTS, ELDERLY: 300 mg–2 g 1–4 times/day.

Hyperkalemia
IV: ADULTS, ELDERLY: 50 mEq over 5 min.

Side effects
Frequent: Abdominal distention, flatulence, belching.
Adverse effects/toxic reactions

Excessive, chronic use may produce metabolic alkalosis (irritability, twitching, paresthesia, cyanosis, slow or shallow respirations, headache, thirst, nausea). Fluid overload results in headache, weakness, blurred vision, behavioral changes, incoordination, muscle twitching, elevated B/P, bradycardia, tachypnea, wheezing, coughing, distended neck veins. Extravasation may occur at the IV site, resulting in tissue necrosis, ulceration.

Nursing considerations

Baseline assessment
Assess for signs and symptoms of acidosis, alkalosis. Do not give PO medication within 1 hr of antacids.

Intervention/evaluation

sodium chloride
so-dee-um klor-ide
Muro 128
Nasal Moist
Ocean
SalineX

CLASSIFICATION
PHARMACOTHERAPEUTIC: Salt.
CLINICAL: Electrolyte, isotonic volume expander, ophthalmic adjunct, bronchodilator.
**Uses**

**Parenteral:** Source of hydration; prevention/treatment of sodium, chloride deficiencies (hypertonic for severe deficiencies). Prevention of muscle cramps, heat prostration occurring with excessive perspiration. **Nasal:** Restores moisture, relieves dry, inflamed nasal membranes. **Ophthalmic:** Therapy in reduction of corneal edema, diagnostic aid in ophthalmoscopic exam.

**Precautions**

**Contraindications:** Hypersensitivity to sodium chloride. Fluid retention, hypernatremia, hypertonic uterus. **Cautions:** HF, renal impairment, cirrhosis, hypertension, edema. Do not use sodium chloride preserved with benzyl alcohol in neonates.

**Action**

Sodium is a major cation of extracellular fluid. **Therapeutic Effect:** Controls water distribution, fluid and electrolyte balance, osmotic pressure of body fluids; maintains acid-base balance.

**Pharmacokinetics**

Well absorbed from GI tract. Widely distributed. Primarily excreted in urine and, to a lesser degree, in sweat, tears, saliva.

**Lifespan considerations**

**Pregnancy/Lactation:** No precautions noted. **Children/Elderly:** No age-related precautions noted.

**Interactions**

**DRUG:** May decrease effect of lithium. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** None significant.

**Availability (Rx)**

**Injection (Concentrate) (Rx):** 23.4% (4 mEq/mL). **Injection Solution (Rx):**
0.45%, 0.9%, 3%. **Irrigation (Rx):** 0.45%, 0.9%. **Nasal Gel (Nasal Moist (OTC):** 0.65%. **Nasal Solution (OTC):** 0.4% (SalineX), 0.65% (Nasal Moist, Ocean). **Ophthalmic Ointment (OTC [Muro 128]):** 5%. **Ophthalmic Solution (OTC [Muro 128]):** 2%, 5%.

**Tablets (OTC):** 1 g.

**Administration/handling**

**IV**
- Hypertonic solutions (3% or 5%) are administered via large vein; avoid infiltration; do not exceed 100 mL/hr.
- Vials containing 2.5–4 mEq/mL (concentrated NaCl) must be diluted with D₅W or D₁₀W before administration.

**PO**
- Do not crush/break enteric-coated or extended-release tablets.
- Administer with full glass of water.

**Nasal**
- Instruct pt to begin inhaling slowly just before releasing medication into nose.
- Instruct pt to inhale slowly, then release air gently through mouth.
- Continue technique for 20–30 sec.

**Ophthalmic**
- Place gloved finger on lower eyelid and pull out until pocket is formed between eye and lower lid.
- Place prescribed number of drops (or 1/4–1/2 inch of ointment) into pocket.
- Instruct pt to close eye gently for 1–2 min so that medication will not be squeezed out of sac.
- When lower lid is released, have pt keep eye open without blinking for at least 30 sec for solution; for ointment have pt close eye, roll eyeball around to distribute medication.
- When using drops, apply gentle finger pressure to lacrimal sac at inner canthus for 1 min to minimize systemic absorption.
Indications/routes/dosage

Dosage based on age, weight, clinical condition; fluid, electrolyte, acid-base balance status.

Usual Parenteral Dosage
IV: ADULTS, ELDERLY, CHILDREN: Determined by laboratory determinations (mEq). Dosage varies widely based on clinical conditions.

Usual Oral Dosage
PO: ADULTS, ELDERLY: 1–2 g 3 times/day.

Usual Nasal Dosage
Intranasal: ADULTS, ELDERLY, CHILDREN: 2–3 sprays as needed.

Usual Ophthalmic Dosage
Ophthalmic Solution: ADULTS, ELDERLY: Apply 1–2 drops q3–4h.
Ophthalmic Ointment: ADULTS, ELDERLY: Apply once daily or as directed.

Side effects

Adverse effects/toxic reactions
Too-rapid administration may produce peripheral edema, HF, pulmonary edema. Excessive dosage may produce hypokalemia, hypervolemia, hypernatremia.

Nursing considerations

Baseline assessment
Obtain baseline serum electrolyte studies. Assess fluid balance (I&O, daily weight, lung sounds, edema).
**Intervention/evaluation**

Monitor fluid balance (I&O, daily weight, lung sounds, edema), IV site for extravasation. Monitor serum electrolytes, acid-base balance, B/P. Hypernatremia associated with edema, weight gain, elevated B/P; hyponatremia associated with muscle cramps, nausea, vomiting, dry mucous membranes.

**Patient/family teaching**

- Temporary burning, irritation may occur upon instillation of eye medication.
- Discontinue eye medication and report if severe pain, headache, rapid change in vision (peripheral, direct), sudden appearance of floating spots, acute redness of eyes, pain on exposure to light, double vision occurs.

---

**sodium polystyrene sulfonate**

so-dee-um pol-ee-stye-reen

Kayexalate

Kionex

PMS-Sodium Polystyrene Sulfonate

SPS

CLASSIFICATION

PHARMACOTHERAPEUTIC: Cation exchange resin.

CLINICAL: Antihyperkalemic.

Do not confuse Kayexalate with Kaopectate.

---

**Uses**

Treatment of hyperkalemia.

**Precautions**

**Contraindications:** Hypersensitivity to sodium polystyrene sulfonate. Hypokalemia, neonates with reduced GI motility, intestinal obstruction/perforation. Oral administration in neonates. **Cautions:** Severe HF, hypertension, edema. Use in premature or low-birth-weight infants, use in children when administering rectally. Avoid use in pts at risk for
constipation/impaction.

**Action**

Releases sodium ions in exchange primarily for potassium ions across intestinal wall. **Therapeutic Effect:** Moves potassium from blood into intestine to be expelled from the body.

**Pharmacokinetics**

Onset: 2–24 hrs. Eliminated only in feces.

**Lifespan considerations**

**Pregnancy/Lactation:** Unknown if drug crosses placenta or is distributed in breast milk. **Children:** Safety and efficacy not established. Contraindicated in neonates. **Elderly:** Increased risk for fecal impaction.

**Interactions**

**DRUG:** Cation-donating antacids, laxatives (e.g., magnesium hydroxide) may decrease effect; may cause systemic alkalosis in pts with renal impairment. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** May decrease serum calcium, magnesium, potassium. May increase serum sodium.

**Availability (Rx)**

**Powder for Suspension (Kayexalate, Kionex):** 15 g/4 level tsp (480 g). **Suspension (SPS):** 15 g/60 mL.

**Administration/handling**

**PO**

- Shake suspension well prior to administration.
- Do not mix with orange juice.
- Chilling suspension will increase palatability.

**Rectal**
• After initial cleansing enema, insert large rubber tube into rectum well into sigmoid colon; tape in place.
• Introduce suspension (with 100 mL aqueous vehicle) via gravity.
• Flush with 50–100 mL fluid and clamp.
• Pt must retain for several hrs if possible.
• Irrigate colon with non–sodium-containing solution to remove resin.

Indications/routes/dosage

Hyperkalemia

PO: ADULTS, ELDERSLY: 60 mL (15 g) 1–4 times/day. CHILDREN: 1 g/kg/dose q6h.
Rectal: ADULTS, ELDERSLY: 30–50 g as needed q6h. CHILDREN: 1 g/kg/dose q2–6h.

Dosage in Renal/Hepatic Impairment
No dose adjustment.

Side effects

Frequent: High dosage: Anorexia, nausea, vomiting, constipation. High dosage in elderly: Fecal impaction (severe stomach pain with nausea/vomiting). Occasional: Diarrhea, sodium retention (decreased urination, peripheral edema, increased weight).

Adverse effects/toxic reactions

Potassium deficiency may occur. Early signs of hypokalemia include confusion, delayed thought processes, extreme weakness, irritability, EKG changes (often associated with prolonged QT interval; widening, flattening, or inversion of T wave; prominent U waves). Hypocalcemia, manifested by abdominal/muscle cramps, occurs occasionally. Arrhythmias, severe muscle weakness may be noted.

Nursing considerations
Baseline assessment

Does not rapidly correct severe hyperkalemia (may take hrs to days). Consider other measures in medical emergency (IV calcium, IV sodium bicarbonate/glucose/insulin, dialysis).

Intervention/evaluation

Monitor serum potassium levels frequently. Assess pt’s clinical condition, EKG (valuable in determining when treatment should be discontinued). Also monitor serum magnesium, calcium levels. Monitor daily pattern of bowel activity, stool consistency (fecal impaction may occur in pts on high dosages, particularly in elderly).

sofosbuvir/velpatasvir/voxilaprevir

soe-fos-bue-vir/vel-pat-as-vir/vox-i-la-pre-vir

Vosevi

CLASSIFICATION
PHARMACOTHERAPEUTIC: NS5A inhibitor, polymerase inhibitor, NS3/4A inhibitor, NS5B RNA polymerase inhibitor.

CLINICAL: Antihepaciviral.

BLACK BOX ALERT Test all pts for hepatitis B virus (HBV) infection prior to initiation. HBV reactivation was reported in HBV/HBC co-infected pts who were undergoing or had completed treatment with HCV direct-acting antivirals and were not receiving HBV antiviral therapy. HBV reactivation may cause fulminant hepatitis, hepatic failure, and death.

Do not confuse sofosbuvir with boceprevir, dasabuvir, fosamprenavir, or simeprevir; or velpatasvir with daclatasvir, grazoprevir, or paritaprevir; or voxilaprevir with boceprevir, grazoprevir, or paritaprevir.

Uses

Treatment of adults with chronic hepatitis C virus (HCV) infection without cirrhosis or with compensated cirrhosis who have genotype 1, 2, 3, 4, 5, or 6 infection and have previously been treated with an HCV regimen containing an NS5A inhibitor or who have genotype 1a or 3 infection and have previously
been treated with an HCV regimen containing sofosbuvir without an NS5A inhibitor.

**Precautions**

**Contraindications:** Hypersensitivity to sofosbuvir, velpatasvir, voxilaprevir. Concomitant use of rifAMPin. **Cautions:** Moderate to severe hepatic impairment, HIV infection. Concomitant use of amiodarone, beta blockers. Pts with underlying cardiac disease and/or advanced liver disease may increase risk of bradycardia. Concomitant use of P-glycoprotein inducers, moderate or strong CYP2C8 inducers, moderate or strong CYP3A4 inducers not recommended.

**Action**

Sofosbuvir inhibits the HCV NS5B RNA-dependent RNA polymerase, velpatasvir inhibits the HCV NS5A protein, voxilaprevir inhibits the NS3/4A protease, necessary for proteolytic cleavage of HCV-encoded polyprotein. **Therapeutic Effect:** Inhibits viral replication of hepatitis C virus.

**Pharmacokinetics**

Widely distributed. Metabolized in liver. Protein binding: sofosbuvir: 61%–65%; velpatasvir: greater than 99.5%; voxilaprevir: greater than 99%. Peak plasma concentration: sofosbuvir: 2 hrs; velpatasvir: 4 hrs; voxilaprevir: 4 hrs. Excreted in sofosbuvir: urine (80%), feces (14%); velpatasvir: feces (94%), urine (0.4%); voxilaprevir: primarily in feces. **Half-life:** sofosbuvir: 0.5 hrs; velpatasvir: 17 hrs; voxilaprevir: 33 hrs.

**Lifespan considerations**

**Pregnancy/Lactation:** Unknown if distributed in breast milk. **Children:** Safety and efficacy not established. **Elderly:** No age-related precautions noted.

**Interactions**

**DRUG:** Amiodarone may increase risk of symptomatic bradycardia. Aluminum- or magnesium-containing antacids, H₂-receptor antagonists (e.g., famotidine), proton pump inhibitors (e.g., omeprazole) may decrease
concentration/effect of velpatasvir. **Anticonvulsants** (e.g., carbamazepine, phenytoin), **antimycobacterials** (e.g., rifabutin, rifampin), tipranavir/ritonavir may decrease concentration/effects. **Moderate or potent inducers** of CYP2B6, CYP2C8, CYP3A4, P-glycoprotein (e.g., carbamazepine, phenytoin, oxcarbazepine) may decrease concentration/effect. May increase concentration/effect of rosvastatin, digoxin. **HERBAL:** St. John’s wort may significantly decrease concentration/effect. **FOOD:** None known. **LAB VALUES:** May increase serum bilirubin, creatine kinase, lipase.

**Availability (Rx)**

**Tablets (fixed-dose combination):** 400 mg (sofosbuvir)/100 mg velpatasvir/100 mg (voxilaprevir).

**Administration/handling**

PO

- Give with food.

**Indications/Routes/Dosage**

**Hepatitis C Virus Infection**

PO: **ADULTS, ELDERLY:** 1 tablet (sofosbuvir/velpatasvir/voxilaprevir) once daily for 12 wks.

**Dosage in Renal Impairment**

**Mild to moderate impairment:** No dose adjustment. **Severe impairment,** ESRD: Not recommended due to higher exposure of sofosbuvir.

**Dosage in Hepatic Impairment**

**Mild impairment:** No dose adjustment. **Moderate to severe impairment:** Not recommended due to higher exposure of voxilaprevir.

**Side Effects**
Frequent (21%–13%): Headache, fatigue, diarrhea, nausea. Occasional (6%–1%): Asthenia, insomnia, rash.

**Adverse Effects/Toxic Reactions**

HBV reactivation was reported in pts co-infected with HBV/HVC; may result in fulminant hepatitis, hepatic failure, death. Cardiac arrest, symptomatic bradycardia, pacemaker implantation were reported in pts taking concomitant amiodarone. Bradycardia usually occurred within hrs to days, but may occur up 2 wks after initiation. Pts with underlying cardiac disease, advanced hepatic disease, or pts taking concomitant beta blockers are at an increased risk for bradycardia when used concomitantly with amiodarone. Psychiatric disorders including depression may occur. Angioedema, blistering skin rashes may occur.

**Nursing Considerations**

**Baseline Assessment**

Obtain renal function test, LFT, HCV-RNA level; serum lipase, CPK; pregnancy test in females of reproductive potential. Confirm hepatitis C virus genotype. Question history of renal impairment, hepatic disease unrelated to HCV infection; HIV infection; concomitant use of antiretroviral therapy. Receive full medication history and screen for interactions (esp. concomitant use of amiodarone).

**Intervention/Evaluation**

Monitor serum lipase, CK. Periodically monitor HCV-RNA level for treatment effectiveness. If unable to discontinue amiodarone, recommend inpatient cardiac monitoring for at least 48 hrs, followed by outpatient or self-monitoring of HR for at least 2 wks after initiation. Cardiac monitoring is also recommended in pts who discontinue amiodarone just prior to initiation. Encourage nutritional intake. Monitor for new-onset or worsening of depression.

**Patient/Family Teaching**

- Pts who take amiodarone (an antiarrhythmic) during therapy may require inpatient and outpatient cardiac monitoring (and in some cases, pacemaker implantation) due to an increased risk of slow heart rate or cardiac arrest. If
amiodarone therapy cannot be withheld or stopped, immediately report symptoms of slow heart rate such as chest pain, confusion, dizziness, fainting, light-headedness, memory problems, palpitations, weakness.
• There is a high risk of drug interactions with other medications. Do not take newly prescribed medications unless approved by prescriber who originally started treatment.
• Do not take herbal products.
• Avoid alcohol.
• Report signs of depression.

<table>
<thead>
<tr>
<th>solifenacin</th>

<tbody>
<tr>
<td>sol-i-fen-a-sin</td>
</tr>
</tbody>
</table>

VESIcare

CLASSIFICATION
PHARMACOTHERAPEUTIC: Anticholinergic agent, muscarinic receptor antagonist.
CLINICAL: Urinary antispasmodic.

Uses

Treatment of overactive bladder with symptoms of urinary frequency, urgency, or urge incontinence.

Precautions

Contraindications: Hypersensitivity to solifenacin. Gastric retention, uncontrolled narrow-angle glaucoma, urinary retention. Cautions: Bladder outflow obstruction, GI obstructive disorders, decreased GI motility, controlled narrow-angle glaucoma, renal/hepatic impairment, congenital or acquired QT prolongation, concurrent medications that prolong QT interval, hypokalemia, hypomagnesemia, hot weather and/or exercise.

Action

Inhibits muscarinic receptors. Therapeutic Effect: Decreases urinary bladder contractions, increases residual urine volume, decreases detrusor muscle pressure.
Pharmacokinetics
Well absorbed. Protein binding: 98%. Metabolized in liver. Excreted in urine (69%), feces (23%). **Half-life:** 40–68 hrs.

**Lifespan considerations**
Pregnancy/Lactation: Unknown if drug crosses placenta or is distributed in breast milk. **Children:** Safety and efficacy not established. **Elderly:** No age-related precautions noted.

Interactions
**DRUG:** CYP3A4 inhibitors (e.g., ketoconazole, erythromycin, azole antifungals, clarithromycin) may increase concentration/effects.
**HERBAL:** St. John’s wort may decrease concentration/effects.
**FOOD:** Grapefruit products may increase effects. **LAB VALUES:** None known.

Availability (Rx)
**Tablets:** 5 mg, 10 mg.

Administration/handling
**PO**
- Give without regard to food. Swallow tablets whole, with liquids.

Indications/routes/dosage
**Overactive Bladder**
**PO:** **ADULTS, ELDERLY:** 5 mg/day; if tolerated, may increase to 10 mg/day.

**Dosage with CYP3A4 Inhibitors**
**Maximum:** 5 mg/day.

**Dosage in Renal/Hepatic Impairment**
Severe renal impairment: (CrCl less than 30 mL/min) or moderate hepatic impairment: Maximum dosage is 5 mg/day. Not recommended in severe hepatic impairment.

Side effects

Frequent (28%–13%): Dry mouth, constipation. Occasional (5%–3%): Blurred vision, UTI, dyspepsia, nausea. Rare (2%–1%): Dizziness, dry eyes, fatigue, depression, edema, hypertension, epigastric pain, vomiting, urinary retention.

Adverse effects/toxic reactions

Angioneurotic edema, GI obstruction occur rarely. Overdose can result in severe anticholinergic effects.

Nursing considerations

Baseline assessment

Assess symptoms of overactive bladder before beginning the drug. Question medical history as listed in Precautions. Screen for concomitant medications known to prolong QT interval. Obtain baseline EKG.

Intervention/evaluation

Monitor I&O, anticholinergic effects, creatinine clearance. Assess for decrease in symptoms. Obtain bladder scan if urinary retention is suspected.

Patient/family teaching

• Avoid tasks requiring alertness, motor skills until response to drug is established.
• Anticholinergic side effects include constipation, urinary retention, blurred vision, heat prostration in hot environment.
• Use caution during exercise, exposure to heat.

somatropin
soe-ma-troe-pin
Genotropin
Genotropin Miniquick
Humatrope
Norditropin
Nutropin
Nutropin AQ
Omnitrope
Saizen
Serostim
Zomacton
Zorbtive

CLASSIFICATION
PHARMACOTHERAPEUTIC: Polypeptide hormone.
CLINICAL: Growth hormone.
Do not confuse somatropin with SUMAtiptan.

Uses

Adults: Growth deficiency due to pituitary disease, hypothalamic disease, surgery, radiation, or trauma; AIDS-related wasting or cachexia. **Zorbtive:** Short bowel syndrome. **Children:** Long-term treatment of growth failure due to lack of or inadequate endogenous growth hormone secretion; chronic renal insufficiency; short stature associated with Turner’s syndrome, Noonan’s syndrome, or homeobox gene deficiency; idiopathic short stature. **OFF-LABEL:** Treatment of pediatric HIV pts with wasting/cachexia; HIV adipose redistribution syndrome.

Precautions

**Contraindications:** Hypersensitivity to growth hormone. Pts with Prader-Willi syndrome with growth hormone deficiency who are severely obese or have severe respiratory impairment, Prader-Willi syndrome without growth hormone
deficiency, children with closed epiphyses, acute critical illness due to complications after open heart or abdominal surgery, multiple accidental trauma, acute respiratory failure, active neoplasia, diabetic retinopathy. Active malignancy, progression of active growing intracranial lesion or tumor. **Cautions:** Diabetes, elderly pts.

**Action**

Stimulates cartilaginous growth areas of long bones; increases number, size of skeletal muscle cells; influences size of organs; increases RBC mass by stimulating erythropoietin. Influences metabolism of carbohydrates (decreases insulin sensitivity), fats (mobilizes fatty acids), minerals (retains phosphorus, sodium, potassium by promotion of cell growth), proteins (increases protein synthesis). **Therapeutic Effect:** Stimulates growth.

**Pharmacokinetics**

Well absorbed after SQ, IM administration. Localized primarily in kidneys, liver. **Half-life:** IV: 20–30 min; SQ, IM: 3–5 hrs.

**Lifespan considerations**

**Pregnancy/Lactation:** Unknown if drug is distributed in breast milk. **Children/Elderly:** No age-related precautions noted.

**Interactions**

**DRUG:** Corticosteroids (e.g., hydrocortisone, prednisone) may inhibit growth response. **Oral estrogens** may decrease response to somatropin. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** May increase serum alkaline phosphatase, inorganic phosphorus, parathyroid hormone. May decrease glucose tolerance. May slightly decrease thyroid function.

**Availability (Rx)**

**Injection, Powder for Reconstitution (Genotropin):** 5 mg, 12 mg. **(Genotropin Miniquick):** 0.2 mg, 0.4 mg, 0.6 mg, 0.8 mg, 1 mg, 1.2 mg, 1.4
mg, 1.6 mg, 1.8 mg, 2 mg. (Omnitrope): 5.8 mg. (Saizen): 5 mg, 8.8 mg. (Serostim): 4 mg, 5 mg, 6 mg. (Zomacton): 5 mg, 10 mg. (Zorbtive): 8.8 mg. 
Injection Solution: (Norditropin): 5 mg/1.5 mL, 10 mg/1.5 mL, 15 mg/1.5 mL. (Nutropin AQ): 10 mg/mL, 5 mg/mL, 2.5 mg/mL. (Omnitrope): 5 mg/1.5 mL, 10 mg/1.5 mL. (Norditropin FlexPro Pen): 5 mg/1.5 mL, 10 mg/1.5 mL, 30 mg/3 mL.

Administration/handling

**Neonate:** Benzyl alcohol as a preservative has been associated with fatal toxicity (gasprompt syndrome) in premature infants. Reconstitute with Sterile Water for Injection only. Use only 1 dose per vial. Discard unused portion.

**Reconstitution**

Genotropin, Genotropin Miniquick: Reconstitute with diluent provided.

Humatrope: Reconstitute with 1.5–5 mL diluent provided, swirl gently, do not shake.

Humatrope Cartridge: Dilute with solution provided with cartridge only.

Nutropin: Reconstitute each 5 mg with 1.5–5 mL diluent, swirl gently, do not shake.

Omnitrope: Reconstitute with diluents provided, swirl gently, do not shake.

Saizen: 5 mg: Reconstitute with 1–3 mL diluent provided, swirl gently, do not shake. 8.8 mg: Reconstitute with 2–3 mL diluent provided, swirl gently, do not shake.

Serostim: Reconstitute with Sterile Water for Injection.

Zorbtive: Reconstitute with 1–2 mL Bacteriostatic Water for Injection.

**Storage**

Long-term storage: Refrigerate all products except Zorbtive. Once reconstituted, Humatrope, Nutropin, Saigen, Zorbtive stable for 14 days, Genotropin for 21 days, Humatrope Cartridge for 28 days. Genotropin Miniquick: Refrigerate, use within 24 hrs.

**Indications/routes/dosage**

**Growth Hormone Deficiency**

SQ:(Genotropin, Omnitrope): ADULTS: 0.04 mg/kg wkly divided into 6–7 equal doses/wk. May increase at 4- to 8-wk intervals to maximum of 0.08 mg/kg/wk. CHILDREN: 0.16–0.24 mg/kg wkly divided into equal daily doses.
SQ: *(Humatrope)*: **ADULTS:** 0.006 mg/kg once daily. May increase to maximum of 0.0125 mg/kg/day. **CHILDREN:** 0.18–0.3 mg/kg wkly divided into alternate-day doses or 6 doses/wk.

**SQ: (Norditropin):** **ADULTS:** 0.004 mg/kg/day. May increase after 6 wks up to 0.016 mg/kg/day. **CHILDREN:** 0.024–0.036 mg/kg/dose 6–7 days/wk.

**SQ: (Nutropin, Nutropin AQ):** **ADULTS:** 0.006 mg/kg once daily. May increase to maximum of 0.025 mg/kg/day (younger than 35 yrs) or 0.0125/kg/day (35 yrs and older). **CHILDREN:** 0.3–0.7 mg/kg wkly divided into equal daily doses.

**SQ: (Saizen):** **ADULTS:** 0.005 mg/kg/day. May increase up to 0.01 mg/kg/day after 4 wks. **CHILDREN:** 0.18 mg/kg/wk divided into equal daily doses or 0.06 mg/kg 3 times/wk or as 0.03 mg/kg administered 6 days/wk.

**Chronic Renal Insufficiency**

**SQ: (Nutropin, Nutropin AQ):** **CHILDREN:** 0.35 mg/kg wkly divided into equal daily doses. Continue until the time of renal transplantation.

**Turner’s Syndrome**

**SQ: (Humatrope, Nutropin, Nutropin AQ):** **CHILDREN:** 0.375 mg/kg wkly divided into equal doses 3–7 times/wk. *(Genotropin, Omnitrope):*0.33 mg/kg wkly divided into 6–7 doses. *(Norditropin):* Up to 0.067 mg/kg/day.

**AIDS-Related Wasting**

**SQ: (Serostim):** **ADULTS WEIGHING MORE THAN 55 KG:** 6 mg once daily at bedtime. **ADULTS WEIGHING 45–55 KG:** 5 mg once daily at bedtime. **ADULTS WEIGHING 35–44 KG:** 4 mg once daily at bedtime. **ADULTS WEIGHING LESS THAN 35 KG:** 0.1 mg/kg once daily at bedtime.

**Short Bowel Syndrome**

**SQ: (Zorbttive):** **ADULTS:** 0.1 mg/kg/day. **Maximum:** 8 mg/day.

**Dosage in Renal/Hepatic Impairment**

No dose adjustment.

**Side effects**
Frequent: Otitis media, other ear disorders (with Turner’s syndrome).
Occasional: Carpal tunnel syndrome, gynecomastia, myalgia, peripheral edema, fatigue, asthenia. Rare: Rash, pruritus, visual changes, headache, nausea, vomiting, injection site pain/swelling, abdominal pain, hip/knee pain.

Adverse effects/toxic reactions
Pancreatitis occurs rarely.

Nursing considerations

Baseline assessment
Obtain baseline lab chemistries, thyroid function, serum glucose level. Obtain full medical history (drug has multiple contraindications).

Intervention/evaluation

Patient/family teaching
• Follow correct procedure to reconstitute drug for administration and for safe handling/disposal of needles.
• Regular follow-up with physician is important part of therapy.
• Report development of severe headache, visual changes, pain in hip/knee, limping.

sonidegib
soe-ni-deg-ib
Odomzo
CLASSIFICATION
PHARMACOTHERAPEUTIC: Hedgehog pathway inhibitor.
CLINICAL: Antineoplastic.

■ BLACK BOX ALERT ■ May cause embryo-fetal death/severe
Uses

Treatment of adult pts with locally advanced basal cell carcinoma that has recurred following surgery or radiation therapy, or those who are not candidates for surgery or radiation.

Precautions

**Contraindications:** Hypersensitivity to sonidegib. **Cautions:** Renal/hepatic impairment. Avoid concomitant use of strong or moderate CYP3A inhibitors, strong or moderate CYP3A inducers.

Action

Inhibits cell migration, proliferation, survival of tumor cells. Binds to and inhibits Smoothened, a transmembrane protein involved in Hedgehog signal transduction. **Therapeutic Effect:** Inhibits tumor cell growth and metastasis.

Pharmacokinetics

Poorly absorbed after PO administration (less than 10%). Metabolized in liver. Protein binding: greater than 97%. Peak plasma concentration: 2–4 hrs. Steady state reached in 4 mos. Excreted in feces (70%), urine (30%). **Half-life:** 28 days.

Lifespan considerations

**Pregnancy/Lactation:** May cause fetal death/malformations. Unknown if distributed in breast milk. Must either discontinue drug or discontinue breastfeeding. Female patients of reproductive potential must use effective contraception during treatment and for at least 20 mos after discontinuation. Due to the potential risk of exposure through semen, male patients must use condoms during sexual activity (even after a vasectomy) during treatment and for at least 8 mos after discontinuation.

Do not confuse sonidegib with vismodegib.
contraception during treatment and up to 20 mos after discontinuation. May compromise female fertility. **Males:** Male patients must use condoms during sexual activity (even after a vasectomy) during treatment and up to 8 mos after discontinuation. **Children:** Safety and efficacy not established. **Elderly:** May have increased risk of severe musculoskeletal adverse events (e.g., muscle spasms, myopathy).

### Interactions

**DRUG:** Strong CYP3A inhibitors (e.g., clarithromycin, ketoconazole), moderate CYP3A inhibitors (e.g., atazanavir, fluconazole) may increase concentration/effect. Strong CYP3A inducers (e.g., carBAzepine, phenytoin, rifAMPin) may decrease concentration/effect. Statins (e.g., simvastatin) may increase risk of rhabdomyolysis. **HERBAL:** St. John’s wort may decrease concentration/effect. **FOOD:** High-fat meals may increase absorption/concentration. **LAB VALUES:** May increase serum ALT/AST, amylase, creatinine, CK, glucose, lipase. May decrease Hct, Hgb, lymphocytes.

### Availability (Rx)

**Capsules:** 200 mg.

### Administration/handling

**PO**

- Give on an empty stomach at least 1 hr before or 2 hrs after a meal.

### Indications/routes/dosage

**Basal Cell Carcinoma**

**PO:** **ADULTS, ELDERLY:** 200 mg once daily. Continue until disease progression or unacceptable toxicity.

### Dose Modification

Interrupt therapy for severe or intolerable musculoskeletal adverse reactions; first occurrence of serum CK level 2.5–10 times upper limit of normal (ULN);
recurrent serum CK level 2.5–5 times ULN. Once resolved, resume at 200 mg once daily.

**Discontinuation**

Permanently discontinue treatment for serum CK level greater than 2.5 times ULN with worsening renal function; serum CK level greater than 10 times ULN; recurrent serum CK level greater than 5 times ULN; recurrent severe or intolerable musculoskeletal adverse reactions.

**Renal Impairment**

No dose adjustment.

**Hepatic Impairment**

**Mild impairment:** No dose adjustment. **Moderate to severe impairment:** Not studied; use caution.

**Side effects**

**Frequent (54%–23%):** Muscle spasm, alopecia, dysgeusia, fatigue, nausea, diarrhea, musculoskeletal pain, decreased appetite. **Occasional (19%–10%):** Myalgia, abdominal pain, headache, generalized pain, vomiting, pruritus.

**Adverse effects/toxic reactions**

Musculoskeletal events occurred in 68% of pts. Common Terminology Criteria for Adverse Events (CTCAE) grade 3 or 4 musculoskeletal events (9% of pts) may require administration of muscle relaxants, analgesics/narcotics, magnesium supplementation, IV hydration. Serum CK level elevations usually occur before musculoskeletal pain or spasms. Increased serum CK levels reported in 61% of pts. The median onset of serum CK elevation was approx. 12 wks. May increase risk of rhabdomyolysis. Amenorrhea lasting longer than 18 mos has occurred.

**Nursing considerations**

**Baseline assessment**

Obtain baseline capillary blood glucose, CBC, LFT, serum CK level, renal

**Intervention/evaluation**

Monitor renal function, serum CK levels periodically and with any musculoskeletal adverse events. If musculoskeletal adverse reactions occur with serum CK levels greater than 2.5 times ULN, obtain serum CK level at least wkly until resolution. Offer antiemetics for nausea/vomiting. Monitor urine color, output. Serum CK level elevation or worsening of renal function may indicate rhabdomyolysis. Monitor pregnancy status during therapy.

**Patient/family teaching**

- Treatment may cause severe muscle damage, which may cause kidney damage.
- Report dark-colored urine or decreased urine output despite hydration.
- Immediately report musculoskeletal symptoms such as muscle pain/spasms/tenderness/weakness.
- Do not donate blood or blood products during treatment and up to 20 mos after discontinuation.
- Males must use condoms during sexual activity during treatment and up to 8 mos following discontinuation.
- Treatment may cause birth defects or miscarriage.
- Immediately report suspected pregnancy.
- Hair loss is an expected side effect.
- Swallow capsules whole; do not chew, crush, cut or open.
- Take on empty stomach at least 1 hr before or 2 hrs after a meal.

---

**SORAfenib**

*soe-raf-e-nib*

**NexAVAR**

*CLASSIFICATION*

**PHARMACOTHERAPEUTIC**: Multikinase inhibitor.

**CLINICAL**: Antineoplastic.

*Do not confuse NexAVAR with NexIUM, or SORAfenib with imatinib or SUNItinib.*
Uses
Treatment of advanced renal cell carcinoma, unresectable hepatocellular carcinoma, locally recurrent or metastatic progressive differentiated thyroid carcinoma refractive to radioactive iodine treatment. **OFF-LABEL:** Recurrent or metastatic angiosarcoma, resistant gastrointestinal stromal tumor.

Precautions
**Contraindications:** Hypersensitivity to SORafenib. Use in combination with CARBOplatin and PACLitaxel in pts with squamous cell lung cancer. **Cautions:** Underlying or poorly controlled hypertension, pts with congenital long QT syndrome, medications that prolong QT interval, electrolyte imbalance (hypokalemia, hypomagnesemia), unstable coronary artery disease, recent MI, HF, concurrent use with strong CYP3A4 inducers.

Action
Decreases tumor cell proliferation by interacting with multiple intracellular, cell surface kinases. **Therapeutic Effect:** Inhibits tumor growth and metastasis

Pharmacokinetics
Metabolized in liver. Protein binding: 99.5%. Excreted mainly in feces, with lesser amount excreted in urine. **Half-life:** 25–48 hrs.

Life-span considerations
**Pregnancy/Lactation:** May cause fetal harm. Adequate contraception should be used during therapy and for at least 2 wks after therapy completion. Unknown if distributed in breast milk. Breastfeeding not recommended. **Children:** Safety and efficacy not established. **Elderly:** No age-related precautions noted.

Interactions
**DRUG:** Strong CYP3A4 inducers (e.g., carBAMazepine, PHENobarbital, rifAMPin) may decrease concentration. **QT interval–prolonging medications** (e.g., amiodarone, azithromycin, ceritinib, haloperidol, moxifloxacin) may increase risk of QT interval prolongation, cardiac arrhythmias. **HERBAL:** St.
John’s wort may decrease concentration. **FOOD:** High-fat meals decrease effectiveness. **LAB VALUES:** May increase serum lipase, amylase, bilirubin, alkaline phosphatase, transaminases. May decrease serum phosphorus, lymphocytes, WBCs, Hgb, Hct.

**Availability (Rx)**

🔍 **Tablets:** 200 mg (NexAVAR).

**Administration/handling**

**PO**

- Give 1 hr before or 2 hrs after eating (high-fat meal reduces effectiveness).
- Swallow tablet whole; do not break, crush, dissolve, or divide tablet.

**Indications/routes/dosage**

**Renal Cell Carcinoma, Hepatocellular Carcinoma, Thyroid Carcinoma**

**PO:** **ADULTS, ELDERLY:** 400 mg (2 tablets) twice daily without food. Continue until disease progression or unacceptable toxicity.

**Dosage in Renal Impairment**

<table>
<thead>
<tr>
<th>Creatinine Clearance</th>
<th>Dosage</th>
</tr>
</thead>
<tbody>
<tr>
<td>40–59 mL/min</td>
<td>400 mg twice daily</td>
</tr>
<tr>
<td>20–39 mL/min</td>
<td>200 mg twice daily</td>
</tr>
<tr>
<td>Hemodialysis</td>
<td>200 mg once daily</td>
</tr>
</tbody>
</table>

**Dosage in Hepatic Impairment**

**Bilirubin greater than 1 to 1.5 times upper limit of normal (ULN) and/or AST greater than ULN:** 400 mg twice daily. **Bilirubin greater than 1.5 to 3 times ULN and any AST:** 200 mg twice daily. **Albumin less than 2.5 g/dL (any bilirubin/AST):** 200 mg once daily.
**Side effects**

**Frequent (43%–16%):** Diarrhea, rash, fatigue, exfoliative dermatitis, alopecia, nausea, pruritus, hypertension, anorexia, vomiting. **Occasional (15%–10%):** Constipation, minor bleeding, dyspnea, sensory neuropathy, cough, abdominal pain, dry skin, weight loss, joint pain, headache. **Rare (9%–1%):** Acne, flushing, stomatitis, mucositis, dyspepsia, arthralgia, myalgia, hoarseness.

**Adverse effects/toxic reactions**

Anemia, neutropenia, thrombocytopenia, leukopenia occur in less than 10% of pts. Pancreatitis, gastritis, erectile dysfunction occur occasionally. Hemorrhage, cardiac ischemia/infarction, hypertensive crisis occur rarely.

**Nursing considerations**

**Baseline assessment**

Monitor B/P wkly during first 6 wks of therapy and routinely thereafter. CBC, serum chemistries including electrolytes, renal function, LFT, chest X-ray should be performed before therapy begins and routinely thereafter.

**Intervention/evaluation**

Determine serum amylase, lipase, phosphate concentrations frequently during therapy. Monitor CBC for evidence of myelosuppression. Monitor for blood dyscrasias (fever, sore throat, signs of local infection, unusual bruising/bleeding from any site), symptoms of anemia (excessive fatigue, weakness). Monitor for signs of neuropathy (gait disturbances, fine motor control difficulties, numbness).

**Patient/family teaching**

- Report any episode of chest pain.
- Do not have immunizations without physician’s approval (drug lowers resistance). Avoid contact with those who have recently taken live virus vaccine.
- Promptly report fever, sore throat, signs of local infection, unusual bruising/bleeding from any site.
- Swallow whole; do not chew, crush, dissolve, or divide tablet.
• Avoid administration after high-fat meals.

**sotalol**  
**soe-ta-lol**
Apo-Sotalol  
Betapace  
Betapace AF  
Novo-Sotalol  
Sorine  
Sotylize

**CLASSIFICATION**  
**PHARMACOTHERAPEUTIC:** Nonselective beta-adrenergic blocking agent.  
**CLINICAL:** Antiarrhythmic.

■ **BLACK BOX ALERT** ■ Initiation, titration to occur in a hospital setting with continuous EKG to monitor potential onset of life-threatening arrhythmias. Betapace should not be substituted for Betapace AF.

Do not confuse Betapace with Betapace AF, or sotalol with Stadol or Sudafed.

**Uses**

**Betapace, Betapace AF, Sorine, Sotylize:** Treatment of documented, life-threatening ventricular arrhythmias. **Betapace, Betapace AF, Sotylize:** Maintain normal sinus rhythm in pts with symptomatic atrial fibrillation/flutter. **OFF-LABEL:** Fetal tachycardia, treatment of atrial fibrillation with hypertrophic cardiomyopathy.

**Precautions**

**Contraindications:** Hypersensitivity to sotalol. Cardiogenic shock, congenital or acquired long QT syndrome, second- or third-degree heart block (unless functioning pacemaker is present), sinus bradycardia, uncontrolled HF, bronchial
asthma or related bronchospastic conditions. **Betapace, Betapace AF, Sotylize (additional):** Baseline QT interval greater than 450 msec, bronchospastic conditions, CrCl less than 40 mL/min, serum potassium less than 4 mEq/L, sick sinus syndrome. **Cautions:** Pts with history of ventricular tachycardia, ventricular fibrillation, cardiomegaly, compensated HF, diabetes mellitus, QT interval prolongation, concurrent medications that prolong QT interval, hypokalemia, hypomagnesemia, renal impairment, within first 2 wks post MI, peripheral vascular disease, Raynaud’s syndrome, myasthenia gravis, psychiatric disease, bronchospastic disease. Concurrent use of digoxin, verapamil, diltiaZEM, history of severe anaphylaxis to allergens.

**Action**

Prolongs cardiac action potential, effective refractory period, QT interval. Decreases heart rate, AV node conduction; increases AV node refractoriness. **Therapeutic Effect:** Produces antiarrhythmic activity.

**Pharmacokinetics**

</table>

Well absorbed from GI tract. Protein binding: None. Widely distributed. Primarily excreted unchanged in urine. Removed by hemodialysis. **Half-life:** 12 hrs (increased in elderly, renal impairment).

**Lifespan considerations**

**Pregnancy/Lactation:** Crosses placenta. Distributed in breast milk. **Children:** Safety and efficacy not established. **Elderly:** Age-related peripheral vascular disease may increase susceptibility to decreased peripheral circulation. Age-related renal impairment may require dosage adjustment.

**Interactions**

**DRUG:** Calcium channel blockers (e.g., dilTIAZem, verapamil) may increase effect on AV conduction, B/P. May mask symptoms of hypoglycemia, prolong hypoglycemic effects of insulin, oral hypoglycemics (e.g., glipizide,
metformin). QT prolonging medications (e.g., amiodarone, ciprofloxacin, haloperidol, ketoconazole, ondansetron) may increase risk of prolonged QT interval. HERBAL: Ephedra may worsen arrhythmias. FOOD: None known. LAB VALUES: May increase serum BUN, glucose, alkaline phosphatase, LDH, lipoprotein, ALT, AST, triglycerides, potassium, uric acid.

Availability (Rx)

Solution, Intravenous: 150 mg/10 mL. Solution, Oral (Sotylize): 5 mg/mL. Tablets: 80 mg (Betapace, Betapace AF, Sorine), 120 mg (Betapace, Betapace AF, Sorine), 160 mg (Betapace, Betapace AF, Sorine), 240 mg (Sorine).

Administration/handling

PO

• Give without regard to food.
• Give at same time each day.

Indications/routes/dosage

Ventricular Arrhythmias

PO: ADULTS, ELDERLY: Initially, 80 mg twice daily. May increase in 80-mg increments at 3-day intervals. Range: 160–320 mg/day in 2–3 divided doses. Maximum: 640 mg/day in life-threatening refractive arrhythmias.

IV: Initially, 75 mg infused over 5 hrs twice daily. Range: 75–150 mg twice daily. Maximum: 300 mg twice daily.

Atrial Fibrillation, Atrial Flutter

PO: ADULTS, ELDERLY: Initially, 80 mg twice daily. May increase to 120–160 mg twice daily.

IV: Initially, 75 mg infused over 5 hrs twice daily. Usual dose: 112.5 mg twice daily. Maximum: 150 mg twice daily.

Usual Dosage for Children

PO: Initially, 90 mg/m²/day in 3 divided doses. May incrementally increase up
to a maximum of 180 mg/m²/day. **Maximum:** 320 mg/day.

**Dosage in Renal Impairment**
Dosage interval is modified based on creatinine clearance.

**BETAPACE, SORINE**

</tr>
</tbody>
</table>

**Dosage in Hepatic Impairment**
No dose adjustment.

**Side effects**

**Frequent:** Diminished sexual function, drowsiness, insomnia, asthenia.
**Occasional:** Depression, cold hands/feet, diarrhea, constipation, anxiety, nasal congestion, nausea, vomiting. **Rare:** Altered taste, dry eyes, pruritus, paresthesia of fingers, toes, scalp.

**Adverse effects/toxic reactions**

Bradycardia, HF, hypotension, bronchospasm, hypoglycemia, prolonged QT interval, torsades de pointes, ventricular tachycardia, premature ventricular complexes may occur.

**Nursing considerations**

**Baseline assessment**
Pt must be on continuous cardiac monitoring upon initiation of therapy. Do not administer without consulting physician if pulse is 60 beats/min or less. Assess creatinine clearance before dosing. Question medical history as listed in Precautions.

**Intervention/evaluation**

Diligently monitor for arrhythmias. Assess B/P for hypotension, pulse for bradycardia. Assess for HF: dyspnea, peripheral edema, jugular vein distention, increased weight, rales in lungs, decreased urinary output.

**Patient/family teaching**

- Do not discontinue, change dose without physician approval.
- Avoid tasks requiring alertness, motor skills until response to drug is established (may cause drowsiness).
- Periodic lab tests, EKGs are essential part of therapy.
- Report rapid heartbeat, chest pain, swelling of ankles/legs, difficulty breathing.

<table>
<thead>
<tr>
<th>spironolactone</th>
</tr>
</thead>
<tbody>
<tr>
<td>spir-on-oh-lak-tone</td>
</tr>
<tr>
<td>Aldactone, CaroSpir</td>
</tr>
</tbody>
</table>

**Fixed-Combination(s)**

**Aldactazide**: spironolactone/hydroCHLOROthiazide (a thiazide diuretic): 25 mg/25 mg, 50 mg/50 mg.

**CLASSIFICATION**

**PHARMACOTHERAPEUTIC**: Aldosterone antagonist.

**CLINICAL**: Potassium-sparing diuretic, antihypertensive, antihypokalemic.

- **BLACK BOX ALERT**
  - Has been shown to produce tumors in chronic toxicity studies.

Do not confuse Aldactone with Aldactazide.

**Uses**
Management of edema associated with excessive aldosterone excretion or with HF that is unresponsive to other therapies; hypertension; hypokalemia, nephrotic syndrome, severe HF; primary hyperaldosteronism. Cirrhosis of liver accompanied by edema or ascites. **OFF-LABEL:** Treatment of edema, hypertension in children, female acne, female hirsutism. Ascites due to cirrhosis.

**Precautions**

**Contraindications:** Hypersensitivity to spironolactone. Acute renal insufficiency, significant impairment of renal excretory function, anuria, hyperkalemia, Addison’s disease, concomitant use with eplerenone. **Cautions:** Dehydration, hyponatremia, concurrent use of supplemental potassium, elderly pts, mild renal impairment, declining renal function, ACE inhibitors or angiotensin receptor blockers.

**Action**

Interferes with sodium reabsorption by competitively inhibiting action of aldosterone in distal tubule, promoting sodium and water excretion, increasing potassium retention. **Therapeutic Effect:** Produces diuresis, lowers B/P.

**Pharmacokinetics**

Well absorbed from GI tract (absorption increased with food). Protein binding: 91%–98%. Metabolized in liver to active metabolite. Primarily excreted in urine. Unknown if removed by hemodialysis. **Half-life:** 78–84 min.

**Lifespan considerations**

**Pregnancy/Lactation:** Active metabolite excreted in breast milk. Breastfeeding not recommended. **Children:** No age-related precautions noted. **Elderly:** May be more susceptible to developing hyperkalemia. Age-related renal impairment may require dosage adjustment.

**Interactions**

**DRUG:** ACE inhibitors (e.g., captopril, lisinopril), angiotensin receptor blockers (e.g., valsartan), potassium-containing medications, potassium...
supplements may increase risk of hyperkalemia. May increase half-life of digoxin. NSAIDs (e.g., ibuprofen, ketorolac, naproxen) may decrease antihypertensive effect. HERBAL: Avoid natural licorice (possesses mineralocorticoid activity). **FOOD**: Food increases absorption. **LAB VALUES**: May increase urinary calcium excretion, serum BUN, glucose, creatinine, magnesium, potassium, uric acid. May decrease serum sodium.

### Availability (Rx)

**Suspension, Oral**: 25 mg/5 ml.  
**Tablets**: 25 mg, 50 mg, 100 mg.

### Administration/handling

**PO**

- Take with food to reduce GI irritation and increase absorption. **Suspension:**
- Shake well.
- May give with or without food (give consistently with respect to food).

### Indications/routes/dosage

#### Edema

**PO:** **ADULTS, ELDERLY**: 25–200 mg/day as single dose or in 2 divided doses. **CHILDREN**: 1–3.3 mg/kg/day in divided doses q12–24h. **Maximum**: 100 mg. **NEONATES**: 1–3 mg/kg/day in divided doses q12–24h.

#### Hypertension

**PO:** **ADULTS, ELDERLY**: 25–50 mg/day in 1–2 doses/day. **Maximum**: 100 mg. **CHILDREN**: 1–3.3 mg/kg/day in divided doses q12–24h. **Maximum**: 100 mg.

#### Hypokalemia

**PO:** **ADULTS, ELDERLY**: 25–100 mg/day as single dose or in 2 divided doses.
Primary Aldosteronism

PO: ADULTS, ELDERLY: 400 mg/day for 4 days up to 3–4 wks, then maintenance dose of 100–400 mg/day as single dose or in 2 divided doses.

HF

Dosage in Renal Impairment

CrCl 50 mL/min or greater: Initially, 12.5–25 mg once daily. Maintenance: 25 mg once or twice daily. CrCl 30–49 mL/min: Initially, 12.5 mg once daily or every other day. Maintenance: 12.5–25 mg once daily. CrCl less than 30 mL/min: Not recommended.

Dosage in Hepatic Impairment

No dose adjustment.

Side effects

Adverse effects/toxic reactions

Severe hyperkalemia may produce arrhythmias, bradycardia, EKG changes (tented T waves, widening QRS complex, ST segment depression). May proceed to cardiac standstill, ventricular fibrillation. Cirrhosis pts at risk for hepatic decompensation if dehydration, hyponatremia occurs. Pts with primary aldosteronism may experience rapid weight loss, severe fatigue during high-dose therapy.
Nursing considerations

Baseline assessment
Weigh pt; initiate strict I&O. Evaluate hydration status by assessing mucous membranes, skin turgor. Obtain baseline serum electrolytes, renal/hepatic function, urinalysis. Assess for edema; note location, extent. Check baseline vital signs, note pulse rate/regularity.

Intervention/evaluation

Patient/family teaching
• Expect increase in volume, frequency of urination.
• Therapeutic effect takes several days to begin and can last for several days when drug is discontinued. This may not apply if pt is on a potassium-losing drug concomitantly (diet, use of supplements should be established by physician).
• Report irregular or slow pulse, symptoms of electrolyte imbalance (see previous Intervention/Evaluation).
• Avoid foods high in potassium, such as whole grains (cereals), legumes, meat, bananas, apricots, orange juice, potatoes (white, sweet), raisins.
• Avoid alcohol.
• Avoid tasks that require alertness, motor skills until response to drug is established (may cause drowsiness).

sulfamethoxazole-trimethoprim
sul-fa-meth-ox-a-zole-trye-meth-oh-prim
Apo-Sulfatrim
Bactrim
Bactrim DS
**Sulfatrim**

**Fixed-Combination(s)**

**Bactrim, Septra:** sulfamethoxazole/trimethoprim: 5:1 ratio remains constant in all dosage forms (e.g., 400 mg/80 mg).

**CLASSIFICATION**

**PHARMACOTHERAPEUTIC:** Sulfonamide/folate antagonist.

**CLINICAL:** Antibiotic.

*Do not confuse Bactrim with bacitracin or Bactroban.*

**Uses**

Treatment of susceptible infections due to *S. pneumoniae, H. influenzae, E. coli, Klebsiella* spp., *Enterobacter* spp., *M. morganii, P. mirabilis, P. vulgaris, S. flexneri, Pneumocystis jiroveci*, including acute or complicated and recurrent or chronic UTI, *Pneumocystis jiroveci* pneumonia (PCP), shigellosis, enteritis, otitis media, chronic bronchitis, traveler’s diarrhea. Prophylaxis of PCP. **OFF-LABEL:** Chronic prostatitis, prophylaxis for UTI, MRSA infections, prosthetic joint infection.

**Precautions**

**Contraindications:** Hypersensitivity to any sulfa medication, trimethoprim. History of drug-induced immune thrombocytopenia with sulfonamides or trimethoprim, infants younger than 4 wks, megaloblastic anemia due to folate deficiency, severe hepatic/renal impairment. **Cautions:** Pts with G6PD deficiency, impaired renal/hepatic function, porphyria, pts with allergies or asthma, elderly pts, alcoholism, thyroid dysfunction, concurrent anticonvulsant therapy.

**Action**

Blocks bacterial folic acid synthesis and growth. **Therapeutic Effect:** Bactericidal in susceptible microorganisms.

**Pharmacokinetics**
Rapidly, well absorbed from GI tract. Protein binding: 45%–60%. Widely distributed. Metabolized in liver. Excreted in urine. Minimally removed by hemodialysis. **Half-life:** sulfamethoxazole, 6–12 hrs; trimethoprim, 6–17 hrs (increased in renal impairment).

**Lifespan considerations**

**Pregnancy/Lactation:** Contraindicated during pregnancy at term and during lactation. Readily crosses placenta. Distributed in breast milk. May produce kernicterus in newborn. **Children:** Contraindicated in pts younger than 2 mos; may increase risk of kernicterus in newborn. **Elderly:** Increased risk for severe skin reaction, myelosuppression, decreased platelet count.

**Interactions**

**DRUG:** May increase/prolong effects, increase adverse effects of phenytoin, digoxin, oral hypoglycemics (e.g., glipiZIDE, metFORMIN), warfarin. May increase effects of methotrexate. **HERBAL:** Dong quai, St. John’s wort may increase photosensitization reaction. **FOOD:** None known. **LAB VALUES:** May increase serum BUN, creatinine, ALT, AST, bilirubin.

**Availability (Rx)**

**Alert** All dosage forms have same 5:1 ratio of sulfamethoxazole (SMZ) to trimethoprim (TMP).

**Injection Solution:** SMZ 80 mg and TMP 16 mg per mL. **Oral Suspension:** SMZ 200 mg and TMP 40 mg per 5 mL. **Tablets (Bactrim):** SMZ 400 mg and TMP 80 mg. **Tablets (Double Strength [Bactrim DS, Septra DS]):** SMZ 800 mg and TMP 160 mg.

**Administration/handling**

**IV**

**Reconstitution**

- For IV infusion (piggyback), dilute each 5 mL with 75–125 mL D₃W.
- Do not mix with other drugs or solutions.

**Rate of Administration**
• Infuse over 60–90 min. Must avoid bolus or rapid infusion.
• Do not give IM.
• Ensure adequate hydration.

**Storage**
• IV infusion (piggyback) stable for 2 hrs (5 mL/75 mL D$_5$W), 4 hrs (5 mL/100 mL D$_5$W), 6 hrs (5 mL/125 mL D$_5$W).
• Discard if cloudy or precipitate forms.

**PO**
• Store tablets, suspension at room temperature.
• Administer without regard to meals.
• Give with at least 8 oz water.

**IV incompatibilities**
Fluconazole (Diflucan), foscarnet (Foscavir), midazolam (Versed), vinorelbine (Navelbine).

**IV Compatibilitys**
Dexmedetomidine (Precedex), diltiaZEM (Cardizem), heparin, HYDROmorphe (Dilaudid), LORazepam (Ativan), magnesium sulfate, morphine, niCARdipine (Cardene).

**Indications/routes/dosage**

**Usual Adult/Elderly Dosage Range**
**PO:** 1–2 double-strength tablets q12–24h. **IV:** 8–20 mg/kg/day as trimethoprim in divided doses q6–12h.

**Usual Dosage Range, Children Older Than 4 wks Mild to Moderate Infection**
**PO:** CHILDREN: 8 mg/kg/day as trimethoprim in divided doses q12h.

**Severe Infections**
PO: CHILDREN: 15–20 mg/kg/day as trimethoprim in divided doses q6h. IV: CHILDREN: 8–12 mg/kg/day as trimethoprim in divided doses q6–12h.

Dosage in Renal Impairment

<td>2.5–7.5 mg/kg trimethoprim q12h</td>
</tr>
</tbody>
</table>

Dosage in Hepatic Impairment

No dose adjustment.

Side effects

Frequent: Anorexia, nausea, vomiting, rash (generally 7–14 days after therapy begins), urticaria. Occasional: Diarrhea, abdominal pain, pain/irritation at IV infusion site. Rare: Headache, vertigo, insomnia, seizures, hallucinations, depression.

Adverse effects/toxic reactions

Rash, fever, sore throat, pallor, purpura, cough, shortness of breath may be early signs of serious adverse effects. Fatalities are rare but have occurred in sulfonamide therapy following Stevens-Johnson syndrome, toxic epidermal necrolysis, fulminant hepatic necrosis, agranulocytosis, aplastic anemia, other blood dyscrasias. Myelosuppression, decreased platelet count, severe dermatologic reactions may occur, esp. in the elderly.

Nursing considerations

Baseline assessment

Obtain history for hypersensitivity to trimethoprim or any sulfonamide, sulfite sensitivity, bronchial asthma. Determine serum renal, hepatic, hematologic baselines.
**Intervention/evaluation**

**Patient/family teaching**

- Continue medication for full length of therapy.
- Space doses evenly around the clock.
- Take oral doses with 8 oz water and drink several extra glasses of water daily.
- Report immediately any new symptoms, esp. rash, other skin changes, bleeding/bruising, fever, sore throat, diarrhea.
- Avoid prolonged exposure to UV, direct sunlight.

---

**sulfaSALAzone**

**sul-fa-sal-a-zeen**

Apo-SulfaSALAzone

Azulfidine

Azulfidine EN-tabs

Salazopyrin

Salazopyrin EN-Tabs

**CLASSIFICATION**

**PHARMACOTHERAPEUTIC:** 5-Aminosalicylic acid derivative.

**CLINICAL:** Anti-inflammatory.

Do not confuse Azulfidine with Augmentin or azaTHIOprine, or sulfaSALAzone with sulfADIAZONE or sulfISOXAZOLE.

---

**Uses**

Treatment of mild to moderate ulcerative colitis, adjunctive therapy in severe ulcerative colitis, rheumatoid arthritis (RA), juvenile rheumatoid arthritis. **OFF-LABEL:** Treatment of ankylosing spondylitis, Crohn’s disease, psoriasis,
psoriatic arthritis.

**Precautions**

**Contraindications:** Hypersensitivity to sulfaSALAzine, sulfa, salicylates; porphyria; GI or GU obstruction. **Cautions:** Severe allergies, bronchial asthma, impaired hepatic/renal function, G6PD deficiency, blood dyscrasias, history of recurring or chronic infections.

**Action**

Modulates local mediators of inflammatory response. **Therapeutic Effect:** Decreases inflammatory response, interferes with GI secretion. Effect appears topical rather than systemic.

**Pharmacokinetics**

**Lifespan considerations**

**Pregnancy/Lactation:** May produce infertility, oligospermia in men while taking medication. Readily crosses placenta; if given near term, may produce jaundice, hemolytic anemia, kernicterus in newborn. Distributed in breast milk. Pt should not breastfeed premature infant or those with hyperbilirubinemia or G6PD deficiency. **Children:** No age-related precautions noted in pts older than 2 yrs. **Elderly:** No age-related precautions noted.

**Interactions**

**DRUG:** Hepatotoxic medications (e.g., acetaminophen, isoniazid, ketoconazole, simvastatin, SSRIs) may increase risk of hepatotoxicity. **HERBAL:** Dong quai, St. John’s wort may increase photosensitization. **FOOD:** Impairs folate absorption. **LAB VALUES:** None significant.
Availability (Rx)

Tablets (Azulfidine): 500 mg.

Tablets (Delayed-Release [Azulfidine EN-tabs]): 500 mg.

Administration/handling

PO

• Space doses evenly (intervals not to exceed 8 hrs).
• Administer after meals or with food.
• Swallow enteric-coated tablets whole; do not break, crush, dissolve, or divide.
• Give with 8 oz of water; encourage several glasses of water between meals.

Indications/routes/dosage

Ulcerative Colitis

PO: ADULTS, ELDERLY: Initially, 3-4 g/day in divided doses q8h. May initiate at 1-2 g/day to reduce GI intolerance. Maximum: 6 g/day. Maintenance: 2 g/day in divided doses at intervals less than or equal to q8h. CHILDREN 6 YRS AND OLDER: Initially, 40–60 mg/kg/day in 3–6 divided doses. Maximum (initial dose): 4 g/day. Maintenance: 30 mg/kg/day in 4 divided doses at intervals less than or equal to q8h. Maximum (maintenance dose): 2 g/day.

Rheumatoid Arthritis (RA)

PO: (Delayed-Release Tablets): ADULTS, ELDERLY: Initially, 0.5–1 g/day for 1 wk. Increase by 0.5 g/wk, up to 2 g/day in 2 divided doses. Maximum: 3 g/day (if response to 2 g/day is inadequate after 12 wks of treatment).

Juvenile Rheumatoid Arthritis (JRA)

PO: (Delayed-Release Tablets): CHILDREN: Initially, 10 mg/kg/day. May increase by 10 mg/kg/day at wkly intervals. Range: 30–50 mg/kg/day. Maximum: 2 g/day.

Dosage in Renal/Hepatic Impairment
Use caution.

**Side effects**

**Frequent (33%):** Anorexia, nausea, vomiting, headache, oligospermia (generally reversed by withdrawal of drug). **Occasional (3%):** Hypersensitivity reaction (rash, urticaria, pruritus, fever, anemia). **Rare (Less Than 1%):** Tinnitus, hypoglycemia, diuresis, photosensitivity.

**Adverse effects/toxic reactions**

Anaphylaxis, Stevens-Johnson syndrome, hematologic toxicity (leukopenia, agranulocytosis), hepatotoxicity, nephrotoxicity occur rarely.

**Nursing considerations**

**Baseline assessment**

Question for hypersensitivity to medications. Check initial urinalysis, CBC, serum renal function, LFT.

**Intervention/evaluation**

Monitor I&O, urinalysis, renal function tests; ensure adequate hydration (minimum output 1,500 mL/24 hrs) to prevent nephrotoxicity. Assess skin for rash (discontinue drug, notify physician at first sign). Monitor daily pattern of bowel activity, stool consistency. (Dosage increase may be needed if diarrhea continues, recurs.) Monitor CBC closely; assess for and report immediately any hematologic effects (bleeding, ecchymoses, fever, pharyngitis, pallor, weakness, purpura). Monitor LFT; observe for jaundice.

**Patient/family teaching**

- May cause orange-yellow discoloration of urine, skin.
- Space doses evenly around the clock.
- Take after or with food with 8 oz of water; drink several glasses of water between meals.
- Swallow enteric-coated tablets whole; do not chew, crush, dissolve, or divide tablets.
• Continue for full length of treatment; may be necessary to take drug even after symptoms relieved.
• Routinely monitor blood levels.
• Inform dentist, surgeon of sulfaSALAzine therapy.
• Avoid exposure to sun, ultraviolet light until photosensitivity determined (may last for mos after last dose).

SUMAtrip坦
soo-ma-trip-tan
Apo-SUMAtrip坦

Imitrex
Onzetra
Sumavel DosePro
Xsail
Zembrace SymTouch

Fixed-Combination(s)
Trexe米特: SUMAtrip坦/naproxen (an NSAID): 85 mg/500 mg, 10 mg/60 mg.
◆ CLASSIFICATION
PHARMACOTHERAPEUTIC: Serotonin 5-HT₁ receptor agonist.
CLINICAL: Antimigraine.
Do not confuse SUMAtrip坦 with SAGagliptin, SATagliptin, somatropin, or ZOLMitraip坦。

Uses
PO, SQ, Intranasal, Transdermal: Acute treatment of migraine headache with or without aura. SQ: Treatment of cluster headaches.

Precautions
Contraindications: Hypersensitivity to SUMAtrip坦. Management of hemiplegic or basilar migraine, peripheral vascular disease, CVA, ischemic heart
disease (including angina pectoris, history of MI, silent ischemia, Prinzmetal’s angina), severe hepatic impairment, transient ischemic attack, uncontrolled hypertension, MAOI use within 14 days, use within 24 hrs of ergotamine preparations or another 5-HT$_1$ agonist. **Cautions:** Mild to moderate hepatic impairment, history of seizure disorder, controlled hypertension, elderly pts.

### Action

Binds selectively to serotonin 5-HT$_1$ receptors in cranial arteries, producing vasoconstrictive effect on cranial blood vessels. **Therapeutic Effect:** Relieves migraine headache.

### Pharmacokinetics

</tbody>
</table>

Rapidly absorbed after SQ administration. Absorption after PO administration is incomplete; significant amounts undergo hepatic metabolism, resulting in low bioavailability (about 14%). Protein binding: 10%–21%. Widely distributed. Undergoes first-pass metabolism in liver. Excreted in urine. **Half-life:** 2 hrs.

### Lifespan considerations

**Pregnancy/Lactation:** Unknown if distributed in breast milk. **Children:** Safety and efficacy not established. **Elderly:** No age-related precautions noted.

### Interactions

**DRUG:** Ergotamine-containing medications may produce vasospastic reaction. MAOIs (e.g., phenelzine, selegiline) may increase concentration, half-life. SSRIs (e.g., escitalopram, paroxetine, sertraline) and SNRIs (e.g., duloxetine, venlafaxine) may increase risk of serotonin syndrome. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** None significant.

### Availability (Rx)
**Injection, Prefilled Autoinjector:** 4 mg/0.5 mL, 6 mg/0.5 mL. *(Zembrace SymTouch):* 3-mg prefilled syringe. **Injection Solution (Imitrex):** 4 mg/0.5 mL, 6 mg/0.5 mL. **(Sumavel DosePro):** 4 mg/0.5 mL, 6 mg/0.5 mL. **Nasal Powder (Onzeta, Xsail):** Capsules: 11 mg (to be used with Xsail breath powdered nasal device). **Nasal Spray (Imitrex Nasal):** 5 mg/actuation, 20 mg/actuation. **Tablets (Imitrex):** 25 mg, 50 mg, 100 mg.

**Administration/handling**

**SQ**
- Follow manufacturer’s instructions for autoinjection device use.
- Administer needleless (Sumavel DosePro) only to abdomen or thigh.

**PO**
- Swallow tablets whole. Do not break, crush, dissolve, or divide.
- Take with full glass of water.

**Nasal**
- Unit contains only one spray—do not test before use.
- Instruct pt to gently blow nose to clear nasal passages.
- With head upright, close one nostril with index finger, breathe out gently through mouth.
- Have pt insert nozzle into open nostril about 1/2 inch, close mouth and, while taking a breath through nose, release spray dosage by firmly pressing plunger.
- Instruct pt to remove nozzle from nose and gently breathe in through nose and out through mouth for 10–20 sec; do not breathe in deeply.

**Indications/routes/dosage**

**Acute Migraine Headache**
**PO: ADULTS, ELDERLY:** 25–100 mg. Dose may be repeated after at least 2 hrs. **Maximum:** 100 mg/single dose; 200 mg/24 hrs.
**SQ: ADULTS, ELDERLY:** Up to 6 mg. **Maximum:** Up to two 6-mg injections/24 hrs (separated by at least 1 hr). *(Zembrace SymTouch):* 3-mg single dose. **Maximum:** 12 mg/24 hrs. Separate dose by at least 1 hr.
Intranasal: ADULTS, ELDERSLY: (Spray): 5–20 mg; may repeat in 2 hrs. Maximum: 40 mg/24 hrs. (Nasal Powder): 11 mg in each nostril. Maximum: 44 mg/24 hrs separated by at least 2 hrs.

Dosage in Renal Impairment
No dose adjustment.

Dosage in Hepatic Impairment
Mild to moderate impairment: Maximum PO dose: 50 mg. Severe impairment: Contraindicated.

Side effects
Frequent: PO (10%–5%): Tingling, nasal discomfort. SQ (greater than 10%): Injection site reactions, tingling, warm/hot sensation, dizziness, vertigo. Nasal (greater than 10%): Altered taste, nausea, vomiting. Occasional: PO (5%–1%): Flushing, asthenia, visual disturbances. SQ (10%–2%): Burning sensation, numbness, chest discomfort, drowsiness, asthenia. Nasal (5%–1%): Nasopharyngeal discomfort, dizziness. Rare: PO (less than 1%): Agitation, eye irritation, dysuria. SQ (less than 2%): Anxiety, fatigue, diaphoresis, muscle cramps, myalgia. Nasal (less than 1%): Burning sensation.

Adverse effects/toxic reactions
Excessive dosage may produce tremors, redness of extremities, reduced respirations, cyanosis, seizures, paralysis. Serious arrhythmias occur rarely, esp. in pts with hypertension, obesity, smokers, diabetes, strong family history of coronary artery disease. Serotonin syndrome may occur (agitation, confusion, hallucinations, hyperreflexia, myoclonus, shivering, tachycardia).

Nursing considerations

Baseline assessment
Receive full medical history, medication history and screen for contraindications. Obtain pregnancy test in female pts of reproductive potential. Question regarding onset, location, duration of migraine, possible precipitating symptoms.
**Intervention/evaluation**
Evaluate for relief of migraine headache and resulting photophobia, phonophobia (sound sensitivity), nausea, vomiting.

**Patient/family teaching**
- Follow proper technique for loading of autoinjector, injection technique, discarding of syringe.
- Do not use more than 2 injections during any 24-hr period and allow at least 1 hr between injections.
- Report immediately if wheezing, palpitations, skin rash, facial swelling, pain/tightness in chest/throat occur.

**SUNItinib**
soo-nit-in-ib

**Sutent**

**CLASSIFICATION**

**PHARMACOTHERAPEUTIC**: Tyrosine kinase inhibitor, vascular endothelial growth factor.

**CLINICAL**: Antineoplastic.

■ **BLACK BOX ALERT** ■ Hepatotoxicity may be severe and/or result in fatal liver failure.

Do not confuse SUNItinib with imatinib or SORAfenib.

**Uses**
Treatment of GI stromal tumor after disease progression while on or demonstrating intolerance to imatinib. Treatment of advanced renal cell carcinoma. Adjuvant treatment of adults at high risk of recurrent RCC following nephrectomy. Treatment of pancreatic neuroendocrine tumor (PNET). **OFF-LABEL**: Non-GI stromal tumor, soft tissue sarcomas, advanced thyroid cancer.

**Precautions**

**Contraindications**: Hypersensitivity to SUNItinib. **Cautions**: Cardiac
dysfunction, bradycardia, electrolyte imbalance, bleeding tendencies, hypertension, history of prolonged QT interval, medications that prolong QT interval, hypokalemia, hypomagnesemia, concurrent use of strong CYP3A4 inducers or inhibitors, HF, renal/hepatic impairment, pregnancy.

**Action**

Inhibitory action against multiple kinases, growth factor receptors, stem cell factor receptors, colony-stimulating factor receptors, glial cell-line neurotrophic factor receptors. **Therapeutic Effect:** Prevents tumor cell growth, produces tumor regression, inhibits metastasis.

**Pharmacokinetics**

Metabolized in liver. Protein binding: 95%. Excreted in feces (61%), urine (16%). **Half-life:** 40–60 hrs.

**Lifespan considerations**

**Pregnancy/Lactation:** Has potential for embryotoxic, teratogenic effects. Breastfeeding not recommended. **Children:** Safety and efficacy not established. **Elderly:** No age-related precautions noted.

**Interactions**

**DRUG:** Strong CYP3A4 inhibitors (e.g., clarithromycin, itraconazole, ketoconazole, voriconazole) may increase concentration, toxicity. Strong CYP3A4 inducers (e.g., carBAMazepine, PHENobarbital, phenytoin, rifAMPin) may decrease concentration/effects. QT interval–prolonging medications (e.g., amiodarone, azithromycin, ceritinib, haloperidol, moxifloxacin) may increase risk of QT interval prolongation, cardiac arrhythmias. **HERBAL:** St. John’s wort may decrease concentration. **FOOD:** Grapefruit products may increase concentration, potential for torsades de pointes, myelotoxicity. **LAB VALUES:** May increase serum alkaline phosphatase, bilirubin, amylase, lipase, creatinine, ALT, AST. May alter serum potassium, sodium, uric acid. May produce thrombocytopenia, neutropenia. May decrease serum phosphate, thyroid function levels.
Availability (Rx)
Capsules: 12.5 mg, 25 mg, 37.5 mg, 50 mg.

Administration/handling

PO
• Give without regard to food. Avoid grapefruit products.

Indications/routes/dosage

GI Stromal Tumor, Renal Cell Carcinoma, RCC (Adjuvant Treatment)
PO: ADULTS, ELDERLY: 50 mg once daily for 4 wks, followed by 2 wks off in 6-wk cycle.

Pancreatic Neuroendocrine Tumor
PO: ADULTS, ELDERLY: 37.5 mg once daily continuously without a scheduled off-treatment period.

Dose Modification
PO: ADULTS, ELDERLY: Dosage increase or reduction in 12.5-mg increments is recommended based on safety and tolerability.

Dosage in Renal Impairment
No initial dose adjustment; subsequent adjustment may be needed.

Dosage in Hepatic Impairment
No dose adjustment initially; grade 3 or 4 hepatotoxicity during treatment: withhold/discontinue if hepatotoxicity does not resolve.

Side effects
Stromal tumor: Common (42%–30%): Fatigue, diarrhea, anorexia, abdominal pain, nausea, hyperpigmentation. Frequent (29%–18%): Mucositis/stomatitis,
vomiting, asthenia, altered taste, constipation, fever. **Occasional (15%–8%)**: Hypertension, rash, myalgia, headache, arthralgia, back pain, dyspnea, cough. **Renal carcinoma**: **Common (74%–43%)**: Fatigue, diarrhea, nausea, mucositis/stomatitis, dyspepsia, altered taste. **Frequent (38%–20%)**: Rash, vomiting, constipation, hyperpigmentation, anorexia, arthralgia, dyspnea, hypertension, headache, abdominal pain. **Occasional (18%–11%)**: Limb pain, peripheral/periorbital edema, dry skin, hair color change, myalgia, cough, back pain, dizziness, fever, tongue pain, flatulence, alopecia, dehydration.

**Adverse effects/toxic reactions**

Palmar-plantar erythrodysesthesia syndrome (PPES) occurs occasionally (14%), manifested as blistersing/rash/peeling of skin on palms of hands, soles of feet. Bleeding, decrease in left ventricular ejection fraction, deep vein thrombosis (DVT), pancreatitis, neutropenia, seizures occur rarely.

**Nursing considerations**

**Baseline assessment**

Question possibility of pregnancy. Obtain baseline CBC, BMP, LFT before beginning therapy and prior to each treatment. Obtain baseline EKG, thyroid function tests. Question medical history as listed in Precautions.

**Intervention/evaluation**

**Patient/family teaching**

• Avoid crowds, those with known infection.
• Avoid contact with anyone who recently received live virus vaccine.
• Do not have immunizations without physician’s approval (drug lowers resistance).
• Avoid pregnancy; use effective contraceptive measures.
• Promptly report fever, unusual bruising/bleeding from any site.
**suvorexant**  
**soo-voe-rex-ant**  
**Belsomra**  

**CLASSIFICATION**  
**PHARMACOTHERAPEUTIC**: Orexin receptor antagonist.  
**CLINICAL**: Sedative-hypnotic.

**Uses**  
Treatment of insomnia, characterized by difficulties with sleep onset and/or sleep maintenance.

**Precautions**  
**Contraindications**: Hypersensitivity to suvorexant. History of narcolepsy.  
**Cautions**: History of COPD, depression, debilitation, drug dependency, obstructive sleep apnea, respiratory disease, pts at high risk of suicide; concomitant use of CNS depressants, strong CYP3A4 inhibitors/inducers. Concomitant use of other insomnia medications not recommended.

**Action**  
Suppresses wake drive of the orexin neuropeptide signaling system, the central promoter of wakefulness. Blocks binding of orexin neuropeptides orexin A and orexin B to receptors of OX1R and OX2R. **Therapeutic Effect**: Induces sleep with fewer nighttime awakenings; improves sleep pattern.

**Pharmacokinetics**  
Rapidly absorbed. Metabolized in liver. Protein binding: greater than 99%. Peak plasma concentration: 2 hrs. Excreted in feces (66%), urine (23%). **Half-life**: 12 hrs.

**Lifespan considerations**  
**Pregnancy/Lactation**: Unknown if distributed in breast milk. **Children**: Safety
and efficacy not established. Elderly: No age-related precautions noted.

Interactions

DRUG: Alcohol, CNS depressants (e.g., LORazepam, morphine, zolpidem) may increase CNS depression. Moderate CYP3A4 inhibitors (e.g., ciprofloxacin, diltiazEM), strong CYP3A4 inhibitors (e.g., ketoconazole, clarithromycin) may increase concentration/effect, CNS depression. CYP3A4 inducers (e.g., rifAMPin, phenytoin) may decrease concentration/effect. May increase concentration/effect of digoxin. HERBAL: Gotu kola, kava kava, valerian may increase CNS depression. St. John’s wort may decrease concentration/effect. FOOD: Meals may decrease absorption/effect. Grapefruit products may increase concentration/effect. LAB VALUES: May increase serum cholesterol.

Availability (Rx)

Tablets: 5 mg, 10 mg, 15 mg, 20 mg.

Administration/handling

PO

• Administer no more than once per night, within 30 min of bedtime.
• Do not administer unless 7 hrs or greater is dedicated for sleep.
• For faster sleep onset, do not give with or immediately after meal.

Indications/routes/dosage

Insomnia

PO: ADULTS, ELDERLY: 10 mg once at bedtime. May increase to 20 mg at bedtime.

Dose Modification

Concomitant use with other CNS depressants, moderate CYP3A4 inhibitors: Decrease starting dose to 5 mg once at bedtime. May increase to 10 mg once at bedtime. Concomitant use of strong CYP3A4 inhibitors: Not
recommended. **Daytime somnolence**: Decrease dose or discontinue if daytime somnolence.

**Dosage in Renal Impairment**
No dose adjustment.

**Dosage in Hepatic Impairment**
**Mild to moderate impairment**: No dose adjustment. **Severe impairment**: Not recommended.

**Side effects**
**Occasional (7%)**: Headache, somnolence. **Rare (3%–2%)**: Dizziness, diarrhea, dry mouth, upper respiratory tract infection, abnormal dreams, cough.

**Adverse effects/toxic reactions**
Obese pts and female pts may have increased exposure-related effects compared to nonobese pts and male pts, respectively. May impair daytime wakefulness even when taken as prescribed. Impairment can occur in the absence of symptoms and may not be reliably detected by ordinary clinical exam. CNS depression may persist for up to several days. May increase risk of falling asleep while driving. Abnormal thinking and behavioral changes such as amnesia, anxiety, lowered sexual inhibition, hallucinations, "sleep driving," preparing and eating meals, making phone calls have been reported. May increase risk of suicidal ideation, worsening of depression. Sleep paralysis (inability to move or speak for up to several min during sleep-wake transitions) and hypnagogic/hypnopompic hallucinations (including vivid and disturbing perceptions) may occur.

**Nursing considerations**

**Baseline assessment**
Assess sleep pattern, ability to fall asleep. Provide environment conductive to restful sleep. Initiate fall precautions. Raise bed rails, provide call light. Receive full medication history, including herbal products, and screen for medication
interactions. Question history of comorbidities, esp. mental health disorders, substance abuse.

**Intervention/evaluation**

Monitor sleep pattern. Evaluate for therapeutic response: decrease in number of nocturnal awakenings, increase in length of sleep. Diligently monitor for daytime somnolence and CNS depressant effects regardless of compliance. Worsening of insomnia, emergence of new cognitive or behavioral abnormalities, or treatment failure after 7–10 days may indicate underlying psychiatric disorder.

**Patient/family teaching**

- Report nighttime episodes of sleep-driving, preparing food, making phone calls, or having sex while not fully awake.
- Do not abruptly discontinue medication after long-term use.
- Avoid tasks that require alertness, motor skills until drug response established.
- Treatment may cause next-day impairment, drowsiness, or falling asleep while driving despite taking medication as prescribed (esp. pts taking higher doses).
- Do not ingest alcohol or grapefruit products.
- Do not take drug unless a full night can be dedicated to sleep.
- **Immediately** report worsening of depression or thoughts of suicide.

---

Canadian trade name

High Alert drug

*underlined* underlined – top prescribed drug
tacrolimus
*ta-kroel-i-mus*
Advagraf
Astagraf XL
Envarsus XR
Prograf
Protopic

**CLASSIFICATION**

PHARMACOTHERAPEUTIC: Immunologic agent.
CLINICAL: Immunosuppressant.

■ **BLACK BOX ALERT** ■ Increased susceptibility to infection and potential for development of lymphoma. Extended-release associated with increased mortality in female liver transplant recipients. Topical form associated with rare cases of malignancy. Topical form should be used only for short-term and intermittent treatment. Use in children younger than 2 yrs of age not recommended. Use only 0.03% ointment for children 2–15 yrs of age. Administer under supervision of physician experienced in immunosuppressive therapy.

Do not confuse Protopic with Protonix, or tacrolimus with everolimus, pimecrolimus, sirolimus, or temsirolimus.

**Uses**

**PO, Injection:** Prevention of organ rejection in pts receiving allogeneic liver, kidney, heart transplant. Should be used concurrently with adrenal
corticosteroids. In heart and kidney transplant pts, should be used in conjunction with azaTHIOprine or mycophenolate. **Topical:** Moderate to severe atopic dermatitis in immunocompetent pts. **OFF-LABEL:** Prevention of organ rejection in lung, small bowel recipients; prevention and treatment of graft-vs-host disease in allogeneic hematopoietic stem cell transplantation.

**Precautions**

**Contraindications:** Hypersensitivity to tacrolimus. **Cautions:** Hypersensitivity to HCO-60 polyoxyl 60 hydrogenated castor oil (used in solution for injection). Renal/hepatic impairment, concurrent use with other nephrotoxic drugs (e.g., cycloSPORINE), concurrent use of strong CYP3A4 inhibitors or inducers. Avoid use of potassium-sparing diuretics, ACE inhibitors, potassium-based salt substitutes. Pts at risk for pure red cell aplasia (e.g., concurrent use of mycophenolate); pts at risk for QT prolongation, hypokalemia, hypomagnesemia. **Topical:** Exposure to sunlight.

**Action**

Inhibits T-lymphocyte activation by binding to intracellular proteins, forming a complex, inhibiting phosphatase activity. **Therapeutic Effect:**Suppresses immunologically mediated inflammatory response; prevents organ transplant rejection.

**Pharmacokinetics**

**Lifespan considerations**

**Pregnancy/Lactation:** Crosses placenta. Hyperkalemia, renal dysfunction noted in neonates. Distributed in breast milk. Breastfeeding not recommended. **Children:** May require higher dosages (decreased bioavailability, increased clearance). May make post-transplant lymphoproliferative disorder more common, esp. in pts younger than 3 yrs. **Elderly:** Age-related renal impairment may require dosage adjustment.
Interactions

**DRUG:** Aluminium-containing antacids may increase concentration. **Strong CYP3A4 inhibitors** (e.g., clarithromycin, ketoconazole, ritonavir), calcium channel blockers (e.g., diltiazem, verapamil) may increase concentration/effects. **Strong CYP3A4 inducers** (e.g., carbamazepine, phenytoin, rifampin) may decrease concentration/effects. May increase concentration of cycloSPORINE. **May decrease therapeutic effects of live vaccines.**

**HERBAL:** Echinacea, St. John’s wort may decrease concentration/effects. **FOOD:** Food decreases rate/extent of absorption. **Grapefruit products** may increase concentration, toxicity (potential for nephrotoxicity). **LAB VALUES:** May increase serum glucose, BUN, creatinine, potassium, triglycerides, cholesterol, bilirubin, amylase, ALT, AST. May decrease serum magnesium, Hgb, Hct, platelets. May alter leukocytes.

Availability (Rx)

**Capsules (Prograf):** 0.5 mg, 1 mg, 5 mg. **Injection Solution (Prograf):** 5 mg/mL. **Ointment (Protopic):** 0.03%, 0.1%.

**Capsule, Extended-Release (Astagraf XL):** 0.5 mg, 1 mg, 5 mg. **Tablet, Extended-Release (Envarsus XR):** 0.75 mg, 1 mg, 4 mg.

Administration/handling

**IV**

**Reconstitution**
- Dilute with appropriate amount (250–1,000 mL, depending on desired dose) 0.9% NaCl or D₅W to provide concentration between 0.004 and 0.02 mg/mL.

**Rate of Administration**
- Give as continuous IV infusion.
- Continuously monitor pt for anaphylaxis for at least 30 min after start of infusion.
- Stop infusion immediately at first sign of hypersensitivity reaction.

**Storage**
- Store diluted infusion solution in glass or polyethylene containers and discard after 24 hrs.
- Do not store in PVC container (decreased stability, potential for extraction).
PO
• Avoid grapefruit products.
• Immediate-Release: Administer without regard to food. Be consistent with timing of administration.
• Extended-Release. Administer at least 1 hr before or 2 hrs after a meal. Do not crush, cut, dissolve, or divide; swallow whole.

Topical
• For external use only.
• Do not cover with occlusive dressing.
• Rub gently, completely onto clean, dry skin.

IV incompatibility
Acyclovir.

IV Compatibilities
Calcium gluconate, dexamethasone (Decadron), diphenhydramINE (Benadryl), DOBUTamine (Dobutrex), DOPamine (Intropin), furosemide (Lasix), heparin, HYDROMorphone (Dilaudid), insulin, leucovorin, LORazepam (Ativan), morphine, nitroglycerin, potassium chloride.

Indications/routes/dosage
Note: Give initial postoperative dose no sooner than 6 hrs after liver or heart transplant and within 24 hrs of kidney transplant.

Prevention of Liver Transplant Rejection
PO: ADULTS, ELDERLY: (Immediate-Release): 0.1–0.15 mg/kg/day in 2 divided doses 12 hrs apart. Titrate to target trough concentration. CHILDREN: 0.15–0.2 mg/kg/day in 2 divided doses 12 hrs apart. Titrate to target trough concentration.
IV: ADULTS, ELDERLY, CHILDREN: 0.03–0.05 mg/kg/day as continuous infusion.
Prevention of Kidney Transplant Rejection

PO: ADULTS, ELDERLY: *(Immediate-Release)*: 0.2 mg/kg/day (in combination with azaTHIOprise) in 2 divided doses 12 hrs apart or 0.1 mg/kg/day (in combination with mycophenolate). Titrate to target trough concentration. *(Extended-Release): (With Basiliximab Induction)*: (Prior to or within 48 hrs of transplant completion): 0.15–0.2 mg/kg once daily (in combination with corticosteroids and mycophenolate). Titrate to target trough concentration. *(Without Basiliximab Induction):* Preoperative dose: 0.1 mg/kg (administer within 12 hrs prior to reperfusion). Postoperative dosing: 0.2 mg/kg once daily (in combination with corticosteroids and mycophenolate). Give at least 4 hrs after preoperative dose and within 12 hrs of reperfusion. Titrate to target trough concentration.

IV: ADULTS, ELDERLY: 0.03–0.05 mg/kg/day as continuous infusion.

Prevention of Heart Transplant Rejection

Note: Recommend in combination with azaTHIOprine or mycophenolate.

PO: ADULTS, ELDERLY: Initially, 0.075 mg/kg/day in 2 divided doses 12 hrs apart. Titrate to target trough concentration.

IV: ADULTS, ELDERLY: 0.01 mg/kg/day as continuous infusion.

Atopic Dermatitis

Topical: ADULTS, ELDERLY, CHILDREN 15 YRS AND OLDER: Apply 0.03% or 0.1% ointment to affected area twice daily. CHILDREN 2–15 YRS: Use 0.03% ointment. Continue treatment for 1 wk after symptoms have resolved. If no improvement within 6 wks, re-examine to confirm diagnosis.

Side effects

Frequent (Greater Than 30%): Headache, tremor, insomnia, paresthesia, diarrhea, nausea, constipation, vomiting, abdominal pain, hypertension.

Occasional (29%–10%): Rash, pruritus, anorexia, asthenia, peripheral edema, photosensitivity.

Adverse effects/toxic reactions

Nephrotoxicity (elevated serum creatinine, decreased urinary output),
neurotoxicity (tremor, headache, altered mental status), pleural effusion occur commonly. Thrombocytopenia, leukocytosis, anemia, atelectasis, sepsis, infection occur occasionally.

**Nursing considerations**

**Baseline assessment**
Assess medical history, esp. renal function; medication history, use of other immunosuppressants. Have aqueous solution of EPINEPHrine 1:1,000, O₂ available at bedside before beginning IV infusion. Assess pt continuously for first 30 min following start of infusion and at frequent intervals thereafter.

**Intervention/evaluation**
Closely monitor pts with renal impairment. Monitor lab values, esp. serum creatinine, serum potassium, CBC with differential, LFT. Monitor I&O closely. CBC should be performed wkly during first mo of therapy, twice monthly during second and third mos of treatment, then monthly throughout the first yr. Report any major change in pt assessment.

**Patient/family teaching**
- Avoid crowds, those with infection.
- Report decreased urination, chest pain, headache, dizziness, respiratory infection, rash, unusual bleeding/bruising.
- Avoid exposure to sun, artificial light (may cause photosensitivity reaction).
- Do not take within 2 hrs of taking antacids. Do not take with grapefruit products.

**tamoxifen**
**ta-mox-fen**
Apo-Tamox
Nolvadex-D
Soltamox

**CLASSIFICATION**
**PHARMACOTHERAPEUTIC**: Selective estrogen receptor modulator
SERM.

**CLINICAL:** Antineoplastic.

- **BLACK BOX ALERT** - Serious, possibly life-threatening CVA, pulmonary emboli, uterine malignancy (endometrial adenocarcinoma, uterine sarcoma) have occurred.

*Do not confuse tamoxifen with pentoxifylline, tamsulosin, or temazepam.*

**Uses**

Adjunct treatment in advanced breast cancer after primary treatment with surgery and radiation, reduction of risk of breast cancer in women at high risk, reduction of risk of invasive breast cancer in women with ductal carcinoma *in situ* (DCIS), metastatic breast cancer in women and men. **OFF-LABEL:** Ovarian cancer (advanced and/or recurrent), treatment of endometrial cancer; risk reduction of breast cancer in women with Paget’s disease of the breast.

**Precautions**

**Contraindications:** Hypersensitivity to tamoxifen. Concomitant warfarin therapy when used in treatment of breast cancer in high-risk women, history of deep vein thrombosis (DVT) or pulmonary embolism (in high-risk women for breast cancer and in women with DCIS). **Cautions:** Thrombocytopenia, pregnancy, history of thromboembolic events, hyperlipidemia, concomitant strong CYP2D6 inhibitors and/or moderate CYP2D6 inhibitors.

**Action**

Competes with estradiol for estrogen-receptor binding sites in breast, uterus, vaginal cells. **Therapeutic Effect:** Inhibits DNA synthesis, estrogen response. Slows tumor growth.

**Pharmacokinetics**

Well absorbed from GI tract. Metabolized in liver. Primarily excreted in feces. **Half-life:** 7 days.
Lifespan considerations

**Pregnancy/Lactation:** If possible, avoid use during pregnancy, esp. first trimester. May cause fetal harm. Unknown if distributed in breast milk. Breastfeeding not recommended. Nonhormonal contraceptives recommended during therapy and for at least 2 mos after discontinuation. **Children:** Safe and effective in girls 2–10 yrs with McCune-Albright syndrome, precocious puberty. **Elderly:** No age-related precautions noted.

Interactions

**DRUG:** May increase effect of warfarin. May decrease effect of anastrozole. Cytotoxic agents may increase risk of thromboembolic events. Moderate/strong CYP2D6 inhibitors (e.g., FLUoxetine, sertraline) may decrease efficacy and increase risk of breast cancer. **HERBAL:** Avoid black cohosh, dong quai in estrogen-dependent tumors. **St. John’s wort** may decrease concentration/effects. **FOOD:** None known. **LAB VALUES:** May increase serum cholesterol, calcium, triglycerides, AST, ALT.

Availability (Rx)

**Solution, Oral (Soltamox):** 10 mg/5 mL. **Tablets:** 10 mg, 20 mg.

Administration/handling

**PO**

- Give without regard to food.
- Use supplied dosing cup for oral solution.

Indications/routes/dosage

**Metastatic Breast Cancer (Males and Females)**

**PO:** **ADULTS, ELDERLY:** 20–40 mg/day. Give doses greater than 20 mg/day in 2 divided doses.

**Breast Cancer Treatment**
PO: ADJUVANT THERAPY (FEMALES), PREMENOPAUSAL WOMEN:
20 mg once daily for 5 yrs.
POSTMENOPAUSAL WOMEN: Duration of 2–3 yrs, followed by an aromatase inhibitor to complete 5 yrs.

Ductal Carcinoma in Situ (DCIS)
PO: ADULTS, ELDERLY: 20 mg once daily for 5 yrs.

Breast Cancer Risk Reduction
PO: ADULTS, ELDERLY: 20 mg once daily for 5 yrs.

Dosage in Renal/Hepatic Impairment
No dose adjustment.

Side effects

Adverse effects/toxic reactions
Retinopathy, corneal opacity, decreased visual acuity noted in pts receiving extremely high dosages (240–320 mg/day) for longer than 17 mos.

Nursing considerations

Baseline assessment
Obtain estrogen receptor assay prior to therapy. Obtain baseline breast and gynecologic exams, mammogram results. CBC, serum calcium levels should be checked before and periodically during therapy.

Intervention/evaluation
Be alert to increased bone pain; ensure adequate pain relief. Monitor I&O, weight. Observe for edema, esp. of dependent areas, signs and symptoms of DVT. Assess for hypercalcemia (increased urinary volume, excessive thirst, nausea, vomiting, constipation, hypotonicity of muscles, deep bone/flank pain, renal stones).

**Patient/family teaching**

- Report vaginal bleeding/discharge/itching, leg cramps, weight gain, shortness of breath, weakness.
- May initially experience increase in bone, tumor pain (appears to indicate good tumor response).
- Report persistent nausea, vomiting.
- Nonhormonal contraceptives are recommended during treatment.

---

**tamsulosin**

tam-**soo**-loe-sin

**Flomax**

Apo-Tamsulosin

**Fixed-Combination(s)**

- **Jalyn**: tamsulosin/dutasteride (an androgen hormone inhibitor): 0.4 mg/0.5 mg.

**CLASSIFICATION**

**PHARMACOTHERAPEUTIC**: Alpha₁-adrenergic blocker.

**CLINICAL**: Benign prostatic hyperplasia agent.

*Do not confuse Flomax with Flonase, Flovent, Foltx, Fosamax, or Volmax, or tamsulosin with tamoxifen or terazosin.*

---

**Uses**

Treatment of symptoms of benign prostatic hyperplasia (BPH). **OFF-LABEL**: Treatment of bladder outlet obstruction or dysfunction. To facilitate expulsion of ureteral stones (distal).
Precautions

Contraindications: Hypersensitivity to tamsulosin. Caution: Concurrent use of phosphodiesterase (PDE5) inhibitors (e.g., sildenafil, tadalafil, vardenafil), pts with orthostatic hypotension.

Action

Antagonist of alpha receptors in prostate. Therapeutic Effect: Relaxes smooth muscle in bladder neck and prostate; improves urinary flow, symptoms of prostatic hyperplasia.

Pharmacokinetics

Lifespan considerations

Interactions

DRUG: Other alpha-adrenergic blocking agents (e.g., doxazosin, prazosin, terazosin) may increase alpha-blockade effects. Sildenafil, tadalafil, vardenafil may cause symptomatic hypotension. CYP3A4 inhibitors (e.g., clarithromycin, ketoconazole, ritonavir) may increase concentration. HERBAL: Avoid saw palmetto (limited experience with this combination). Black cohosh, periwinkle may increase hypotensive effect. St. John’s wort may decrease concentration/effects. FOOD: Grapefruit products may increase risk for orthostatic hypotension. LAB VALUES: None known.

Availability (Rx)

Capsules: 0.4 mg.
Administration/handling

PO
• Give at same time each day, 30 min after the same meal.
• Do not break, crush, or open capsule.

Indications/routes/dosage

Benign Prostatic Hyperplasia (BPH)
PO: ADULTS: 0.4 mg once daily, approximately 30 min after same meal each day. May increase dosage to 0.8 mg if inadequate response in 2–4 wks.

Dosage in Renal/Hepatic Impairment
No dose adjustment.

Side effects
Frequent (9%–7%): Dizziness, drowsiness. Occasional (5%–3%): Headache, anxiety, insomnia, orthostatic hypotension. Rare (Less Than 2%): Nasal congestion, pharyngitis, rhinitis, nausea, vertigo, impotence.

Adverse effects/toxic reactions
First-dose syncope (hypotension with sudden loss of consciousness) may occur within 30–90 min after initial dose. May be preceded by tachycardia (pulse rate of 120–160 beats/min).

Nursing considerations

Baseline assessment
Assess history of prostatic hyperplasia (difficulty initiating urine stream, dribbling, sense of urgency, leaking). Question for sensitivity to tamsulosin, or use of other alpha-adrenergic blocking agents. Obtain vital signs.

Intervention/evaluation
Assist with ambulation if dizziness occurs. Monitor renal function, I&O, weight changes, peripheral edema, B/P. Monitor for first-dose syncope.

**Patient/family teaching**

- Take at same time each day, 30 min after the same meal.
- Go from lying to standing slowly.
- Avoid tasks that require alertness, motor skills until response to drug is established.
- Do not break, crush, open capsule.
- Avoid grapefruit products.

---

**tapentadol**

*ta-pen-ta-dol*

**Nucynta**

**Nucynta ER**

**Nucynta IR**

**CLASSIFICATION**

**PHARMACOTHERAPEUTIC**: Centrally acting synthetic analgesic (Schedule II).

**CLINICAL**: Analgesic.

*Do not confuse tapentadol with traMADol.*

---

**Uses**

**Nucynta**: Relief of moderate to severe acute pain in adults 18 yrs and older.

**Nucynta ER**: Management of moderate to severe chronic or neuropathic pain associated with diabetic peripheral neuropathy when around-the-clock analgesic is needed for extended period.

---

**Precautions**

**Contraindications**: Hypersensitivity to tapentadol. Severe respiratory depression, acute or severe bronchial asthma, hypercapnia in uncontrolled settings, known or suspected paralytic ileus, concurrent use or ingestion within 14 days of MAOI use. **Cautions**: Respiratory disease or respiratory compromise
(e.g., hypoxia, hypercapnia, or decreased respiratory reserve), asthma, COPD, severe obesity, sleep apnea syndrome, CNS depression, pts with head injury, intracranial lesions, pancreatic or biliary disease, renal or hepatic impairment, seizure disorder, conditions that increase risk of seizures, pts at risk for hypotension, adrenal insufficiency, concurrent use with serotonergic agents, elderly pts, debilitated or cachetic pts. History of substance abuse.

**Action**

Binds to mu-opioid receptors in the central nervous system, causing inhibition of ascending pain pathways; increases norepinephrine by inhibiting its reabsorption into nerve cells. **Therapeutic Effect:** Produces analgesia. Reduces level of pain perception.

**Pharmacokinetics**

Metabolized in liver. Primarily excreted in the urine. Widely distributed. Protein binding: 20%. **Half-life:** 4 hrs.

**Lifespan considerations**

- **Pregnancy/Lactation:** Unknown if drug crosses placenta or is distributed in breast milk. **Children:** Not recommended for use in this pt population. **Elderly:** Age-related renal impairment may increase risk of side effects.

**Interactions**

**DRUG:** Alcohol, CNS depressants (e.g., LORazepam, morphine, zolpidem) may increase CNS depression, respiratory depression. **MAOIs** (e.g., phenelzine, selegiline), **SSRIs** (e.g., FLUoxetine), **tricyclic antidepressants** (e.g., amitriptyline), triptans (e.g., SUMAtrip坦) may increase risk of serotonin syndrome. **HERBAL:** Kava kava, St. John’s **wort**, valerian may increase CNS depression. **St. John’s wort** may increase risk for serotonin syndrome. **FOOD:** None known. **LAB VALUES:** None significant.

**Availability (Rx)**

**Tablets:** 50 mg, 75 mg, 100 mg.
Tablets, Extended-Release: 50 mg, 100 mg, 150 mg, 200 mg, 250 mg.

Administration/handling

PO

• Give without regard to food.
• Tablets may be crushed.
• Give extended-release tablets whole; do not break, crush, dissolve, or divide.

Indications/routes/dosage

Note: Not recommended in severe renal or hepatic impairment.

Pain Control

PO: ADULTS, ELDERLY: Nucynta: 50–100 mg q4–6h as needed. Maximum: 600 mg/day (700 mg on day 1). Nucynta ER: Initially, 50 mg twice daily (12 hrs apart). May increase by 50 mg twice daily q3days to effective dose. Range: 100–250 mg twice daily. Maximum: 500 mg/day.

Conversion to Extended-Release

Oral Opioids: Discontinue all other opioids when extended-release tapentadol is initiated. Begin with a dose that is 50% of estimated tapentadol needed with immediate-release rescue medications as a supplement.

Immediate-Release tapentadol: Use same total daily dose but divide into 2 equal doses given twice daily. Maximum dose: 500 mg daily.

Dosage in Renal Impairment

CrCl 30 mL/min or greater: No adjustment. CrCl less than 30 mL/min: Not recommended.

Dosage in Hepatic Impairment

Immediate-release: Moderate impairment: 50 mg q8h. Maximum: 3 doses/24 hrs. Extended-release: Initially, 50 mg/day. Maximum: 100 mg/day.
Side effects

**Frequent (Greater Than 10%)**: Nausea, dizziness, vomiting, sleepiness, headache.

**Adverse effects/toxic reactions**

Respiratory depression, serotonin syndrome have been reported.

**Nursing considerations**

**Baseline assessment**

Assess onset, type, location, and duration of pain. Obtain vital signs before giving medication. If respirations are 12/min or lower, withhold medication, contact physician. Question medical history as listed in Precautions.

**Intervention/evaluation**

Be alert for decreased respirations or B/P. Initiate deep breathing and coughing exercises, particularly in pts with impaired pulmonary function. Assess for clinical improvement and record onset of pain relief.

**Patient/family teaching**

- Avoid tasks that require alertness, motor skills until response to drug is established.
- Avoid alcohol, CNS depressants.
- Report nausea, vomiting, shortness of breath, difficulty breathing.

---

**tedizolid**

**ted-eye-zoe-lid**

**Sivextro**

CLASSIFICATION

PHARMACOTHERAPEUTIC: Oxazolidinone-class antibacterial.

CLINICAL: Antibiotic.

Do not confuse tedizolid with linezolid.
Uses

Treatment of adult pts with acute bacterial skin and skin structure infections (ABSSSI) caused by susceptible strains of gram-positive microorganisms including *Staphylococcus aureus* (including methicillin-susceptible and methicillin-resistant strains), *S. agalactiae*, *S. anginosus* group (including *S. anginosus*, *S. intermedius*, *S. constellatus*), *S. pyogenes*, and *E. faecalis*.

Precautions

**Contraindications:** Hypersensitivity to tedizolid. **Cautions:** History of *C. difficile* infection or antibiotic-associated colitis, myelosuppression, neutropenia, peripheral/optic neuropathy.

Action

Inhibits cellular protein synthesis by binding to 50S subunit of bacterial ribosome. **Therapeutic Effect:** Antibiotic.

Pharmacokinetics

Readily absorbed following PO administration. Protein binding: 70%–90%. Peak plasma concentration: PO: 3 hrs; IV: end of infusion. Excreted in feces (82%), urine (18%). Minimally removed by hemodialysis. **Half-life:** 12 hrs.

* Lifespan considerations

**Pregnancy/Lactation:** Unknown if distributed in breast milk. **Children:** Safety and efficacy not established in pts younger than 18 yrs. **Elderly:** No age-related precautions noted.

Interactions

**DRUG:** None significant. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** May decrease Hgb, platelets, neutrophils. May increase serum ALT, AST.

Availability (Rx)
Lyophilized Powder for Injection: 200 mg/vial. Tablets: 200 mg.

Administration/handling

**IV**

- Vials contain no preservatives or bacteriostatic agents.
- Must reconstitute with Sterile Water for Injection and subsequently dilute with 0.9% NaCl only.
- Do not inject as IV push or bolus.

**Reconstitution**

- Reconstitute vial with 4 mL of Sterile Water for Injection.
- To avoid foaming, alternate between gentle swirling and inversion until powder is completely dissolved. If foaming occurs, let vial stand until foam dispersed.
- Visually inspect for particulate matter or discoloration. Do not use if particulate matter is observed.
- Withdraw 4 mL of solution with vial in upright position; do not invert vial during draw-up.
- Further dilute in 250 mL 0.9% NaCl.
- Gently invert bag to mix; do not shake.

**Rate of Administration**

- Infuse over 1 hr via dedicated line.

**Storage**

- Reconstituted solution should appear clear, colorless to yellow.
- Administer within 24 hrs of reconstitution.
- May refrigerate or store solution at room temperature up to 24 hrs.

**PO**

- Give without regard to meal.

**IV incompatibilities**

Any solutions containing divalent cations (e.g., Ca^{2+}, Mg^{2+}), lactated Ringer’s injection. Do not infuse with other medications.

**Indications/routes/dosage**
Acute Bacterial Skin and Skin Structure Infection

PO/IV: ADULTS, ELDERLY: 200 mg once daily for 6 days.

Dosage in Renal/Hepatic Impairment
No dose adjustment.

Side effects
Occasional (8%–3%): Nausea, headache, diarrhea, vomiting. Rare (2%): Dizziness, dermatitis, insomnia.

Adverse effects/toxic reactions
Safety and efficacy in pts with neutropenia not established. Antibacterial activity may be reduced in the absence of granulocytes. C. difficile–associated diarrhea with severity ranging from mild diarrhea to fatal colitis has been reported for up to 2 mos following administration. Treatment in the absence of proven or strongly suspected bacterial infection may increase risk of drug-resistant bacteria. Infusion/hypersensitivity reactions (pruritus, urticaria, flushing, hypertension, palpitations, tachycardia), optic disorders (asthenopia, blurry vision, neuropathy, visual impairment, vitreous floaters), neurologic disorders (hypoesthesia, paresthesia, peripheral neuropathy, cranial nerve VII paralysis), infections (oral candidiasis, vulvovaginal mycotic infection) occur rarely.

Nursing considerations

Baseline assessment
Obtain baseline CBC (note WBC, bands), wound culture/sensitivity, vital signs. Question history of recent C. difficile infection, hypersensitivity reaction. Assess skin wound characteristics; hydration status. Question pt’s usual stool characteristics (color, frequency, consistency).

Intervention/evaluation
Monitor skin infection/wound for improvement. Monitor daily pattern of bowel activity, stool consistency; increasing severity may indicate antibiotic-associated
colitis. If frequent diarrhea occurs, obtain *C. difficile* toxin screen and initiate isolation precautions until result confirmed. Encourage PO intake. Monitor I&O. Monitor for infusion-related/hypersensitivity reaction.

**Patient/family teaching**

- It is essential to complete drug therapy despite symptom improvement. Early discontinuation may result in antibacterial resistance or an increased risk of recurrent infection.
- Report episodes of diarrhea, esp. following wks after treatment completion. Frequent abdominal pain, blood-streaked stool, diarrhea, fever, may indicate infectious diarrhea, which may be contagious.
- Drink plenty of fluids.

### teduglutide
teduglu-tide

**Gattex**

**CLASSIFICATION**
**PHARMACOTHERAPEUTIC**: Human glucagon-like peptide-2.

**CLINICAL**: Short bowel syndrome (short gut syndrome, short gut) agent.

*Do not confuse teduglutide with liraglutide or albiglutide, or Gattex with Gas-X.*

### Uses

Treatment of adults with short bowel syndrome (SBS) who are dependent on parenteral support.

### Precautions

**Contraindications**: Hypersensitivity to teduglutide. **Cautions**: Cardiovascular disease, HF, pts at increased risk for malignancy, biliary tract (gallbladder, pancreatic) disease, hypervolemia, stenosis, renal impairment.

### Action

Analogue of naturally occurring peptide secreted by L cells of distal intestine,
known to increase intestinal, portal blood flow, and inhibit gastric secretion. **Therapeutic Effect:** Improves intestinal absorption.

**Pharmacokinetics**

**Lifespan considerations**

**Pregnancy/Lactation:** Unknown if distributed in breast milk. **Children:** Safety and efficacy not established. **Elderly:** No age-related precautions noted.

**Interactions**

**DRUG:** May increase absorption of any concomitant oral medication. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** None significant.

**Availability (Rx)**

**Injection, Powder for Reconstitution:** 5 mg (delivers maximum of 0.38 mL containing 3.8 mg teduglutide).

**Administration/handling**

**Subcutaneous**

**Reconstitution**

• If diluent syringe (contains 0.5 mL Sterile Water for Injection) has a white snap-off cap, snap or twist off white cap.
• If diluent syringe has a gray screw top, unscrew top counterclockwise.
• Push prefilled syringe into vial containing teduglutide.
• After all diluent has gone into vial, remove syringe, needle and discard.
• Allow vial to sit for 30 sec.
• Gently roll vial for 15 sec (do not shake) and let stand for 2 min.
• Withdraw prescribed dose, discard remaining fluid.

**Administration**
• Insert needle subcutaneously into upper arms, outer thigh, or abdomen, and inject solution.
• Do not inject into areas of active skin disease or injury such as sunburns, skin rashes, inflammation, skin infections, or active psoriasis.
• Do not administer IV or intramuscularly.
• Rotate injection sites.

Storage
• Store kit in refrigerator.
• Reconstituted solution should appear as a clear, colorless to light straw-colored liquid.
• Discard if particulate is present.
• Drug should be completely dissolved before solution is withdrawn from vial.

Indications/routes/dosage

Short Bowel Syndrome
SQ: ADULTS/ELDERLY: 0.05 mg/kg once daily.

Dosage in Moderate to Severe Renal Impairment
SQ: ADULTS/ELDERLY: CrCl less than 50 mL/min: 50% dose reduction.

Dosage in Hepatic Impairment
No dose adjustment.

Side effects
Frequent (30%–22%): Abdominal pain, nausea, injection site reactions. Occasional (18%–14%): Headache, abdominal distention, vomiting. Rare (9%): Flatulence, hypersensitivity, appetite disorders, sleep disturbances.

Adverse effects/toxic reactions
Upper respiratory tract infection occurs in 12% of pts. Fluid overload (hypervolemia) reported in 7% of pts. Potential for hypovolemia is increased in pts with cardiovascular disease, HF. Therapy increases risk for acceleration for neoplastic growth. Cholecystitis, cholangitis, cholelithiasis, pancreatitis have
Nursing considerations

Baseline assessment
Obtain baseline serum chemistries, LFT, lipase, amylase. Colonoscopy (or alternate imaging) with removal of polyps should be completed within 5 mos prior to initiating treatment.

Intervention/evaluation
Follow-up colonoscopy (or alternate imaging) is recommended at the end of 1 year. If no polyp is found, subsequent colonoscopies should be done no less frequently than every 5 yrs. If a polyp is found, adherence to current polyp follow-up guidelines is recommended. Discovery of intestinal obstruction, intestinal malignancy necessitates discontinuation of treatment. Subsequent laboratory assessments, LFT are recommended every 6 mos. If clinically meaningful elevation is seen, further diagnostic workup is recommended as clinically indicated.

Patient/family teaching
• Teach proper use and administration of medication.
• Be aware of need for any new supplies.
• Instruct pt in preparation of medication, and observe correct administration technique.
• Report yellowing of skin or eyes, dark urine, changes in stool color or consistency, severe abdominal pain, nausea, vomiting, sudden weight gain, swelling, or difficulty breathing.

**telavancin**
tel-a-van-sin

**Vibativ**

**CLASSIFICATION**
**PHARMACOTHERAPEUTIC**: Lipoglycopeptide antibacterial.
**CLINICAL**: Antibiotic.
BLACK BOX ALERT  Pts with preexisting renal impairment (CrCl less than 50 mL/min) who are treated for hospital-acquired pneumonia may have increased mortality risk when compared to vancomycin. May cause new or worsening renal impairment. May cause fetal harm (low birth weight, limb malformations). Women of childbearing potential should have pregnancy test before treatment; avoid use during pregnancy unless benefit to pt outweighs fetal risk.

Do not confuse telavancin with dalbavancin or oritavancin; or Vibativ with Vibra-Tabs or vigabatrin.

Uses

Treatment of complicated skin, soft tissue infections (cSSSI) caused by gram-positive microorganisms, including methicillin-susceptible or methicillin-resistant *S. aureus*, vancomycin-susceptible *Enterococcus*. Treatment of hospital-acquired and ventilator-associated bacterial pneumonia (HABP/VABP) caused by susceptible isolates of *S. aureus*.

Precautions

**Contraindications:** Prior hypersensitivity reactions to telavancin. Concomitant use of IV unfractionated heparin. **Cautions:** Renal impairment (CrCl 50 mL/min or less), concurrent therapy with other nephrotoxic medications (e.g., NSAIDs, ACE inhibitors, aminoglycosides). Avoid use in pts with history of congenital QT syndrome, known prolongation of QT interval, uncompensated HF, severe left ventricular hypertrophy, or receiving treatment with other drugs known to prolong QT interval, hypokalemia, hypomagnesemia, known vancomycin hypersensitivity.

Action

Inhibits bacterial cell wall synthesis by blocking polymerization and cross-linking of peptidoglycan. Disrupts membrane potential and changes cell wall permeability. **Therapeutic Effect:** Bactericidal. Antibiotic.
Pharmacokinetics

Not metabolized in liver; pathway unspecified. Protein binding: 90%. Primarily excreted unchanged in urine. Not removed by hemodialysis. **Half-life:** 8–9 hrs.

Lifespan considerations

**Pregnancy/Lactation:** May cause fetal harm at regular dosage. Unknown if distributed in breast milk. **Children:** Safety and efficacy not established. **Elderly:** Age-related renal impairment may increase risk of nephrotoxicity; dosage adjustment recommended.

Interactions

**DRUG:** Telavancin may increase levels/effects of dronedarone, nilotinib, pimozide, quinINE, tetrabenazine, thioridazine, ziprasidone. QT interval–prolonging medications (e.g., amiodarone, azithromycin, ceritinib, haloperidol, moxifloxacin) may increase risk of QT interval prolongation, cardiac arrhythmias. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** May alter serum potassium. May increase serum bilirubin, ALT, AST, BUN, creatinine; PT, aPTT, INR. May decrease Hgb, Hct, WBC count.

Availability (Rx)

**Injection, Powder for Reconstitution:** 250 mg, 750 mg.

Administration/handling

**IV**

*ALERT* Give by intermittent IV infusion (piggyback). Do not give by IV push (may result in hypotension).

**Reconstitution**

- Reconstitute with 45 mL Sterile Water for Injection, D$_5$W, or 0.9% NaCl to provide concentration of 15 mg/mL (total volume approximately 50 mL).
- Prior to administration, further dilute with D$_5$W or 0.9% NaCl to final concentration of 0.6–8 mg/mL.
- Do not shake.

**Rate of Administration**
Infuse over at least 60 min. Flush line with D₅W or 0.9% NaCl before and after administration.

**Storage**
- Discard if particulate is present.
- Following reconstitution, drug is stable for 4 hrs at room temperature or 72 hrs if refrigerated in vial or infusion bag.

**IV incompatibilities**
Amphotericin, colistimethate, levoFLOXacin (Levaquin), micafungin (Mycomine).

**IV Compatibilities**
Azithromycin, caspofungin, cefepime, cefTAZidime, cefTRIAXone, ciprofloxacin, doripenem, doxycycline, gentamicin, ertapenem, fluconazole, meropenem, tobramycin, pantoprazole, piperacillin-tazobactam, tigecycline.

**Indications/routes/dosage**

**Usual Parenteral Dosage**

**IV Infusion: ADULTS, ELDERLY:** 10 mg/kg once every 24 hrs for 7–14 days (cSSSI); 14–21 days (HABP/VABP). Duration based on severity, infection site, and clinical progress of pt.

**Dosage in Renal Impairment**

<table>
<thead>
<tr>

<td>10 mg/kg every 48 hrs</td>
</tr>
<tr>
<td>Less than 10 mL/min</td>
<td>No dose adjustment (not studied)</td>
</tr>
</tbody>
</table>

**Dosage in Hepatic Impairment**
No dose adjustment (unless concomitant renal impairment).
Side effects

**Frequent** (33%–27%): Altered taste, nausea. **Occasional** (14%–6%): Vomiting, foamy urine, diarrhea, dizziness, pruritus. **Rare** (4%–2%): Rigors, rash, infusion site pain, anorexia, infusion site erythema.

Adverse effects/toxic reactions

Nephrotoxicity (acute kidney injury, acute tubular necrosis, renal failure), diarrhea due to *C. difficile* may occur. "Red-man syndrome" (characterized by erythema on face, neck, upper torso), tachycardia, hypotension, myalgia, angioedema may occur from too-rapid rate of infusion. May cause QT interval prolongation.

Nursing considerations

**Baseline assessment**
Obtain pregnancy test prior to treatment. Obtain baseline serum BUN, creatinine, creatinine clearance prior to initiating therapy, every 48–72 hrs, and after treatment is completed. Obtain culture and sensitivity tests before giving first dose (therapy may begin before results are known). Question history of renal impairment, long QT interval syndrome, HF.

**Intervention/evaluation**

**Patient/family teaching**
- Use effective contraception during treatment.
- Report rash, signs/symptoms of nephrotoxicity, diarrhea.
- Blood levels will be monitored routinely.
- Report chest pain, irregular heart rhythm, palpitations, passing out.
**Fixed-Combination(s)**

**Micardis HCT:** telmisartan/hydroCHLORothiazide (a diuretic): 40 mg/12.5 mg, 80 mg/12.5 mg. **Twynda:** telmisartan/amLODIPine (a calcium channel blocker): 40 mg/5 mg, 40 mg/10 mg, 80 mg/5 mg, 80 mg/10 mg.

**CLASSIFICATION**

**PHARMACOTHERAPEUTIC:** Angiotensin II receptor antagonist.  
**CLINICAL:** Antihypertensive.

■ **BLACK BOX ALERT** ■ May cause fetal injury, mortality. Discontinue as soon as possible once pregnancy is detected.

**Uses**

Treatment of hypertension alone or in combination with other antihypertensives. Reduces cardiovascular risk in pts 55 yrs of age and older unable to take ACE inhibitors and at high risk of major cardiovascular event (e.g., MI, stroke).

**Precautions**

**Contraindications:** Hypersensitivity to telmisartan. Concurrent use with aliskiren in pts with diabetes. **Cautions:** Hypovolemia, hyperkalemia, hepatic/renal impairment, renal artery stenosis (unilateral, bilateral), biliary obstructive disease, significant aortic/mitral stenosis. Concurrent use with ramipril not recommended. Avoid potassium supplements.

**Action**

Blocks vasoconstrictor and aldosterone-secreting effects of angiotensin II, inhibiting binding of angiotensin II to AT$_1$ receptors. **Therapeutic Effect:** Causes vasodilation, decreases peripheral resistance, decreases B/P.

Rapidly, completely absorbed. Protein binding: greater than 99%. Metabolized in liver. Excreted in feces. Unknown if removed by hemodialysis. **Half-life:** 24 hrs.

⚠️ **Lifespan considerations**

**Pregnancy/Lactation:** May cause fetal harm. Unknown if drug is distributed in breast milk. **Children:** Safety and efficacy not established. **Elderly:** No age-related precautions noted.

**Interactions**

**DRUG:** NSAIDs (e.g., ibuprofen, ketorolac, naproxen) may decrease antihypertensive effect. May increase digoxin concentration, risk of toxicity. **HERBAL:** Ephedra, ginger, licorice, ginseng, yohimbe may worsen hypertension. Black cohosh, periwinkle may increase antihypertensive effect. **FOOD:** None known. **LAB VALUES:** May increase serum BUN, creatinine, uric acid, cholesterol. May decrease Hgb, Hct.

**Availability (Rx)**

**Tablets:** 20 mg, 40 mg, 80 mg.

**Administration/handling**

**PO**

• Give without regard to meals.

**Indications/routes/dosage**

**Hypertension**

**PO:** **ADULTS, ELDERLY:** Initially, 40 mg once daily. Usual range: 40–80 mg/day.
Cardiovascular Risk Reduction

PO: ADULTS, ELDERLY: 80 mg once daily.

Dosage in Renal Impairment

No dose adjustment.

Dosage in Hepatic Impairment

Use with caution.

Side effects

Occasional (7%–3%): Upper respiratory tract infection, sinusitis, back/leg pain, diarrhea. Rare (1%): Dizziness, headache, fatigue, nausea, heartburn, myalgia, cough, peripheral edema.

Adverse effects/toxic reactions

Overdosage may manifest as hypotension, tachycardia; bradycardia occurs less often.

Nursing considerations

Baseline assessment

Obtain B/P, apical pulse immediately before each dose, in addition to regular monitoring (be alert to fluctuations). If excessive reduction in B/P occurs, place pt in supine position, feet slightly elevated. Assess medication history (esp. diuretics). Question for history of hepatic/renal impairment, renal artery stenosis. Obtain serum BUN, creatinine, Hgb, Hct, vital signs (particularly B/P, pulse rate).

Intervention/evaluation

Monitor B/P, pulse, serum electrolytes, renal function. Monitor for hypotension when initiating therapy.

Patient/family teaching
• Avoid tasks that require alertness, motor skills until response to drug is established (possible dizziness effect).
• Maintain proper hydration.
• Avoid pregnancy.
• Immediately report suspected pregnancy.
• Report any sign of infection (sore throat, fever).
• Avoid excessive exertion during hot weather (risk of dehydration, hypotension).

**telotristat ethyl**
tel-oh-tri-state eth-il

**Xermelo**

CLASSIFICATION

PHARMACOTHERAPEUTIC: Tryptophan hydroxylase inhibitor.

CLINICAL: GI agent.

Do not confuse telotristat with Triostat, or Xermelo with Xarelto.

**Uses**

Treatment of carcinoid syndrome diarrhea in combination with somatostatin analog (SSA) therapy in adults with symptoms inadequately controlled by SSA therapy.

**Precautions**

Contraindications: Hypersensitivity to telotristat, telotristat ethyl. Cautions: Pts with advanced carcinoid tumors may be at risk for altered structural integrity of the GI wall. Conditions that may impair integrity of GI wall (e.g., Crohn’s disease, diverticulitis, GI tract malignancies, intestinal adhesions, Ogilvie’s syndrome, peptic ulcers, peritoneal malignancies).

**Action**

Inhibits enzyme tryptophan hydroxylase (TPH). TPH converts tryptophan to 5-hydroxytryptophan, and then to serotonin, reducing overproduction and biosynthesis of peripheral serotonin. **Therapeutic Effect:** Reduces frequency of
carcinoid syndrome diarrhea.

Pharmacokinetics

Does not cross blood-brain barrier Undergoes hydrolysis via carboxylesterases to active metabolite telotristat. Protein binding: greater than 99%. Peak plasma concentration: 1-3 hrs (telotristat). Excreted in feces (93%), urine (less than 1%). **Half-life:** 5 hrs (telotristat).

 salarié

Lifespan considerations

**Pregnancy/Lactation:** Unknown if crosses placenta or distributed in breastmilk. May increase risk of constipation in nursing infants. **Children:** Safety and efficacy not established. **Elderly:** No age-related precautions noted.

Interactions

**DRUG:** Octreotide may decrease concentration/effect (gived short acting octreotide at least 30 min after telotristat ethyl). **HERBAL:** None significant. **FOOD:** High-fat meals increases drug exposure. **LAB VALUES:** May increase alkaline phosphatase, ALT, AST, GGT.

Availability (Rx)

**Tablets:** 250 mg.

Administration/handling

**PO**

- Give with food.
- If applicable, give short-acting octreotide at least 30 mins after telotristat ethyl.
- If a dose is missed, do not give extra dose. Administer next dose at regularly scheduled time.

Indications/Routes/Dosage

**Carcinoid Syndrome Diarrhea**
PO: ADULTS, ELDERLY: 250 mg 3 times/day.

Dosage in Renal Impairment

Creatinine clearance greater than 20 mL/min: No dose adjustment. ESRD requiring hemodialysis: Not studied; use caution.

Dosage in Hepatic Impairment

Mild impairment: No dose adjustment. Moderate to severe impairment: Not studied; use caution.

Side Effects

Occasional (13%-5%): Nausea, headache, peripheral edema, flatulence, decreased appetite, pyrexia, abdominal pain, abdominal distension, constipation.

Adverse Effects/Toxic Reactions

Severe constipation resulting in GI perforation, bowel obstruction may occur. Depression reported in 9% of pts.

Nursing Considerations

Baseline Assessment

Question characteristics of diarrhea, frequency of bowel movements. Assess bowel sounds. Question history of GI obstruction, GI perforation, baseline GI disease. Assess hydration status.

Intervention/Evaluation

Assess bowel sounds. Monitor for severe, persistent, or worsening of abdominal pain. Discontinue if severe constipation, severe abdominal pain, GI perforation, bowel obstruction occurs. Monitor daily pattern of bowel activity, stool consistency.

Patient/Family Teaching

• Take with food.
- Immediately report severe, persistent abdominal pain; abdominal distension, fever, nausea, vomiting; may indicate tear or blockage in GI tract.
- Report severe constipation.
- Do not breastfeed.
- If therapy includes somatostatin, take somatostatin at least 30 mins after dose.

**t**emozolomide
**tem-oh-zoe-loe-myde**

**Temodal**

**Temodar**

**CLASSIFICATION**
**PHARMACOTHERAPEUTIC:** Imidazotetrazine derivative, alkylating agent.
**CLINICAL:** Antineoplastic.

**Do not confuse Temodar with Tambocor.**

**Uses**
Treatment of adults with refractory anaplastic astrocytoma, newly diagnosed glioblastoma multiforme (concomitantly with radiotherapy, then as maintenance therapy). **OFF-LABEL:** Malignant glioma, metastatic melanoma, metastatic CNS lesions, cutaneous T-cell lymphomas, advanced neuroendocrine tumors, soft tissue sarcoma, pediatric neuroblastoma. Ewing’s sarcoma (recurrent or progressive).

**Precautions**
**Contraindications:** Hypersensitivity to temozolomide, dacarbazine. **Cautions:** Severe renal/hepatic impairment, pregnancy.

**Action**
Produces cytotoxic effect through alkylation of DNA, causing DNA double strand breaks and apoptosis. **Therapeutic Effect:** Inhibits DNA replication, causing cell death.
Pharmacokinetics
Rapidly, completely absorbed after PO administration. Protein binding: 15%. Peak plasma concentration: 1 hr. Penetrates blood-brain barrier. Excreted in urine (38%), feces (19%). **Half-life:** 1.6–1.8 hrs.

Lifespan considerations
**Pregnancy/Lactation:** May cause fetal harm. May produce malformation of external organs, soft tissue, skeleton. If possible, avoid use during pregnancy. Unknown if drug is distributed in breast milk. **Children:** Safety and efficacy not established. **Elderly:** Pts older than 70 yrs may experience higher risk of developing grade 4 neutropenia, grade 4 thrombocytopenia.

Interactions
**DRUG:** Medications causing blood dyscrasias (altering blood cell counts) may increase leukopenic, thrombocytopenic effects. **Valproic acid** may decrease oral clearance. **Bone marrow depressants** may increase myelosuppression. **Live virus vaccines** may potentiate virus replication, increase vaccine side effects, decrease pt’s antibody response to vaccine. **HERBAL:** **Echinacea** may decrease effects. **FOOD:** **All foods** decrease rate, extent of drug absorption. **LAB VALUES:** May decrease Hgb, neutrophils, platelets, WBC count, lymphocytes.

Availability (Rx)
**Capsules:** 5 mg, 20 mg, 100 mg, 140 mg, 180 mg, 250 mg. **Injection, Powder for Reconstitution:** 100 mg.

Administration/handling
**IV**
- Reconstitute each 100-mg vial with 41 mL Sterile Water for Injection to provide concentration of 2.5 mg/mL.
- Swirl gently; do not shake.
- Do NOT further dilute.
- Infuse over 90 min.
- Stable for 14 hrs (includes infusion time).
PO

- Food reduces rate, extent of absorption; increases risk of nausea, vomiting.
- For best results, administer at bedtime.
- Give capsule whole with glass of water. Do not break, open, or crush capsules.

**Indications/routes/dosage**

**Anaplastic Astrocytoma (Refractory)**

**IV Infusion, PO: ADULTS, ELDERLY:** Initially, 150 mg/m²/day for 5 consecutive days of 28-day treatment cycle. Subsequent doses of 100–200 mg/m²/day based on platelet count, absolute neutrophil count (ANC) during previous cycle. **Maintenance:** 200 mg/m²/day for 5 days q4wks if ANC greater than 1,500 cells/mm³ and platelets more than 100,000 cells/mm³. Continue until disease progression is observed. Minimum: 100 mg/m²/day for 5 days q4wks.

**Glioblastoma Multiforme**

**Note:** *Pneumocystis carinii* pneumonia (PCP) prophylaxis required during concomitant phase and continue in pts who develop lymphocytopenia until recovery to grade 1 or less. **IV Infusion, PO: ADULTS, ELDERLY:** 75 mg/m² daily for 42 days (with focal radiotherapy) if ANC 1,500 cells/mm³ or greater, platelet count 100,000 cells/mm³ or greater, and nonhematologic toxicity grade 1 or less. **Maintenance: (begin 4 wks after concomitant phase): (Cycle 1):** 150 mg/m² once daily for 5 days followed by 23 days without treatment. **(Cycles 2–6):** May increase to 200 mg/m² once daily for 5 days followed by 23 days without treatment if ANC greater than 1,500 cells/mm³, platelets greater than 100,000 cells/mm³, and nonhematologic toxicity with previous cycle is grade 2 or less (exclude alopecia, nausea, vomiting).

**Dosage in Renal/Hepatic Impairment**

No dose adjustment. Use caution in severe hepatic impairment.

**Side effects**

**Frequent (53%–33%):** Nausea, vomiting, headache, fatigue, constipation, seizure. **Occasional (16%–10%):** Diarrhea, asthenia, fever, dizziness, peripheral
edema, incoordination, insomnia. **Rare (9%–5%)**: Paresthesia, drowsiness, anorexia, urinary incontinence, anxiety, pharyngitis, cough.

**Adverse effects/toxic reactions**

Myelosuppression is characterized by neutropenia and thrombocytopenia, with elderly pts and women showing higher incidence of developing severe myelosuppression. Usually occurs within first few cycles; is not cumulative. Nadir occurs in approximately 26–28 days, with recovery within 14 days of nadir. May increase occurrence of *Pneumocystis carinii* pneumonia, myelodysplastic syndrome including myeloid leukemia, or secondary malignancies.

**Nursing considerations**

**Baseline assessment**

Obtain baseline CBC. Before dosing, ANC must be greater than 1,500 cells/mm$^3$ and platelet count greater than 100,000 cells/mm$^3$. Potential for nausea, vomiting (readily controlled with antiemetic therapy). Offer emotional support.

**Intervention/evaluation**

Obtain CBC on day 22 (21 days after first dose) or within 48 hrs of that day, and wkly, until ANC is greater than 1,500 cells/mm$^3$ and platelet count is greater than 100,000 cells/mm$^3$. Monitor for hematologic toxicity (fever, sore throat, signs of local infection, unusual bruising/bleeding from any site), symptoms of anemia (excessive fatigue, weakness).

**Patient/family teaching**

- To reduce nausea/vomiting, take on an empty stomach at bedtime.
- Promptly report fever, sore throat, signs of local infection, unusual bruising/bleeding from any site, or difficulty breathing.
- Avoid crowds, those with infection.
- Do not have immunizations without physician’s approval.
- Avoid pregnancy.
tem-sir-oh-li-mus

Torisel

CLASSIFICATION
PHARMACOTHERAPEUTIC: Kinase inhibitor.
CLINICAL: Antineoplastic.
Do not confuse temsirolimus with everolimus, sirolimus, or tacrolimus.

Uses
Treatment of advanced renal cell carcinoma.

Precautions
Contraindications: Hypersensitivity to temsirolimus. Moderate-severe hepatic impairment; serum bilirubin greater than 1.5 times upper limit of normal (ULN).
Cautions: Hypersensitivity to sirolimus, mild hepatic impairment, diabetes, hyperlipidemia. Concurrent use with other medication that may cause angioedema (e.g., ACE inhibitors).

Action
Prevents activation of mTOR (mammalian target of rapamycin), preventing tumor cell division. Therapeutic Effect: Inhibits tumor cell growth, produces tumor regression.

Pharmacokinetics

Lifespan considerations
Pregnancy/Lactation: May cause fetal harm. Unknown if distributed in breast milk. Children: Safety and efficacy not established. Elderly: No age-related precautions noted.

Interactions
DRUG: CYP3A4 inhibitors (e.g., clarithromycin, ketoconazole, ritonavir) may increase concentration. CYP3A4 inducers (e.g., carBAMazepine, phenytoin, rifAMPin) may decrease concentration. FOOD: Grapefruit products may increase plasma concentration. HERBAL: St. John’s wort may decrease plasma concentration. Flaxseed, garlic, ginger, ginkgo biloba, ginseng, omega-3 may increase risk of bleeding. LAB VALUES: May increase serum bilirubin, alkaline phosphatase, AST, creatinine, glucose, cholesterol, triglycerides. May decrease WBCs, neutrophils, Hgb, platelets, serum phosphorus, potassium.

Availability (Rx)

Injection Solution Kit: 25 mg/mL supplied with 1.8-mL diluent vial.

Administration/handling

IV

Reconstitution
• Inject 1.8 mL of diluent into vial.
• The vial contains an overfill of 0.2 mL (30 mg/1.2 mL).
• Due to the overfill, the drug concentration of resulting solution will be 10 mg/mL.
• A total volume of 3 mL will be obtained, including the overfill.
• Mix well by inverting the vial. Allow sufficient time for air bubbles to subside.
• Mixture must be injected rapidly into 250 mL 0.9% NaCl.
• Invert bag to mix; avoid excessive shaking (may cause foaming).

Rate of Administration
• Administer through an in-line filter not greater than 5 microns; infuse over 30–60 min.
• Final diluted infusion solution should be completed within 6 hrs from the time drug solution and diluent mixture is added to the 250 mL 0.9% NaCl.

Storage
• Refrigerate kit.
• Reconstituted solution appears clear to slightly turbid, colorless to yellow, and free from visible particulates.
• The 10 mg/mL drug solution/diluent mixture is stable for up to 24 hrs at room temperature.
• Solutions diluted for infusion (in 250 mL 0.9% NaCl) must be infused within 6 hrs of preparation.

**IV incompatibilities**
Both acids and bases degrade solution; combinations of temsirolimus with agents capable of modifying solution pH should be avoided.

**Indications/routes/dosage**

> Alert Pretreat with IV diphenhydramine 25–50 mg, 30 min before infusion.

Renal Cancer

**IV: ADULTS/ELDERLY:** 25 mg once wkly. Treatment should continue until disease progresses or unacceptable toxicity occurs.

**Dose Modification**

Concomitant CYP3A4 inhibitors: Consider dose of 12.5 mg/wk. Concomitant CYP3A4 inducers: Consider dose of 50 mg/wk.

**Dosage in Renal Impairment**
No dose adjustment.

**Dosage in Hepatic Impairment**

Mild impairment: Reduce dose to 15 mg/wk. Moderate to severe impairment: Contraindicated.

**Side effects**

Common (51%–32%): Asthenia, rash, mucositis, nausea, edema (facial edema, peripheral edema), anorexia. Frequent (28%–20%): Generalized pain, dyspnea, diarrhea, cough, fever, abdominal pain, constipation, back pain, impaired taste. Occasional (19%–8%): Weight loss, vomiting, pruritus, chest pain, headache, nail disorder, insomnia, nosebleed, dry skin, acne, chills, myalgia.

**Adverse effects/toxic reactions**
UTI occurs in 15% of pts, hypersensitivity reaction in 9%, pneumonia in 8%, upper respiratory tract infection, hypertension, conjunctivitis in 7%.

Nursing considerations

Baseline assessment
Question possibility of pregnancy. Obtain baseline CBC, serum chemistries, renal function, LFT routinely thereafter. Offer emotional support.

Intervention/evaluation

Patient/family teaching
• Avoid crowds, those with known infection.
• Avoid contact with anyone who recently received live virus vaccine.
• Do not have immunizations without physician’s approval (drug lowers body resistance).
• Promptly report fever, unusual bruising/bleeding from any site.

Tenecteplase

TNKase

CLASSIFICATION
PHARMACOTHERAPEUTIC: Tissue plasminogen activator.
CLINICAL: Thrombolytic.
Do not confuse TNKase with tPA.

Uses
Management of ST-elevation myocardial infarction (STEMI) for lysis of thrombi to restore perfusion and reduce mortality.
Precautions

**Contraindications:** Hypersensitivity to tenecteplase. Active internal bleeding, cerebral aneurysm, AV malformation, bleeding diathesis, history of CVA, intracranial or intraspinal surgery or trauma within past 2 mos, intracranial neoplasm, severe uncontrolled hypertension. **Cautions:** Recent major surgery, GI or genitourinary (GU) bleeding, trauma, acute pericarditis, subacute bacterial endocarditis, pregnancy, severe hepatic impairment, hemorrhagic ophthalmic conditions, concurrent use of anticoagulants, elderly pts, cerebrovascular disease, hemostatic defects.

Action

Produced by recombinant DNA that binds to fibrin and converts plasminogen to plasmin. Initiates fibrinolysis by degrading fibrin clots, fibrinogen, other plasma proteins. **Therapeutic Effect:** Exerts thrombolytic action (dissolves clots).

Pharmacokinetics

Extensively distributed to tissues. Completely eliminated by hepatic metabolism. **Half-life:** 90–130 min.

**Lifespan considerations**

**Pregnancy/Lactation:** Unknown if distributed in breast milk. **Children:** Safety and efficacy not established. **Elderly:** May have increased risk of intracranial hemorrhage, stroke, major bleeding; caution advised.

Interactions

**DRUG:** Anticoagulants (e.g., heparin, warfarin), aspirin, dipyridamole, glycoprotein IIb/IIIa inhibitors increase risk of bleeding. **HERBAL:** Cat’s claw, dong quai, evening primrose, feverfew, garlic, ginkgo biloba, ginseng, red clover may increase risk of bleeding. **FOOD:** None known. **LAB VALUES:** Decreases plasminogen, fibrinogen levels during infusion, decreasing clotting time (confirms presence of lysis). May decrease Hgb, Hct.

Availability (Rx)
Injection, Powder for Reconstitution: 50 mg.

Administration/handling

**IV**

Reconstitution
- Add 10 mL Sterile Water for Injection without preservative to vial to provide concentration of 5 mg/mL.
- Gently swirl until dissolved. Do not shake.
- If foaming occurs, leave vial undisturbed for several min.

Rate of Administration
- Administer as IV push over 5 sec.

Storage
- Store at room temperature.
- If possible, use immediately, but may refrigerate up to 8 hrs after reconstitution.
- Appears as colorless to pale yellow solution.
- Do not use if discolored or contains particulates.
- Discard after 8 hrs.

**IV incompatibilities**

Do not mix with dextrose-containing solutions or any other medications.

Indications/routes/dosage

**Alert** Give as single IV bolus over 5 sec. Precipitate may occur when given in IV line containing dextrose. Flush line with saline before and after administration.

Acute MI

**IV: ADULTS:** Dosage is based on pt’s weight. Treatment should be initiated as soon as possible after onset of symptoms.

**Dosage in Renal/Hepatic Impairment**
No dose adjustment.

**Side effects**
*Frequent:* Bleeding (minor, 21.8%; major, 4.7%).

**Adverse effects/toxic reactions**
Internal bleeding, including intracranial, retroperitoneal, GI, GU, respiratory sites, may occur. Lysis of coronary thrombi may produce atrial or ventricular arrhythmias, stroke.

**Nursing considerations**

**Baseline assessment**
Obtain baseline B/P, apical pulse. Record weight. Evaluate 12-lead EKG, cardiac enzymes, serum electrolytes. Assess Hgb, Hct, platelet count, thrombin time, aPTT, PT, fibrinogen level before therapy is instituted. Type and hold blood. Screen for contraindications (e.g., history of CVA, bleeding of any kind, uncontrolled hypertension).

**Intervention/evaluation**
Monitor continuous EKG for arrhythmias, B/P, pulse, respirations q15min until stable, then hourly or per protocol. Check peripheral pulses, heart and lung sounds. Monitor for chest pain relief; notify physician of continuation/recurrence (note location, type, intensity). Assess for overt or occult blood in any body substance. Monitor aPTT per protocol. Maintain B/P. Avoid any trauma that might increase risk of bleeding (e.g., injections, shaving). Assess neurologic status with vital signs.
Fixed-Combination(s)

Atripla: tenofovir (TDF)/efavirenz/emtricitabine (antiretroviral agents): 300 mg/600 mg/200 mg. Complera: tenofovir (TDF)/emtricitabine/rilpivirine (antiretroviral agents): 300 mg/200 mg/25 mg. Descovy: tenofovir (TAF)/emtricitabine: 25 mg/200 mg. Genvoya: tenofovir (TAF)/elvitegravir/cobicistat/emtricitabine: 10 mg/150 mg/150 mg/200 mg. Odefsey: tenofovir (TAF)/emtricitabine/rilpivirine: 25 mg/200 mg/25 mg. Stribild: tenofovir (TDF)/elvitegravir (an integrase inhibitor)/cobicistat (a pharmacokinetic enhancer)/emtricitabine (a nucleoside reverse transcriptase inhibitor): 300 mg/150 mg/150 mg/200 mg. Truvada: tenofovir (TDF)/emtricitabine (an antiretroviral agent): 300 mg/200 mg.

CLASSIFICATION

PHARMACOTHERAPEUTIC: Nucleotide analogue (reverse transcriptase inhibitor).

CLINICAL: Antiretroviral.

■ BLACK BOX ALERT ■ Lactic acidosis, severe hepatomegaly with steatosis (fatty liver), including fatalities, have occurred.

Uses

Viread: Treatment of HIV-1 infection in combination with at least two other antiretroviral agents. Treatment of chronic hepatitis B virus infection in pts with hepatic disease. Vemlidy: Treatment of chronic hepatitis B virus infection in adults with compensated hepatic disease.

Precautions

Contraindications: Hypersensitivity to tenofovir. Cautions: Hepatic/renal impairment, pts at risk for hepatic disease (e.g., obesity), concurrent nephrotoxic medications, pts with low body weight, risk factors or prior history of...
pancreatitis, elderly pts. Pts with history of fractures or with risk factors for bone loss, osteoporosis.

**Action**

Inhibits HIV reverse transcriptase by interfering with HIV viral RNA–dependent DNA polymerase. Inhibits replication of hepatitis B virus (HBV) by inhibiting HBV polymerase. **Therapeutic Effect:** Slows HIV replication, reduces HIV RNA levels (viral load). Inhibits HBV replication.

**Pharmacokinetics**

Bioavailability in fasted pts is approximately 25%. High-fat meals increase bioavailability. Protein binding: 0.7%–7.2%. Excreted in urine. Removed by hemodialysis. **Half-life:** 17 hrs.

**Lifespan considerations**

**Pregnancy/Lactation:** Crosses placenta and is distributed in breast milk. Complete avoidance of breastfeeding by HIV-infected women is recommended to decrease potential transmission of HIV. **Children:** Safety and efficacy not established in children younger than 2 yrs. **Elderly:** No age-related precautions noted.

**Interactions**

**DRUG:** May increase didanosine concentration. May decrease concentrations of atazanavir, indinavir, lamiVUDine, lopinavir, ritonavir. **HERBAL:** None significant. **FOOD:** High-fat food increases bioavailability. **LAB VALUES:** May increase serum ALT, AST, creatinine, phosphate, protein; urinary glucose. May decrease neutrophils.

**Availability (Rx)**

**Tablets:** *(Vemlidy):* 25 mg. *(Viread)*: 150 mg, 200 mg, 250 mg, 300 mg. **Oral Powder:** 40 mg per 1 g of oral powder.

**Administration/handling**
PO

• (Vemlidy) Give with food. (Viread) May be given without regard to meals.
• Give oral powder with soft food. Do not mix in liquid; use only the supplied dosing scoop to measure powder.

Indications/routes/dosage

Hepatitis B
PO: (Vemlidy): ADULTS, ELDERLY: 25 mg once daily with food. (Viread): ADULTS, ELDERLY, CHILDREN 12 YRS AND OLDER: 300 mg once daily.

HIV (in Combination with Other Antiretroviral Agents)
PO: (Viread): ADULTS, ELDERLY, CHILDREN 12 YRS AND OLDER (WEIGHT 35 KG OR GREATER): 300 mg once daily. CHILDREN 2 YRS AND OLDER (WEIGHT LESS THAN 35 KG): 8 mg/kg/dose once daily. Maximum: 300 mg/day.

Dosage in Renal Impairment

<table>

<tr>
<td>Hemodialysis</td>
<td>300 mg q7days or after approximately 12 hrs of dialysis</td>
</tr>
</tbody>
</table>

Dosage in Hepatic Impairment

No dose adjustment.

Side effects

Occasional: GI disturbances (diarrhea, flatulence, nausea, vomiting).

Adverse effects/toxic reactions

Lactic acidosis, hepatomegaly with steatosis (excess fat in liver) occur rarely; may be severe.
Nursing considerations

Baseline assessment
Obtain baseline laboratory testing, esp. serum renal function, triglycerides, LFT and at periodic intervals during therapy.

Intervention/evaluation

Patient/family teaching
• Continue therapy for full length of treatment.
• Tenofovir is not a cure for HIV infection, nor does it reduce risk of transmission to others.
• Take with a high-fat meal (increases absorption).
• Report persistent abdominal pain, nausea, vomiting.

| terbutaline  |
| ter-bue-ta-leen |

Bricanyl

CLASSIFICATION
PHARMACOTHERAPEUTIC: Beta₂-adrenergic agonist.
CLINICAL: Bronchodilator, premature labor inhibitor.

BLACK BOX ALERT  Should not be used for prolonged tocolysis (longer than 48–72 hrs).

Do not confuse terbutaline with terbinafine.

Uses
Symptomatic relief of reversible bronchospasm due to bronchial asthma, bronchitis, emphysema. OFF-LABEL: Delays premature labor in pregnancies between 20 and 34 wks.
Precautions

**Contraindications:** Hypersensitivity to terbutaline. Cardiac arrhythmias associated with tachycardia, tachycardia caused by digoxin toxicity. 

**(Additional) Injection:** Prolonged prevention or management of preterm labor. 

**Oral:** Prevention or treatment of preterm labor. **Cautions:** Cardiac impairment, diabetes, glaucoma, hypertension, hyperthyroidism, history of seizures.

Action

Stimulates beta$_2$-adrenergic receptors, resulting in relaxation of uterine, bronchial smooth muscle. **Therapeutic Effect:** Inhibits uterine contractions. Relieves bronchospasm, reduces airway resistance.

Pharmacokinetics

Partially absorbed in GI tract following PO administration. Protein binding: 14%–25%. Metabolized in liver. Excreted in urine (30%–50%), feces (unspecified). **Half-life:** 11–16 hrs.

Lifespan considerations

**Pregnancy/Lactation:** Crosses placenta; distributed in breast milk. **Children:** Safety and efficacy not established in pts younger than 6 yrs. **Elderly:** Increased risk of tremors, tachycardia due to sympathomimetic sensitivity.

Interactions

**DRUG:** May decrease effects of beta blockers (e.g., labetolol, metoprolol). Digoxin, sympathomimetics (e.g., dopamine, norepinephrine) may increase risk of arrhythmias. MAOIs (e.g., phenelzine, selegiline) may increase risk of hypertensive crisis. Tricyclic antidepressants (e.g., amitriptyline, nortriptyline) may increase cardiovascular effects. **HERBAL:** Ephedra, yohimbe may cause CNS stimulation. **FOOD:** None known. **LAB VALUES:** May decrease serum potassium. May increase serum glucose.

Availability (Rx)
Injection Solution: 1 mg/mL. Tablets: 2.5 mg, 5 mg.

Administration/handling

IV
- May administer undiluted, direct IV over 5–10 min or continuous infusion diluted in D₅W or 0.9% NaCl.

SQ
- Do not use if solution appears discolored.
- Inject subcutaneously into lateral deltoid region.

PO
- Give without regard to food (give with food if GI upset occurs).
- Tablets may be crushed.

Indications/routes/dosage

Bronchospasm
PO: ADULTS, ELDERLY, CHILDREN 15 YRS AND OLDER: Initially, 5 mg 3 times/day. Maintenance: 2.5–5 mg 3 times/day q6h while awake. Maximum: 15 mg/day. CHILDREN 12–14 YRS: 2.5 mg 3 times/day. Maximum: 7.5 mg/day. CHILDREN YOUNGER THAN 12 YRS: Initially, 0.05 mg/kg/dose q8h. May increase up to 0.15 mg/kg/dose. Maximum: 5 mg/24 hr.
SQ: ADULTS, CHILDREN 12 YRS AND OLDER: Initially, 0.25 mg. Repeat in 15–30 min for 3 doses. Total dose of 0.75 mg should not be exceeded. CHILDREN YOUNGER THAN 12 YRS: 0.01 mg/kg/dose q15–20min for 3 doses. May repeat q2–6h as needed.

Preterm Labor
- IV form should be used with caution in pregnancy; do not administer for longer than 48–72 hrs.
- IV: ADULTS: Acute: 2.5–10 mcg/min. May increase gradually q15–20min up to 17.5–30 mcg/min. SQ: 0.25 mg q20min–3 hrs.
Dosage in Renal/Hepatic Impairment
No dose adjustment.

Side effects

Frequent (38%–23%): Tremor, anxiety. Occasional (11%–10%): Drowsiness, headache, nausea, heartburn, dizziness. Rare (3%–1%): Flushing, asthenia, oropharyngeal dryness, irritation (with inhalation therapy).

Adverse effects/toxic reactions
Too-frequent or excessive use may lead to decreased drug effectiveness and/or severe, paradoxical bronchoconstriction. Excessive sympathomimetic stimulation may cause palpitations, extrasystoles, tachycardia, chest pain, slight increase in B/P followed by a substantial decrease, chills, diaphoresis, skin blanching.

Nursing considerations

Baseline assessment

Bronchospasm: Offer emotional support (high incidence of anxiety due to difficulty in breathing, sympathomimetic response to drug). Preterm labor: Assess baseline maternal pulse, B/P, frequency and duration of contractions, fetal heart rate. Question history of cardiac arrhythmias, narrow-angle glaucoma, hypertension, seizures.

Intervention/evaluation

Patient/family teaching
- Report persistent palpitations, chest pain, muscle tremor, dizziness, headache, flushing, breathing difficulties.
- May cause nervousness, anxiety, shakiness.
- Avoid excessive use of caffeine derivatives (chocolate, coffee, tea, cola, cocoa).

**teriflunomide**

*ter-i-* floo-noe-myde

**Aubagio**

- **CLASSIFICATION**
  - Pharmacotherapeutic: Pyrimidine synthesis inhibitor, immunomodulatory agent.
  - Clinical: Multiple sclerosis agent.

  - **BLACK BOX ALERT**
    - May result in major birth defects. Pregnancy must be excluded before initiating therapy and must be avoided during treatment or prior to completion of an accelerated elimination procedure. Severe hepatic injury may occur. Do not initiate with acute/chronic liver disease or serum ALT greater than 2 times upper limit of normal.

  - Do not confuse teriflunomide with leflunomide.

**Uses**

Treatment of relapsing forms of multiple sclerosis.

**Precautions**

**Contraindications:** Hypersensitivity to teriflunomide. Pregnant women or women of childbearing potential who are not using reliable contraception, severe hepatic impairment, concurrent use of leflunomide. **Cautions:** Concomitant neurotoxic medications, diabetes, pulmonary disease, severe immunodeficiency or bone marrow dysplasia, history of significant hematologic abnormalities, uncontrolled infection, history of new/recurrent infections, pts older than 60 yrs.

**Action**
Inhibits pyrimidine synthesis, exhibiting anti-inflammatory and antiproliferative properties. **Therapeutic Effect:** May slow progression of multiple sclerosis.

**Pharmacokinetics**

Well absorbed following PO administration. Peak concentration: 1–4 hrs. Protein binding: greater than 99%. Metabolized by hydrolysis. Excreted in urine (23%), feces (38%). **Half-life:** 18–19 days.

**Lifespan considerations**

**Pregnancy/Lactation:** May produce embryo-fetal toxicity. Pregnancy contraindicated. Avoid breastfeeding. Detected in human semen. **Children:** Safety and efficacy not established in pts younger than 18 yrs. **Elderly:** No age-related precautions noted.

**Interactions**

**DRUG:** May increase concentration/effects of CYP2C8 substrates (e.g., repaglinide, PACLitaxel, pioglitazone, or rosiglitazone), oral contraceptives. May decrease concentration/effects of warfarin, CYP1A2 substrates (e.g., DULoxetine, tiZANidine). **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** May increase serum potassium, ALT, AST, alkaline phosphatase, bilirubin. May decrease WBCs, neutrophil count.

**Availability (Rx)**

**Tablets:** 7 mg, 14 mg.

**Administration/handling**

**PO**

• Give without regard to food.

**Indications/routes/dosage**

**Multiple Sclerosis**
PO: ADULTS, ELDERLY: 7 mg or 14 mg once daily.

Adjustment of Toxicity
ALT elevation greater than 3 times ULN: Discontinue teriflunomide and initiate drug elimination procedures: cholestyramine 8 g q8h for 11 days (if not tolerated, may decrease to 4 g q8h) or activated charcoal 50 g q12h for 11 days. Note: The 11 days do not need to be consecutive unless plasma concentration needs to be lowered rapidly.

Dosage in Renal Impairment
No dose adjustment.

Dosage in Hepatic Impairment
Mild to moderate impairment: No dose adjustment. Severe impairment: Contraindicated.

Side effects
Frequent (19%–6%): Headache, diarrhea, nausea, alopecia, paresthesia, upper abdominal pain. Occasional (4%–3%): Hypertension, oral herpes, anxiety, hypertension, toothache, musculoskeletal pain. Rare (2%–1%): Seasonal allergy, sciatica, burning sensation, carpal tunnel syndrome, blurred vision, acne, pruritus, myalgia, abdominal distention, conjunctivitis.

Adverse effects/toxic reactions
Influenza occurs in 12% of pts, upper respiratory infection with sinusitis, bronchitis in 9%. Cystitis, sinusitis, viral gastroenteritis may occur. Neutropenia, leukopenia occur rarely.

Nursing considerations
Baseline assessment
Because of high potential for birth defects/fetal death, female pts must avoid pregnancy. Obtain baseline PPD for latent TB. Obtain CBC, hepatic function test results prior to treatment and monthly for 6 mos thereafter. Obtain baseline
pregnancy test. Assess baseline symptoms of MS (e.g., bladder/bowel dysfunction, cognitive impairment, depression, dysphagia, fatigue, gait disorder, numbness/tingling, pain, seizures, spasticity, tremors, weakness).

**Intervention/evaluation**

Monitor for signs/symptoms of infection. Treatment should not be initiated if pt has active infection; discontinuation of treatment must be considered. If drug-induced hepatic impairment, peripheral neuropathy, severe skin reaction occur, discontinue medication, begin accelerated elimination procedure (cholestyramine or charcoal for 11 days). Monitor for symptom improvement of MS.

**Patient/family teaching**

- Women of childbearing potential must be counseled regarding fetal risk, use of reliable contraceptives confirmed, possibility of pregnancy excluded.
- May take without regard to food.
- Report symptoms of infection such as body aches, chills, cough, fatigue, fever.

---

**teriparatide**

*ter-i-par-a-tide*

**Forteo**

*CLASSIFICATION*

**PHARMACOTHERAPEUTIC:** Parathyroid hormone.

**CLINICAL:** Osteoporosis agent.

- **BLACK BOX ALERT**  
  Increased risk of osteosarcoma; risk dependent on dose and duration.

---

**Uses**

Treatment of postmenopausal women with osteoporosis who are at increased risk for fractures. Treatment of men with primary or hypogonadal osteoporosis who are at high risk for fractures. High-risk pts include those with a history of osteoporotic fractures, who have failed previous osteoporosis therapy, or were intolerant of previous osteoporosis therapy. Treatment of glucocorticoid-induced
osteoporosis in men and women.

**Precautions**

**Contraindications:** Hypersensitivity to teriparatide. **Cautions:** Conditions that increase risk of osteosarcoma (e.g., Paget’s disease, unexplained elevations of alkaline phosphatase level, children or young adults with open epiphyses, prior skeletal radiation therapy, implant therapy), hypercalcemia, hypercalcemic disorders (e.g., hyperparathyroidism), bone metastases, history of skeletal malignancies, metabolic bone diseases other than osteoporosis, cardiac disease, renal/hepatic impairment, pts at risk for orthostasis, active or recent urolithiasis.

**Action**

Stimulates osteoblast function. Increases calcium absorption from GI tract/renal tubular reabsorption. **Therapeutic Effect:** Increases bone mineral density, bone mass/strength, reduces osteoporosis-related fractures.

**Pharmacokinetics**

Extensively absorbed following SQ injection. Metabolized in liver. Excreted in urine. **Half-life:** 1 hr.

**Lifespan considerations**

**Pregnancy/Lactation:** Unknown if drug crosses placenta or is distributed in breast milk. **Children:** Safety and efficacy not established. **Elderly:** No age-related precautions noted.

**Interactions**

**DRUG:** None significant. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** May increase serum calcium (transient), uric acid.

**Availability (Rx)**

**Injection Solution:** 600 mcg/2.4 mL (injector pen containing 28 daily doses of 20 mcg).
Administration/handling

Subcutaneous

• Refrigerate, but minimize time out of refrigerator. Do not freeze; discard if frozen.
• Administer into thigh, abdominal wall.
Indications/routes/dosage

Osteoporosis
SQ: ADULTS, ELDERLY: 20 mcg once daily into thigh, abdominal wall.

Dosage in Renal/Hepatic Impairment
No dose adjustment.

Side effects
Occasional: Leg cramps, nausea, dizziness, headache, orthostatic hypotension, tachycardia.

Adverse effects/toxic reactions
Angina pectoris has been reported.

Nursing considerations

Baseline assessment
Obtain urinary, serum calcium, ionized calcium levels, serum parathyroid hormone levels, bone mineral density.

Intervention/evaluation
Monitor bone mineral density, urinary/serum calcium levels, serum parathyroid hormone levels. Observe for symptoms of hypercalcemia. Monitor B/P for hypotension, pulse for tachycardia. Question medical history as listed in Precautions.

Patient/family teaching
• Go from lying to standing slowly.
• Report persistent symptoms of hypercalcemia (nausea, vomiting, constipation, lethargy, asthenia).

CLASSIFICATION

PHARMACOTHERAPEUTIC: Androgen.

CLINICAL: Sex hormone.

BLACK BOX ALERT

Virilization in children and women may occur following secondary exposure to testosterone gel. Aveed: Serious pulmonary oil microembolism reaction and anaphylaxis reported during or immediately after administration.

Do not confuse testosterone with testolactone.

Uses
Androgen replacement therapy in treatment of delayed male puberty, male hypogonadism (congenital or acquired), inoperable female breast cancer pts who are 1–5 yrs postmenopausal.

**Precautions**

**Contraindications:** Hypersensitivity to testosterone. Breastfeeding, pregnant or who may become pregnant, prostate (known or suspected) or breast cancer in males. **Depo-Testosterone (additional):** Severe cardiac/hepatic/renal disease. **Cautions:** Renal/hepatic/cardiac dysfunction, pts with history of MI or CAD; conditions influenced by edema (e.g., seizure disorder, migraines).

**Action**

Promotes growth, development of male sex organs, maintains secondary sex characteristics in androgen-deficient males. **Therapeutic Effect:** Relieves androgen deficiency.

**Pharmacokinetics**

Well absorbed after IM administration. Protein binding: 98%. Metabolized in liver. Primarily excreted in urine. Unknown if removed by hemodialysis. **Half-life:** 10–100 min.

**Lifespan considerations**

**Pregnancy/Lactation:** Contraindicated in pregnant women, women who may become pregnant, or during lactation. **Children:** Safety and efficacy not established; use with caution. **Elderly:** May increase risk of hyperplasia, stimulate growth of occult prostate carcinoma.

**Interactions**

**DRUG:** May decrease serum glucose, requiring **insulin** adjustments. **HERBAL:** St. John’s *wort* may decrease concentration/effects. **FOOD:** None known. **LAB VALUES:** May increase Hgb, Hct, LDL, serum alkaline phosphatase, bilirubin, calcium, potassium, sodium, AST. May decrease HDL.
Availability (Rx)

Cream (First Testosterone, MC): 2%. Cream, Transdermal (EC-Rx Testosterone): 0.2%, 0.4%, 10%, 20%. Ointment (First Testosterone): 2% Gel, Topical (AndroGel, Testim): 1%, 1.62%. (Vogelxo): 50-mg packet or tube, 12.5 mg/actuation metered dose pump. (Fortesta): 10 mg/actuation. Injection (Cypionate [Depo-Testosterone]): 100 mg/mL, 200 mg/mL. (Enanthate [Delatestryl]): 200 mg/mL. (Aveed [undecanoate]): 750 mg/3 mL. Mucoadhesive, for Buccal Application (Striant): 30 mg. Nasal Gel (Natesto): 5.5 mg/actuation. Pellet, for Subcutaneous Implantation: 12.5 mg, 25 mg, 37.5 mg, 50 mg, 75 mg. Solution (Metered Dose Pump [Axiron]): 30 mg/activation. Transdermal System (Androderm): 2 mg/day or 4 mg/day.

Administration/handling

IM

• Give deep in gluteal muscle.
• Do not give IV.
• Warming or shaking redissolves crystals that may form in long-acting preparations.
• Wet needle of syringe may cause solution to become cloudy; this does not affect potency.

Buccal

(Striant):

• Apply to gum area (above incisor tooth).
• Hold firmly in place for 30 sec to ensure adhesion. Instruct pt to not chew or swallow.
• Not affected by food, toothbrushing, gum, chewing, alcoholic beverages.
• Remove before placing new system.

Transdermal

(Androderm):

• Apply to clean, dry area on skin on back, abdomen, upper arms, thighs.
• Do not use tape to secure. Avoid bathing, swimming for at least 3 hrs after each application.
• Do not apply to bony prominences (e.g., shoulder) or oily, damaged, irritated skin. Do not apply to scrotum.
• Rotate application site with 7-day interval to same site.

Transdermal Gel
(AndroGel, Testim, Vogelxo):
• Apply (morning preferred) to clean, dry, intact skin of shoulder, upper arms. (AndroGel 1% may also be applied to abdomen.)
• Upon opening packet(s), squeeze entire contents into palm of hand, immediately apply to application site.
• Allow to dry.
• Do not apply to genitals.
(Fortesta):
• Apply to skin of front and inner thighs.

Topical Solution
(Axiron):
• Apply using applicator to axilla at same time each morning.
• Avoid washing site for 2 hrs after application.

Indications/routes/dosage

Male Hypogonadism
IM: ADULTS: 50–400 mg q2–4wks or 75–100 mg/wk or 150–200 mg q2wks. (Aveed): 750 mg at initiation, 4 wks and q10 wks thereafter. ADOLESCENTS: Initiation of pubertal growth: 25–75 mg q3–4wks, gradually titrate q6–9mos to 100–150 mg. Duration: 3–4yrs. Maintenance Virilizing Dose: 200–250 mg q3–4wks. May convert to other testosterone replacement dosages once expected adult height and adequate virilization achieved.
SQ: (Pellets): ADULTS: 150–450 mg q3–6mos.
Topical Gel: (Fortesta): 40 mg once daily in morning. Range: 10–70 mg.
(Vogelxo): 50 mg once daily (one tube or one packet or 4 pump actuations).
Topical Solution: (Axiron): ADULTS, ELDERLY: 60 mg once daily (1 pump activation of 30 mg to each axilla). Range: 30–120 mg.
Transdermal Patch: (Androderm): ADULTS, ELDERLY: Start therapy with 4
mg/day patch applied at night. Apply patch to abdomen, back, thighs, upper arms. Dose adjustment based on testosterone levels.

**Transdermal Gel: (AndroGel):** ADULTS, ELDERLY: (AndroGel 1%): Initial dose of 5 g delivers 50 mg testosterone and is applied once daily to abdomen, shoulders, upper arms. May increase to 7.5 g, then to 10 g, if necessary. (AndroGel 1.62%): Initial dose of 40.5 mg applied once daily in the morning to shoulder and upper arms. May increase to 81 mg. Further adjustments based on testosterone levels.

**Transdermal Gel: (Testim):** ADULTS, ELDERLY: Initial dose of 5 g delivers 50 mg testosterone and is applied once daily to the shoulders, upper arms. May increase to 10 g (100 mg testosterone).

**Buccal: (Striant):** ADULTS, ELDERLY: 30 mg q12h.

**Nasal Gel: (Natesto):** ADULTS ELDERLY: 11 mg (2 actuations, 1 per each nostril) 3 times/day.

**Delayed Male Puberty**

**IM: (Cypionate or enanthate):** ADOLESCENTS: 50–200 mg q2–4wks for limited duration.

**SQ: (Pellets):** ADULTS: 150–450 mg q3–6mos.

**Breast Carcinoma**

**IM: (Testosterone Cypionate, Testosterone Ethanate):** ADULTS: 200–400 mg q2–4wks.

**Dosage in Renal/Hepatic Impairment**

Use caution.

**Side effects**

**Frequent:** Gynecomastia, acne. **Females:** Hirsutism, amenorrhea, other menstrual irregularities; deepening of voice; clitoral enlargement (may not be reversible when drug is discontinued). **Occasional:** Edema, nausea, insomnia, oligospermia, priapism, male-pattern baldness, bladder irritability, hypercalcemia (in immobilized pts, those with breast cancer), hypercholesterolemia, inflammation/pain at IM injection site. **Transdermal:** Pruritus, erythema, skin irritation. **Rare:** Polycythemia (with high dosage),
hypersensitivity.

**Adverse effects/toxic reactions**

Peliosis hepatitis (presence of blood-filled cysts in parenchyma of liver), hepatic neoplasms, hepatocellular carcinoma have been associated with prolonged high-dose therapy. Anaphylactic reactions occur rarely. Venous thromboembolism (e.g., DVT, PE) reported.

**Nursing considerations**

**Baseline assessment**

Establish baseline weight, B/P, Hgb, Hct. Check LFT, electrolytes, cholesterol. Wrist X-rays may be ordered to determine bone maturation in children. Question history of hepatic/renal impairment, seizure disorder, thromboembolism (CVA, MI, pulmonary embolism).

**Intervention/evaluation**

**Patient/family teaching**

- Regular visits to physician and monitoring tests are necessary.
- Do not take any other medication without consulting physician.
- Maintain diet high in protein, calories.
- Food may be better tolerated in small, frequent feedings.
- Weigh daily; report 5 lb/wk gain.
- Report nausea, vomiting, acne, pedal edema.
- **Females:** Promptly report menstrual irregularities, hoarseness, deepening of
voice.

- **Males:** Report frequent erections, difficulty urinating, gynecomastia.
- Treatment may cause arterial or venous blood clots; report symptoms of heart attack (chest pain, difficulty breathing, jaw pain, nausea, pain that radiates to the left arm, sweating), stroke (blindness, confusion, one-sided weakness, loss of consciousness, trouble speaking, seizures); DVT (swelling, pain, hot feeling in the arms or legs), lung embolism (difficulty breathing, chest pain, rapid heart rate).

### tiaGABine

**tye-a-ga-been**

**Gabitril**

- **CLASSIFICATION**
  - **PHARMACOTHERAPEUTIC:** Selective GABA reuptake inhibitor.
  - **CLINICAL:** Anticonvulsant.
  - **Do not confuse tiaGABine with tiZANidine.**

### Uses

Adjunctive therapy for treatment of partial seizures in adults and children 12 yrs or older.

### Precautions

- **Contraindications:** Hypersensitivity to tiaGABine. **Cautions:** Hepatic impairment. Pts at risk for suicidal behavior/thoughts.

### Action

Enhances activity of gamma-aminobutyric acid (GABA), the major inhibitory neurotransmitter in the CNS. **Therapeutic Effect:** Inhibits seizure activity.

### Pharmacokinetics

Rapidly absorbed from GI tract. Protein binding: 96%. Metabolized in liver. Primarily excreted in feces. **Half-life:** 2–5 hrs.
Lifespan considerations

**Pregnancy/Lactation:** May produce teratogenic effects. Distributed in breast milk. **Children:** Safety and efficacy not established in pts younger than 12 yrs. **Elderly:** Age-related hepatic impairment may require dosage adjustment.

Interactions

**DRUG:** CarBAMazepine, PHENobarbital, phenytoin may increase clearance. May alter effects of *valproic acid.* **HERBAL:** Evening *primrose* may decrease seizure threshold. *St. John’s wort* may decrease concentration. *Gotu kola, kava kava, St. John’s wort, valerian* may increase CNS depression. **FOOD:** None known. **LAB VALUES:** None significant.

Availability (Rx)

**Tablets:** 2 mg, 4 mg, 12 mg, 16 mg.

Administration/handling

• Give with food.

Indications/routes/dosage

**Note:** Pts not taking enzyme-inducing antiepileptic drugs (AEDs): Lower doses required and slower titration may be needed.

Partial Seizures

**PO:** **ADULTS, ELDERLY:** (Pts receiving enzyme-inducing AED regimens): Initially, 4 mg once daily. May increase by 4–8 mg/day at wkly intervals. **Maintenance:** 32–56 mg/day in 2–4 divided doses. **CHILDREN 12–18 YRS:** Initially, 4 mg once daily for 1 wk. May increase by 4 mg in 2 divided doses for 1 wk, then may increase by 4–8 mg at wkly intervals thereafter. **Maximum:** 32 mg/day in 2–4 divided doses.

Dosage in Renal Impairment

No dose adjustment.
Dosage in Hepatic Impairment
Use caution.

Side effects

Frequent (34%–20%): Dizziness, asthenia (loss of strength, energy), drowsiness, nervousness, confusion, headache, infection, tremor. Occasional: Nausea, diarrhea, abdominal pain, impaired concentration.

Adverse effects/toxic reactions
Overdose characterized by agitation, confusion, hostility, weakness. Full recovery occurs within 24 hrs of discontinuation. Depression, suicidal ideation.

Nursing considerations

Baseline assessment
Review history of seizure disorder (intensity, frequency, duration, level of consciousness). Observe frequently for recurrence of seizure activity. Initiate seizure precautions.

Intervention/evaluation
For pts on long-term therapy, serum hepatic/renal function tests, CBC should be performed periodically. Assist with ambulation if dizziness occurs. Assess for clinical improvement (decrease in intensity, frequency of seizures). Monitor for depression, unusual behavior, suicidal ideation or thoughts.

Patient/family teaching
• Go from lying to standing slowly.
• Avoid tasks that require alertness, motor skills until response to drug is established.
• Avoid alcohol.
• Report worsening seizure activity, thoughts of suicide, increased depression.
Brilinta

CLASSIFICATION
PHARMACOTHERAPEUTIC: P2Y$_{12}$ platelet aggregation inhibitor.

CLINICAL: Antiplatelet.

- **BLACK BOX ALERT** - May cause significant, sometimes fatal bleeding. Do not use with active bleeding or history of intracranial bleeding. Do not initiate in pts planning urgent coronary artery bypass graft (CABG) surgery. Discontinue at least 5 days prior to any surgery. Suspect bleeding in any pt who is hypotensive and has had recent percutaneous coronary intervention (PCI), CABG, or other surgical procedures. If possible, manage bleeding without discontinuing therapy to decrease risk of cardiovascular events. Aspirin maintenance doses greater than 100 mg/day may reduce effectiveness and should be strictly avoided.

**Uses**

Reduce rate of cardiovascular death, MI, stroke in pts with acute coronary syndrome (ACS) or history of MI. Reduce rate of stent thrombosis in pts who have been stented for treatment of ACS.

**Precautions**

**Contraindications:** Hypersensitivity to ticagrelor. History of intracranial hemorrhage, active pathologic bleeding, severe hepatic impairment. **Cautions:** Moderate hepatic impairment, renal impairment, history of hyperuricemia or gouty arthritis. Pts at increased risk of bradycardia, concurrent use of strong CYP3A4 inhibitors or inducers, elderly pts. (Recommend holding dose 5 days before planned surgery if applicable.) Pts with risk factors for bleeding (e.g., trauma, peptic ulcer disease).

**Action**

Reversibly inhibits platelet P2Y$_{12}$ ADP receptor to prevent signal transduction and platelet activation. **Therapeutic Effect:** Reduces platelet aggregation.
Pharmacokinetics
Readily absorbed after PO administration. Protein binding: 99%. Metabolized in liver. Primarily excreted in feces (58%), urine (26%). **Half-life:** 7–9 hrs.

*Lifespan considerations*

**Pregnancy/Lactation:** Unknown if distributed in breast milk. Must either discontinue breastfeeding or discontinue drug therapy. **Children:** Safety and efficacy not established. **Elderly:** No age-related precautions noted.

**Interactions**

**DRUG:** Aspirin greater than 100 mg/day may decrease effectiveness. **CYP3A4 inhibitors** (e.g., clarithromycin, ketoconazole, ritonavir) may increase concentration/effects. **CYP3A4 inducers** (e.g., carBAMazepine, phenytoin, rifAMPIn) may decrease concentration/effects. **Anticoagulants** (e.g., warfarin), antiplatelets (e.g., aspirin, clopidogrel), NSAIDs (e.g., ibuprofen, ketorolac, naproxen) may increase risk of bleeding. May increase concentration of digoxin, simvastatin, lovastatin. **HERBAL:** St. John’s wort may decrease effectiveness. Fenugreek, feverfew, flaxseed, garlic, ginger, ginkgo biloba, ginseng, omega-3, red clover with anticoagulant/antiplatelet activity may increase risk of bleeding. **FOOD:** Grapefruit products may increase potential for bleeding. **LAB VALUES:** May increase serum uric acid, creatinine.

**Availability (Rx)**

**Tablets:** 60 mg, 90 mg.

**Administration/handling**

**PO**

- Give without regard to meals.
- May be crushed, mixed with water, and drunk immediately (refill glass with water, stir and drink contents).

**Indications/routes/dosage**
Acute Coronary Syndrome

**PO: ADULTS:** Initially, 180 mg once, then 90 mg twice daily. Give with aspirin 325 mg once (loading dose), then maintain with aspirin 75–100 mg daily. Continue for up to 12 mos, then decrease dose to 60 mg twice daily.

**Dosage in Renal Impairment**

No dose adjustment.

**Dosage in Hepatic Impairment**

**Mild impairment:** No dose adjustment. **Moderate impairment:** Use caution. **Severe impairment:** Avoid use.

**Side effects**

**Occasional (13%–7%):** Dyspnea, headache. **Rare (5%–3%):** Cough, dizziness, nausea, diarrhea, back pain, fatigue.

**Adverse effects/toxic reactions**

Life-threatening events including intracranial bleeding, epistaxis, intrapericardial bleeding with cardiac tamponade, hypovolemic shock requiring vasopressive support or blood transfusion reported. Pts with history of sick sinus syndrome, second- or third-degree AV block, bradycardic syncope have increased risk of bradycardia. May induce episodes of atrial fibrillation, hypotension, hypertension. Gynecomastia reported in less than 1% of men.

**Nursing considerations**

**Baseline assessment**

Obtain CBC, serum chemistries, renal function, LFT. Question for history of bleeding, stomach ulcers, colon polyps, head trauma, cardiac arrhythmias, unstable angina, recent MI, hepatic impairment, hypertension, stroke. Receive full medication history including herbal products. Question for history of COPD, chronic bronchitis, emphysema, asthma, exertional dyspnea.
**Intervention/evaluation**

**Patient/family teaching**

- It may take longer to stop bleeding during therapy.
- Do not vigorously blow nose.
- Use soft toothbrush, electric razor to decrease risk of bleeding.
- Immediately report bloody stool, urine, or nosebleeds.
- Report all newly prescribed medications.
- Inform physician of any planned dental procedures or surgeries.

---

**tigecycline**

tyee-gee-sye-kleen

*Tygacil*

**CLASSIFICATION**

*PHARMACOTHERAPEUTIC*: Glycylcycline.

*CLINICAL*: Antibiotic.

■ **BLACK BOX ALERT** ■ An increase in all-cause mortality observed in Phase 3 and 4 clinical trials. Use is reserved when alternate treatment are not appropriate.

---

**Uses**

Precautions

Contraindications: Hypersensitivity to tigecycline. Cautions: Hypersensitivity to tetracyclines, pregnancy, hepatic impairment, monotherapy for pts with intestinal perforation. Do not use for diabetic foot infections, healthcare (hospital)-acquired pneumonia, or ventilator-associated pneumonia.

Action

Inhibits protein synthesis by binding to ribosomal receptor sites of bacterial cell wall. Therapeutic Effect: Bacteriostatic effect.

Pharmacokinetics

Extensive tissue distribution, minimally metabolized. Excreted by biliary/fecal route (59%), urine (33%). Protein binding: 71%–89%. Half-life: Single dose: 27 hrs; following multiple doses: 42 hrs.

Lifespan considerations

Pregnancy/Lactation: May cause fetal harm. May be distributed in breast milk. Permanent discoloration of the teeth (brown-gray) may occur if used during tooth development. Children: Safety and efficacy not established in pts younger than 8 yrs. Use is reserved for when no effective alternative is available. Elderly: No age-related precautions noted.

Interactions

DRUG: May decrease effects of oral contraceptives. May increase concentration of warfarin, increase bleeding time. HERBAL: None significant. FOOD: None known. LAB VALUES: May increase serum alkaline phosphatase, amylase, BUN, bilirubin, glucose, LDH, ALT, AST. May decrease Hgb, WBCs, thrombocytes, serum potassium, protein.

Availability (Rx)

Injection, Powder for Reconstitution (Tygacil): 50-mg vial.
Administration/handling

### IV

#### Reconstitution
- Add 5.3 mL 0.9% NaCl or D5W to each 50-mg vial.
- Swirl gently to dissolve.
- Resulting solution is 10 mg/mL.
- Immediately withdraw 5 mL reconstituted solution and add to 100 mL 0.9% NaCl or D5W bag for infusion (final concentration should not exceed 1 mg/mL).

#### Rate of Administration
- Administer over 30–60 min every 12 hrs.
- May be given through a dedicated line or piggyback. If same line is used for sequential infusion of several different drugs, line should be flushed before and after infusion of tigecycline with either 0.9% NaCl or D5W.

#### Storage
- Reconstituted solution is stable for up to 6 hrs at room temperature or up to 24 hrs if refrigerated.
- Reconstituted solution appears yellow to red-orange.
- Discard if solution is discolored (green, black) or precipitate forms.

### IV incompatibilities

Amphotericin B, methylPREDNISolone, voriconazole.

### IV Compatibilities

Amikacin, azithromycin, aztreonam, cefepime, cefTAZidime, ciprofloxacin, doripenem, ertapenem, fluconazole, gentamicin, linezolid, piperacillin-tazobactam, potassium chloride, telavancin, tobramycin, vancomycin.

### Indications/routes/dosage

#### Systemic Infections

**IV: ADULTS OVER 18 YRS, ELDERLY:** Initially, 100 mg, followed by 50 mg every 12 hrs for 5–14 days. **CHILDREN 12 YRS AND OLDER:** 50 mg q12h. **CHILDREN 8–11 YRS:** 1.2 mg/kg q12h. **Maximum dose:** 50 mg.
Dosage in Renal Impairment
No dose adjustment.

Dosage in Hepatic Impairment
No dose adjustment in mild to moderate impairment.

Dosage in Severe Hepatic Impairment
IV: ADULTS OVER 18 YRS, ELDERLY: Initially, 100 mg, followed by 25 mg every 12 hrs.

Side effects
Frequent (29%–13%): Nausea, vomiting, diarrhea. Occasional (7%–4%): Headache, hypertension, dizziness, increased cough, delayed healing. Rare (3%–2%): Peripheral edema, pruritus, constipation, dyspepsia, asthenia (loss of strength, energy), hypotension, phlebitis, insomnia, rash, diaphoresis.

Adverse effects/toxic reactions
Dyspnea, abscess, pseudomembranous colitis (abdominal cramps, severe watery diarrhea, fever) ranging from mild to life-threatening may result from altered bacterial balance in GI tract.

Nursing considerations

Baseline assessment
Obtain baseline CBC, hepatic function test. Question for history of allergies, esp. tetracyclines, before therapy.

Intervention/evaluation
Monitor daily pattern of bowel activity, stool consistency. Be alert for superinfection: fever, anal/genital pruritus, oral mucosal changes (ulceration, pain, erythema). Nausea, vomiting may be controlled by antiemetics.

Patient/family teaching
• Report diarrhea, rash, mouth soreness, other new symptoms.

**tiotropium**

*tye-oh-trope-ee-yum*

**Spiriva HandiHaler**

**Spiriva Respimat**

**Fixed-Combination(s)**

**Stioltto Respimat:** tiotropium/olodaterol (a bronchodilator): 2.5 mcg/2.5 mcg.

**CLASSIFICATION**

**PHARMACOTHERAPEUTIC:** Anticholinergic.

**CLINICAL:** Bronchodilator.

*Do not confuse Spiriva with Inspra, or tiotropium with ipratropium.*

**Uses**

Long-term maintenance treatment of bronchospasm associated with COPD, including chronic bronchitis, emphysema, and for reducing COPD exacerbations. Maintenance treatment of asthma in pts 6 yrs and older.

**Precautions**

**Contraindications:** Hypersensitivity to tiotropium. History of hypersensitivity to ipratropium. **Cautions:** Narrow-angle glaucoma, prostatic hypertrophy, bladder neck obstruction, moderate to severe renal impairment, history of hypersensitivity to atropine, myasthenia gravis.

**Action**

Competitively and reversibly inhibits action of acetylcholine at muscarinic receptors in bronchial smooth muscle. **Therapeutic Effect:** Relieves bronchospasm.

**Pharmacokinetics**

Binds extensively to tissue. Protein binding: 72%. Metabolized by oxidation.
Excreted in urine. **Half-life:** 5–6 days.

**Lifespan considerations**

**Pregnancy/Lactation:** Unknown if distributed in breast milk. **Children:** Safety and efficacy not established. **Elderly:** Higher frequency of dry mouth, constipation, UTI noted with increasing age.

**Interactions**

**DRUG:** Concurrent administration with anticholinergics (e.g., ipratropium) may increase adverse effects. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** None significant.

**Availability (Rx)**

**Inhalation Spray (Spiriva Respimat):** 1.25 mcg/actuation, 2.5 mcg/actuation.  
**Powder for Inhalation (Spiriva):** 18 mcg/capsule (in blister packs).

**Administration/handling**

**Inhalation (Spiriva)**

- Open dustcap of HandiHaler by pulling it upward, then open mouthpiece.  
- Place capsule in center chamber and firmly close mouthpiece until a click is heard, leaving the dustcap open.  
- Hold HandiHaler device with mouthpiece upward, press piercing button completely in once, and release.  
- Instruct pt to breathe out completely before breathing in slowly and deeply but at rate sufficient to hear the capsule vibrate.  
- Have pt hold breath as long as it is comfortable until exhaling slowly.  
- Instruct pt to repeat once again to ensure full dose is received.

**Spiriva Respimat**

- Refer to manufacturer’s pt instructions.

**Storage**

- Store at room temperature. Do not expose capsules to extreme temperature, moisture.
• Do not store capsules in HandiHaler device.
• Use immediately once foil is peeled back or removed.

Indications/routes/dosage

COPD (Maintenance Treatment, Reduction of COPD Exacerbations)

Inhalation: (Spiriva): ADULTS, ELDERLY: 18 mcg (1 capsule)/day via HandiHaler inhalation device. (Spiriva Respimat): 2 inhalations (2.5 mg/inhalation) once daily.

Asthma

Inhalation: (Spiriva Respimat): ADULTS, ELDERLY, CHILDREN 6 YRS AND OLDER: 2 inhalations of 1.25 mcg once daily. Maximum benefit may take up to 4–8 wks.

Dosage in Renal Impairment

CrCl 60 mL/min or less: Use caution in moderate to severe impairment.

Dosage in Hepatic Impairment

No dose adjustment.

Side effects

Frequent (16%–6%): Dry mouth, sinusitis, pharyngitis, dyspepsia, UTI, rhinitis. Occasional (5%–4%): Abdominal pain, peripheral edema, constipation, epistaxis, vomiting, myalgia, rash, oral candidiasis.

Adverse effects/toxic reactions

Angina pectoris, depression, flu-like symptoms, glaucoma, increased intraocular pressure occur rarely.

Nursing considerations
Baseline assessment
Question history of glaucoma, bladder outlet obstruction, renal impairment, myasthenia gravis. Auscultate lung sounds.

Intervention/evaluation
Monitor rate, depth, rhythm, type of respiration; quality, rate of pulse. Assess lung sounds for rhonchi, wheezing, rales. Monitor ABGs. Observe for clavicular retractions, hand tremor. Evaluate for clinical improvement (quieter, slower respirations, relaxed facial expression, cessation of clavicular retractions).

Patient/family teaching
• Increase fluid intake (decreases lung secretion viscosity).
• Do not use more than 1 capsule for inhalation in a 24h period.
• Rinsing mouth with water immediately after inhalation may prevent mouth/throat dryness, thrush.
• Avoid excessive use of caffeine derivatives (chocolate, coffee, tea, cola, cocoa).
• Report eye pain/discomfort, blurred vision, visual halos.

tipiracil/trifluridine
trye-flure-i-deen/tye-pir-a-sil
Lonsurf
♦CLASSIFICATION
PHARMACOTHERAPEUTIC: Nucleoside metabolic inhibitor/thymidine phosphorylase inhibitor.
CLINICAL: Antineoplastic.
Do not confuse trifluridine with floxuridine, or tipiracil with tipifarnib or Pipracil.

Uses
Treatment of pts with metastatic colorectal cancer who have been previously treated with fluoropyrimidine-, oxaliplatin-, and irinotecan-based chemotherapy, an anti–vascular endothelial growth factor (VEGF) biological therapy, and if RAS wild-type, an anti–epidermal growth factor (EGFR) therapy.
Precautions

Contraindications: Hypersensitivity to trifluridine or tipiracil. Cautions: Baseline anemia, leukopenia, neutropenia, thrombocytopenia; active infection, pts at increased risk of infection (e.g., diabetes, indwelling catheters), pts with high tumor burden, history of pulmonary embolism; pregnancy, moderate to severe hepatic impairment.

Action

Trifluridine interferes with DNA synthesis and cell proliferation of cancer cells. Tipiracil increases exposure of trifluridine by inhibiting metabolism via thymidine phosphorylase. Therapeutic Effect: Inhibits tumor cell growth and metastasis.

Pharmacokinetics

Rapidly absorbed. Metabolized by thymidine phosphorylase (not metabolized in liver). Protein binding: trifluridine: 96%; tipiracil: 8%. Peak plasma concentration: 2 hrs. Excreted primarily in urine (50%). Half-life: trifluridine: 1.4 hrs (2.1 hrs at steady state); tipiracil: 2.1 hrs (2.4 hrs at steady state).

Lifespan considerations

Pregnancy/Lactation: Avoid pregnancy; may cause fetal harm. Female pts of reproductive potential must use effective contraception during treatment. Unknown if distributed in breast milk. Breastfeeding not recommended. Males: Due to risk of potential exposure, male pts must use condoms during sexual activity during treatment and up to 3 mos after discontinuation. Children: Safety and efficacy not established. Elderly: May have increased risk of neutropenia, thrombocytopenia.

Interactions

DRUG: Not specified (no formal studies conducted). HERBAL: None significant. FOOD: None known. LAB VALUES: Expected to decrease Hct, Hgb, platelets, neutrophils, RBC, WBC.
Availability (Rx)

Fixed-Dose Combination Tablets: trifluridine/tipiracil: 15 mg/6.14 mg, 20 mg/8.19 mg.

Administration/handling

PO

• Give within 1 hr of completion of morning and evening meals. Do not give on empty stomach.

Indications/routes/dosage

Note: Do not initiate the cycle until ANC is 1,500 cells/mm$^3$ or greater; febrile neutropenia is resolved; platelet count is 75,000 cells/mm$^3$ or greater; grade 3 or 4 nonhematologic toxicity is resolved to grade 1 or 0.

Colorectal Cancer

PO: ADULTS, ELDERLY:(Dose based on trifluridine component) 35 mg/m$^2$ (rounded to nearest 5-mg increment) twice daily on days 1–5 and days 8–12 of 28-day cycle. Continue until disease progression or unacceptable toxicity. Maximum: 80 mg/dose (based on trifluridine component).

Dose Modification

Based on Common Terminology Criteria for Adverse Events (CTCAE).

Hematologic/Nonhematologic Toxicity

Interrupt treatment for ANC less than 500 cells/mm$^3$; febrile neutropenia; platelet count less than 50,000 cells/mm$^3$; grade 3 or 4 nonhematologic toxicity. Do not restart until ANC is 1,500 cells/mm$^3$ or greater; febrile neutropenia is resolved; platelet count is 75,000 cells/mm$^3$ or greater; grade 3 or 4 nonhematologic toxicity is resolved to grade 1 or 0 (except grade 3 nausea and/or vomiting controlled by antiemetic therapy; grade 3 diarrhea responsive to antidiarrheal medication). Once resolved, resume at decreased incremental dose of 5 mg/m$^2$ from previous dose. A maximum of 3 dose reductions is allowed to dosage minimum of 20 mg/m$^2$ twice daily. Do not increase dose after it has been
reduced.

**Dosage in Renal Impairment**

**Mild to moderate impairment:** No dose adjustment. **Severe impairment:** Not studied; use caution.

**Dosage in Hepatic Impairment**

**Mild impairment:** No dose adjustment. **Moderate to severe impairment:** Not studied; use caution.

**Side effects**

**Frequent (52%–19%):** Asthenia, fatigue, nausea, diarrhea, decreased appetite, vomiting, abdominal pain, pyrexia. **Occasional (8%–7%):** Stomatitis, dysgeusia, alopecia.

**Adverse effects/toxic reactions**

Severe and/or life-threatening myelosuppression including anemia (77% of pts), grade 3 anemia (18% of pts), neutropenia (67% of pts), grade 3 or 4 neutropenia (27% and 11% of pts), thrombocytopenia (42% of pts), grade 3 or 4 thrombocytopenia (5% and 1% of pts), febrile neutropenia (3.8% of pts) may occur. Infectious processes including nasopharyngitis, urinary tract infection reported in 2%–4% of pts. Pulmonary embolism occurred in 2% of pts. Interstitial lung disease occurs rarely.

**Nursing considerations**

**Baseline assessment**

Obtain baseline CBC and screen for anemia, neutropenia, thrombocytopenia. Obtain vital signs. Verify pregnancy status before start of each cycle. Screen for active infection, history of pulmonary embolism. Assess hydration status. Question pt’s usual stool characteristics (color, frequency, consistency).

**Intervention/evaluation**

Follow proper handling and disposal procedures for cytotoxic drugs. Monitor
ANC, CBC on day 15 of each cycle. If any grade 3 or 4 hematologic toxicity occurs, repeat ANC, CBC more frequently. If chest pain, dyspnea, tachycardia occurs, provide supplemental O₂ and obtain radiologic testing to rule out pulmonary embolism. Diligently monitor for infection. Monitor daily stool pattern, consistency. Encourage PO intake. Monitor for bleeding if thrombocytopenia occurs.

**Patient/family teaching**
- Blood levels will be monitored regularly.
- Treatment may cause fetal harm. Female pts of childbearing potential should use effective contraception during treatment. Immediately report suspected pregnancy. Do not breastfeed.
- Male pts must use condoms during sexual activity.
- Immediately report chest pain, difficult breathing, fast heart rate, rapid breathing; may indicate life-threatening blood clot in the lungs.
- Report symptoms of bone marrow suppression or infection such as bruising easily, chills, cough, dizziness, fainting, fever, shortness of breath, weakness, or burning with urination.
- Avoid crowds, those with active infection.
- Take within 1 hr of breakfast and evening meal.
- Drink plenty of fluids.
- Report diarrhea, nausea, vomiting that is not controlled by antinausea, antidiarrheal medication.
- Report bleeding of any kind.

**tipranavir**

*tye-pran-a-veer*

Aptivus

**CLASSIFICATION**

PHARMACOTHERAPEUTIC: Protease inhibitor.

CLINICAL: Antiretroviral.

- **BLACK BOX ALERT** May cause hepatitis (including fatalities), hepatic dysfunction. Pts with HBV or HCV at greater risk. Intracranial hemorrhage has occurred (in combination with ritonavir).
Uses

Treatment of HIV infection in combination with ritonavir and other antiretroviral agents (limited to highly treatment experienced or multi–protease inhibitor resistant pts).

Precautions

Contraindications: Hypersensitivity to tipranavir. Moderate to severe hepatic impairment, medications dependent on CYP3A for clearance, concurrent use of tipranavir/ritonavir with strong CYP3A inducers: alfuzosin, amiodarone, bepridil, dihydroergotamine, ergonovine, ergotamine, flecainide, lovastatin, lurasidone, methylergonovine, midazolam (oral), pimozide, propafenone, quiNIDine, rifAMPin, sildenafil (pulmonary arterial hypertension), simvastatin, St. John’s wort, triazolam. Cautions: Hemophilia, known sulfonamide allergy, mild hepatic impairment, pts at increased risk for bleeding from trauma, surgery, concurrent antiplatelet/anticoagulant therapy. Pts coinfected with HBV or HCV.

Action

Binds to HIV-1 protease activity sites. Inhibits cleavage of viral protein precursors into functional proteins necessary for infectious HIV. Therapeutic Effect: Prevents formation of mature infectious viral cells.

Pharmacokinetics

Incompletely absorbed following PO administration. Protein binding: 98%–99%. Metabolized in liver. Excreted in feces (82%), urine (4%). Half-life: 6 hrs.

Lifespan considerations

Pregnancy/Lactation: Unknown if drug crosses placenta or is distributed in breast milk. Children: Safety and efficacy not established in children younger than 2 yrs. Elderly: Age-related hepatic impairment may require dosage adjustment.

Interactions

DRUG: May interfere with metabolism of amiodarone, bepridil, ergotamine,
midazolam, oral contraceptives. CarBAMazepine, PHENobarbital, phenytoin, rifAMPin may decrease concentration. May increase concentration of colchicine, HMG-CoA reductase inhibitors (e.g., simvastatin), fluoxetine, PARoxetine, sertraline. HMG-CoA reductase inhibitors may increase risk of myopathy including rhabdomyolysis. HERBAL: St. John’s wort may lead to loss of virologic response, potential resistance to tipranavir. FOOD: High-fat meals may increase bioavailability. LAB VALUES: May increase serum cholesterol, triglycerides, amylase, ALT, AST. May decrease WBC count.

Availability (Rx)
Capsules: 250 mg. Oral Solution: 100 mg/mL.

Administration/handling

PO
• May take without regard to food. When taken with ritonavir tablets, must be taken with meals.
• Store unopened bottles of capsules in refrigerator.
• Do not freeze/refrigerate oral solution.
• Once bottle is opened, capsules may be stored at room temperature for 60 days. Use oral solution within 60 days after opening.

Indications/routes/dosage

Note: Must be taken with ritonavir.

HIV Infection
PO: ADULTS, ELDERLY: 500 mg administered with 200 mg of ritonavir twice daily. CHILDREN 2–18 YRS: 14 mg/kg with 6 mg/kg ritonavir twice daily. Maximum: 500 mg with 200 mg ritonavir twice daily.

Dosage in Renal Impairment
No dose adjustment.

Dosage in Hepatic Impairment
Mild impairment: Use caution. Moderate to severe impairment: Contraindicated.

Side effects

Frequent (11%): Diarrhea. Occasional (7%–2%): Nausea, fever, fatigue, headache, depression, vomiting, abdominal pain, weakness, rash. Rare (Less Than 2%): Abdominal distention, anorexia, flatulence, dizziness, insomnia, myalgia.

Adverse effects/toxic reactions

Bronchitis occurs in 3% of pts. Anemia, neutropenia, thrombocytopenia, diabetes mellitus, hepatic failure, hepatitis, peripheral neuropathy, pancreatitis occur rarely.

Nursing considerations

Baseline assessment

Obtain baseline LFT before beginning therapy and at periodic intervals during therapy. Offer emotional support. Obtain full medication history and screen for interactions. Review medical history for HBV or HCV.

Intervention/evaluation

Closely monitor for evidence of GI discomfort. Monitor daily pattern of bowel activity, stool consistency. Assess skin for evidence of rash. Monitor serum chemistry tests for marked laboratory abnormalities, particularly hepatic profile, CD4 cell count, HIV RNA plasma levels. Assess for opportunistic infections (onset of fever, oral mucosa changes, cough, other respiratory symptoms).

Patient/family teaching

• Eat small, frequent meals to offset nausea, vomiting.
• Continue therapy for full length of treatment.
• Doses should be evenly spaced.
• Tipranavir is not a cure for HIV infection, nor does it reduce risk of transmission to others.
• Pt may continue to experience illnesses, including opportunistic infections.
• Diarrhea can be controlled with OTC medication.

**tiZANidine**

tye-zan-i-deen

Apo-TiZANidine
Zanaflex

**CLASSIFICATION**

**PHARMACOTHERAPEUTIC**: Alpha\textsubscript{2}-adrenergic agonist.

**CLINICAL**: Antispastic.

Do not confuse tiZANidine with tiaGABine.

**Uses**

Acute and intermittent management of muscle spasticity (spasms, stiffness, rigidity), spasticity associated with multiple sclerosis or spinal cord injury.

**Precautions**

**Contraindications**: Hypersensitivity to tiZANidine. Concurrent use with strong CYP1A2 inhibitors. **Cautions**: Renal/hepatic disease, pts at risk for severe hypotensive effects, cardiac disease, psychiatric disorders, elderly pts.

**Action**

Increases presynaptic inhibition of spinal motor neurons mediated by alpha\textsubscript{2}-adrenergic agonists, reducing facilitation to postsynaptic motor neurons. **Therapeutic Effect**: Reduces muscle spasticity.

**Pharmacokinetics**

Metabolized in liver. Primarily excreted in urine. **Half-life**: 2 hrs.

**Interactions**

**DRUG**: Alcohol, other CNS depressants (e.g., LORazepam, morphine,
zolpidem) may increase CNS depressant effects. Antiarrhythmics (e.g., amiodarone, sotalol), cimetidine, oral contraceptives, acyclovir may increase risk of bradycardia, hypotension, or CNS depression. Strong CYP1A2 inhibitors (e.g., ciprofloxacin, fluvoxamine) may increase concentration/adverse effects (contraindicated). HERBAL: Gotu kola, kava kava, St. John’s wort, valerian may increase CNS depression. Black cohosh, hawthorn, periwinkle may increase hypotensive effect. FOOD: None known. LAB VALUES: May increase serum alkaline phosphatase, ALT, AST.

Availability (Rx)
Capsules: 2 mg, 4 mg, 6 mg. Tablets: 2 mg, 4 mg.

Administration/handling

PO
• Capsules may be opened and sprinkled on food.
• May give without regard to food.
• Administration should be consistent and not switched between giving with or without food.

Indications/routes/dosage

Muscle spasticity
PO: ADULTS, ELDERLY: Initially, 2 mg up to 3 times/day at 6- to 8-hr intervals as needed. Can be gradually increased in 2- to 4-mg increments with a minimum of 1–4 days between dosage increases. **Maximum:** 36 mg/24 hrs in divided doses.
Discontinuation of Therapy: Gradually taper dose by 2–4 mg daily.

Dosage in Renal Impairment
May require dose reduction/less frequent dosing. **CrCl less than 25 mL/min:** Reduce dose by 50%. If higher doses needed, increase dose instead of frequency.

Dosage in Hepatic Impairment
Avoid use if possible. If used, monitor for adverse effects (e.g., hypotension).

**Side effects**

**Frequent (49%–41%)**: Dry mouth, drowsiness, asthenia. **Occasional (16%–4%)**: Dizziness, UTI, constipation. **Rare (3%)**: Nervousness, amblyopia, pharyngitis, rhinitis, vomiting, urinary frequency.

**Adverse effects/toxic reactions**

Hypotension may be associated with bradycardia, orthostatic hypotension, and, rarely, syncope. Risk of hypotension increases as dosage increases; hypotension is noted within 1 hr after administration. May cause visual hallucinations.

**Nursing considerations**

**Baseline assessment**

Record onset, type, location, duration of muscular spasm. Check for immobility, stiffness, swelling. Obtain LFT.

**Intervention/evaluation**

Assist with ambulation at all times. For those on long-term therapy, serum hepatic/renal function tests should be performed periodically. Evaluate for therapeutic response (decreased intensity of skeletal muscle pain/tenderness, improved mobility, decrease in spasticity). Go from lying to standing slowly.

**Patient/family teaching**

• Avoid tasks that require alertness, motor skills until response to drug is established.
• Avoid sudden changes in posture.
• May cause hypotension, sedation, impaired coordination.
• Avoid alcohol.

**tobramycin**

**toe-bra-mye-sin**
TOBI
Tobrex

Fixed-Combination(s)

TobraDex: tobramycin/dexamethasone (a steroid): 0.3%/0.1% per mL or per g. Zylet: tobramycin/loteprednol: 0.3%/0.5%.

CLASSIFICATION
PHARMACOTHERAPEUTIC: Aminoglycoside. CLINICAL: Antibiotic.

■ BLACK BOX ALERT ■ May cause neurotoxicity, nephrotoxicity, ototoxicity. Ototoxicity usually is irreversible. Increased risk of neuromuscular blockade, including respiratory paralysis, particularly when given after anesthesia or muscle relaxants. May cause fetal harm.

Do not confuse tobramycin with vancomycin, or Tobrex with TobraDex.

Uses

Treatment of susceptible infections due to P. aeruginosa, other gram-negative organisms including skin/skin structure, bone, joint, respiratory tract infections; postop, burn, intra-abdominal infections; complicated UTI; septicemia; meningitis. Ophthalmic: Superficial eye infections: blepharitis, conjunctivitis, keratitis, corneal ulcers. Inhalation: Bronchopulmonary infections (Pseudomonas aeruginosa) in pts with cystic fibrosis.

Precautions

Contraindications: Hypersensitivity to tobramycin, other aminoglycosides (cross-sensitivity) and their components. Cautions: Renal impairment, preexisting auditory or vestibular impairment, conditions that depress neuromuscular transmission, Parkinson’s disease, myasthenia gravis, hypocalcemia, pregnancy, elderly pts.

Action
Irreversibly binds to protein on bacterial ribosomes. **Therapeutic Effect:** Interferes with protein synthesis of susceptible microorganisms.

**Pharmacokinetics**
Rapid, complete absorption after IM administration. Protein binding: less than 30%. Widely distributed (does not cross blood-brain barrier; low concentrations in CSF). Excreted unchanged in urine. Removed by hemodialysis. **Half-life:** 2–4 hrs (increased in renal impairment, neonates; decreased in cystic fibrosis, febrile or burn pts).

**Lifespan considerations**

- **Pregnancy/Lactation:** Drug readily crosses placenta; distributed in breast milk. May cause fetal nephrotoxicity. Ophthalmic form should not be used in breastfeeding mothers and only when specifically indicated in pregnancy.
- **Children:** Immature renal function in neonates, premature infants may increase risk of toxicity. **Elderly:** Age-related renal impairment may increase risk of toxicity; dosage adjustment recommended.

**Interactions**

**DRUG:** Nephrotoxic medications (e.g., NSAIDs, IV contrast, lisinopril, furosemide), ototoxic medications (e.g., bumetanide, furosemide) may increase risk of nephrotoxicity, ototoxicity. **Neuromuscular blockers (e.g., cisatracurium, vecuronium)** may increase neuromuscular blockade.

**HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** May increase serum BUN, bilirubin, creatinine, alkaline phosphatase, LDH, ALT, AST. May decrease serum calcium, magnesium, potassium, sodium. Therapeutic peak serum level: 5–20 mcg/mL; therapeutic trough serum level: 0.5–2 mcg/mL. Toxic peak serum level: greater than 20 mcg/mL; toxic trough serum level: greater than 2 mcg/mL.

**Availability (Rx)**

- **Infusion, Premix:** 60 mg/50 mL, 80 mg/100 mL. **Inhalation Powder (TOBI Podhaler):** 28 mg in a capsule. **Injection, Powder for Reconstitution:** 1.2 g. **Injection, Solution:** 10 mg/mL, 40 mg/mL. **Ointment, Ophthalmic (Tobrex):**
0.3%. **Solution, Nebulization (TOBI):** 60 mg/mL. **Solution, Ophthalmic (Tobrex):** 0.3%.

**Administration/handling**

- Coordinate peak and trough lab draws with administration times.

**IV**

**Reconstitution**
- Dilute with 50–100 mL D$_5$W or 0.9% NaCl. Amount of diluent for infants, children depends on individual need.

**Rate of Administration**
- Infuse over 30–60 min.

**Storage**
- Store vials at room temperature.
- Solutions may be discolored by light or air (does not affect potency).
- Reconstituted solution stable for 24 hrs at room temperature or 96 hrs if refrigerated.

**IM**
- To minimize discomfort, give deep IM slowly.
- Less painful if injected into gluteus maximus rather than lateral aspect of thigh.

**Inhalation**
- Refrigerate.
- May store at room temperature up to 28 days after removing from refrigerator.
- Do not use if cloudy or contains particulates.
- **Podhaler:** Pt must not swallow capsules.
- Doses should be as close as possible to 12 hrs apart and not less than 6 hrs apart.
- Use Podhaler device supplied.

**Ophthalmic**
- Place gloved finger on lower eyelid, pull out until pocket is formed between eye and lower lid.
- Place correct number of drops (1/4–1/2 inch ointment) into pocket.
• **Solution:** Apply digital pressure to lacrimal sac for 1–2 min (minimizes drainage into nose/throat, reducing risk of systemic effects).
• **Ointment:** Instruct pt to close eye for 1–2 min, rolling eyeball (increases contact area of drug to eye).
• Remove excess solution/ointment around eye.

### IV incompatibilities

Amphotericin B complex (Abelcet, AmBisome, Amphotec), heparin, indomethacin (Indocin), piperacillin-tazobactam (Zosyn), propofol (Diprivan), sargramostim (Leukine, Prokine).

### IV Compatibilities

Amiodarone (Cordarone), calcium gluconate, cefepime, ceftaroline, cefTAZidime, dexmedetomidine (Precedex), diltiaZEM (Cardizem), furosemide (Lasix), HYDROMorphone (Dilaudid), insulin, linezolid (Zyvox), magnesium sulfate, midazolam (Versed), morphine, niCARdipine (Cardene), tigecycline (Tygacil).

### Indications/routes/dosage

**Alert** Space parenteral doses evenly around the clock. Dosage based on ideal body weight. Peak, trough levels determined periodically to maintain desired serum concentrations (minimizes risk of toxicity). Recommended peak level: 4–10 mcg/mL; trough level: 0.5–2 mcg/mL.

#### Usual Parenteral Dosage

**IV: ADULTS, ELDERLY:** 3–7.5 mg/kg/day in 3 divided doses. Once-daily dosing: 4–7 mg/kg every 24 hrs. **CHILDREN 5 YRS AND OLDER:** 2–2.5 mg/kg/dose q8h. **CHILDREN YOUNGER THAN 5 YRS:** 2.5 mg/kg/dose q8h. **NEONATES LESS THAN 1 KG (14 DAYS OR YOUNGER):** 5 mg/kg/dose q48h; **(15–28 DAYS):** 5 mg/kg/dose q36h. **1–2 KG (7 DAYS OR YOUNGER):** 5 mg/kg/dose q48h; **(8–28 DAYS):** 5 mg/kg/dose q36h. **GREATER THAN 2 KG (7 DAYS OR YOUNGER):** 4 mg/kg q24h; **(8–28 DAYS):** 4–5 mg/kg q12–24hrs.
Usual Ophthalmic Dosage

**Ophthalmic Ointment:** ADULTS, ELDERLY, CHILDREN 2 MOS AND OLDER: Apply 1/2 inch to conjunctiva q8–12h (q3–4h for severe infections).

**Ophthalmic Solution:** ADULTS, ELDERLY, CHILDREN 2 MOS AND OLDER: 1–2 drops in affected eye q4h (2 drops/hr for severe infections).

Usual Inhalation Dosage (Cystic Fibrosis)

**Inhalation High Dose:** ADULTS, CHILDREN 6 YRS AND OLDER: 300 mg q12h 28 days on, 28 days off. **Tobi Podhaler:** Four 28-mg capsules twice daily for 28 days followed by 28 days off.

Dosage in Renal Impairment

Dosage and frequency modified based on degree of renal impairment, serum drug concentration. After loading dose of 1–2 mg/kg, maintenance dose and frequency are based on serum creatinine levels, creatinine clearance.

<table>
<thead>

Dosage in Hepatic Impairment

No dose adjustment.

Side effects

**Occasional:** IM: Pain, induration. IV: Phlebitis, thrombophlebitis. Topical: Hypersensitivity reaction (fever, pruritus, rash, urticaria). **Ophthalmic:** Tearing, itching, redness, eyelid swelling. **Rare:** Hypotension, nausea, vomiting.

Adverse effects/toxic reactions

Nephrotoxicity (acute kidney injury, acute tubular necrosis, renal failure) may be
reversible if drug is stopped at first sign of symptoms. Irreversible ototoxicity (dizziness, ringing/roaring in ears, hearing loss), neurotoxicity (headache, dizziness, lethargy, tremor, visual disturbances) occur occasionally. Risk increases with higher dosages or prolonged therapy or if solution is applied directly to mucosa. Superinfections, particularly fungal infections, may result from bacterial imbalance with any administration route. Anaphylaxis may occur.

**Nursing considerations**

**Baseline assessment**

Dehydration must be treated before beginning parenteral therapy. Question for history of allergies, esp. aminoglycosides, sulfite (and parabens for topical, ophthalmic routes). Establish baseline hearing acuity. Obtain baseline lab tests, esp. renal function.

**Intervention/evaluation**

Monitor I&O (maintain hydration), urinalysis, renal function. Monitor results of peak/trough blood tests. **Therapeutic serum level:** peak: 5–20 mcg/mL; trough: 0.5–2 mcg/mL. **Toxic serum level:** peak: greater than 20 mcg/mL; trough: greater than 2 mcg/mL. Be alert to ototoxic, neurotoxic symptoms. Evaluate IV site for phlebitis (heat, pain, red streaking over vein). Assess for rash. Be alert for superinfection, particularly anal/genital pruritus, changes of oral mucosa, diarrhea. When treating pts with neuromuscular disorders, assess respiratory response carefully. **Ophthalmic:** Assess for redness, swelling, itching, tearing.

**Patient/family teaching**

• Report any hearing, visual, balance, urinary problems, even after therapy is completed.
• **Ophthalmic:** Blurred vision, tearing may occur briefly after application.
• Report persistent tearing, redness, irritation.

**tocilizumab**

 toe-si-liz-oo-mab

**Actemra**

CLASSIFICATION
**PHARMACOTHERAPEUTIC**: Interleukin (IL)-6 receptor inhibitor.  
**CLINICAL**: Antirheumatic arthritis agent.

- **BLACK BOX ALERT**  
  Tuberculosis, serious invasive fungal infections, other opportunistic infections have occurred. Test for tuberculosis prior to and during treatment, regardless of initial result. Consider treatment of latent TB prior to initiation.

**Uses**

Treatment of moderate to severe rheumatoid arthritis in adults who had inadequate response to disease-modifying antirheumatic drugs (DMARDs). Treatment of active systemic juvenile idiopathic arthritis (SJIA) in pts 2 yrs of age and older. Treatment of active polyarticular juvenile idiopathic arthritis (PJIA) in pts 2 yrs and older. Treatment of adults and children 2 yrs of age and older with chimeric antigen receptor (CAR) T cell-induced severe or life-threatening cytokine release syndrome. Treatment of giant cell arteritis in adults.

**Precautions**

**Contraindications**: Hypersensitivity to tocilizumab. **Cautions**: Platelet count 100,000 cells/mm³ or less, ANC less than 2,000 cells/mm³, ALT, AST greater than 1.5 times upper limit of normal (ULN) prior to treatment. Do not administer to pts with active infection. Preexisting or recent-onset CNS demyelinating disorders, including multiple sclerosis; pts with chronic or recurrent infection or who have been exposed to tuberculosis; hematologic cytopenia, hepatic impairment, elderly pts, pts at increased risk of GI perforation. Avoid live vaccinations.

**Action**

Binds to IL-6 receptors, inhibiting signals of proinflammatory cytokines. **Therapeutic Effect**: Inhibits/slows structural joint damage, improves physical function.

**Pharmacokinetics**
Distributed in steady state of plasma and tissue compartments. Undergoes biphasic elimination from circulation. **Half-life:** 11–13 days.

**Lifespan considerations**

**Pregnancy/Lactation:** Unknown if distributed in breast milk. **Children:** Safety and efficacy not established in conditions other than SJIA. **Elderly:** Cautious use due to increased risk of serious infections, malignancy.

**Interactions**

**DRUG:** Anakinra, abatacept, corticosteroids, methotrexate may increase risk of infection. Live vaccines not recommended. May decrease effects of lovastatin, simvastatin, oral contraceptives, phenytoin, warfarin. **HERBAL:** Echinacea may alter levels/effects. **FOOD:** None known. **LAB VALUES:** May increase serum ALT, AST, lipids. May decrease platelets, neutrophils.

**Availability (Rx)**

**Injection Solution:** 20 mg/mL (80 mg/4 mL, 200 mg/10 mL, 400 mg/20 mL). **Syringe for Subcutaneous Administration:** 162 mg/0.9 mL. (Intended only for adults with RA.)

**Administration/handling**

- Do not infuse IV push or bolus.

**IV**

**Reconstitution**

- Dilute in 100 mL 0.9% NaCl (50 mL 0.9% NaCl for SJIA pts weighing less than 30 kg).
- Prior to mixing, withdraw and discard volume of NaCl equal to volume of patient-dosed solution.
- Invert bag to avoid foaming.
- Inject solution and dilute for mixture that equals 50 mL or 100 mL in NaCl bag.

**Rate of Administration**
• Infuse over 1 hr.

Storage
• Refrigerate vials; do not freeze.
• Diluted solutions may be stored for 24 hrs at room temperature or refrigerated.
• Protect from light until time of use.
• Solution appears colorless. Discard solution if it appears cloudy, discolored, or contains particulate.

Indications/routes/dosage

Note: Do not infuse concomitantly in same IV line with other drugs. Do not begin if ANC less than 2,000 cells/mm$^3$, platelets less than 100,000 cells/mm$^3$, or ALT or AST more than 1.5 times ULN.

Moderate to Severely Active Rheumatoid Arthritis

IV Infusion: ADULTS, ELDERLY: 4 mg/kg every 4 wks initially. May increase to 8 mg/kg every 4 wks. Maximum: 800 mg per dose.

SQ: ADULTS, ELDERLY (100 KG OR GREATER): 162 mg/wk. (LESS THAN 100 KG): 162 mg every other wk. May increase to every wk based on clinical response. Cytokine Release Syndrome IV: ADULTS, CHILDREN greater than 30 kg: 8 mg/kg. Pts less than 30 kg: 12 mg/kg. If no clinical improvement, 3 additional doses may be given with an interval of at least 8 hrs.

Giant Cell Arteritis SQ: ADULTS, ELDERLY: 162 mg once every wk (in combination with tapering course of glucocorticoid). May be given alone following discontinuation of glucocorticoid.

Dosage Modification

Hepatic enzyme levels greater than ULN.

<table>

SJIA

IV: CHILDREN MORE THAN 30 KG: 8 mg/kg q2wks. CHILDREN 30 KG
OR LESS: 12 mg/kg q2wks.

PJIA
IV: CHILDREN MORE THAN 30 KG: 8 mg/kg q4wks. CHILDREN 30 KG OR LESS: 10 mg/kg q4wks.

Dosage in Renal Impairment
Mild impairment: No dose adjustment. Moderate to severe impairment: Use caution (not studied).

Dosage in Hepatic Impairment
Not recommended.

Side effects
Occasional (8%–6%): Upper respiratory tract infection, nasopharyngitis, headache, hypertension. Rare (5%–3%): Infusion reaction, dizziness, bronchitis, rash, oral ulceration.

Adverse effects/toxic reactions
Up to 48% of pts experience elevated ALT, AST. Neutropenia, thrombocytopenia occur in 4% of pts. Serious infections, including sepsis, pneumonia, tuberculosis, invasive fungal infections, hepatitis B, have occurred. Anaphylactic reaction, rash, pruritus, urticaria, bronchospasm, swelling, dyspnea occur in less than 0.2% of pts; hypersensitivity reactions (hypertension, headaches, flushing) occur more frequently. Increased risk of lymphoma, melanoma. New onset or exacerbation of CNS demyelinating disorders, including multiple sclerosis. Risk of gastric perforation with concomitant use of NSAIDs, corticosteroids.

Nursing considerations
Baseline assessment
Evaluate pt for active tuberculosis and test for latent infection prior to initiating treatment and periodically during therapy. Induration of 5 mm or greater with
tuberculin skin testing should be considered a positive test result when assessing for latent tuberculosis. Antifungal therapy should be considered for pts who reside or travel to regions where mycoses are endemic. Do not initiate therapy during an active infection. Viral reactivation can occur in cases of herpes zoster, HIV. Assess baseline lab results (hepatic enzymes, cholesterol, triglycerides, platelets, neutrophils) q4–8wks during treatment. Pts should report history of diverticulitis, weakened immune system, HIV, hepatic disease, GI bleeding, hemoptysis, diarrhea, weight loss, cancer, prior cancer treatment, use of NSAIDs, glucocorticosteroids.

**Intervention/evaluation**

Monitor hepatitis B carriers during and several months following therapy. If reactivation occurs, consider interrupting treatment. Monitor pts for signs/symptoms of tuberculosis regardless of baseline PPD. Discontinue treatment if pt develops acute infection, opportunistic infection, or sepsis and initiate appropriate antimicrobial therapy. Monitor warfarin, theophylline, cycloSPORINE levels for therapeutic ranges. Modify, interrupt, or discontinue treatment if ALT, AST is 1–5 times ULN.

**Patient/family teaching**

- Inform pt that therapy may lower immune system response.
- Detail any concomitant immunosuppressive therapy, methotrexate.
- Report any history of HIV, fungal infections, hepatitis B, multiple sclerosis, hemoptysis, tuberculosis, or close relatives with active tuberculosis.
- Report any travel plans to possible endemic areas.
- Report signs/symptoms of stomach pain to evaluate risk of gastric perforation or history of taking NSAIDs, corticosteroids, methotrexate.
- Pt will need blood levels drawn q4–8wks during treatment along with routine tuberculosis screening.
- Seek immediate medical attention if adverse reaction occurs.
- Do not receive live vaccines during therapy.
- Notify physician if pregnant or planning on becoming pregnant.
- During treatment, report any signs of liver problems, such as stomach pains, yellowing of skin/eyes, dark-amber urine, clay-colored or bloody stools, fatigue, reduced appetite, coffee-ground emesis.
- Pt must adhere to strict dosing schedule.
• Decreased platelet count may lead to risk of bleeding.

**CLASSIFICATION**

**PHARMACOTHERAPEUTIC**: Janus kinase (JAK) inhibitor.

**CLINICAL**: Antirheumatic agent.

**BLACK BOX ALERT**

Increased risk for developing bacterial, viral, invasive fungal, other opportunistic infections including tuberculosis, cryptococcosis, pneumocystosis that may lead to hospitalization or death; infections often occurred in combination with other immunosuppressants (methotrexate, corticosteroids). Closely monitor for development of infection. Test for latent tuberculosis prior to treatment and during treatment, regardless of initial result. Treatment for latent TB should be initiated before use. Malignancies including lymphoma, nonmelanoma skin cancer reported. Increased rate of Epstein-Barr virus–associated post-transplant lymphoproliferative disorder observed in renal transplant pts who are treated with tofacitinib and other immunosuppressive therapy drugs.

Do not confuse tofacitinib with tipifarnib or Xeljanz with Xeloda.

**Uses**

Treatment of adult pts with moderate to severe active rheumatoid arthritis with previous inadequate response or intolerance to methotrexate. May be used as monotherapy or in combination with methotrexate or other nonbiologic disease-modifying antirheumatic drugs (DMARDs). Do not use in combination with other biologic DMARDs or with potent immunosuppressants (e.g., azaTHIOprine, cycloSPORINE).

**Precautions**

**Contraindications**: Hypersensitivity to tofacitinib. **Cautions**: Pts exposed to
TB, history of serious opportunistic infections, conditions that predispose to infections (e.g., diabetes), pts at risk for GI perforation (e.g., diverticulitis), pts who resided or traveled in areas where TB is endemic, moderate to severe renal impairment, elderly pts, hepatic impairment, history of anemia, hyperlipidemia, hepatitis, Asian ancestry, pts with history of interstitial lung disease, heart rate less than 60 bpm, conduction abnormalities, ischemic heart disease, HF.

**Action**

Inhibits JAK enzymes, which are involved in stimulating hematopoiesis and immune cell functioning. **Therapeutic Effect:** Reduces inflammation, tenderness, swelling of joints; slows or prevents progressive joint destruction in rheumatoid arthritis (RA).

**Pharmacokinetics**

Rapidly absorbed following PO administration. Protein binding: 40%. Peak concentration: 30–60 min. Metabolized in liver. Excreted primarily in urine. **Half-life:** 3 hrs.

**Lifespan considerations**

**Pregnancy/Lactation:** Not recommended in nursing mothers. Must either discontinue drug or discontinue breastfeeding. Unknown if distributed in breast milk. **Children:** Safety and efficacy not established. **Elderly:** Increased risk for serious infections, malignancy.

**Interactions**

**DRUG:** May alter effects of live virus vaccines. **Immunosuppressants** (e.g., azaTHIOPrine, cycloSPORINE) may increase risk for added immunosuppression, infection. CYP3A4 inhibitors (e.g., ketoconazole), CYP2C19 inhibitors (e.g., fluconazole) may increase concentration/effects. CYP3A4 inducers (e.g., rifAMPin, phenytoin) may decrease concentration/effects. **HERBAL:** St. John’s wort may decrease concentration/effect. **FOOD:** None known. **LAB VALUES:** May increase ALT, AST, bilirubin, lipids, creatinine. May decrease Hgb, neutrophils, lymphocytes.
**Availability (Rx)**

**Tablets, Film-Coated: (Xeljanz):** 5 mg. **(Xeljanz XR):** 11 mg.

**Administration/handling**

**PO**

- Give without regard to food.
- Do not cut, split, crush, or chew XR tablet.

**Indications/routes/dosage**

**[Alert]** Do not initiate treatment in pts with baseline active infection (systemic/localized), severe hepatic impairment, lymphocytes less than 500 cells/mm\(^3\), ANC less than 1,000 cells/mm\(^3\), Hgb less than 9 g/dL.

**Moderate to Severe Rheumatoid Arthritis**

**PO:** **ADULTS/ELDERLY:** **(Xeljanz):** 5 mg twice daily. **(Xeljanz XR):** 11 mg once daily.

**Dose Modification**

Reduce to 5 mg once daily for any of the following: moderate to severe renal impairment, moderate hepatic impairment, concurrent use of potent CYP3A4 inhibitors, concurrent use of one or more moderate CYP3A4 or potent CYP2C19 inhibitors.

**Lymphopenia**

Interrupt treatment until lymphocytes greater than or equal to 500 cells/mm\(^3\). Discontinue if lymphocytes less than 500 cells/mm\(^3\) after repeat testing.

**Neutropenia**

Interrupt treatment until neutrophils greater than 1,000 cells/mm\(^3\). Discontinue if neutrophils less than 500 cells/mm\(^3\) after repeat testing.

**Anemia**

Interrupt treatment until Hgb greater than or equal to 9 g/dL or baseline Hgb
decreases less than or equal to 2 g/dL after repeat testing.

**Hepatotoxicity**
Interrupt treatment until diagnosis of drug-induced hepatic injury has been excluded.

**Dosage in Renal Impairment**
- **Mild impairment:** No dose adjustment. **Moderate to severe impairment:** 5 mg once daily.

**Dosage in Hepatic Impairment**
- **Mild impairment:** No dose adjustment. **Moderate impairment:** 5 mg once daily. **Severe impairment:** Not recommended.

**Side effects**
- **Rare (4%–2%):** Upper respiratory tract infection, diarrhea, nasopharyngitis, headache, hypertension.

**Adverse effects/toxic reactions**
Neutropenia, lymphopenia may increase risk for infection. Serious infections may include aspergillosis, BK virus, cellulitis, coccidioidomycosis, cryptococcus, cytomegalovirus, esophageal candidiasis, histoplasmosis, invasive fungal infections, listeriosis, pneumocystosis, pneumonia, tuberculosis, UTI, sepsis. Increased risk for various malignancies. May induce viral reactivation of hepatitis B or C virus infection, herpes zoster, HIV. Epstein-Barr virus–associated post-transplant lymphoproliferative disorder reported in 2% of pts with renal transplant. Increased risk for GI perforation.

**Nursing considerations**

**Baseline assessment**
Obtain vital signs, CBC, BMP, LFT, lipid panel, urine pregnancy test results. Evaluate for active tuberculosis (TB) and test for latent infection prior to and during treatment. Induration of 5 mm or greater with purified protein derivative
(PPD) is considered positive result when assessing for latent TB. Question possibility of pregnancy or breastfeeding. Screen for history/co-morbidities. Obtain full medication history including vitamins, herbal products.

**Intervention/evaluation**

Obtain CBC every 4–8 wks, then every 3 mos, lipid panel 4–8 wks after initiation; hepatic function panel if hepatic impairment suspected. Monitor for TB regardless of baseline PPD. Consider discontinuation if pt develops acute infection, opportunistic infection, sepsis; initiate appropriate antimicrobial therapy. Immediately report any hemorrhaging, melena, abdominal pain, hemoptysis (may indicate GI perforation).

**Patient/family teaching**

- Routinely monitor blood levels.
- Therapy will lower immune system response.
- Do not receive live virus vaccines.
- Other immunosuppressant drugs may increase risk for infection.
- Expect routine TB screening.
- Fever, cough, burning with urination, body aches, chills, skin changes may indicate infection.
- Report history of HIV, recent infections, hepatitis B or C, TB or close relatives who have active TB.
- Report any travel plans to possible endemic areas.
- Notify physician if pregnant or planning pregnancy.
- Do not breastfeed.
- Immediately report bleeding of any kind.
- Yellowing of skin or eyes, right upper quadrant abdominal pain, bruising, clay-colored stool, dark urine may indicate liver problem.
- Avoid grapefruit products.

**tolterodine**

tol-ter-oh-deen

**Detrol**

**Detrol LA**

**Unidet**
**Uses**

Treatment of overactive bladder in pts with symptoms of urinary frequency, urgency, or urge incontinence.

**Precautions**

**Contraindications:** Hypersensitivity to tolterodine or fesoterodine. Gastric retention, uncontrolled narrow-angle glaucoma, urinary retention. **Cautions:** Renal impairment, clinically significant bladder outflow obstruction (risk of urinary retention), GI obstructive disorders (e.g., pyloric stenosis [risk of gastric retention]), treated narrow-angle glaucoma, myasthenia gravis, prolonged QT interval (congenital/medications, hypokalemia, hypomagnesemia), hepatic impairment, elderly.

**Action**

Antagonist of muscarinic receptors mediating urinary bladder contraction. Increases residual urine volume, reduces detrusor muscle pressure. **Therapeutic Effect:** Decreases urinary frequency, urgency.

**Pharmacokinetics**

**Lifespan considerations**

**Pregnancy/Lactation:** Unknown if drug is distributed in breast milk. Breastfeeding not recommended. **Children:** Safety and efficacy not established. **Elderly:** No age-related precautions noted.
Interactions

**DRUG:** CYP3A4 inhibitors (e.g., clarithromycin, ketoconazole, ritonavir) may increase concentration. **FLUoxetine** may inhibit drug metabolism. **HERBAL:** St. John's wort may decrease concentration/effects. **FOOD:** None known. **LAB VALUES:** None known.

Availability (Rx)

Tablets (Detrol): 1 mg, 2 mg.

Capsules (Extended-Release [Detrol LA]): 2 mg, 4 mg.

Administration/handling

**PO**

- May give without regard to food.
- Give extended-release capsules whole; do not break, crush, or open.

Indications/routes/dosage

Overactive Bladder

**PO: ADULTS, ELDERLY (IMMEDIATE-RELEASE):** 1–2 mg twice daily **(WITH CYP3A4 INHIBITORS):** 1 mg twice daily. **(EXTENDED-RELEASE):** 2–4 mg once daily. **(WITH CYP3A4 INHIBITORS):** 2 mg once daily.

Dosage in Renal/Hepatic Impairment

**Mild to moderate impairment:** (**IMMEDIATE-RELEASE):** 1 mg twice daily. Use caution. **(EXTENDED-RELEASE):** 2 mg once daily. Use caution. **Severe impairment:** Not recommended.

Side effects

**Frequent (40%):** Dry mouth. **Occasional (11%–4%):** Headache, dizziness, fatigue, constipation, dyspepsia, upper respiratory tract infection, UTI, dry eyes, abnormal vision (accommodation problems), nausea, diarrhea. **Rare (3%):**
Drowsiness, chest/back pain, arthralgia, rash, weight gain, dry skin.

**Adverse effects/toxic reactions**
Overdose can result in severe anticholinergic effects, including abdominal cramps, facial warmth, excessive salivation/lacrimation, diaphoresis, pallor, urinary urgency, blurred vision, prolonged QT interval.

**Nursing considerations**

**Baseline assessment**
Assess degree of overactive bladder (urinary urgency, frequency, incontinence). Question history as listed in Precautions.

**Intervention/evaluation**
Assist with ambulation if dizziness occurs. Question for visual changes. Monitor incontinence, postvoid residuals.

**Patient/family teaching**
- May cause blurred vision, dry eyes/mouth, constipation.
- Report any confusion, altered mental status.
- Avoid tasks that require alertness, motor skills until response to drug is established.

**topiramate**
 toe-peer-a-mate
Apo-Topiramate
Qudexy XR
**Topamax**
Topamax Sprinkle
Trokendi XR

**CLASSIFICATION**
**PHARMACOTHERAPEUTIC**: Carbonic anhydrase inhibitor.
CLINICAL: Anticonvulsant. Do not confuse Topamax or topiramate with TEGretol, TEGretol XR, or Toprol XL.

Uses
Monotherapy for treatment of partial-onset or primary generalized tonic-clonic seizures in pts 2 yrs and older (immediate-release, Qudexy XR) or 6 yrs and older (Trokendi XR). Adjunctive therapy for partial-onset, primary generalized tonic-clonic seizures or seizures associated with Lennox-Gastaut syndrome in pts 2 yrs and older (immediate-release, Qudexy XR) or 6 yrs and older (Trokendi XR). Prevention of migraine headache. OFF-LABEL: Neuropathic pain, diabetic neuropathy, prophylaxis of cluster headaches, infantile spasms.

Precautions
Contraindications: Hypersensitivity to topiramate. (Extended-Release): Recent alcohol use (within 6 hrs prior to or after); pts with metabolic acidosis who are taking metFORMIN. Caution: Hepatic/renal impairment, elderly pts, pts who are at high risk for suicide, respiratory impairment, pts with congenital metabolism dysfunction or decreased mitochondrial activity. During strenuous exercise, exposure to high environmental temperature, concomitant use of medications with anticholinergic activity.

Action
Blocks neuronal sodium channels, enhances GABA activity; antagonizes glutamate receptors and weakly inhibits carbonic anhydrase. Therapeutic Effect: Decreases seizure activity.

Pharmacokinetics

Lifespan considerations
Pregnancy/Lactation: Unknown if distributed in breast milk. Children: No age-related precautions noted in pts older than 2 yrs. Elderly: Age-related renal impairment may require dosage adjustment.

Interactions

**DRUG:** Alcohol, other CNS depressants (e.g., LORazepam, morphine, zolpidem) may increase CNS depression. CarBAMazepine, phenytoin, valproic acid may decrease concentration/effects. Carbonic anhydrase inhibitors may increase risk of kidney stone formation and severity of metabolic acidosis. May decrease effectiveness of oral contraceptives. **HERBAL:** Evening primrose may decrease seizure threshold. **FOOD:** None known. **LAB VALUES:** May reduce serum bicarbonate, increase ALT, AST.

Availability (Rx)

Capsules (Sprinkle): 15 mg, 25 mg.

Tablets: (Topamax, Topiragen) 25 mg, 50 mg, 100 mg, 200 mg.

Tablets: (Topamax, Topiragen) 25 mg, 50 mg, 100 mg, 200 mg.

Capsules, Extended-Release (Trokendi XR): 25 mg, 50 mg, 100 mg, 200 mg. **Qudexy XR:** 25 mg, 50 mg, 100 mg, 150 mg, 200 mg.

Administration/handling

**PO**

- Do not break, crush, dissolve, or divide tablets (bitter taste).
- Give without regard to meals.
- Sprinkle capsules may either be swallowed whole or contents sprinkled on teaspoonful of soft food and swallowed immediately; do not chew.
- **Trokendi XR:** Give whole. Do not sprinkle on food, chew, or crush. **Qudexy XR:** Swallow whole; may open and sprinkle on spoonful of soft food.

Indications/routes/dosage

**Note:** Do not abruptly discontinue; taper gradually to prevent rebound effects.

Adjunctive Treatment of Partial-Onset Seizures, Lennox-Gastaut
Syndrome (LGS), Tonic-Clonic Seizures

PO: ADULTS, ELDERLY, CHILDREN 17 YRS AND OLDER: (Immediate-Release): Initially, 25 mg once or twice daily for 1 wk. May increase by 25–50 mg/day at wkly intervals. Usual maintenance dose: 100–200 mg twice daily (partial-onset) or 200 mg 2 times/day (primary tonic-clonic). Maximum: 400 mg/day. CHILDREN 2–16 YRS: Initially, 1–3 mg/kg/day to maximum of 25 mg at night for 1 wk. May increase by 1–3 mg/kg/day at wkly intervals given in 2 divided doses. Maintenance: 5–9 mg/kg/day in 2 divided doses. ADULTS, ELDERLY: (Extended-Release): Initially, 25–50 mg/day. Increase by 25–50 mg/day at wkly intervals, up to 400 mg/day. CHILDREN 2 YRS AND OLDER: Initially, 25 mg (based on range of 1–3 mg/kg) once daily at bedtime for 1 wk. Increase dose by 1–3 mg/kg at 1–2 wk intervals up to 5–9 mg/kg once daily.

Monotherapy with Partial-Onset, Tonic-Clonic Seizures

PO: ADULTS, ELDERLY, CHILDREN 10 YRS AND OLDER: (Immediate-Release): Initially, 25 mg twice daily. May increase at wkly intervals up to 400 mg/day according to the following schedule: Wk 1, 25 mg twice daily. Wk 2, 50 mg twice daily. Wk 3, 75 mg twice daily. Wk 4, 100 mg twice daily. Wk 5, 150 mg twice daily. Wk 6, 200 mg twice daily. CHILDREN 2–9 YRS: Initially, 25 mg/day. Then 25 mg 2 times/day wk 2; then increase by 25–50 mg/day at wkly intervals up to minimum dose. (See table below.) ADULTS, ELDERLY, CHILDREN 10 YRS OR OLDER: (Extended-Release): (Quedexy XR, Trokendi XR): Initially, 50 mg once daily. Increase by 50 mg/day at wkly intervals for first 4 wks, then by 100 mg/day for wks 5 and 6, up to 400 mg/day. CHILDREN 2–9 YRS: (Quedexy XR): 6–9 YRS: (Trokendi XR): Initially, 25 mg once daily in evening. May increase to 50 mg once daily in wk 2, then 25–50 mg/day at wkly intervals over 5–7 wks up to minimum daily dose (32 KG OR MORE): 250 mg; (12–31 KG): 200 mg; (11 KG OR LESS): 150 mg. Maximum daily dose: (38 KG OR MORE): 400 mg; (23–38 KG): 350 mg; (12–22 KG): 300 mg; (11 KG OR LESS): 250 mg.

Migraine Prevention

PO: ADULTS, ELDERLY, CHILDREN 12 YRS AND OLDER: (Immediate-Release): Initially, 25 mg/day. May increase by 25 mg/day at 7-day intervals up to a total daily dose of 100 mg/day in 2 divided doses. Extended-Release: (Qudexy XR): Initially, 25 mg once daily at bedtime. May increase wkly by 25 mg increments up to 100 mg once daily.

Dosage in Renal Impairment
Reduce drug dosage by 50% and titrate more slowly in pts who have CrCl less than 70 mL/min.

Dosage in Hepatic Impairment
Use caution.

Side effects

Frequent (30%–10%): Drowsiness, dizziness, ataxia, nervousness, nystagmus, diplopia, paresthesia, nausea, tremor. Occasional (9%–3%): Confusion, breast pain, dysmenorrhea, dyspepsia, depression, asthenia, pharyngitis, weight loss, anorexia, rash, musculoskeletal pain, abdominal pain, difficulty with coordination, sinusitis, agitation, flu-like symptoms. Rare (3%–2%): Mood disturbances (e.g., irritability, depression), dry mouth, aggressive behavior, impaired heat regulation.

Adverse effects/toxic reactions
Psychomotor slowing, impaired concentration, language problems (esp. word-finding difficulties), memory disturbances occur occasionally. Metabolic acidosis, suicidal ideation occur rarely.

Nursing considerations

Baseline assessment
Seizures: Review history of seizure disorder (intensity, frequency, duration,
level of consciousness). Initiate seizure precautions. Provide quiet, dark environment. Question for sensitivity to topiramate, pregnancy, use of other anticonvulsant medication (esp. carBAMAzepine, valproic acid, phenytoin).

**Migraine:** Assess pain location, duration, intensity. Assess renal function.

**Intervention/evaluation**
Observe frequently for recurrence of seizure activity. Assess for clinical improvement (decrease in intensity/frequency of seizures). Monitor renal function tests, LFT. Assist with ambulation if dizziness occurs.

**Patient/family teaching**
- Avoid tasks that require alertness, motor skills until response to drug is established (may cause dizziness, drowsiness, impaired concentration).
- Drowsiness usually diminishes with continued therapy.
- Avoid use of alcohol, other CNS depressants.
- Do not abruptly discontinue drug (may precipitate seizures).
- Strict maintenance of drug therapy is essential for seizure control.
- Do not chew, crush, dissolve, or divide tablets (bitter taste).
- Maintain adequate fluid intake (decreases risk of renal stone formation).
- Report blurred vision, eye pain.
- Report suicidal ideation, depression, unusual behavior.
- Use caution with activities that may increase core temperature (exposure to extreme heat, dehydration).
- Instruct pt to use alternative/additional means of contraception (topiramate decreases effectiveness of oral contraceptives).

**topotecan**

*toe-poe-tee-kan*

**Hycamtn**

**CLASSIFICATION**
PHARMACOTHERAPEUTIC: DNA topoisomerase inhibitor.

**CLINICAL:** Antineoplastic.

■ **BLACK BOX ALERT** ■ Must be administered by personnel trained in administration/handling of chemotherapeutic agents. Potent immunosuppressant; severe neutropenia (absolute neutrophil count [ANC]
less than 500 cells/mm$^3$) occurs in 60% of pts. Do not administer with baseline neutrophils less than 1,500 cells/mm$^3$ and platelets less than 100,000 cells/mm$^3$.

Do not confuse Hycamtin with Hycomine, Mycamine, or topotecan with irinotecan.

Uses

Treatment of metastatic ovarian cancer, relapsed or refractory small cell lung cancer, recurrent or resistant cervical cancer (in combination with CISplatin). **OFF-LABEL:** Treatment of central nervous system lesions/lymphoma, Ewing’s sarcoma, rhabdomyosarcoma, neuroblastoma, acute myeloid leukemia.

Precautions

**Contraindications:** Hypersensitivity to topotecan. Baseline neutrophil count less than 1,500 cells/mm$^3$ and platelet count less than 100,000 cells/mm$^3$, severe myelosuppression. **Cautions:** Mild myelosuppression, renal impairment, breastfeeding, pregnancy, elderly pts. Pts at risk for developing interstitial lung disease (e.g., lung cancer, pulmonary fibrosis).

Action

Interacts with topoisomerase I, an enzyme that relieves torsional strain in DNA by inducing reversible single-strand breaks. Prevents religation of DNA strand, resulting in damage to double-strand DNA, cell death. **Therapeutic Effect:** Produces cytotoxic effect.

Pharmacokinetics

Hydrolyzed to active form after IV administration. Protein binding: 35%. Excreted in urine. **Half-life:** 2–3 hrs (increased in renal impairment).

Lifespan considerations

**Pregnancy/Lactation:** May cause fetal harm. Avoid pregnancy; breastfeeding not recommended. **Children:** Safety and efficacy not established. **Elderly:** Age-
related renal impairment may require dosage adjustment.

Interactions

**DRUG:** Live virus vaccines may potentiate virus replication, increase vaccine side effects, decrease pt’s antibody response to vaccine. Other bone marrow depressants may increase risk of myelosuppression. **HERBAL:** Echinacea may decrease effectiveness. **FOOD:** None known. **LAB VALUES:** May increase serum bilirubin, ALT, AST, alkaline phosphatase. May decrease RBC, leukocyte, neutrophil, platelet counts, Hgb, Hct.

Availability (Rx)

**Injection, Powder for Reconstitution:** 4 mg (single-dose vial). **Injection, Solution:** 1 mg/mL (4 mL). **Capsule:** 0.25 mg, 1 mg.

Administration/handling

**Alert** Because topotecan may be carcinogenic, mutagenic, teratogenic, handle drug with extreme care during preparation/administration.

**PO**
- May take with or without food.
- Swallow whole; do not break, crush, dissolve, or divide capsule.
- Do not give replacement dose if vomiting occurs.

**IV**

**Reconstitution**
- Reconstitute each 4-mg vial (lyophilized powder) with 4 mL Sterile Water for Injection.
- Further dilute with 50–100 mL 0.9% NaCl or D₅W.

**Rate of Administration**
- Administer as IV infusion over 30 min.
- Extravasation associated with only mild local reactions (erythema, ecchymosis).

**Storage**
- Store vials (lyophilized powder) at room temperature; refrigerate diluted
solution. Diluted solution for infusion stable for 24 hrs at room temperature.

■ **IV incompatibilities**

Dexamethasone (Decadron), 5-fluorouracil, mitoMYcin (Mutamycin).

■ **IV Compatibilities**

CARBOplatin (Paraplatin), CISplatin (Platinol AQ), cyclophosphamidie (Cytoxan), DOXOrubicin (Adriamycin), etoposide (VePesid), gemcitabine (Gemzar), granisetron (Kytril), ondansetron (Zofran), PACLitaxel (Taxol), palonosetron (Aloxi), vinCRIStine (Oncovin).

**Indications/routes/dosage**

**<ALERT>** Do not give topotecan if baseline neutrophil count is less than 1,500 cells/mm$^3$ and platelet count is less than 100,000 cells/mm$^3$. For retreatment, neutrophils should be greater than 1,000 cells/mm$^3$, platelets greater than 100,000 cells/mm$^3$, and Hgb 9 g/dL or greater.

**Ovarian Carcinoma, Small Cell Lung Cancer**

**IV:** **ADULTS, ELDERLY:** 1.5 mg/m$^2$/day over 30 min for 5 consecutive days, beginning on day 1 of 21-day course. Minimum of 4 courses recommended. If severe neutropenia (neutrophil count less than 1,500 cells/mm$^3$) occurs during treatment, reduce dose for subsequent courses by 0.25 mg/m$^2$ or administer filgrastim (G-CSF) no sooner than 24 hrs after last dose of topotecan.

**PO (Small Cell Lung Cancer):** **ADULTS, ELDERLY:** 2.3 mg/m$^2$/day for 5 days; repeat q21days (dose rounded to nearest 0.25 mg). **For severe neutropenia or prolonged neutropenia, platelets less than 25,000 cells/mm$^3$, recovery from grade 3 or 4 diarrhea:** Reduce dose by 0.4 mg/m$^2$/day for subsequent cycles.

**Cervical Cancer**

**IV:** **ADULTS, ELDERLY:** 0.75 mg/m$^2$/day for 3 days (followed by CISplatin 50 mg/m$^2$ on day 1 only). Repeat q21days (baseline neutrophil count greater than 1,500 cells/mm$^3$ and platelet count greater than 100,000 cells/mm$^3$). For severe febrile neutropenia (neutrophils less than 1,000 cells/mm$^3$ with temperature of
38°C) or platelet count less than 25,000 cells/mm³: Reduce dose to 0.6 mg/m²/day for subsequent cycles. If necessary, further decrease dose to 0.45 mg/m²/day.

**Dosage in Renal Impairment**

**IV:** No dosage adjustment is necessary in pts with mild renal impairment (CrCl 40–60 mL/min). For moderate renal impairment (CrCl 20–39 mL/min), give 0.75 mg/m².

**PO:** **CrCl 30–49 mL/min:** 1.5 mg/m²/day. May increase by 0.4 mg/m²/day following first cycle if no GI/hematologic toxicities occur. **CrCl less than 30 mL/min:** Decrease dose to 0.6 mg/m²/day. May increase by 0.4 mg/m²/day following first cycle if no GI/hematologic toxicities occur.

**Dosage in Hepatic Impairment**

No dose adjustment.

**Side effects**

**Frequent (77%–21%):** Nausea, vomiting, diarrhea, total alopecia, headache, dyspnea. **Occasional (9%–3%):** Paresthesia, constipation, abdominal pain. **Rare:** Anorexia, malaise, arthralgia, asthenia, myalgia.

**Adverse effects/toxic reactions**

Severe neutropenia (absolute neutrophil count [ANC] less than 500 cells/mm³) occurs in 60% of pts (develops at median of 11 days after day 1 of initial therapy). Thrombocytopenia occurs in 26% of pts. Severe anemia (RBC count less than 8 g/dL) occurs in 40% of pts (develops at median of 15 days after day 1 of initial therapy). Severe diarrhea may occur.

**Nursing considerations**

**Baseline assessment**

Offer emotional support. Assess CBC with differential before each dose. Myelosuppression may precipitate life-threatening hemorrhage, infection, anemia. If platelet count drops, minimize trauma to pt (e.g., IM injections, pt
positioning). Premedicate with antiemetics on day of treatment, starting at least 30 min before administration.

**Intervention/evaluation**

Assess for bleeding, signs of infection, anemia. Monitor hydration status, I&O, serum electrolytes (severe diarrhea, vomiting are common side effects). Monitor CBC for evidence of myelosuppression. Monitor renal function, LFT. Assess response to medication; provide interventions (e.g., small, frequent meals; antiemetics for nausea/vomiting). Question for complaints of headache. Assess breathing pattern for evidence of dyspnea.

**Patient/family teaching**

- Hair loss is reversible but new hair may have different color, texture.
- Diarrhea may cause dehydration, electrolyte depletion.
- Antiemetic and antidiarrheal medications may reduce side effects.
- Notify physician if diarrhea, vomiting, persistent fever, bruising/bleeding, yellowing of eyes/skin occur.
- Do not have immunizations without physician’s approval (drug lowers resistance).
- Avoid contact with those who have recently received live virus vaccine.

---

**torsemide**

tore-se-myde

**Demadex**

CLASSIFICATION
PHARMACOTHERAPEUTIC: Loop diuretic.
CLINICAL: Antihypertensive, diuretic.
Do not confuse torsemide with furosemide.

**Uses**

Treatment of hypertension either alone or in combination with other antihypertensives. (Not recommended for initial treatment of hypertension.) Edema associated with HF, hepatic/renal impairment.
Precautions

Contraindications: Hypersensitivity to torsemide or any sulfonylurea. Anuria, other sulfonylureas. Cautions: Pts with cirrhosis, hypotension, hypokalemia.

Action

Enhances excretion of sodium, chloride, potassium, water at ascending limb of loop of Henle. Reduces plasma, extracellular fluid volume. Therapeutic Effect: Produces diuresis, relieves edema; lowers B/P.

Pharmacokinetics

Lifespan considerations

Pregnancy/Lactation: Unknown if drug is distributed in breast milk. Children: Safety and efficacy not established. Elderly: No age-related precautions noted.

Interactions

DRUG: NSAIDs (e.g., ibuprofen, ketorolac, naproxen), aspirin may increase risk of renal impairment. May increase risk of digoxin toxicity associated with torsemide-induced hypokalemia. May increase risk of lithium toxicity. Other hypokalemia-causing medications (e.g., HCTZ) may increase risk of hypokalemia. HERBAL: Ephedra, ginseng, yohimbe, licorice may worsen hypertension. Black cohosh may increase antihypertensive effect. FOOD: None known. LAB VALUES: May increase serum BUN, creatinine, uric acid. May decrease serum calcium, chloride, magnesium, potassium, sodium.

Availability (Rx)

Injection Solution: 10 mg/mL. Tablets: 5 mg, 10 mg, 20 mg, 100 mg.
Administration/handling

**IV**

Rate of Administration

Flush IV line with 0.9% NaCl before and following administration.

- May give undiluted as IV push over minimum of 2 min.

Storage

- Store at room temperature.

**PO**

- Give without regard to food. Give with food to avoid GI upset, preferably with breakfast (prevents nocturia).

**IV compatibility**

Milrinone (Primacor).

**Indications/routes/dosage**

**Hypertension**

**PO: ADULTS, ELDERLY:** Initially, 2.5–5 mg/day. May increase to 10 mg/day if no response in 4–6 wks. If still not effective, add additional antihypertensive. Range: 5–10 mg/day.

**Edema Associated with HF**

**PO, IV: ADULTS, ELDERLY:** Initially, 10–20 mg/day. May increase by approximately doubling dose until desired therapeutic effect is attained. 

**Maximum dose:** PO: 200 mg; IV: 100–200 mg.

**Edema Associated with Chronic Renal Failure**

**PO, IV: ADULTS, ELDERLY:** Initially, 20 mg/day. May increase by approximately doubling dose until desired therapeutic effect is attained. 

**Maximum dose:** 200 mg/day.

**Hepatic Cirrhosis**
PO: ADULTS, ELDERLY: Initially, 5–10 mg/day given with aldosterone antagonist or potassium-sparing diuretic. May increase by approximately doubling dose until desired therapeutic effect is attained. **Maximum single dose:** 40 mg.

**Dosage in Renal/Hepatic Impairment**
No dose adjustment.

**Side effects**

**Frequent (10%–4%):** Headache, dizziness, rhinitis. **Occasional (3%–1%):** Asthenia, insomnia, nervousness, diarrhea, constipation, nausea, dyspepsia, edema, EKG changes, pharyngitis, cough, arthralgia, myalgia. **Rare (Less Than 1%):** Syncope, hypotension, arrhythmias.

**Adverse effects/toxic reactions**

Ototoxicity may occur with too-rapid IV administration or with high doses; must be given slowly. Overdose produces acute, profound water loss, volume/electrolyte depletion, dehydration, decreased blood volume, circulatory collapse.

**Nursing considerations**

**Baseline assessment**
Obtain serum electrolyte levels, esp. potassium. Obtain baseline weight; check for edema. Assess lungs for crackles, signs of HF. Obtain B/P.

**Intervention/evaluation**
Monitor B/P, serum electrolytes (esp. potassium), I&O, weight. Notify physician of any hearing abnormality. Note extent of diuresis. Assess lungs for rales. Check for signs of edema, particularly of dependent areas. Although less potassium is lost with torsemide than with furosemide, assess for signs of hypokalemia (change of muscle strength, tremor, muscle cramps, altered mental status, cardiac arrhythmias).
Patient/family teaching

- Take medication in morning to prevent nocturia.
- Expect increased urinary volume, frequency.
- Report palpitations, muscle weakness, cramps, nausea, dizziness.
- Do not take other medications (including OTC drugs) without consulting physician.
- Eat foods high in potassium such as whole grains (cereals), legumes, meat, bananas, apricots, orange juice, potatoes (white, sweet), raisins.

<table>
<thead>
<tr>
<th>trabectedin</th>
</tr>
</thead>
<tbody>
<tr>
<td>tra-bek-te-din</td>
</tr>
<tr>
<td>Yondelis</td>
</tr>
</tbody>
</table>

CLASSIFICATION
PHARMACOTHERAPEUTIC: Alkylating agent.
CLINICAL: Antineoplastic.

Uses

Treatment of unresectable or metastatic soft tissue sarcoma (liposarcoma or leiomyosarcoma) in pts who have received a prior anthracycline-containing regimen.

Precautions

Contraindications: Hypersensitivity reaction, anaphylactic reaction to trabectedin. Cautions: Baseline anemia, neutropenia, thrombocytopenia; chronic liver disease, cirrhosis, hepatic impairment, hepatitis; renal impairment; history of DVT, pulmonary embolism; recent MI, cardiomyopathy, HF. Concomitant use of strong CYP3A inducers, strong CYP3A inhibitors not recommended.

Action

Binds to guanine residues in the minor groove of DNA, leading to cell cycle disruption and cellular death. Therapeutic Effect: Inhibits tumor cell growth and metastasis.
Pharmacokinetics

Widely distributed. Metabolized in liver. Protein binding: 97%. Excreted in feces (58%), urine (6%). Hemodialysis not expected to enhance elimination. **Half-life:** 175 hrs.

Lifespan considerations

**Pregnancy/Lactation:** Avoid pregnancy; may cause fetal harm/malformations. Female pts of reproductive potential should use effective contraception during treatment and up to 2 mos after discontinuation. Breastfeeding not recommended. **Males:** Male pts with female partners of reproductive potential should use barrier methods, abstinence during treatment and up to 5 mos after discontinuation. May impair fertility in both females and males. **Children:** Safety and efficacy not established. **Elderly:** Safety and efficacy not established.

Interactions

**DRUG:** Strong CYP3A inducers (e.g., carBAMazepine, PHENobarbital, rifAMPin) may decrease concentration/effect. **Strong CYP3A inhibitors** (e.g., clarithromycin, ketoconazole, ritonavir) may increase concentration/effects. **HERBAL:** St. John’s wort may decrease concentration/effect. **FOOD:** Grapefruit products may increase concentration/effect. **LAB VALUES:** May decrease Hgb, Hct, platelets, neutrophils, RBCs; serum albumin, phosphate. May increase serum alkaline phosphatase, ALT, AST, bilirubin, CPK, creatinine. May reduce diagnostic effect of *Coccidioides immitis* skin test.

Availability (Rx)

**Powder for Reconstitution:** 1 mg.

Administration/handling

**IV**

**Reconstitution**

- Contents are hazardous; use cytotoxic precautions during handling and disposal.
- Reconstitute with 20 mL Sterile Water for Injection for final concentration of
0.05 mg/mL.
• Shake until fully dissolved.
• Visually inspect solution for particulate matter or discoloration. Solution should appear clear, colorless to pale brownish-yellow in color. Discard if solution is discolored or particles are observed.
• Dilute in 500 mL 0.9% NaCl or D5W bag.
• See manufacturer guidelines for materials/containers that are compatible with diluted solution.

**Infusion Guidelines**
• Premedicate with dexamethasone 20 mg IV (or appropriate corticosteroid) 30 min prior to each infusion.
• Infuse diluted solution immediately after reconstitution.
• Use an in-line, 0.2-micron polyethersulfone filter.
• Infuse via dedicated central venous line using an infusion pump.

**Rate of Administration**
• Infuse over 24 hrs.

**Storage**
• Refrigerate unused vials.
• Diluted solution must be administered within 30 hrs of reconstitution.

### IV incompatibilities
Do not mix or infuse with other medications.

**Indications/routes/dosage**

**Liposarcoma, Leiomyosarcoma**

**IV: ADULTS, ELDERLY:** 1.5 mg/m² once q3wks until disease progression or unacceptable toxicity.

**Dosage in Renal Impairment**

- **CrCl greater than or equal to 30 mL/min:** No dose adjustment.
- **CrCl greater less than 30 mL/min or end-stage renal disease:** Not specified; use caution.

**Dosage in Hepatic Impairment**
Mild impairment: No dose adjustment. Moderate impairment: 0.9 mg/m² once q3wks. Severe impairment: Not recommended.

Dose Reduction for Normal Hepatic Function or Mild Hepatic Impairment
Initial dose: 1.5 mg/m² once q3wks. First dose reduction: 1.2 mg/m² once q3wks. Second dose reduction: 1 mg/m² once q3wks.

Dose Reduction for Moderate Hepatic Impairment
Initial dose: 0.9 mg/m² once q3wks. First dose reduction: 0.6 mg/m² once q3wks. Second dose reduction: 0.3 mg/m² once q3wks.

Dose Modification

Hepatotoxicity
Serum ALT/AST greater than 2.5 times upper limit of normal (ULN): Delay next dose for up to 3 wks.
Serum alkaline phosphatase greater than 2.5 times ULN; serum ALT/AST greater than 5 times ULN; total serum bilirubin greater than ULN: Delay next dose for up to 3 wks, then resume at reduced dose level.

Hematologic Toxicity
Absolute neutrophil count (ANC) less than 1,500 cells/mm³: Delay next dose for up to 3 wks.
ANC less than 1,000 cells/mm³ with fever or infection; ANC less than 500 cells/mm³ lasting more than 5 days: Delay next dose for up to 3 wks, then resume at reduced dose level.
Platelet count less than 100,000 cells/mm³: Delay next dose for up to 3 wks.
Platelet count less than 25,000 cells/mm³: Delay next dose for up to 3 wks, then resume at reduced dose level.

Nonhematologic Toxicity
CPK greater than 2.5 times ULN: Delay next dose for up to 3 wks.
CPK greater than 5 times ULN: Delay next dose for up to 3 wks, then resume at reduced dose level.
Decreased LVEF less than lower limit of normal or clinical evidence of cardiomyopathy: Delay next dose for up to 3 wks.
Decreased LVEF with an absolute decrease of 10% or more from baseline and less than lower limit of normal, or clinical evidence of cardiomyopathy: Delay next dose for up to 3 wks, then resume at reduced dose level.
Any other grade 3 or 4 reaction: Delay next dose for up to 3 wks, then resume at reduced dose level.

Permanent Discontinuation
Permanently discontinue for persistent adverse effects requiring a delay of treatment for more than 3 wks; continued adverse effects after reducing dose to 1 mg/m² in pts with normal hepatic function, or 0.3 mg/m² in pts with preexisting moderate hepatic impairment; severe hepatic dysfunction with bilirubin 2 times ULN, and ALT/AST 3 times ULN, and alkaline phosphatase less than 2 times ULN in prior treatment cycle in pts with baseline normal hepatic function; exacerbation of hepatic dysfunction in pts with preexisting moderate hepatic impairment.

Side effects
Frequent (75%–25%): Nausea, fatigue, asthenia, malaise, vomiting, decreased appetite, constipation, diarrhea, peripheral edema, dyspnea, headache.
Occasional (15%–11%): Insomnia, arthralgia, myalgia, paresthesia.

Adverse effects/toxic reactions
Anemia, neutropenia, thrombocytopenia are expected responses to therapy. Life-threatening, sometimes fatal, neutropenic sepsis (3% of pts) may occur. Grade 3 or 4 neutropenia (43% of pts), febrile neutropenia (5% of pts) were reported. Fatal rhabdomyolysis, muscular toxicity may result in renal failure. CPK elevation occurred in 32% of pts; grade 3 or 4 CPK elevation occurred in 6% of pts. Hepatotoxicity, including hepatic failure, may occur. LFT elevation occurred in 70%–90% of pts. Cardiomyopathy including decreased ejection fraction, diastolic dysfunction, HF, right ventricular dysfunction reported in 6% of pts; grade 3 or 4 cardiomyopathy reported in 4% of pts. Drug extravasation may result in tissue necrosis requiring debridement. Other adverse effects may include phlebitis (15% of pts), pulmonary embolism (less than 10% of pts),
hypersensitivity reaction.

**Nursing considerations**

**Baseline assessment**

Obtain ANC, CBC, CPK, BMP, LFT; vital signs prior to each dose and periodically thereafter. Obtain baseline echocardiogram to assess LVEF. Verify placement of central venous line. Receive full medication history. Assess nutritional status. Question history of DVT, pulmonary embolism, cardiac disease, recent MI; renal/hepatic impairment; prior hypersensitivity reaction. Screen for active infection. Offer emotional support.

**Intervention/evaluation**

Monitor ANC, CBC for anemia, neutropenia, thrombocytopenia; CPK, serum creatinine for rhabdomyolysis, renal failure; LFT for hepatotoxicity; BMP for electrolyte imbalance (esp. in pts with diarrhea, vomiting, malnutrition); vital signs. Assess LVEF by echocardiogram at 2- to 3-mo intervals (or more frequently in pts with cardiomyopathy). Diligently screen for infections, sepsis. Monitor for DVT (leg or arm pain/swelling), rhabdomyolysis (decreased urinary output, amber-colored urine, fatigue, muscle pain/weakness), pulmonary embolism (sudden chest pain, dyspnea, hypoxia, tachycardia), HF (dyspnea, fatigue, palpitations, edema, exercise intolerance); hypersensitivity reaction; side effects of dexamethasone (e.g., hyperglycemia, weight loss, decreased appetite). Monitor I&O. Monitor daily pattern of bowel activity, stool consistency.

**Patient/family teaching**

• Treatment may depress your immune system and reduce your ability to fight infection. Report symptoms of infection such as body aches, chills, cough, fatigue, fever. Avoid those with active infection.
• Blood levels, echocardiograms will be routinely monitored.
• Life-threatening events, such as heart failure (shortness of breath, fast or slow heart rate, exercise intolerance, swelling of the ankles or legs), liver injury or failure (abdominal pain, easy bruising, clay-colored stools, dark-amber urine, fatigue, loss of appetite, yellowing of skin or eyes), muscle toxicity (muscle pain/weakness, kidney failure), blood clots in lungs (difficulty breathing, fast heart rate, chest pain), may occur.
- Avoid pregnancy. Female pts of childbearing potential should use effective contraception during treatment and for at least 2 mos after last dose. Do not breastfeed. Male pts with female partners of reproductive potential should use condoms during sexual activity for at least 5 mos after last dose.
- Treatment may impair fertility.
- Avoid grapefruit products, herbal supplements.
- Do not receive live vaccines.

**traMADol**

**tram-a-dol**

Apo-TraMADol

ConZip

Synapryn FusePaq

Ultram

**Fixed-Combination(s)**

**Ultracet:** traMADol/acetaminophen (a non-narcotic analgesic): 37.5 mg/325 mg.

**CLASSIFICATION**

PHARMACOTHERAPEUTIC: Centrally acting synthetic opioid.

CLINICAL: Analgesic.

Do not confuse traMADol with tapentadol, Toradol, or Trandate, or Ultram with Ultracet.

**Uses**

**Immediate-Release:** Management of moderate to moderately severe pain.

**Extended-Release:** Around-the-clock management of moderate to moderately severe pain for extended period.

**Precautions**

**Contraindications:** Hypersensitivity to traMADol, opioids. (Additional)

**Immediate-Release, Extended-Release:** Acute alcohol intoxication, concurrent...
use of centrally acting analgesics, hypnotics, opioids, psychotropic drugs, hypersensitivity to opioids. (Additional) ConZip: Severe/acute bronchial asthma, hypercapnia, significant respiratory depression. Caution: CNS depression, anoxia, advanced hepatic cirrhosis, respiratory depression, elevated ICP, history of seizures or risk for seizures, hepatic/renal impairment, treatment of acute abdominal conditions, opioid-dependent pts, head injury, myxedema, hypothyroidism, hypoadrenalism, pregnancy. Avoid use in pts who are suicidal or addiction prone, emotionally disturbed, depressed, heavy alcohol users, elderly pts, debilitated pts.

**Action**

Binds to mu-opioid receptors, inhibits reuptake of norepinephrine, serotonin, inhibiting ascending and descending pain pathways. Therapeutic Effect: Reduces pain.

**Pharmacokinetics**

**Lifespan considerations**

**Pregnancy/Lactation:** Crosses placenta. Distributed in breast milk. **Children:** Safety and efficacy not established in children 16 yrs or less. **Elderly:** Age-related renal impairment may require dosage adjustment.

**Interactions**

**DRUG:** Alcohol, other CNS depressants (e.g., LORazepam, morphine, zolpidem) may increase CNS depression. CarBAMazepine decreases concentration/effects. **CYP2D6 inhibitors** (e.g., PARoxetine), **CYP3A4 inhibitors** (e.g., clarithromycin, ketoconazole, ritonavir), triptans, selective...
serotonin reuptake inhibitors (SSRIs), tricyclic antidepressants (e.g., amitriptyline, doxepin) may increase risk of seizures, risk of serotonin syndrome. HERBAL: Gotu kola, kava kava, St. John’s wort, valerian may increase CNS depression. St. John’s wort may increase risk of serotonin syndrome. FOOD: None known. LAB VALUES: May increase serum creatinine, ALT, AST. May decrease Hgb. May cause proteinuria.

Availability (Rx)

Tablets (Immediate-Release) (Ultram): 50 mg. Capsules (Variable-Release) (ConZip): 100 mg (25 mg immediate/75 mg extended), 200 mg (50 mg immediate/150 mg extended), 300 mg (50 mg immediate/250 mg extended). Suspension, Oral (Synapryn FusePaq): 10 mg/mL.

Tablets (Extended-Release) (Ultram ER): 100 mg, 200 mg, 300 mg.

Administration/handling

PO

• Give without regard to meals but consistently with or without meals.
• Extended-Release: Swallow whole; do not break, crush, dissolve, or divide.

Indications/routes/dosage

Moderate to Moderately Severe Pain

PO (Immediate-Release): ADULTS, ELDERLY, CHILDREN 17 YRS AND OLDER: 50–100 mg q4–6h. Maximum: 400 mg/day for pts 75 yrs and younger; 300 mg/day for pts older than 75 yrs.

PO (Extended-Release): ADULTS, ELDERLY, CHILDREN 18 YRS AND OLDER: Initially, 100 mg once daily. Titrate q5days. Maximum: 300 mg once daily.

Dosage in Renal Impairment

Immediate-Release: For pts with CrCl less than 30 mL/min, increase dosing interval to q12h. Maximum: 200 mg/day. Do not use extended-release.
Dosage in Hepatic Impairment

Immediate-Release: Cirrhosis: Dosage is decreased to 50 mg q12h. Do not use extended-release with severe hepatic impairment.

Side effects

Frequent (25%–15%): Dizziness, vertigo, nausea, constipation, headache, drowsiness. Occasional (10%–5%): Vomiting, pruritus, CNS stimulation (e.g., nervousness, anxiety, agitation, tremor, euphoria, mood swings, hallucinations), asthenia, diaphoresis, dyspepsia, dry mouth, diarrhea. Rare (less than 5%): Malaise, vasodilation, anorexia, flatulence, rash, blurred vision, urinary retention/frequency, menopausal symptoms.

Adverse effects/toxic reactions

Seizures reported in pts receiving traMADol within recommended dosage range. May have prolonged duration of action, cumulative effect in pts with hepatic/renal impairment, serotonin syndrome (agitation, hallucinations, tachycardia, hyperreflexia). May cause suicidal ideation and behavior.

Nursing considerations

Baseline assessment

Assess onset, type, location, duration of pain. Assess drug history, esp. carBAMazepine, analgesics, CNS depressants, MAOIs. Review past medical history, esp. epilepsy, seizures. Assess renal function, LFT.

Intervention/evaluation

Patient/family teaching
• May cause dependence.
• Avoid alcohol, OTC medications (analgesics, sedatives).
• May cause drowsiness, dizziness, blurred vision.
• Avoid tasks requiring alertness, motor skills until response to drug is established.
• Report severe constipation, difficulty breathing, excessive sedation, seizures, muscle weakness, tremors, chest pain, palpitations.

<table>
<thead>
<tr>
<th>trametinib</th>
<th>tra-me-ti-nib</th>
</tr>
</thead>
<tbody>
<tr>
<td>Mekinist</td>
<td></td>
</tr>
</tbody>
</table>

**CLASSIFICATION**

**PHARMACOTHERAPEUTIC:** Kinase inhibitor.

**CLINICAL:** Antineoplastic.

Do not confuse trametinib with imatinib or tipifarnib.

**Uses**

Used as a single agent or in combination with dabrafenib for treatment of unresectable or metastatic melanoma with BRAF V600E or V600L mutations, as detected by FDA-approved test. Single-agent regimen is not indicated in pts who have received prior BRAF-inhibitor therapy.

**Precautions**

**Contraindications:** Hypersensitivity to trametinib. **Cautions:** Cardiac/pulmonary impairment, preexisting diabetes or diabetes.

**Action**

Inhibits mitogen-activated extracellular kinase (MEK). **Therapeutic Effect:** Inhibits tumor cell growth, causing apoptosis.

**Pharmacokinetics**

Rapidly absorbed after PO administration. Protein binding: 97.4%. Peak plasma
concentration: 1.5 hrs. Metabolized in liver. Excreted in feces (80%), urine (20%). **Half-life:** 3.9–4.8 days.

**Lifespan considerations**

**Pregnancy/Lactation:** Avoid pregnancy. May cause fetal harm. Must use effective nonhormonal contraception during treatment and for at least 4 wks after discontinuation (intrauterine device, barrier methods). Unknown if distributed in breast milk. Must either discontinue breastfeeding or discontinue treatment. **Children:** Safety and efficacy not established. **Elderly:** May have increased risk of adverse effects, skin lesions, primary malignancies. **Males:** May decrease sperm count.

**Interactions**

**DRUG:** May decrease levels/effect of ARIPiprazole, ibrutinib, SAXagliptin, simeprevir. **HERBAL:** None known. **FOOD:** High-fat meals may decrease absorption/effect. **LAB VALUES:** **SINGLE REGIMEN:** May increase serum alkaline phosphatase, ALT, AST. May decrease serum albumin; Hgb, Hct. **COMBINATION REGIMEN:** May increase serum alkaline phosphatase, ALT, AST, bilirubin, calcium, creatinine, glucose, GGT, potassium. May decrease Hgb, Hct, leukocytes, lymphocytes, neutrophils, platelets; serum albumin, calcium, magnesium, phosphorus, potassium, sodium.

**Availability (Rx)**

**Tablets:** 0.5 mg, 2 mg.

**Administration/handling**

**PO**

• Administer at least 1 hr before or 2 hrs after meal.

**Indications/routes/dosage**

**Melanoma**

**PO:** **ADULTS/ELDERLY:** 2 mg once daily (either as a single agent or in
combination with dabrafenib). Continue until disease progression or unacceptable toxicity.

**Dose Reduction Schedule**

**Trametinib Regimen:** FIRST DOSE REDUCTION: 1.5 mg once daily. SECOND DOSE REDUCTION: 1 mg once daily. Discontinue if unable to tolerate 1-mg dose.

**Dabrafenib Combination Regimen:** FIRST DOSE REDUCTION: 100 mg twice daily. SECOND DOSE REDUCTION: 75 mg twice daily. THIRD DOSE REDUCTION: 50 mg twice daily. Discontinue if unable to tolerate 50-mg dose.

**Dose Modification**

Based on Common Terminology Criteria for Adverse Events (CTCAE) grading 1–4.

**Cardiac:** ASYMPTOMATIC DECREASE IN LEFT VENTRICULAR EJECTION FRACTION (LVEF) GREATER THAN 10% FROM BASELINE: Withhold trametinib up to 4 wks. If LVEF improved, resume at lower dose level. Discontinue if not improved. Do not modify dabrafenib dose. SYMPTOMATIC HF OR DECREASE IN LVEF GREATER THAN 20% FROM BASELINE: Discontinue trametinib. Withhold dabrafenib until improved, then resume at lower dose level.

**CUTANEOUS EVENTS:** INTOLERABLE GRADE 2 SKIN TOXICITY OR GRADE 3–4 TOXICITY: Withhold both regimens for up to 3 wks. If improved, resume both at lower dose level. Discontinue both regimens if not improved. FEBRILE EVENTS: FEVER OF 101.3°F–104°F: Do not modify trametinib dose. Withhold dabrafenib until fever resolved, then resume at either same dose or lower dose level. FEVER GREATER THAN 104°F OR FEVER COMPLICATED BY DEHYDRATION, HYPOTENSION, RENAL FAILURE: Withhold trametinib until resolved, then resume at either same dose or lower dose level. Withhold dabrafenib until resolved, then resume at either lower dose level or discontinue.

**New Primary Malignancies:** CUTANEOUS: No changes required for either regimen. NONCUTANEOUS: Do not change trametinib dose. Discontinue dabrafenib in pts who develop RAS mutation-positive malignancies.
Nonspecific Adverse Reactions: INTOLERABLE GRADE 2 OR ANY GRADE 3: Withhold both regimens until resolved to grade 0–1, then resume at lower dose level. Discontinue both regimens if not improved. FIRST OCCURRENCE OF ANY GRADE 4 REACTIONS: Withhold both regimens until resolved to grade 0–1, then resume at lower dose level or discontinue.

Ocular Toxicities: GRADE 2–3 RETINAL PIGMENT EPITHELIAL DETACHMENTS: Withhold trametinib up to 3 wks. If improved to grade 0–1, resume at lower dose level. Discontinue if not improved. Do not modify dabrafenib. RETINAL VEIN OCCLUSION: Discontinue trametinib. Do not modify dabrafenib. UVEITIS OR IRITIS: Do not modify trametinib. Withhold dabrafenib for up to 6 wks. If improved to grade 0–1, then resume at same dose level. Discontinue if not improved.

Pulmonary: INTERSTITIAL LUNG DISEASE: Discontinue trametinib. Do not modify dabrafenib.

Venous Thromboembolism (Uncomplicated DVT or PE): Withhold trametinib for up to 3 wks. If improved to grade 0–1, then resume at lower dose level. Discontinue if not improved. Do not modify dabrafenib. LIFE-THREATENING PE: Discontinue both regimens.

Dosage in Renal/Hepatic Impairment
No dose adjustment.

Side effects

Single Regimen:
Frequent (57%–32%): Rash, diarrhea, lymphedema, peripheral edema. Occasional (19%–10%): Dermatitis acneiform, hypertension, stomatitis, mouth ulceration, mucosal ulceration, abdominal pain, dry skin, pruritus, paronychia, folliculitis, cellulitis, dizziness, dysgeusia, blurred vision, dry eye.

Combination Regimen:
Frequent (71%–40%): Pyrexia, chills, fatigue, rash, nausea, vomiting. Occasional (36%–11%): Diarrhea, abdominal pain, peripheral edema, headache, cough, arthralgia, night sweats, myalgia, constipation, decreased appetite, back pain, dry skin, insomnia, dermatitis acneiform, dizziness, muscle spasm, extremity pain, actinic keratosis, erythema, oral/throat pain, urinary tract
infection, pruritus, dry mouth, dehydration.

**Adverse effects/toxic reactions**

Primary malignancies including basal or squamous cell carcinoma, keratoacanthoma, pancreatic adenocarcinoma, glioblastoma (brain cancer) reported. DVT, PE reported in 9% of pts. May increase cell proliferation of wild-type BRAF melanoma or new malignant melanomas. Serious, sometimes fatal intracranial or gastric bleeding occurred in 5% of pts. Other hemorrhagic events may include conjunctival/gingival/rectal/hemorrhoidal/vaginal bleeding, epistaxis (nosebleed), melena (bloody stools). Cardiomyopathy, HF, decreased LVEF reported in 7%–9% of pts. Ocular toxicities such as retinal vein occlusion, retinal detachment, vision loss, glaucoma, uveitis, iritis reported. Cough, dyspnea, hypoxia, pleural effusion, infiltrates may indicate interstitial lung disease. Serious febrile reactions may lead to renal failure, severe dehydration, hypotension, rigors. Skin toxicities including palmar-plantar erythrodysesthesia syndrome (PPES), papilloma have occurred. Hyperglycemia reported in 2%–5% of pts. Other effects may include hypertension, rhabdomyolysis. May prolong QT interval of cardiac cycle.

**Nursing considerations**

**Baseline assessment**

Obtain baseline CBC, serum metabolic panel (with LFT), magnesium, phosphate, ionized calcium, capillary glucose level, vital signs. Obtain BRAF V600E mutation history, negative pregnancy status, ophthalmologic exam with visual acuity, echocardiogram, EKG before initiating treatment. Assess skin for moles, lesions, papillomas. Question current breastfeeding status. Receive full medication history including herbal products. Question any history as listed in PRECAUTIONS. Offer emotional support.

**Intervention/evaluation**

Offer emotional support. Monitor CBC, serum electrolytes, capillary blood glucose, stool characteristics routinely. Monitor for signs of hyperglycemia (thirst, polyuria, confusion, dehydration). Assess skin for new lesions, toxicities every 2 mos during treatment and at least 6 mos after discontinuation. Obtain
LVEF by echocardiogram 1 mo after initiation, then every 2–3 mos; ophthalmologic exam with any vision changes. Immediately report any altered mental status, bleeding events, vision changes, eye pain/swelling/infection, fever, urinary changes. Screen for bleeding of any kind. If dyspnea or leg swelling occurs, contact physician and initiate appropriate medical therapy (may require oxygen therapy, EKG, or radiologic test to rule out DVT, PE, or ILD).

**Patient/family teaching**

- Blood work, cardiac function tests, eye exams will be performed routinely.
- Treatment may lead to heart failure, vision changes, lung complications, difficulty breathing, fever, skin toxicities (such as severe rash, peeling), high blood pressure, severe diarrhea.
- Report bloody stools/urine, heavy menstruation, or nosebleeds.
- Do not breastfeed.
- Avoid pregnancy; nonhormonal contraception should be used during treatment and up to 4 wks after treatment.
- Take medication at least 1 hr before or at least 2 hrs after meal (food reduces absorption).
- Report any increased urination, thirst, confusion (may indicate high blood sugar); chest pain, eye pain, fever, leg swelling, new skin moles or lesions, vision changes.
- Minimize sunlight exposure.
- Males may experience a decreased sperm count.
- Report any newly prescribed medications.

---

**trastuzumab**
tras-too-zoo-mab

**Herceptin**

**CLASSIFICATION**
PHARMACOTHERAPEUTIC: HER2 receptor antagonist. Monoclonal antibody.
CLINICAL: Antineoplastic.

**BLACK BOX ALERT**
Anaphylactic reaction, infusion reaction, acute respiratory distress syndrome have been associated with fatalities. Reduction in left ventricular ejection fraction, severe heart failure may result in thrombus formation, stroke, cardiac death. Exposure during
pregnancy may result in pulmonary hypoplasia, skeletal malformations, neonatal death.

Do not confuse trastuzumab with ado-trastuzumab.

**Uses**

Treatment of HER2-overexpressing breast cancer (adjuvant), metastatic breast cancer, metastatic gastric or gastroesophageal junction adenocarcinoma (in pts without prior treatment). **OFF-LABEL:** Treatment of HER2-positive metastatic breast cancer in pts who have not received prior anti-HER2 therapy or in pts whose cancer has progressed on prior trastuzumab therapy (in combination with lapatinib).

**Precautions**

**Contraindications:** Hypersensitivity to trastuzumab. **Cautions:** Preexisting cardiac disease or dysfunction, preexisting pulmonary disease or extensive pulmonary tumor involvement, pregnancy.

**Action**

Binds to HER2 protein, overexpressed in 25%–30% of primary breast cancers, inhibiting proliferation of tumor cells. **Therapeutic Effect:** Inhibits growth of tumor cells, mediates antibody-dependent cellular cytotoxicity.

**Pharmacokinetics**

**Half-life:** 11–23 days.

**Lifespan considerations**

**Pregnancy/Lactation:** Women should use effective contraception during treatment and for at least 7 mos after discontinuation. Unknown if distributed in breast milk. Breastfeeding not recommended. **Children:** Safety and efficacy not established. **Elderly:** Age-related cardiac dysfunction may require dosage adjustment.
Interactions

**DRUG:** None significant. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** None significant.

Availability (Rx)

**Injection, Powder for Reconstitution:** 440 mg.

Administration/handling

**IV**

**Reconstitution**
- Reconstitute with 20 mL Bacteriostatic Water for Injection to yield concentration of 21 mg/mL.
- Add calculated dose to 250 mL 0.9% NaCl (do not use D₅W).
- Gently mix contents in bag.

**Rate of Administration**
- Do not give IV push or bolus.
- Give loading dose (4 mg/kg) over 90 min. Give maintenance infusion (2 mg/kg) over 30 min.

**Storage**
- Refrigerate.
- Reconstituted solution appears colorless to pale yellow.
- Reconstituted solution in vial is stable for 28 days if refrigerated after reconstitution with Bacteriostatic Water for Injection (if using Sterile Water for Injection without preservative, use immediately; discard unused portions).
- Solution diluted in 250 mL 0.9% NaCl stable for 24 hrs if refrigerated.

**IV incompatibilities**

Do not mix with D₅W or any other medications.

Indications/routes/dosage

**Breast Cancer (Adjuvant)**
IV: ADULTS, ELDERLY: (With concurrent PACLitaxel or DOCEtaxel): Initially, 4 mg/kg as 90-min infusion, then 2 mg/kg wkly as 30-min infusion for 12 wks followed 1 wk later (when concurrent chemotherapy completed) by 6 mg/kg infusion over 30–90 min q3wks for total therapy duration of 52 wks. (With DOCEtaxel/CARBOplatin): Initially, 4 mg/kg as 90-min infusion, then 2 mg/kg wkly as 30-min infusion for a total of 18 wks, followed 1 wk later (when concurrent chemotherapy completed) by 6 mg/kg infused over 30–90 min q3wks for total therapy duration of 52 wks. (Following multimodality chemotherapy): Initially, 8 mg/kg over 90 min, then 6 mg/kg over 30–90 min q3wks for total of 52 wks.

Breast Cancer (Metastatic)
IV: ADULTS, ELDERLY: (Either as single agent or in combination with PACLitaxel): Initially, 4 mg/kg as 90-min infusion, then 2 mg/kg as 30-min infusion wkly until disease progression.

Gastric Cancer
IV: ADULTS, ELDERLY: (In combination with CISplatin and either capecitabine or fluorouracil for 6 cycles, then as monotherapy): Initially, 8 mg/kg over 90 min, then 6 mg/kg over 30–90 min q3wks until disease progression.

Dosage Adjustment in Cardiotoxicity
Left ventricular ejection fraction (LVEF) 16% or greater decrease from baseline WNL (within normal limits) or LVEF below normal limits and 10% or greater decrease from baseline: Hold treatment for 4 wks. Repeat LVEF q4wks. Resume therapy if LVEF returns to normal limits in 4–8 wks and remains at 15% or less decrease from baseline.

Dosage in Renal/Hepatic Impairment
No dose adjustment.

Side effects
Frequent (Greater Than 20%): Pain, asthenia, fever, chills, headache, abdominal pain, back pain, infection, nausea, diarrhea, vomiting, cough,
dyspnea. **Occasional (15%–5%)**: Tachycardia, HF, flu-like symptoms, anorexia, edema, bone pain, arthralgia, insomnia, dizziness, paresthesia, depression, rhinitis, pharyngitis, sinusitis. **Rare (Less Than 5%)**: Allergic reaction, anemia, leukopenia, neuropathy, herpes simplex.

**Adverse effects/toxic reactions**

Cardiomyopathy, ventricular dysfunction, HF occur rarely. Pancytopenia may occur.

**Nursing considerations**

**Baseline assessment**

Evaluate left ventricular function. Obtain baseline echocardiogram, EKG, multigated acquisition (MUGA) scan. Obtain CBC at baseline and at regular intervals during therapy.

**Intervention/evaluation**

**Patient/family teaching**

• Do not have immunizations without physician’s approval (lowers resistance).
• Avoid contact with those who have recently taken oral polio vaccine.
• Avoid crowds, those with infection.

---

| traZODone |
| traz-o-done |
| Apo-TraZODone |
| Novo-TraZODone |
| Oleptro |
| CLASSIFICATION |
**PHARMACOTHERAPEUTIC**: Serotonin reuptake inhibitor.

**CLINICAL**: Antidepressant.

**BLACK BOX ALERT**
Increased risk of suicidal ideation and behavior in children, adolescents, young adults 18–24 yrs with major depressive disorder, other psychiatric disorders.

Do not confuse traZODone with traMADol or ziprasidone.

**Uses**
Treatment of major depressive disorder (MDD). **OFF-LABEL**: Insomnia.

**Precautions**

**Contraindications**: Hypersensitivity to traZODone. Use of MAOIs (concurrently or within 14 days of discontinuing traZODone or MAOI); initiation in pt receiving linezolid or IV methylene blue. **Cautions**: Cardiac disease, arrhythmias, cerebrovascular disease, hepatic/renal impairment, pts at high risk of suicide. Conditions predisposing to priapism (e.g., sickle cell anemia); concurrent use of antihypertensives; history of seizure disorder or conditions predisposing to seizures (e.g., alcoholism); elderly pts.

**Action**
Blocks reuptake of serotonin at neuronal presynaptic membranes, increasing its availability at postsynaptic receptor sites. **Therapeutic Effect**: Relieves depression.

**Pharmacokinetics**
Well absorbed from GI tract. Protein binding: 85%–95%. Metabolized in liver. Primarily excreted in urine. Unknown if removed by hemodialysis. **Half-life**: 5–9 hrs (increased in elderly).

**Lifespan considerations**

**Pregnancy/Lactation**: Drug crosses placenta; minimally distributed in breast
milk. **Children:** Safety and efficacy not established in pts younger than 6 yrs. **Elderly:** More likely to experience sedative, hypotensive effects; lower dosage recommended.

**Interactions**

**DRUG:** CYP3A4 inhibitors (e.g., ritonavir, ketoconazole) increase concentration/effects. May increase concentration of **digoxin, phenytoin.**

**HERBAL:** Gotu kola, kava kava, St. John’s wort, valerian may increase CNS depression and serotonin syndrome. **FOOD:** None known. **LAB VALUES:** May decrease WBC, neutrophil counts.

**Availability (Rx)**

**Tablets:** 50 mg, 100 mg, 150 mg, 300 mg.  

**Tablets: (Extended-Release [Oleptro]):** 150 mg, 300 mg.

**Administration/handling**

**PO**

- **(Immediate-Release):** Give shortly after snack, meal (reduces risk of dizziness).
- Tablets may be crushed.
- **(Extended-Release):** Give whole or break in half along score line but do not crush or chew. Take on empty stomach.

**Indications/routes/dosage**

**Alert** Therapeutic effect may take up to 6 wks to occur.

**Depression**

**PO: ADULTS: (Immediate-Release):** Initially, 150 mg/day in 3 equally divided doses. Increase by 50 mg/day at 3- to 4-day intervals until therapeutic response is achieved. **Maximum:** 600 mg/day (inpatients); 400 mg/day (outpatients).  

**ELDERLY:** Initially, 25–50 mg at bedtime. May increase by 25–50 mg every 3–7 days. Range: 75–150 mg/day. **Tablets (Extended-Release):** ADULTS, **ELDERLY:** Initially, 150 mg once daily. May increase by 75 mg q3days.
Maximum: 375 mg/day. ADOLESCENTS 13–18 YRS: (Immediate-Release): Initially, 25–50 mg/day. May increase to 100–150 mg/day in divided doses. CHILDREN 6–12 YRS: (Immediate-Release): Initially, 1.5–2 mg/kg/day in divided doses. May increase gradually q3–4 days to 6 mg/kg/day in 3 divided doses.

Dosage in Renal/Hepatic Impairment
Use caution.

Side effects
Frequent (9%–3%): Drowsiness, dry mouth, light-headedness, dizziness, headache, blurred vision, nausea, vomiting. Occasional (3%–1%): Nervousness, fatigue, constipation, myalgia/arthralgia, mild hypotension. Rare: Photosensitivity reaction.

Adverse effects/toxic reactions
Priapism, altered libido, retrograde ejaculation, impotence occur rarely. Appears to be less cardiotoxic than other antidepressants, although arrhythmias may occur in pts with preexisting cardiac disease.

Nursing considerations
Baseline assessment
Assess mental status, mood, behavior. For pts on long-term therapy, serum hepatic/renal function tests, blood counts should be performed periodically. Elderly pts are more likely to experience sedative, hypotensive effects. Question history as listed in PRECAUTIONS.

Intervention/evaluation
Monitor for suicidal ideation (esp. at beginning of therapy or dosage change). Assess appearance, behavior, speech pattern, level of interest, mood. Monitor WBC, neutrophil count, hepatic enzymes. Assist with ambulation if dizziness, light-headedness occurs.
Patient/family teaching

- Immediately discontinue medication, consult physician if priapism occurs.
- **Immediate-Release:** May take after meal, snack.
- **Extended-Release:** Take on empty stomach.
- May take at bedtime if drowsiness occurs.
- Change positions slowly to avoid hypotensive effect.
- Avoid tasks that require alertness, motor skills until response to drug is established.
- Tolerance to sedative, anticholinergic effects usually develops during early therapy.
- Photosensitivity to sun may occur.
- Dry mouth may be relieved by sugarless gum, sips of water.
- Report visual disturbances, worsening depression, suicidal ideation, unusual changes in behavior.
- Do not abruptly discontinue medication.
- Avoid alcohol.

**tretinoin**

- tret-i-noyn
- Atralin
- Avita
- Refissa
- Rejuva-A
- Renova
- Retin-A
- Retin-A Micro
- Tretin X
- Vesnoid

**Fixed-Combination(s)**

With octyl methoxycinnamate and oxybenzone, moisturizers, and SPF-12, a sunscreen *(Retin-A Regimen Kit).*

◆ CLASSIFICATION
PHARMACOTHERAPEUTIC: Retinoid.
CLINICAL: Antiacne, transdermal, antineoplastic.

■ BLACK BOX ALERT ■ High risk for teratogenicity; major fetal abnormalities, spontaneous abortions. Pts with acute promyelocytic leukemia (APL) are at severe risk for reactions (fever, dyspnea, acute respiratory distress syndrome [pulmonary infiltrates, pleural effusions, pericardial effusions]), edema, hepatic, renal, and/or multiorgan failure; 40% develop leukocytosis.

Do not confuse tretinoin with ISOtretinoin, phenytoin, or triamcinolone.

Uses

Precautions

Action

Pharmacokinetics

**Topical:** Minimally absorbed. **PO:** Well absorbed following PO administration. Protein binding: greater than 95%. Metabolized in liver. Primarily excreted in urine. **Half-life:** 0.5–2 hrs.

**Lifespan considerations**

**Pregnancy/Lactation:** **Topical:** Use during pregnancy only if clearly necessary. Unknown if distributed in breast milk. **PO:** Teratogenic, embryotoxic effect. **Children/Elderly:** Safety and efficacy not established.

**Interactions**

**DRUG:** **TOPICAL:** Retinoids (e.g., acitretin, oral tretinoin) may increase drying, irritative effects. **PO:** Tetracyclines may increase risk of pseudotumor cerebri, intracranial hypertension. **Aminocaproic acid** may increase risk of thrombotic complications. **CYP3A4 inducers** (e.g., PHENobarbital, rifAMPin) may decrease concentration/effects. **CYP3A4 inhibitors** (e.g., clarithromycin, ketoconazole, ritonavir) may increase concentration, risk of toxicity. **HERBAL:** St. John’s wort may decrease concentration/effects. Dong quai, St. John’s wort may increase photosensitization. **Vitamin A** supplementation may increase vitamin A toxicity. **FOOD:** None known. **LAB VALUES:** **PO:** Leukocytosis occurs commonly (40%). May elevate serum hepatic function tests, cholesterol, triglycerides.

**Availability (Rx)**

**Cream:** 0.02% (Renova), 0.025% (Avita, Retin-A, Tretin X), 0.05% (Refissa, Retin-A, Tretin X), 0.1% (Retin-A). **Gel:** 0.01% (Retin-A, Tretin X), 0.025% (Avita, Retin-A, Tretin X), 0.04% (Retin-A Micro), 0.1% (Retin-A Micro).

**Capsules:** (Vesanoid): 10 mg.

**Administration/handling**

**PO**

- Do not crush/break capsule.
- Administer with a meal.
**Topical**
- Thoroughly cleanse area before applying tretinoin.
- Lightly cover only affected area. Liquid may be applied with fingertip, gauze, cotton; do not rub onto unaffected skin.
- Keep medication away from eyes, mouth, angles of nose, mucous membranes.
- Wash hands immediately after application.

**Indications/routes/dosage**

**Acne**

Topical: **ADULTS, CHILDREN 12 YRS AND OLDER:** Apply once daily at bedtime or in the evening.

**Remission Induction in Acute Promyelocytic Leukemia (APL)**

PO: **ADULTS, ELDERLY, CHILDREN:** 45 mg/m²/day given as 2 evenly divided doses until complete remission is documented. Discontinue therapy 30 days after complete remission or after 90 days of treatment, whichever comes first.

**Remission Maintenance in APL**

PO: **ADULTS, ELDERLY:** 45 mg/m²/day in 2 divided doses for 15 days q3mos for 2 yrs. **CHILDREN:** 25 mg/m²/day in 2 divided doses for 15 days q3mos for 2 yrs.

**Dosage in Renal/Hepatic Impairment**

No dose adjustment.

**Side effects**

**Topical:** Temporary change in pigmentation, photosensitivity. Local inflammatory reactions (peeling, dry skin, stinging, erythema, pruritus) are to be expected and are reversible with discontinuation of tretinoin. **Frequent: PO (87%–54%):** Headache, fever, dry skin/oral mucosa, bone pain, nausea, vomiting, rash. **Occasional: PO (26%–6%):** Mucositis, earache or feeling of fullness in ears, flushing, pruritus, diaphoresis, visual disturbances,
hypotension/hypertension, dizziness, anxiety, insomnia, alopecia, skin changes.

**Rare (Less Than 6%):** Altered visual acuity, temporary hearing loss.

### Adverse effects/toxic reactions

**PO:** Retinoic acid syndrome (fever, dyspnea, weight gain, abnormal chest auscultatory findings [pulmonary infiltrates, pleural/pericardial effusions], episodic hypotension) occurs commonly (25%), as does leukocytosis (40%). Syndrome generally occurs during first month of therapy (sometimes after first dose). High-dose steroids (dexamethasone 10 mg IV) at first suspicion of syndrome reduce morbidity, mortality. Pseudotumor cerebri may be noted, esp. in children (headache, nausea, vomiting, visual disturbances). **Topical:** Possible tumorigenic potential when combined with ultraviolet radiation.

### Nursing considerations

#### Baseline assessment

**PO:** Inform women of childbearing potential of risk to fetus if pregnancy occurs. Instruct on need for use of 2 reliable forms of contraceptives concurrently during therapy and for 1 mo after discontinuation of therapy, even in infertile women. Pregnancy test should be obtained within 1 wk before institution of therapy. Obtain initial serum LFT, cholesterol, triglyceride levels.

#### Intervention/evaluation

**PO:** Monitor LFT, hematologic, coagulation profiles, cholesterol, triglycerides. Monitor for signs/symptoms of pseudotumor cerebri in children.

#### Patient/family teaching

- **Topical:** Avoid exposure to sunlight, tanning beds; use sunscreens, protective clothing.
- Protect affected areas from wind, cold.
- If skin is already sunburned, do not use drug until fully healed.
- Keep tretinoin away from eyes, mouth, angles of nose, mucous membranes.
- Do not use medicated, drying, abrasive soaps; wash face no more than 2–3 times/day with gentle soap.
- Avoid use of preparations containing alcohol, menthol, spice, lime (e.g.,
shaving lotions, astringents, perfume).
• Mild redness, peeling are expected; decrease frequency or discontinue medication if excessive reaction occurs.
• Nonmedicated cosmetics may be used; however, cosmetics must be removed before tretinoin application.
• Improvement noted during first 24 wks of therapy.
• **Antiacne:** Therapeutic results noted in 2–3 wks; optimal results in 6 wks.
• **Oral:** Avoid tasks requiring motor skills, alertness until response to drug is established.
• Avoid alcohol.
• Avoid exposure to sunlight, tanning beds.
• Report persistent vomiting, diarrhea, unusual bleeding/bruising, acute abdominal pain, vision changes, or if pregnancy is suspected.

| trospium  
| tro-spee-um  
| Trosec  

**CLASSIFICATION**

PHARMACOTHERAPEUTIC: Anticholinergic.
CLINICAL: Antispasmodic.

**Uses**

Treatment of overactive bladder with symptoms of urge urinary incontinence, urgency, urinary frequency.

**Precautions**

**Contraindications:** Hypersensitivity to trospium. Gastric retention, uncontrolled narrow-angle glaucoma, urinary retention. **Cautions:** Decreased GI motility, renal/hepatic impairment, obstructive GI disorders, ulcerative colitis, intestinal atony, myasthenia gravis, controlled narrow-angle glaucoma, bladder flow obstruction, Alzheimer’s disease, hot weather/exercise, elderly pts.

**Action**
Antagonizes effect of acetylcholine on muscarinic receptors, producing parasympatholytic action. **Therapeutic Effect:** Reduces smooth muscle tone in bladder.

**Pharmacokinetics**

Minimally absorbed after PO administration. Protein binding: 50%–85%. Distributed in plasma. Excreted in feces (82%), urine (6%). **Half-life:** 20 hrs.

**Lifespan considerations**

**Pregnancy/Lactation:** Unknown if drug crosses placenta or is distributed in breast milk. **Children:** Safety and efficacy not established. **Elderly:** Higher incidence of dry mouth, constipation, dyspepsia, UTI, urinary retention in pts 75 yrs and older.

**Interactions**

**DRUG:** Other anticholinergic agents increase severity, frequency of side effects, may alter absorption of other drugs due to anticholinergic effects on GI motility. **Morphine, procainamide, tenofovir, vancomycin** may increase concentration. **HERBAL:** None significant. **FOOD:** High-fat meals may reduce absorption. **LAB VALUES:** None significant.

**Availability (Rx)**

**Tablets:** 20 mg. **Capsules, Extended-Release:** 60 mg.

**Administration/handling**

**PO**

- Store at room temperature.
- Give at least 1 hr before meals or on an empty stomach.
- Do not break, crush, dissolve, or divide tablets or extended-release capsules; swallow whole.
- Administer tablets at bedtime, capsules in morning with full glass of water, 1 hr before eating.
Indications/routes/dosage

Overactive Bladder

PO: ADULTS: (Immediate-Release): 20 mg twice daily. ELDERLY 75 YRS AND OLDER: 20 mg once daily at bedtime. (Extended-Release): 60 mg once daily.

Dosage in Renal Impairment

For pts with CrCl less than 30 mL/min, immediate-release dosage reduced to 20 mg once daily at bedtime. Extended-release not recommended.

Dosage in Hepatic Impairment

Mild impairment: No dose adjustment. Moderate to severe impairment: Use with caution.

Side effects

Frequent (20%): Dry mouth. Occasional (10%–4%): Constipation, headache. Rare (Less Than 2%): Fatigue, upper abdominal pain, dyspepsia (heartburn, indigestion, epigastric pain), flatulence, dry eyes, urinary retention.

Adverse effects/toxic reactions

Overdose may result in severe anticholinergic effects, characterized by nervousness, restlessness, nausea, vomiting, confusion, diaphoresis, facial flushing, hypertension, hypotension, respiratory depression, irritability, lacrimation. Supraventricular tachycardia and hallucinations occur rarely.

Nursing considerations

Baseline assessment

Assess for presence of dysuria, urinary urgency, frequency, incontinence.

Intervention/evaluation

Monitor for symptomatic relief. Monitor I&O; palpate bladder for retention.
Monitor daily pattern of bowel activity, stool consistency. Dry mouth may be relieved by sips of tepid water.

**Patient/family teaching**

- Report nausea, vomiting, diaphoresis, increased salivary secretions, palpitations, severe abdominal pain.
- Swallow tablets, extended-release capsules whole.
- Give 1 hr before meals.

- [Canadian trade name](#)
- [High Alert drug](#)

*underlined* underlined – top prescribed drug
**umeclidinium**

ue-**mek-**li-din-ee-um

**Incruse Ellipta**

**Fixed-Combination(s)**

**Anoro Ellipta:** umeclidinium/vilanterol (bronchodilator): 62.5 mcg/25 mcg.

**Trelegy Ellipta:** umeclidium/fluticasone (corticosteroid)/vilanterol (bronchodilator): 62.5 mcg/100 mcg/25 mcg.

**CLASSIFICATION**

**PHARMACOTHERAPEUTIC:** Anticholinergic.

**CLINICAL:** Bronchodilator.

Do not confuse umeclidinium with aclidinium or clidinium.

**Uses**

Long-term, once-daily maintenance treatment of airflow obstruction in pts with COPD including chronic bronchitis and/or emphysema.

**Precautions**

**Contraindications:** Hypersensitivity to umeclidinium. Severe hypersensitivity to milk proteins or any drug components. **Cautions:** Bladder neck obstruction, myasthenia gravis, narrow-angle glaucoma, prostatic hypertrophy, urinary retention. Not recommended in pts with acutely deteriorating COPD requiring emergent relief of acute symptoms.

**Action**
Inhibits muscarinic M₃ receptor in lungs, resulting in relaxation of bronchial smooth muscle. **Therapeutic Effect:** Relieves bronchospasm, reduces airway resistance, improves bronchodilation.

**Pharmacokinetics**

Rapidly absorbed following inhalation. Primarily metabolized by enzyme cytochrome P4502D6. Protein binding: 89%. Peak concentration: 5–15 min. Steady state reached within 14 days. **Half-life:** 11 hrs.

**Lifespan considerations**

**Pregnancy/Lactation:** Unknown if distributed in breast milk. Must either discontinue drug or discontinue breastfeeding. **Children:** Not indicated in this pt population. **Elderly:** No age-related precautions noted.

**Interactions**

**DRUG:** Anticholinergics (e.g., atropine, dicyclomine, glycopyrrolate, scopolamine), medications with anticholinergic properties (e.g., diphenhydramINE) may increase effects/risk of toxicity. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** None known.

**Availability (Rx)**

**Inhalation Powder:** 62.5 mcg/capsule (in blister packs containing 7 or 30 doses).

**Administration/handling**

**Inhalation**

**Administration**

- Follow instructions for preparation according to manufacturer guidelines.
- Do not shake or prime. Prior to inhaling dose, exhale fully (do not exhale into inhaler). Close lips tightly around inhaler and inhale (rapidly, steadily, and deeply). Do not breathe through nose or block air vent with fingers.
- Remove mouthpiece and hold breath for 3–4 sec, then breathe out slowly and gently. Do not close container until medication has been inhaled.
• Close lid cover.
**Storage**
• Store at room temperature up to 6 wks after opening tray.
• Do not refrigerate or freeze.
• Protect from sunlight and moisture.
• Discard after counter reaches 0.
• Do not reuse inhaler.

**Indications/routes/dosage**

**COPD**
**Inhalation:** **ADULTS, ELDERLY:** One inhalation (62.5 mcg) once daily, at same time each day. **Maximum:** 1 inhalation/24 hrs.

**Dose Modification**
**Deterioration of COPD:** Discontinue treatment. Institute short-acting bronchodilators and supportive pulmonary therapy.

**Dosage in Renal Impairment**
No dose adjustment.

**Dosage in Hepatic Impairment**
**Mild to moderate impairment:** No dose adjustment. **Severe impairment:** Use caution.

**Side effects**
**Occasional (8%–5%):** Nasopharyngitis, upper respiratory tract infection. **Rare (3%–1%):** Cough, arthralgia, viral respiratory tract infection, pharyngitis, myalgia, abdominal pain, toothache, tachycardia.

**Adverse effects/toxic reactions**
Life-threatening asthma-related events, bronchospasm, worsening of COPD-related symptoms have been reported. Hypersensitivity reactions may occur (esp. in pts with undiagnosed severe milk protein allergy or allergy to products
containing lactose). Worsening of narrow-angle glaucoma (eye pain, blurry vision, visual halos, colored images in association with red eyes from conjunctival congestion and corneal edema) may occur. May cause worsening of urinary retention, esp. in pts with prostatic hypertrophy or bladder neck obstruction.

Nursing considerations

Baseline assessment
Obtain baseline O₂ saturation, vital signs; pulmonary function test, if applicable. Assess respiratory rate, depth, rhythm. Assess lung sounds for wheezing, rales. Screen for concomitant use of anticholinergic medications. Question history of asthma, BPH, bladder neck obstruction, glaucoma. Teach proper inhaler priming and administration techniques. Conduct ophthalmologic exam in pts with narrow-angle glaucoma.

Intervention/evaluation
Routinely monitor O₂ saturation, vital signs. Auscultate lung sounds and monitor for symptom improvement. Recommend discontinuation of short-acting beta₂-agonists while on long-term therapy. Monitor for COPD deterioration, narrow-angle glaucoma, urinary retention/obstruction. Monitor for increased use of rescue inhaler; may indicate worsening of respiratory status.

Patient/family teaching
• Report fever, productive cough, body aches, paradoxical bronchospasm, difficulty breathing; may indicate lung infection, worsening of COPD.
• Therapy not intended for acute COPD symptom relief, and extra doses are not advised.
• Report symptoms of acute narrow-angle glaucoma, urinary retention, bladder distention.
• Refill prescription when counter on left of inhaler reaches red area of scale.
• Follow manufacturer guidelines for proper use of inhaler.
• Drink plenty of fluids (decreases lung secretion viscosity).
• Rinse mouth with water after inhalation to decrease mouth/throat irritation.
ustekinumab
yoo-ste-kin-ue-mab

Stelara

CLASSIFICATION
PHARMACOTHERAPEUTIC: Interleukin-12, interleukin-23 inhibitor, monoclonal antibody.
CLINICAL: Antipsoriasis agent.
Do not confuse Stelara with Aldara, or ustekinumab with inFLIXimab or riTUXimab.

Uses
Treatment of adults, adolescents 12 yrs or older with moderate to severe plaque psoriasis who are candidates for systemic therapy or phototherapy. Treatment of adults with active psoriatic arthritis alone or in combination with methotrexate. Treatment of adults with moderate to severe active Crohn’s disease.

Precautions

Action
Strongly binds with cellular components involved in responses to inflammation and immune system, thereby decreasing likelihood of aggravating psoriatic eruptions. Therapeutic Effect: Significantly slows growth, migration of circulating total lymphocytes (predominant in psoriatic lesions).

Pharmacokinetics
Following subcutaneous injections, clearance is affected by body weight, is not affected by gender or race. Degraded into small peptides and amino acids via catabolic pathways. Steady state reached in 28 wks. Half-life: 10–126 days.
Lifespan considerations

Interactions

DRUG: Immunosuppressive agents (e.g., abatacept, cyclosporine, fingolimod, methotrexate, sirolimus) increase risk of infection. Abciximab, trastuzumab may increase concentration/effects. May decrease therapeutic effects of vaccines, increase risk of adverse effects of live vaccines. HERBAL: Echinacea may decrease concentration/effects. FOOD: None known. LAB VALUES: May increase lymphocyte count.

Availability (Rx)

Injection Solution (Prefilled Syringes): 45 mg/0.5 ml, 90 mg/ml.

Administration/handling

IV

Infuse over at least 1 hr. Use with in-line protein-binding filter (0.2 microns).

Subcutaneous

• Do not inject into areas where skin is tender, bruised, erythematous, indurated.
• Avoid areas where psoriasis is present.
• Administer into thigh, abdomen, buttocks, upper arm.
• Refrigerate unopened vial.
• Solution appears colorless to light yellow. Discard if solution contains more than a few small translucent or white particles or is cloudy.

Indications/routes/dosage

Plaque Psoriasis

SQ: ADULTS, ELDERLY WEIGHING 100 KG OR LESS: Initially, 45 mg,
then 45 mg 4 wks later, followed by 45 mg every 12 wks. **WEIGHING MORE THAN 100 KG:** Initially, 90 mg, then 90 mg 4 wks later, followed by 90 mg every 12 wks. **Note:** 45 mg also efficacious; however, 90 mg is recommended due to greater efficacy. **CHILDREN 12 YRS AND OLDER:** (GREATER THAN 100 KG): Initially, 90 mg, repeat in 4 wks, then q12 wks. (61–100 KG): Initially, 45 mg, repeat in 4 wks, then q12 wks. (60 KG OR LESS): Initially, 0.75 mg/kg, repeat in 4 wks, then q12 wks.

**Psoriatic Arthritis**

**SQ:** ADULTS, ELDERLY: Initially, 45 mg repeated in 4 wks followed by 45 mg q12wks. **PTS WITH COEXISTENT MODERATE TO SEVERE PLAQUE PSORIASIS WEIGHING MORE THAN 100 KG:** Initially, 90 mg repeated in 4 wks, then 90 mg q12wks.

**Crohn’s Disease**

**IV INFUSION:** ADULTS, ELDERLY: Initially, (as a single dose) 520 mg (greater than 85 kg); 390 mg (56–85 kg); 260 mg (up to 54 kg).

**SQ (Maintenance):** 90 mg q8wks beginning 8 wks following the IV induction dose.

**Dosage in Renal/Hepatic Impairment**

No dose adjustment.

**Side effects**

**Occasional (8%–4%):** Nasopharyngitis, upper respiratory tract infection, headache. **Rare (3%–1%):** Fatigue, diarrhea, back pain, dizziness, pruritus, injection site erythema, myalgia, depression.

**Adverse effects/toxic reactions**

Worsening of psoriasis, thrombocytopenia, malignancies, serious infections (cellulitis, diverticulitis, gastroenteritis, pneumonia, osteomyelitis, UTI, postoperative wound infection) has been noted. Reversible posterior leukoencephalopathy syndrome (headache, seizures, confusion, visual disturbances) occurs rarely.
Nursing considerations

Baseline assessment
Pts should not receive live vaccines during treatment, 1 yr prior to initiating treatment, or 1 yr following discontinuation of treatment. Inform pt of duration of treatment and required monitoring procedures. Assess skin prior to therapy; document extent and location of psoriasis lesions. Test pt for tuberculosis infection prior to initiating treatment.

Intervention/evaluation

Patient/family teaching
• If appropriate, pt may self-inject after proper training in preparation and injection technique.
• Report any signs of infection.
• If new diagnosis of malignancy occurs, inform physician of current treatment with ustekinumab.

underlined – top prescribed drug
ValACYclovir
val-a-sye-kloe-veer
Apo-ValACYclovir
Valtrex

CLASSIFICATION
PHARMACOTHERAPEUTIC: Nucleoside analogue DNA polymerase inhibitor.
CLINICAL: Antiviral.
Do not confuse ValACYclovir with acyclovir or valGANciclovir, or Valtrex with Valcyte.

Uses

Precautions
Contraindications: Hypersensitivity to acyclovir, valACYclovir. Cautions: Renal impairment, concurrent use of nephrotoxic agents, elderly pts.

Action
Converted to acyclovir by intestinal/hepatic metabolism. Competes for viral
DNA polymerase; inhibits incorporation into viral DNA. **Therapeutic Effect:** Inhibits DNA synthesis and viral replication.

**Pharmacokinetics**
Rapidly absorbed after PO administration. Protein binding: 13%–18%. Rapidly converted by hydrolysis to active compound acyclovir. Widely distributed to tissues, body fluids (including CSF). Primarily excreted in urine. Removed by hemodialysis. **Half-life:** (acyclovir) 2.5–3.3 hrs (increased in renal impairment).

**Lifespan considerations**
- **Pregnancy/Lactation:** May cross placenta. May be distributed in breast milk.
- **Children:** Safety and efficacy not established in children younger than 2 yrs (chickenpox); younger than 12 yrs (cold sores). **Elderly:** Age-related renal impairment may require dosage adjustment.

**Interactions**
- **DRUG:** Nephrotoxic medications (e.g., lisinopril, gentamicin, IV contrast media) may increase risk of nephrotoxicity, renal impairment.
- **HERBAL:** None significant.
- **FOOD:** None known.
- **LAB VALUES:** None significant.

**Availability (Rx)**
- **Tablets:** 500 mg, 1,000 mg.

**Administration/handling**

**PO**
- Give without regard to meals.
- If GI upset occurs, give with meals.

**Indications/routes/dosage**

**Herpes Zoster (Shingles)**
- **PO:** **ADULTS, ELDERLY:** 1 g 3 times/day for 7 days.
Herpes Simplex (Cold Sores)
PO: ADULTS, ELDERLY: 2 g twice daily for 1 day (separate by 12 hrs).

Initial Episode of Genital Herpes
PO: ADULTS, ELDERLY: 1 g twice daily for 10 days.

Recurrent Episodes of Genital Herpes
PO: ADULTS, ELDERLY: 500 mg twice daily for 3 days.

Suppressive Therapy of Genital Herpes
PO: ADULTS, ELDERLY: (HIV infected): 500 mg twice daily. (Immunocompetent): 1 g once daily (500 mg once daily in pts with 9 or fewer recurrences/yr).

Chickenpox
PO: CHILDREN 2–17 YRS: 20 mg/kg/dose 3 times/day for 5 days. Maximum: 1 g 3 times/day.

Dosage in Renal Impairment
Dosage and frequency are modified based on creatinine clearance. HD: Give dose postdialysis.

Dosage in Hepatic Impairment

No dose adjustment.

Side effects

**Frequent:** Herpes zoster (17%–10%): Nausea, headache. **Genital herpes (17%):** Headache. **Occasional:** Herpes zoster (7%–3%): Vomiting, diarrhea, constipation (50 yrs and older), asthenia, dizziness (50 yrs and older). **Genital herpes (8%–3%):** Nausea, diarrhea, dizziness. **Rare:** Herpes zoster (3%–1%): Abdominal pain, anorexia. **Genital herpes (3%–1%):** Asthenia, abdominal pain.

Adverse effects/toxic reactions

Neutropenia, thrombocytopenia, renal failure occur rarely.

Nursing considerations

**Baseline assessment**

Question for history of allergies, particularly to valACYclovir, acyclovir. Tissue cultures for herpes zoster, herpes simplex should be obtained before giving first dose (therapy may proceed before results are known). Assess medical history, esp. HIV infection, bone marrow or renal transplantation, renal/hepatic impairment. Assess characteristics, frequency of lesions.

**Intervention/evaluation**

**Patient/family teaching**

- Drink adequate fluids.
- Do not touch lesions with fingers to avoid spreading infection to new site.
- **Genital herpes:** Continue therapy for full length of treatment.
- Space doses evenly.
• Avoid sexual intercourse during duration of lesions to prevent infecting partner.
• ValACYclovir does not cure herpes.
• Report if lesions recur or do not improve.
• Pap smears should be done at least annually due to increased risk of cervical cancer in women with genital herpes.
• Initiate treatment at first sign of recurrent episode of genital herpes or herpes zoster (early treatment within first 24–48 hrs is imperative for therapeutic results).

valbenazine
val-ben-a-zeen
Ingrezza

♦CLASSIFICATION
PHARMACOTHERAPEUTIC: Pharmacotherapeutic classification.
CLINICAL: Monoamine uptake regulator.
Do not confuse with carBAMazepine, deutetraBenazine, or tetrabenazine.

Uses

Treatment of adults with tardive dyskinesia.

Precautions

Contraindications: Hypersensitivity to valbenazine. Cautions: Pts at risk for falls, severe osteoporosis; concomitant use with strong CYP2D6 inhibitors, strong CYP3A4 inhibitors or in a poor CYP2D6 metabolizer, QTc interval–prolonging medications. Pts with congenital QT syndrome, arrhythmias associated with prolonged QT interval. Pts with depression or suicidal ideation, moderate to severe hepatic impairment. Avoid use in severe renal impairment.

Action

Exact mechanism of action for dyskinesia unknown. Thought to be mediated by reversible inhibition of VMAT2, a transporter that regulates uptake of monoamine from the cytoplasm to the synaptic vesicle for storage and release. Therapeutic Effect: Reduces abnormal involuntary movements; improves
motor function.

**Pharmacokinetics**

Widely distributed. High-fat meals decrease absorption. Metabolized by hydrolysis to active metabolite. Protein binding: greater than 99%. Peak plasma concentration: 30–60 min (metabolite: 4–8 hrs). Excreted in urine (60%), feces (30%). **Half-life:** 15–22 hrs.

**Lifespan considerations**

Pregnancy/Lactation: Unknown if distributed in breast milk. Breastfeeding not recommended during treatment and for at least 5 days after discontinuation. **Children:** Safety and efficacy not established. **Elderly:** No age-related precautions noted.

**Interactions**

**DRUG:** Deutetrabanzine, tetrabenzine may enhance adverse/toxic effects. Strong CYP3A4 inhibitors (e.g., clarithromycin, ketoconazole, ritonavir), strong CYP2D6 inhibitors (e.g., fluoxetine, PARoxetine, quinidine) may increase concentration/effect. Strong CYP3A4 inducers (e.g., carBAMazepine, phenytoin, rifAMPin) may decrease concentration/effect. May increase concentration/adverse effects of MAOIs (e.g., phenelzine, selegiline). QT interval–prolonging medications (e.g., amiodarone, azithromycin, ceritinib, haloperidol, moxifloxacin, sotalol) may increase risk of QTc interval prolongation, torsades de pointes, sudden cardiac death. **HERBAL:** St. John’s wort may decrease concentration/effects. **FOOD:** None known. **LAB VALUES:** May increase alkaline phosphatase, bilirubin, prolactin, glucose.

**Availability (Rx)**

Capsules: 40 mg, 80 mg.

**Administration/handling**

PO
• Give with or without food.

Indications/Routes/Dosage

Tardive Dyskinesia

**PO:** **ADULTS, ELDERLY:** 40 mg once daily. May increase to 80 mg once daily if tolerated after 7 days.

Dose Modification

**CYP2D2 poor metabolizers:** Consider reducing dose based on tolerability.

Dosage in Renal Impairment

**Mild to moderate:** No dose adjustment. **Severe:** Not recommended.

Dosage in Hepatic Impairment

**Mild impairment:** No dose adjustment. **Moderate to severe impairment:** 40 mg once daily.

Side Effects

**Occasional (13%–3%):** Somnolence, fatigue, sedation, dry mouth, constipation, attention disturbance, blurry vision, urinary retention, gait disturbance, dizziness, balance disorder, vomiting. **Rare (2%):** musculoskeletal disorders, arthralgia.

Adverse Effects/Toxic Reactions

May increase risk of falls, injury. Elevated serum alkaline phosphatase, bilirubin may indicate risk of cholestasis. May cause QTc prolongation in pts who are CYP2D6 poor metabolizers or taking concomitant CYP2D6 inhibitors, which may increase the risk of torsades de pointes, sudden cardiac death. VMAT2 inhibitors are associated with elevated serum prolactin levels, which may cause low estrogen levels, thereby increasing risk of amenorrhea, galactorrhea, gynecomastia, osteoporosis.

Nursing Considerations
Baseline Assessment

Obtain baseline LFTs, EKG (pts at risk for QT prolongation). Assess for depression or suicidal ideation. Assess baseline of abnormal involuntary movements. Receive full medication history and screen for interactions. Initiate fall precautions. Offer emotional support.

Intervention/Evaluation

Assess for clinical improvement, reversal of symptoms (lip smacking, puckering, tongue protrusion or chewing, jaw movement, rapid blinking of the eye; slow, deliberate movements; rapid jerking motion that interrupts normal coordinated movement). Assist with ambulation.

Patient/Family Teaching

• Therapy is not a cure, but it may help with abnormal involuntary movements associated with disease.
• Do not take newly prescribed medications unless approved by prescriber that originally started treatment.
• Report fainting, chest pain, palpitations, irregular heart rhythm.
• Avoid tasks that require alertness, motor skills until response to drug is established.
• Do not breastfeed during treatment and for at least 5 days after final dose.

valGANCiclovir
val-gan-sye-kloe-veer
Apo-ValGANCiclovir
Valcyte

CLASSIFICATION
PHARMACOTHERAPEUTIC: Synthetic nucleoside.
CLINICAL: Antiviral.

BLACK BOX ALERT ■ May adversely affect spermatogenesis, fertility.
Risk for granulocytopenia, anemia, thrombocytopenia.

Do not confuse Valcyte with Valium or Valtrex, or valGANCiclovir with valACYclovir.
Uses

**Adults:** Treatment of cytomegalovirus (CMV) retinitis in AIDS. Prevention of CMV disease in high-risk renal, cardiac, renal-pancreas transplant pts. **Children:** Prevention of CMV disease in high-risk renal (4 mos to 16 yrs) and cardiac transplant pts (1 mo to 16 yrs).

Precautions

**Contraindications:** Hypersensitivity to valGANciclovir, ganciclovir. **Cautions:** Use extreme caution in children due to long-term carcinogenicity, reproductive toxicity. Renal impairment, concurrent nephrotoxic medications, preexisting bone marrow suppression or cytopenias, history of cytopenic reactions to other drugs, elderly pts (at greater risk for renal impairment).

Action

Inhibits binding of deoxyguanosine triphosphate to DNA polymerase. **Therapeutic Effect:** Inhibits viral DNA synthesis.

Pharmacokinetics

Well absorbed, rapidly converted to ganciclovir by intestinal mucosal cells and hepatocytes. Widely distributed including CSF, ocular tissue. Slowly metabolized intracellularly. Primarily excreted in urine. Removed by hemodialysis. **Half-life:** Ganciclovir: 4 hrs (increased in renal impairment).

Lifespan considerations

**Pregnancy/Lactation:** Avoid pregnancy; may cause fetal harm/malformations. Female pts of reproductive potential should use effective contraception during treatment. Avoid breastfeeding; may be resumed no sooner than 72 hrs after last dose. May impair fertility in both females and males. **Children:** Safety and efficacy not established in pts younger than 1 month. **Elderly:** Age-related renal impairment may require dosage adjustment.

Interactions

**DRUG:** Bone marrow depressants may increase myelosuppression. May
increase risk of toxicity of didanosine, mycophenolate. Probenecid may decrease renal clearance, increase concentration. Zidovudine (AZT) may increase risk of hematologic toxicity. HERBAL: None significant. FOOD: All foods maximize drug bioavailability. LAB VALUES: May decrease creatinine clearance, platelet count, neutrophils, Hgb, Hct. May increase serum creatinine.

Availability (Rx)

**Powder for Oral Solution:** 50 mg/mL (100 mL).

**Tablets:** 450 mg.

Administration/handling

**PO**

- Take with meals.
- Do not break, crush, dissolve, or divide tablets; give whole (potential carcinogen).
- Avoid contact with skin.
- Wash skin with soap, water if contact occurs.
- Store oral suspension in refrigerator. Discard after 49 days.

Indications/routes/dosage

**Note:** Do not use if absolute neutrophil count (ANC) less than 500 cells/mm$^3$, platelets less than 25,000 cells/mm$^3$, or Hgb less than 8 g/dL.

**Cytomegalovirus (CMV) Retinitis**

**PO: ADULTS:** Initially, 900 mg (two 450-mg tablets) twice daily for 21 days. **Maintenance:** 900 mg once daily.

**Prevention of CMV After Transplant**

**PO: ADULTS, ELDERLY:** 900 mg once daily beginning within 10 days of transplant and continuing until 100 days (heart, kidney, or pancreas transplant) or 200 days (kidney transplant) post-transplant. **CHILDREN 1 MO–16 YRS:** Once daily based on body surface area (BSA) and CrCl using formula: (Dose = 7 × BSA × CrCl). **Maximum:** 900 mg/day.
Dosage in Renal Impairment

Dosage and frequency are modified based on creatinine clearance.

Dosage in Hepatic Impairment

No dose adjustment.

Side effects

Frequent (16%–9%): Diarrhea, neutropenia, headache. Occasional (8%–3%): Nausea. Rare (Less Than 3%): Insomnia, paresthesia, vomiting, abdominal pain, fever.

Adverse effects/toxic reactions

Hematologic toxicity, including severe neutropenia (most common), anemia, thrombocytopenia, leukopenia, aplastic anemia, pancytopenia, bone marrow suppression may occur. Retinal detachment occurs rarely. Overdose may result in renal toxicity. May decrease sperm production, fertility.

Nursing considerations

Baseline assessment

Obtain baseline CBC, serum chemistries, renal function, urinalysis; pregnancy test. Receive full medication history.

Intervention/evaluation

Monitor I&O, ensure adequate hydration (minimum 1,500 mL/24 hrs). Diligently evaluate CBC for decreased WBCs, Hgb, Hct, platelets; changes in urinary characteristics, consistency. Question pt regarding vision, therapeutic improvement, complications.
Patient/family teaching

- ValGANciclovir provides suppression, not cure, of CMV retinitis.
- Frequent blood tests are necessary during therapy because of toxic nature of drug.
- Ophthalmologic exam q4–6wks during treatment is advised.
- Report any new symptom promptly.
- May temporarily or permanently inhibit sperm production in men, suppress fertility in women.
- Barrier contraception should be used during and for 90 days after therapy (mutagenic potential).
- Swallow whole; do not chew, crush, dissolve, or divide.
- Avoid handling broken/crushed tablets, oral solution.
- Report fever, chills, unusual bleeding/bruising, urinary changes.

valproic acid

val-pro-ick as-id

Apo-Divalproex
Depacon
Depakene

**Depakote**

Depakote ER
Depakote Sprinkle
Novo-Divalproex

Stavzor

CLASSIFICATION

PHARMACOTHERAPEUTIC: Histone deacetylase inhibitor.

CLINICAL: Anticonvulsant, antimanic, antimigraine.

BLACK BOX ALERT ■ Embryo, fetal neural tube defects (spina bifida) have occurred. Life-threatening pancreatitis, complete hepatic failure have occurred.

Do not confuse Depakene with Depakote.
Uses
Monotherapy/adjunctive therapy of complex partial seizures, simple and complex absence seizures. Adjunctive therapy of multiple seizures including absence seizures. **Additional uses for Depakote, Depakote ER, Stavzor:** Treatment of manic episodes with bipolar disorder, prophylaxis of migraine headaches. **OFF-LABEL:** Refractory status epilepticus, diabetic neuropathy. Mood stabilizer for behaviors in dementia.

Precautions
**Contraindications:** Hypersensitivity to valproic acid. Active hepatic disease, urea cycle disorders, known mitochondrial disorders; migraine prevention in pregnant women. **Cautions:** Children younger than 2 yrs. Pts at risk for hepatotoxicity. History of hepatic impairment, bleeding abnormalities, pts at high risk for suicide, elderly pts.

Action
Directly increases concentration of inhibitory neurotransmitter gamma-aminobutyric acid (GABA). **Therapeutic Effect:** Decreases seizure activity, stabilizes mood, prevents migraine headache.

Pharmacokinetics
Well absorbed from GI tract. Protein binding: 80%–90%. Metabolized in liver. Primarily excreted in urine. Not removed by hemodialysis. **Half-life:** 9–16 hrs (may be increased in hepatic impairment, elderly pts, children younger than 18 mos).

/licenses

**Lifespan considerations**
**Pregnancy/Lactation:** Drug crosses placenta; is distributed in breast milk. **Children:** Increased risk of hepatotoxicity in pts younger than 2 yrs. **Elderly:** No age-related precautions, but lower dosages recommended.

Interactions
**DRUG:** Carbapenems (e.g., meropenem), CYP3A4 inducers (e.g.,
Carbamazepine, phenytoin, rifampin) may decrease concentration/effects. May alter effect of warfarin. May increase concentration of lamotrigine. Topiramate may increase risk of elevated serum ammonia levels. Herbal: Evening primrose may decrease seizure threshold. Food: None known. Lab values: May increase serum LDH, bilirubin, ALT, AST. Therapeutic serum level: 50–100 mcg/mL; toxic serum level: greater than 100 mcg/mL.

Availability (Rx)

Capsules (Depakene): 250 mg. Capsules, Sprinkle (Depakote Sprinkle): 125 mg. Injection, Solution (Depacon): 100 mg/mL. Syrup (Depakene): 250 mg/5 mL.

Tablets, Delayed-Release (Depakote): 125 mg, 250 mg, 500 mg. Tablets, Extended-Release (Depakote ER): 250 mg, 500 mg.

Administration/handling

IV

Reconstitution

• Dilute each single dose with at least 50 mL D5W, 0.9% NaCl, or lactated Ringer’s.

Rate of Administration

• Infuse over 60 min at rate of 20 mg/min or less.
• Alternatively, single doses of up to 45 mg/kg given over 5–10 min (1.5–6 mg/kg/min).

Storage

• Store vials at room temperature.
• Diluted solutions stable for 24 hrs.
• Discard unused portion.

PO

• May give without regard to food. Do not mix oral solution with carbonated beverages (may cause mouth/throat irritation).
• May sprinkle capsule (Depakote Sprinkle) contents on applesauce and give immediately (do not chew sprinkle beads).
• Give delayed-release/extended-release tablets whole. Do not crush, break, open
delayed-release capsule (Stavzor).
• Regular-release and delayed-release formulations usually given in 2–4 divided doses/day. Extended-release formulation (Depakote ER) usually given once daily.

IV incompatibilities
None known.

IV Compatibilities
Cefepime, cefTAZidime.

Indications/routes/dosage

Seizures
PO: ADULTS, ELDERLY, CHILDREN 10 YRS AND OLDER: Initially, 10–15 mg/kg/day in 1–3 divided doses. May increase by 5–10 mg/kg/day at wkly intervals up to 60 mg/kg/day. Usual adult dosage: 1,000–2,500 mg/day.
IV: ADULTS, ELDERLY, CHILDREN: Same frequency as oral dose.

Manic Episodes
PO: (Depakote): ADULTS, ELDERLY: Initially, 750 mg/day in divided doses. Maximum: 60 mg/kg/day.
PO: (Extended-Release [Depakote ER]): Initially, 25 mg/kg/day once daily. Maximum: 60 mg/kg/day. (Delayed-Release [Stavzor]): Initially, 750 mg/day in divided dose. Titrate to lowest therapeutic dose. Maximum: 60 mg/kg/day.

Prevention of Migraine Headaches
PO: (Extended-Release [Depakote ER]): ADULTS, ELDERLY: Initially, 500 mg/day for 7 days. May increase up to 1,000 mg/day.
PO: (Delayed-Release [Depakote]): ADULTS, ELDERLY, CHILDREN 16 YRS AND OLDER: Initially, 250 mg twice daily. May increase up to 1,000 mg/day. ADULTS, ELDERLY, CHILDREN 12 YRS AND OLDER: (Stavzor): 250 mg twice daily. May increase to 1,000 mg/day.
Dosage in Renal Impairment
No dose adjustment.

Dosage in Hepatic Impairment
Mild to moderate impairment: Not recommended. Severe impairment: Contraindicated.

Side effects
Frequent: Epilepsy: Abdominal pain, irregular menses, diarrhea, transient alopecia, indigestion, nausea, vomiting, tremors, fluctuations in body weight. Mania (22%–19%): Nausea, drowsiness. Occasional: Epilepsy: Constipation, dizziness, drowsiness, headache, skin rash, unusual excitement, restlessness. Mania (12%–6%): Asthenia, abdominal pain, dyspepsia, rash. Rare: Epilepsy: Mood changes, diplopia, nystagmus, spots before eyes, unusual bleeding/bruising.

Adverse effects/toxic reactions
Hepatotoxicity may occur, particularly in first 6 mos of therapy. May be preceded by loss of seizure control, malaise, weakness, lethargy, anorexia, vomiting rather than abnormal LFT results. Blood dyscrasias may occur.

Nursing considerations
Baseline assessment
Anticonvulsant: Review history of seizure disorder (intensity, frequency, duration, level of consciousness). Initiate safety measures, quiet dark environment. CBC should be performed before and 2 wks after therapy begins, then 2 wks following maintenance dose. Obtain baseline LFT. Antimanic: Assess behavior, appearance, emotional status, response to environment, speech pattern, thought content. Antimigraine: Question pt regarding onset, location, duration of migraine, possible precipitating symptoms.

Intervention/evaluation
Monitor CBC, LFT, serum ammonia. **Anticonvulsant:** Observe frequently for recurrence of seizure activity. Assess skin for ecchymoses, petechiae. Monitor for clinical improvement (decrease in intensity/frequency of seizures). **Antimanic:** Question for suicidal ideation. Assess for therapeutic response (interest in surroundings, increased ability to concentrate, relaxed facial expression). **Antimigraine:** Evaluate for relief of migraine headache and resulting photophobia, phonophobia, nausea, vomiting. **Therapeutic serum level:** 50–100 mcg/mL; **toxic serum level:** greater than 100 mcg/mL.

**Patient/ family teaching**
- Do not abruptly discontinue medication after long-term use (may precipitate seizures).
- Strict maintenance of drug therapy is essential for seizure control.
- Avoid tasks that require alertness, motor skills until response to drug is established.
- Drowsiness usually disappears during continued therapy.
- Avoid alcohol.
- Report liver problems such as nausea, vomiting, lethargy, altered mental status, weakness, loss of appetite, abdominal pain, yellowing of skin, unusual bruising/bleeding.
- Report if seizure control worsens, suicidal ideation (depression, unusual changes in behavior, suicidal thoughts) occurs.

<table>

**Fixed-Combination(s)**

**Diovan HCT:** valsartan/hydroCHLOROthiazide (a diuretic): 80 mg/12.5 mg, 160 mg/12.5 mg, 160 mg/25 mg, 320 mg/12.5 mg, 320 mg/25 mg. **Byvalson:** valsartan/nebivolol (a beta blocker): 80 mg/5 mg. **Exforge:** valsartan/amLODIPine (a calcium channel blocker): 160 mg/5 mg, 160 mg/10 mg, 320 mg/5 mg, 320 mg/10 mg. **Exforge HCT:** valsartan/amLODIPine (a calcium channel blocker)/hydroCHLOROthiazide (a diuretic): 160 mg/5 mg.
mg/12.5 mg, 160 mg/5 mg/25 mg, 160 mg/10 mg/12.5 mg, 160 mg/10 mg/25 mg, 320 mg/10 mg/25 mg. **Valturna:** valsartan/aliskiren (a direct renin inhibitor): 160 mg/150 mg, 320 mg/300 mg.

**CLASSIFICATION**

**PHARMACOTHERAPEUTIC:** Angiotensin II receptor antagonist.  
**CLINICAL:** Antihypertensive.

■ **BLACK BOX ALERT** ■ May cause fetal injury, mortality. Discontinue as soon as possible once pregnancy is detected.

Do not confuse Diovan with Zyban, or valsartan with losartan or Valstar.

**Uses**

Treatment of hypertension alone or in combination with other antihypertensives. Treatment of HF (NYHA Class II–IV). Reduce mortality in high-risk pts (left ventricular failure/dysfunction) following MI.

**Precautions**

**Contraindications:** Hypersensitivity to valsartan. Concomitant use with aliskiren in pts with diabetes. **Cautions:** Concurrent use of potassium-sparing diuretics or potassium supplements, mild to severe hepatic impairment, unstented bilateral/unilateral renal artery stenosis, renal impairment, significant aortic/mitral stenosis, elderly pts.

**Action**

Directly antagonizes angiotensin II receptors. Blocks vasoconstrictor, aldosterone-secreting effects of angiotensin II, inhibiting binding of angiotensin II to AT₁ receptors. **Therapeutic Effect:** Produces vasodilation, decreases peripheral resistance, decreases B/P.

**Pharmacokinetics**

Poorly absorbed after PO administration. Food decreases peak plasma concentration. Protein binding: 95%. Metabolized in liver. Excreted in feces.
(83%), urine (13%). Unknown if removed by hemodialysis. **Half-life:** 6 hrs.

**Lifespan considerations**

**Pregnancy/Lactation:** May cause fetal harm. Unknown if distributed in breast milk. **Children:** Safety and efficacy not established. **Elderly:** No age-related precautions noted.

**Interactions**

**DRUG:** NSAIDs (e.g., ibuprofen, ketorolac, naproxen) may decrease antihypertensive effects. **Potassium-sparing drugs** (e.g., spironolactone, triamterene), potassium supplements may increase serum potassium. **Diuretics** (e.g., furosemide, HCTZ) may produce additive hypotensive effects. **HERBAL:** Ginger, ginseng, licorice may worsen hypertension. **Black cohosh, periwinkle** may increase antihypertensive effects. **FOOD:** None known. **LAB VALUES:** May increase serum bilirubin, ALT, AST, BUN, creatinine, potassium. May decrease Hgb, Hct, WBC.

**Availability (Rx)**

**Tablets:** 40 mg, 80 mg, 160 mg, 320 mg.

**Administration/handling**

**PO**

- Give without regard to meals.

**Indications/routes/dosage**

**Hypertension**

**PO:** **ADULTS, ELDERLY:** Initially, 80–160 mg/day in pts who are not volume depleted. **Maximum:** 320 mg/day. **CHILDREN 6–16 YRS:** Initially, 1.3 mg/kg once daily (**Maximum:** 40 mg). May increase up to 2.7 mg/kg once daily (**Maximum:** 160 mg/day).

**HF**
PO: **ADULTS, ELDERLY:** Initially, 20–40 mg twice daily. May increase up to 160 mg twice daily. **Maximum:** 320 mg/day.

**Post-MI, Left Ventricular Dysfunction**

PO: **ADULTS, ELDERLY:** May initiate 12 hrs or longer following MI. Initially, 20 mg twice daily. May increase within 7 days to 40 mg twice daily. May further increase up to target dose of 160 mg twice daily.

**Dosage in Renal Impairment**

**CrCl greater than 30 mL/min:** No dose adjustment. **CrCl 30 mL/min or less:** **ADULTS:** Safety/efficacy not established. **CHILDREN 6–16 YRS:** Not recommended.

**Dosage in Hepatic Impairment**

No dose adjustment.

**Side effects**

**Rare (2%–1%):** Insomnia, fatigue, heartburn, abdominal pain, dizziness, headache, diarrhea, nausea, vomiting, arthralgia, edema.

**Adverse effects/toxic reactions**

Overdosage may manifest as hypotension, tachycardia. Bradycardia occurs less often. Viral infection, upper respiratory tract infection (cough, pharyngitis, sinusitis, rhinitis) occur rarely.

**Nursing considerations**

**Baseline assessment**

Obtain CBC, BMP, LFT. Obtain B/P, apical pulse immediately before each dose, in addition to regular monitoring (be alert to fluctuations). If excessive reduction in B/P occurs, place pt in supine position, feet slightly elevated. Question for possibility of pregnancy. Assess medication history (esp. diuretic). Question for history of hepatic/renal impairment, renal artery stenosis, history of severe HF.
**Intervention/evaluation**

**Patient/ family teaching**

- Females of childbearing potential must use effective contraception during treatment.
- Inform physician as soon as possible if pregnancy occurs.
- Report any sign of infection (sore throat, fever).
- Do not stop taking medication.
- Report swelling of extremities, chest pain, palpitations; decreased urine output, amber-colored urine, fatigue, yellowing of the skin or eyes.

---

**vancomycin**

*van-koe-mye-sin*

**Vancocin**

**CLASSIFICATION**

PHARMACOTHERAPEUTIC: Tricyclic glycopeptide antibiotic.

CLINICAL: Antibiotic.

Do not confuse vancomycin with clindamycin, gentamicin, tobramycin, or Vibramycin.

---

**Uses**

**Systemic:** Treatment of infections caused by staphylococcal, streptococcal spp. bacteria. **PO:** Treatment of *C. difficile*–associated diarrhea and treatment of enterocolitis caused by *S. aureus* (including MRSA). **OFF-LABEL:** Treatment of infections caused by gram-positive organisms in pts with serious allergies to beta-lactam antibiotics; treatment of beta-lactam–resistant gram-positive infections. Surgical prophylaxis, treatment of prosthetic joint infection.

---

**Precautions**

**Contraindications:** Hypersensitivity to vancomycin. **Cautions:** Renal
impairment; concurrent therapy with other ototoxic, nephrotoxic medications, elderly pts, dehydration.

**Action**

Binds to bacterial cell walls, altering cell membrane permeability, inhibiting RNA synthesis. **Therapeutic Effect:** Bactericidal.

**Pharmacokinetics**

**PO:** Poorly absorbed from GI tract. Primarily excreted in feces. **Parenteral:** Widely distributed (except CSF). Protein binding: 10%–50%. Primarily excreted unchanged in urine. Not removed by hemodialysis. **Half-life:** 4–11 hrs (increased in renal impairment).

**Lifespan considerations**

**Pregnancy/Lactation:** Drug crosses placenta, distributed in breast milk following IV administration. **Children:** Close monitoring of serum levels recommended in premature neonates, young infants. **Elderly:** Age-related renal impairment may increase risk of ototoxicity, nephrotoxicity; dosage adjustment recommended.

**Interactions**

**DRUG:** Aminoglycosides (e.g., gentamicin, tobramycin), amphotericin B, CISplatin may increase risk of ototoxicity, nephrotoxicity of parenteral vancomycin. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** May increase BUN. **Therapeutic peak serum level:** (Not routinely obtained) 20–40 mcg/mL; **therapeutic trough serum level:** 10–20 mcg/mL. **Toxic peak serum level:** greater than 40 mcg/mL; **toxic trough serum level:** greater than 20 mcg/mL.

**Availability (Rx)**

**Capsules (Vancocin):** 125 mg, 250 mg. **Infusion (Premix [Vancocin HCl]):** 500 mg/100 mL, 750 mg/150 mL, 1 g/200 mL. **Injection, Powder for Reconstitution (Vancocin HCl):** 500 mg, 750 mg, 1 g. **Solution, Oral:** 25
mg/mL, 50 mg/mL. **Suspension, Oral:** 50 mg/mL.

**Administration/handling**

**IV**

*Alert* Give by intermittent IV infusion (piggyback) or continuous IV infusion. Do not give IV push (may result in exaggerated hypotension or "red man" syndrome).

**Reconstitution**

- For intermittent IV infusion (piggyback), reconstitute each 500-mg vial with 10 mL Sterile Water for Injection (20 mL for 1-g vial) to provide concentration of 50 mg/mL.
- Further dilute with D₅W or 0.9% NaCl to final concentration not to exceed 5 mg/mL.

**Rate of Administration**

- Administer over 60 min or longer (30 min for each 500 mg recommended).
- Monitor B/P closely during IV infusion.

**Storage**

- Reconstituted vials are stable for 14 days at room temperature or if refrigerated.
- Diluted solutions are stable for 14 days if refrigerated or 7 days at room temperature.
- Discard if precipitate forms.

**PO**

- May give with food.
- Powder for injection may be reconstituted and diluted for oral administration.

**IV incompatibilities**

Albumin, amphotericin B complex (Abelcet, AmBisome, Amphotec), aztreonam (Azactam), ceFAZolin (Ancef), cefotaxime (Clavulan), cefOXitin (Mefoxin), cefTAZidime (Fortaz), cefTRIAXone (Rocephin), cefuroxime (Zinacef), foscarnet (Foscavir), heparin, nafcillin (Nafcil), piperacillin and tazobactam (Zosyn).

**IV Compatibilities**
Amiodarone (Cordarone), calcium gluconate, dexmedetomidine (Precedex), diltiaZEM (Cardizem), HYDROMorphone (Dilaudid), insulin, LORazepam (Ativan), magnesium sulfate, midazolam (Versed), morphine, niCARdipine (Cardene), potassium chloride, propofol (Diprivan).

**Indications/routes/dosage**

**Note:** A loading dose of 25–30 mg/kg may be used to rapidly achieve target concentration for complicated infections in seriously ill pts.

**Usual Parenteral Dosage**

**IV:** **ADULTS, ELDERLY:** 15–20 mg/kg/dose q8–12h. Dosage requires adjustment in renal impairment. **CHILDREN OLDER THAN 1 MO:** 10–15 mg/kg/dose q6h. **Maximum:** 2,000 mg/dose. **NEONATES:** 15 mg/kg q24h up to 10–15 mg/kg/dose q6–24h.

**Staphylococcal Enterocolitis, Antibiotic-Associated Pseudomembranous Colitis Caused by Clostridium Difficile**

**PO:** **ADULTS, ELDERLY:** 125–500 mg q4h for 7–10 days. **CHILDREN:** 40 mg/kg/day in 3–4 divided doses for 7–10 days. **Maximum:** 2 g/day.

**Dosage in Renal Impairment**

After loading dose, subsequent dosages and frequency are modified based on creatinine clearance, severity of infection, and serum concentration of drug.

**Dosage in Hepatic Impairment**

No dose adjustment.

**Side effects**

**Frequent:** **PO:** Bitter/unpleasant taste, nausea, vomiting, mouth irritation (with oral solution). **Rare:** **Parenteral:** Phlebitis, thrombophlebitis, pain at peripheral IV site, dizziness, vertigo, tinnitus, chills, fever, rash, necrosis with extravasation. **PO:** Rash.
Adverse effects/toxic reactions

Nephrotoxicity (acute kidney injury, acute tubular necrosis, renal failure), ototoxicity (temporary or permanent hearing loss) may occur. Too-rapid infusion may cause "red man syndrome," a common adverse reaction characterized by pruritus, urticaria, erythema, angioedema, tachycardia, hypotension, myalgia, maculopapular rash (usually appears on face, neck, upper torso). Cardiovascular toxicity (cardiac depression, arrest) occurs rarely. Onset usually occurs within 30 min of start of infusion, resolves within hrs following infusion. May result from too-rapid rate of infusion.

Nursing considerations

Baseline assessment
Avoid other ototoxic, nephrotoxic medications if possible. Obtain culture, sensitivity test before giving first dose (therapy may begin before results are known). Consider placement of central venous line/PICC line.

Intervention/evaluation
Monitor serum renal function tests, I&O. Assess skin for rash. Check hearing acuity, balance. Monitor B/P carefully during infusion. Monitor for "red man" syndrome. Evaluate IV site for phlebitis (heat, pain, red streaking over vein). Obtain vancomycin peak/trough level as ordered by physician or pharmacist. **Therapeutic serum level: peak:** 20–40 mcg/mL; **trough:** 10–20 mcg/mL. **Toxic serum level: peak:** greater than 40 mcg/mL; **trough:** greater than 20 mcg/mL.

Patient/ family teaching
• Continue therapy for full length of treatment.
• Doses should be evenly spaced.
• Report ringing in ears, hearing loss, changes in urinary frequency or consistency.
• Lab tests are important part of total therapy.

vandetanib
van-det-a-nib
Uses

Treatment of symptomatic or progressive medullary thyroid cancer in pts with unresectable locally advanced or metastatic disease.

Precautions

**Contraindications:** Hypersensitivity to vandetanib. Congenital long QT syndrome. **Cautions:** Pregnancy, concurrent medications that prolong QT interval, hypokalemia, hypomagnesemia, hypothyroidism, cerebrovascular disease, moderate to severe renal/hepatic impairment, hypertension, uncompensated HF, history of torsades de pointes.

Action

Inhibits tyrosine kinases including epidermal growth factor (EGF) and vascular endothelial growth factor (VEGF). Inhibits cell migration, proliferation, survival, and angiogenesis (new blood vessel formation). **Therapeutic Effect:** Inhibits thyroid tumor cell growth and metastasis.
Pharmacokinetics

Slowly absorbed following PO administration. Peak concentration: 4–10 hrs. Metabolized in liver. Protein binding: 90%. Excreted in feces (44%), urine (25%). *Half-life:* 19 days.

Lifespan considerations

**Pregnancy/Lactation:** May cause fetal harm. Avoid pregnancy. Must use effective contraception during treatment and for at least 4 mos after treatment. Unknown if distributed in breast milk. **Children:** Safety and efficacy not established. **Elderly:** No age-related precautions noted.

Interactions

**DRUG:** Medications prolonging QT interval (e.g., amiodarone, azithromycin, ciprofloxacin, clarithromycin, erythromycin, haloperidol) may increase risk of QT prolongation. **CYP3A4 inducers** (e.g., carBAMazepine, OXcarbazepine, phenytoin, rifAMPin) may decrease concentration/effects. **HERBAL:** St. John’s wort may decrease concentration/effect. **FOOD:** Grapefruit products may increase risk of torsades de pointes, myelotoxicity. **LAB VALUES:** May decrease WBC, Hgb, neutrophils. May increase serum bilirubin, ALT, AST, creatinine; urine protein. May alter serum calcium, glucose, magnesium, potassium.

Availability (Rx)

**Tablets:** 100 mg, 300 mg.

Administration/handling

**PO**

- Give without regard to food.
- Do not crush.
- May disperse in 2 oz of noncarbonated water and stir for 10 min until tablet is evenly dispersed (will not completely dissolve). Administer dispersion immediately. Rinse residue in glass with 4 oz water and administer. Can be given via feeding tube.
• Direct contact of crushed tablets with skin or mucous membranes should be strictly avoided. If contact occurs, wash thoroughly.

**Storage**
• Contact pharmacy to properly discard out-of-date tablets.

---

**Indications/routes/dosage**

**Thyroid Cancer**

**PO: ADULTS, ELDERLY:** 300 mg once daily. Continue until disease progression or unacceptable toxicity.

**Dosage Adjustment for QT Prolongation or Toxicity**
Interrupt therapy until resolved or improved, then restart at 100–200 mg once daily.

**Dosage in Renal Impairment**

**CrCl less than 50 mL/min:** 200 mg once daily. Closely monitor QT interval.

**Dosage in Hepatic Impairment**

**Mild impairment:** No dose adjustment.
**Moderate to severe impairment:** Not recommended.

---

**Side effects**

**Frequent (57%–21%):** Diarrhea/colitis, rash, dermatitis acneform/acne, nausea, headache, fatigue, anorexia, abdominal pain. **Occasional (15%–10%):** Dry skin, vomiting, asthenia, photosensitivity, insomnia, nasopharyngitis, dyspepsia, cough, pruritus, weight decrease, depression.

---

**Adverse effects/toxic reactions**

Prolonged QT interval resulting in torsades de pointes, ventricular arrhythmias, sudden cardiac death have been reported. Frequent diarrhea may result in electrolyte imbalances. Severe skin reactions, including Stevens-Johnson syndrome, have been reported. Interstitial lung disease (ILD) or pneumonitis reported (may result in respiratory-related death). Consider ILD in pts with
hypoxia, pleural effusion, cough, dyspnea. Ischemic cerebrovascular events have been reported. Life-threatening events including hypertensive crisis, reversible posterior leukoencephalopathy syndrome (RPLS) have been noted. Adverse reactions resulting in death included respiratory failure/arrest, aspiration pneumonia, cardiac failure, sepsis, GI bleeding.

**Nursing considerations**

**Baseline assessment**

Obtain CBC with differential, serum chemistries, magnesium, ionized calcium, TSH, UA, EKG, vital signs. Obtain negative urine pregnancy before therapy. Question for history of congenital long QT syndrome, HF, arrhythmias, hepatic/renal impairment, seizures, CVA, hemorrhagic events, HTN. Obtain full medication history including contraception. Perform full head-to-toe exam including visual acuity, thorough skin assessment.

**Intervention/evaluation**

Monitor blood levels including electrolytes esp. during episodes of diarrhea. Obtain EKG during wks 2–4, wks 8–12, then every 3 mos thereafter. Obtain EKG for palpitations, chest pain, hypokalemia, hyperkalemia, hypocalcemia, bradycardia, ventricular arrhythmias, syncope. Report any respiratory changes including dyspnea, cough (may indicate ILD). Reversible posterior leukoencephalopathy syndrome should be considered in pts with seizures, headache, visual disturbances, confusion, altered mental status. Ophthalmologic exams including slit lamp recommended in pts with visual disturbances.

**Patient/family teaching**

- Blood levels, EKGs will be routinely monitored.
- Strictly avoid pregnancy. Contraception should be taken during treatment and 4 mos after discontinuation.
- Changes in mental status, seizures, headache, blurry vision, trouble speaking, one-sided weakness may indicate stroke, high blood pressure crisis, or life-threatening brain swelling. Immediately report any newly prescribed medications.
- Do not take herbal products.
- Limit exposure to sunlight.
• Report any yellowing of skin or eyes, abdominal pain, bruising, black/tarry stools, dark urine, decreased urine output, skin changes.
• Report palpitations, chest pain, shortness of breath, dizziness, fainting (may indicate arrhythmia).

varenicline
var-en-i-kleen
Champix
Chantix
CLASSIFICATION
PHARMACOTHERAPEUTIC: Selective partial nicotine agonist.
CLINICAL: Smoking deterrent.

BLACK BOX ALERT
Risk of psychiatric symptoms and suicidal behavior. Agitation, hostility, depressed mood have been reported.

Uses
Aid to smoking-cessation treatment.

Precautions
Contraindications: Hypersensitivity to varenicline. Cautions: Renal impairment, history of suicidal ideation or preexisting psychiatric illness, bipolar disorder, depression, schizophrenia. History of seizures or factors that lower seizure threshold.

Action
Prevents nicotine stimulation of mesolimbic system associated with nicotine addiction. Therapeutic Effect: Decreases desire to smoke.

Pharmacokinetics
Completely absorbed following PO administration. Absorption unaffected by

**Lifespan considerations**

**Pregnancy/Lactation:** Unknown if distributed in breast milk. **Children:** Not recommended. **Elderly:** Age-related renal impairment may require dosage adjustment.

**Interactions**

**DRUG:** Cimetidine may increase effect. May increase concentration/effect of nicotine. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** None significant.

**Availability (Rx)**

**Tablets (Film-Coated):** 0.5 mg, 1 mg.

**Administration/handling**

- Give after meal and with full glass of water.
- Do not break, crush, dissolve, or divide film-coated tablets.

**Indications/routes/dosage**

**Alert** Therapy should start 1 wk before stopping smoking.

**Smoking Deterrent**

**PO: ADULTS, ELDERLY:** Days 1–3: 0.5 mg once daily. Days 4–7: 0.5 mg twice daily. **Day 8–end of treatment:** 1 mg twice daily. Therapy should last for total of 12 wks. Pts who have successfully stopped smoking at the end of 12 wks should continue with an additional 12 wks of treatment to increase likelihood of long-term abstinence.

**Dosage in Renal Impairment**

**CrCl less than 30 mL/min:** 0.5 mg once daily. **Maximum:** 0.5 mg twice daily.
End-stage renal disease, undergoing hemodialysis: Maximum: 0.5 mg once daily.

Dosage in Hepatic Impairment
No dose adjustment.

Side effects
Frequent (30%–13%): Nausea, insomnia, headache, abnormal dreams. Occasional (8%–5%): Constipation, abdominal discomfort, fatigue, dry mouth, flatulence, altered taste, dyspepsia, vomiting, anxiety, depression, irritability. Rare (3%–1%): Drowsiness, rash, increased appetite, lethargy, nightmares, gastroesophageal reflux disease, rhinorrhea, agitation, mood swings.

Adverse effects/toxic reactions
Abrupt withdrawal may cause irritability, sleep disturbances in 3% of pts. Hypertension, angina pectoris, arrhythmia, bradycardia, coronary artery disease, gingivitis, anemia, lymphadenopathy occur rarely. May cause bizarre behavior, suicidal ideation.

Nursing considerations

Baseline assessment
Screen, evaluate for coronary heart disease (history of MI, angina pectoris), cardiac arrhythmias, suicidal ideation. Assess smoking pack/yr history.

Intervention/evaluation
Discontinue use if cardiovascular symptoms occur or worsen. Monitor for psychiatric symptoms (changes in behavior, mood, level of interest, appearance). Assess for cravings, noncompliance with cessation.

Patient/family teaching
• Initiate treatment 1 wk before quit-smoking date.
• Take with food and with full glass of water.
• With twice-daily dosing, take 1 tablet in morning, 1 in evening.
- Report persistent nausea, insomnia.
- Report change in behavior, mood, level of interest, appearance.

- **CLASSIFICATION**
  - **PHARMACOTHERAPEUTIC**: Posterior pituitary hormone.
  - **CLINICAL**: Vasopressor, antidiuretic.

Do not confuse Pitressin with Pitocin.

---

**Uses**

Prevention/control of polydipsia, polyuria, dehydration in pts with neurogenic diabetes insipidus or differential diagnosis of diabetes insipidus. Vasoconstriction: To increase blood pressure in adults with vasodilatory shock who remain hypotensive despite fluids and catecholamines. **OFF-LABEL**: Adjunct in treatment of acute massive GI hemorrhage or esophageal varices.

**Precautions**

**Contraindications**: Hypersensitivity to vasopressin. **Cautions**: Seizure disorder, migraine, asthma, vascular disease, renal/cardiac disease, goiter (with cardiac complications), arteriosclerosis, nephritis, elderly pts.

**Action**

Increases reabsorption of water by renal tubules. Directly stimulates smooth muscle in GI tract. **Therapeutic Effect**: Causes peristalsis, vasoconstriction. Decreases urine output.

*Lifespan considerations*

**Pregnancy/Lactation:** Caution in giving to breastfeeding women.

**Children/Elderly:** Caution due to risk of water intoxication/hyponatremia.

**Interactions**

**DRUG:** Alcohol, *demeclocycline*, lithium, *norepinephrine* may decrease antidiuretic effect. *CarBAMazepine*, *chlorproPAMIDE*, *clofibrate* may increase antidiuretic effect. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** None significant.

**Availability (Rx)**

**Injection Solution:** 20 units/mL.

**Administration/handling**

**IV**

**Reconstitution**

- Dilute with D$_5$W or 0.9% NaCl to concentration of 0.1–1 unit/mL (usual concentration: 100 units/500 mL D$_5$W).

**Rate of Administration**

- Give as IV infusion.

**Storage**

- Store at room temperature.

**IM, SQ**

- Give with 1–2 glasses of water to reduce side effects.

**IV incompatibilities**
Furosemide (Lasix), phenytoin (Dilantin).

**IV Compatibilities**

Amiodarone, argatroban, diltiazEM (Cardizem), DOBUTamine (Dobutrex), DOPamine (Intropin), heparin, insulin, milrinone (Primacor), nitroglycerin, norepinephrine (Levophed), pantoprazole (Protonix), phenylephrine (Neo-Synephrine).

**Indications/routes/dosage**

**Diabetes Insipidus**

**NOTE:** May be administered intranasally by nasal spray or on cotton pledgets; dosage is individualized.

**IM, SQ: ADULTS, ELDERLY:** 5–10 units 2–4 times/day. **CHILDREN:** 2.5–10 units, 2–4 times/day.

**Vasodilatory Shock**

**IV Infusion: ADULTS, ELDERLY:** Initially, 0.01 units/min. Titrate by 0.005 units/min at 10–15-min intervals. **Maximum:** 0.07 units/min.

**Dosage in Renal/Hepatic Impairment**

No dose adjustment.

**Side effects**

**Frequent:** Pain at injection site (with vasopressin tannate). **Occasional:** Abdominal cramps, nausea, vomiting, diarrhea, dizziness, diaphoresis, pale skin, circumoral pallor, tremors, headache, eructation, flatulence. **Rare:** Chest pain, confusion, allergic reaction (rash, urticaria, pruritus, wheezing, difficulty breathing, facial/peripheral edema), sterile abscess (with vasopressin tannate).

**Adverse effects/toxic reactions**

Anaphylaxis, MI, water intoxication have occurred. Elderly, very young are at higher risk for water intoxication.
Nursing considerations

Baseline assessment
Establish baselines for weight, B/P, pulse, serum electrolytes, Hgb, Hct, urine specific gravity.

Intervention/evaluation

Patient/family teaching
• Promptly report headache, chest pain, shortness of breath, other symptoms.
• Stress importance of I&O.
• Avoid alcohol.
• Report confusion, seizure activity.

| vedolizumab |
| ve-doe-liz-ue-mab |
Entyvio

CLASSIFICATION
PHARMACOTHERAPEUTIC: Selective adhesion molecule inhibitor. Monoclonal antibody.
CLINICAL: GI agent.
Do not confuse vedolizumab with certolizumab, eculizumab, natalizumab, omalizumab, tocilizumab.

Uses
Treatment of adult pts with moderately to severely active ulcerative colitis (UC) who have had an inadequate response with, lost response to, or were intolerant to
a tumor necrosis factor (TNF) blocker or immunomodulator; or had an inadequate response with, were intolerant to, or demonstrated dependence on corticosteroids. Treatment of adult pts with moderately to severely active Crohn’s disease (CD) who have had an inadequate response with, lost response to, or were intolerant to a TNF blocker or immunomodulator; or had an inadequate response with, were intolerant to, or demonstrated dependence on corticosteroids.

Precautions

Contraindications: Hypersensitivity to vedolizumab. Cautions: Hepatic impairment, immunocompromised pts, live vaccine administration. Active infections (not recommended during active infection), conditions predisposing to infections (e.g., diabetes, renal failure, open wounds, indwelling catheters). Preexisting or recent-onset CNS demyelinating disorders including multiple sclerosis.

Action

Binds to T-lymphocyte integrin receptors and blocks the interaction with mucosal addressin cell adhesion molecule-1 (MAdCAM-1). Inhibits migration and homing of memory T-lymphocytes into inflamed GI tissue. Therapeutic Effect: Reduces chronic inflammation of colon.

Pharmacokinetics

Metabolism not specified. Excretion not specified. Halflife: 25 days.

Lifespan considerations

Pregnancy/Lactation: Unknown if distributed in breast milk. Use caution when administering to nursing women. Children: Safety and efficacy not established. Elderly: No age-related precautions noted.

Interactions

DRUG: Natalizumab may increase risk of progressive multifocal leukoencephalopathy (PML). Other TNF blockers (e.g., inFLIXimab) may
increase risk of infection. **HERBAL:** None significant. **FOOD:** None known. 
**LAB VALUES:** May increase serum ALT, AST, bilirubin.

**Availability (Rx)**

**Lyophilized Powder for Injection:** 300 mg.

**Administration/handling**

- **IV**
  - Do not administer IV push or bolus.
  - Reconstitute with Sterile Water for Injection and subsequently dilute with 0.9% NaCl only.
  - After infusion completed, flush IV line with 30 mL of 0.9% NaCl.

**Reconstitution**

- Remove flip cap and swab with alcohol.
- Reconstitute vial with 4.8 mL Sterile Water for Injection. Direct stream toward glass wall to avoid excessive foaming.
- Gently swirl contents for at least 15 sec until completely dissolved.
- Do not shake or invert vial.
- Allow solution to sit at room temperature for up to 20 min to allow remaining foam to settle and powder to dissolve. If not fully dissolved after 20 min, allow additional 10 min for dissolution. Do not use if product is not dissolved within 30 min.
- Visually inspect for particulate matter and discoloration. Do not use if discolored or if particle matter is observed.
- Prior to withdrawing solution, invert vial 3 times to ensure mixing.
- Withdraw 5 mL and further dilute in 250 mL 0.9% NaCl bag.
- Infuse immediately.

**Rate of Administration**

- Infuse over 30 min.

**Storage**

- Reconstituted solution should appear clear to opalescent, colorless to light brownish yellow and free of particles.
- May refrigerate diluted solution for up to 4 hrs.
Indications/routes/dosage

Ulcerative Colitis and Crohn’s Disease

IV: ADULTS, ELDERLY: 300 mg once at wk 0, wk 2, and wk 6, then every 8 wks thereafter. Discontinue in pts who do not show evidence of therapeutic benefit by wk 14.

Dosage in Renal Impairment

Use caution.

Dosage in Hepatic Impairment

Use caution. Discontinue for jaundice or signs/symptoms of hepatic injury.

Side effects

Occasional (13%–4%): Nasopharyngitis, headache, arthralgia, nausea, pyrexia, upper respiratory tract infection, fatigue, cough, bronchitis, influenza, back pain.

Rare (3%): Rash, pruritus, sinusitis, oropharyngeal pain, extremity pain.

Adverse effects/toxic reactions

Infusion-related reactions, including anaphylaxis, characterized by bronchospasm, dyspnea, flushing, hypotension, laryngeal edema, nausea, pyrexia, tachycardia, wheezing, vomiting, reported in less than 1% of pts. May increase risk of severe infections such as anal abscess, cytomegaloviral colitis, giardiasis, Listeria meningitis, Salmonella sepsis, TB, UTI, which may lead to fatal sepsis. PML (weakness, paralysis, vision loss, aphasia, cognition impairment) has occurred rarely; however, immunocompromised pts are at increased risk for development. Drug-induced hepatotoxicity with serum ALT, AST greater than 3 times upper limit of normal reported in less than 2% of pts. Malignancies including B-cell lymphoma, breast cancer, colon cancer, lung cancer of primary neuroendocrine carcinoma, lung neoplasm, malignant hepatic neoplasm, melanoma, renal cancer, squamous cell carcinoma, transitional cell carcinoma occur rarely. Immunogenicity (anti-vedolizumab antibodies) occurred in 4%–13% of pts.
Nursing considerations

Baseline assessment
Obtain CBC, LFT. Prior to initiating treatment, all pts should be up to date with all immunizations according to proper guidelines. Continuously screen for active infection. Evaluate for active TB and test for latent infection prior to and during treatment. Induration of 5 mm or greater with tuberculin skin test should be considered a positive result when assessing for latent TB. Antifungal therapy should be considered for those who reside in or travel to regions where mycoses are endemic. Have supplemental oxygen, anaphylaxis kit readily available. Conduct full neurologic exam. Question history of malignancies.

Intervention/evaluation
Routinely monitor LFT. Withhold treatment if acute infection, opportunistic infection, sepsis occurs and initiate appropriate antimicrobial therapy. Monitor for hypersensitivity reaction. Infusion-related reactions generally occur within 2 hrs after infusion. Consider administration of antihistamine, antipyretic, and/or corticosteroid if mild to moderate hypersensitivity reaction occurs. If anaphylaxis occurs, provide immediate resuscitation support. Monitor for new onset or worsening of neurologic symptoms, esp. in pts with CNS disorders; may indicate PML.

Patient/family teaching
• Blood levels, TB screening will be routinely monitored.
• Therapy may lower immune system response. Report travel plans to possible endemic areas.
• Do not receive live vaccines unless approved by your doctor.
• Report history of fungal infections, multiple sclerosis, TB or close relatives who have active TB.
• Infusion may cause severe allergic reactions such as face/tongue swelling, hives, itching, low blood pressure, trouble breathing, or, in some cases, anaphylaxis.
• Do not breastfeed.
• Abdominal pain, bruising, clay-colored stools, dark-amber urine, fatigue, loss of appetite, yellowing of skin or eyes may indicate liver problem.
• Paralysis, vision changes, impaired speech, altered mental status may indicate
life-threatening neurologic event called progressive multifocal leukoencephalopathy (PML).

**vemurafenib**

vem-ue-raf-e-nib

Zelboraf

**CLASSIFICATION**

**PHARMACOTHERAPEUTIC:** BRAF kinase inhibitor.

**CLINICAL:** Antineoplastic.

## Uses

Treatment of unresectable or metastatic melanoma with a BRAF V600E mutation as detected by FDA-approved test. Treatment of Erdheim-Chester disease (ECD) in pts with a BRAF V600E mutation.

## Precautions

**Contraindications:** Hypersensitivity to vemurafenib. **Cautions:** Avoid sun exposure. Prior radiation therapy. Prolonged QT syndrome, concurrent use of medications that prolong QT interval, hepatic impairment, uncorrected electrolyte imbalance (hypokalemia, hypomagnesemia), elderly pts.

## Action

Inhibits kinase activity of certain mutated forms of BRAF. **Therapeutic Effect:** Blocks tumor cell proliferation in melanoma with the mutation.

## Pharmacokinetics

Readily absorbed after PO administration. Protein binding: 99%. Minimally metabolized in liver. Primarily excreted in feces (94%). **Half-life:** 57 hrs. Range: 30–120 hrs.

**Lifespan considerations**

**Pregnancy/Lactation:** Avoid pregnancy. May cause fetal harm. Must use
effective contraception during treatment and for at least 2 mos after discontinuation. Unknown if distributed in breast milk. Must either discontinue breastfeeding or discontinue therapy. **Children:** Safety and efficacy not established. **Elderly:** May have increased risk of adverse reactions, side effects.

**Interactions**

**DRUG:** Antiarrhythmics (e.g., amiodarone, procainamide, quiNIDine, sotalol), azithromycin, barbiturates, ciprofloxacin, dexamethasone, fluconazole, haloperidol, phenothiazines, phenytoins, traZODone, tricyclic antidepressants, vardenafil, voriconazole may prolong QT interval. **CYP3A4 inhibitors** (e.g., clarithromycin, ketoconazole, rifAMPin) may alter concentration. May increase bleeding effect with warfarin. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** May increase serum alkaline phosphatase, ALT, AST, gamma-glutamyl transferase (GGT), bilirubin.

**Availability (Rx)**

 Kami Film-Coated Tablets: 240 mg.

**Administration/handling**

**PO**

• Give in morning and evening approximately 12 hrs apart.
• Give without regard to food.
• Do not break, crush, dissolve, or divide tablets; swallow whole.
• Give with full glass of water.

**Indications/routes/dosage**

**Note:** Management of adverse drug reactions may require dose reduction, treatment interruption, or discontinuation.

**ECD, Melanoma**

**PO:** ADULTS, ELDERLY: 960 mg twice daily (in morning and evening about 12 hrs apart). Continue until disease progression or unacceptable toxicity.
Dosage Modification

Based on Common Terminology Criteria for Adverse Events (CTCAE). **Grade 1 or grade 2 (tolerable):** No dose adjustment. **Grade 2 (intolerable) or grade 3:**

**First incident:** Interrupt treatment until toxicity returns to grade 0 or 1, then resume at 720 mg twice daily. **Second incident:** Interrupt treatment, then resume at 480 mg twice daily. **Third incident:** Discontinue. **Grade 4:**

**First incident:** Interrupt treatment, then resume at 480 mg twice daily. **Second incident:** Discontinue.

Dosage in Renal/Hepatic Impairment

**Mild to moderate impairment:** No dose adjustment. **Severe impairment:** Use with caution.

Side effects

**Frequent (53%–33%):** Arthralgia, alopecia, fatigue, rash, nausea. **Occasional (28%–11%):** Diarrhea, hyperkeratosis, headache, pruritus, pyrexia, dry skin, extremity pain, anorexia, vomiting, peripheral edema, erythema, dysgeusia, myalgia, constipation, asthenia. **Rare (8%–5%):** Maculopapular rash, actinic keratitis, musculoskeletal pain, back pain, cough, papular rash.

Adverse effects/toxic reactions

Cutaneous squamous cell carcinoma (cuSCC) and keratoacanthomas reported in 24% of pts. Pts at increased risk of cuSCC include elderly pts, pts with prior skin cancer, chronic sun exposure. Hypersensitivity reactions including erythema, hypotension, anaphylaxis reported. Mild to severe photosensitivity was reported. Serious dermatologic reactions include Stevens-Johnson syndrome, toxic epidermal necrolysis. Ophthalmologic reactions including uveitis reported. Increased LFT may lead to discontinuation.

Nursing considerations

Baseline assessment

Confirm presence of BRAF V600E mutation. Review history for previous radiation therapy. Obtain serum chemistries, renal function test, serum

**Intervention/evaluation**

Monitor EKG 15 days after initiation, then monthly for first 3 mos, then q3mos thereafter. Routinely assess skin and for 6 mos after discontinuation. Immediately report any new skin lesions. Obtain EKG for palpitations, chest pain, hypokalemia, hyperkalemia, hypocalcemia, bradycardia, ventricular arrhythmias, syncope. Monitor PT/INR while pt is on warfarin. Pruritus, difficulty breathing, erythema, hypotension may indicate anaphylaxis.

**Patient/family teaching**

- Blood levels, EKG, eye examinations are routinely ordered.
- Strictly avoid pregnancy. Contraception should be used during treatment and for 2 mos after last dose.
- Avoid sunlight exposure.
- Report any skin changes, including new warts, sores, reddish bumps that bleed or do not heal, change in mole size or color.
- Report yellowing of skin or eyes, abdominal pain, bruising, black/tarry stools, dark urine, decreased urine output, skin changes.
- Report palpitations, chest pain, shortness of breath, dizziness, fainting (may indicate arrhythmia).

---

**venetoclax**

ven-et-oh-klax

Venclexta

CLASSIFICATION

CLINICAL: Antineoplastic.

Do not confuse venetoclax or Venclexta with Venelex.
Uses
Treatment of pts with chronic lymphocytic leukemia (CLL) with 17p deletion, as detected by an FDA-approved test, who have received at least one prior therapy.

Precautions

Contraindications: Hypersensitivity to venetoclax. Concomitant use of strong CYP3A inhibitors at initiation and during ramp-up phase. Caution: Baseline anemia, leukopenia, neutropenia, thrombocytopenia; concomitant use of moderate CYP3A inhibitors, P-gp inhibitors; active infection or pts at increased risk of infection (diabetes, kidney failure, indwelling catheters, open wounds), hepatic/renal impairment, electrolyte imbalance; history of gout; pts at high risk for tumor lysis syndrome (high tumor burden).

Action
Binds to and inhibits B-cell lymphoma-2 protein and displaces proapoptotic proteins, restoring process of apoptosis. Therapeutic Effect: Inhibits tumor cell growth and metastasis.

Pharmacokinetics

Lifespan considerations

Pregnancy/Lactation: Avoid pregnancy; may cause fetal harm/malformations. Female and male pts of reproductive potential should use effective contraception during treatment and for at least 30 days after discontinuation. Unknown if distributed in breast milk. Breastfeeding not recommended. May impair fertility in males. Children: Safety and efficacy not established. Elderly: No age-related precautions noted.

Interactions

DRUG: Strong CYP3A inhibitors (e.g., clarithromycin, ketoconazole,
ritonavir) may significantly increase concentration/effect; use contraindicated. Moderate CYP3A inhibitors (e.g., erythromycin, ciprofloxacin, diltiaZEM, dronedarone, fluconazole, verapamil), P-gp inhibitors (e.g., amiodarone, azithromycin, captopril, carvedilol, cycloSPORINE, felodipine, ranolazine, ticagrelor) may increase concentration/effect; consider alternative therapy. Strong CYP3A inducers (e.g., carBAMazepine, phenytoin, rifAMPin) may decrease concentration/effect. HERBAL: St. John’s wort may decrease concentration/effect. FOOD: Grapefruit products, Seville oranges, starfruit may increase concentration/effect. Low-fat meals, high-fat meals increase exposure/concentration. LAB VALUES: May decrease Hgb, Hct, neutrophils, platelets, RBCs; serum calcium, potassium. Tumor lysis syndrome may result in elevated serum phosphate, potassium, uric acid.

Availability (Rx)

Tablets: 10 mg, 50 mg, 100 mg.

Administration/handling

PO

• Give with food and water at same time each day.
• Administer tablets whole; do not cut, crush, or divide.
• If a dose is missed by no more than 8 hrs, administer as soon as possible. If dose is missed by more than 8 hrs or if vomiting occurs after dosing, skip dose and administer the next dose on schedule.

Indications/routes/dosage

CLL

PO: ADULTS, ELDERLY: Week 1: 20 mg once daily for 7 days. Week 2: 50 mg once daily for 7 days. Week 3: 100 mg once daily for 7 days. Week 4: 200 mg once daily for 7 days. Week 5 and beyond: 400 mg once daily. Continue until disease progression or unacceptable toxicity.

Dose Modification

Based on Common Terminology Criteria for Adverse Events (CTCAE). For pts
with dose interruption greater than 1 wk during 5-wk ramp-up phase or greater than 2 wks at 400 mg daily dose, reassess risk of tumor lysis syndrome to determine if reinitiation with a reduced dose is needed. Consider discontinuation in pts who require reduced dosage of less than 100 mg for more than 2 wks.

**Dose Reduction Schedule**

**Note:** During ramp-up phase, continue reduced dose for 1 wk before increasing dose.

- **Dose interruption at 400 mg:** Resume at 300 mg.
- **Dose interruption at 300 mg:** Resume at 200 mg.
- **Dose interruption at 200 mg:** Resume at 100 mg.
- **Dose interruption at 100 mg:** Resume at 50 mg.
- **Dose interruption at 50 mg:** Resume at 20 mg.
- **Dose interruption at 20 mg:** Resume at 10 mg.

**Tumor Lysis Syndrome**

**Any occurrence of blood chemistry abnormalities:** Withhold next dose, then resume at same dose if resolved within 24–48 hrs of last dose. If not resolved within 48 hrs, resume at reduced dose.

**Any event of tumor lysis syndrome:** Resume at reduced dose once resolved.

**Grade 3 or 4 Nonhematologic Toxicity**

**First occurrence:** Withhold treatment until resolved to grade 1 or baseline, then resume at same dose.

**Second and subsequent occurrences:** Withhold treatment until resolved, then follow dose reduction schedule (or reduce dose at prescriber’s discretion).

**Hematologic Toxicity**

**First occurrence of grade 3 or 4 neutropenia with infection or fever; grade 4 hematologic toxicity (except lymphopenia):** Withhold treatment until resolved to grade 1 or baseline, then resume at same dose.

**Second and subsequent occurrences:** Withhold treatment until resolved, then follow dose reduction schedule (or reduce dose at prescriber’s discretion).

**Concomitant Use CYP3A Inhibitors, P-gp Inhibitors**

**Strong CYP3A inhibitors:** Avoid inhibitor or reduce venetoclax dose by at least
Moderate CYP3A inhibitors or P-gp Inhibitors: Avoid inhibitor or reduce venetoclax dose by at least 50%.

Dosage in Renal/Hepatic Impairment

Mild to moderate impairment: No dose adjustment.
Severe impairment: Not specified; use caution.

Side effects

Frequent (35%–14%): Diarrhea, nausea, fatigue, pyrexia, vomiting, headache, constipation. Occasional (13%–10%): Cough, peripheral edema, back pain.

Adverse effects/toxic reactions

Anemia, neutropenia, thrombocytopenia are expected responses to therapy. Grade 3 or 4 neutropenia reported in 41% of pts. Pts with high tumor burden, renal impairment, concomitant use of strong or moderate CYP3A inhibitors, P-gp inhibitors may experience life-threatening tumor lysis syndrome, which mainly occurs during the 5-wk ramp-up phase and as early as 6–8 hrs after dose (hospitalization may be necessary). Tumor lysis syndrome may cause renal failure requiring emergent dialysis. Other reactions may include upper respiratory tract infection, pneumonia, autoimmune hemolytic anemia.

Nursing considerations

Baseline assessment

Obtain ANC, CBC, BMP, renal function test; serum phosphate, calcium; vital signs prior to initiation and periodically thereafter. Obtain pregnancy test in female pts of reproductive potential. Question history of hepatic/renal impairment, gout. Assess all pts for high risk of tumor lysis syndrome and provide adequate hydration and antihyperuricemics (according to manufacturer guidelines) prior to first dose. Conduct tumor burden assessments including blood chemistries, radiologic testing (e.g., CT scan). Correct electrolyte imbalances prior to initiation. Receive full medication history (esp. CYP3A inhibitors, P-gp inhibitors, drugs with narrow therapeutic index). Screen for
active infection. Offer emotional support.

**Intervention/evaluation**

Monitor ANC, CBC for anemia, leukopenia, neutropenia, thrombocytopenia. Diligently monitor for tumor lysis syndrome (acute renal failure, electrolyte imbalance, cardiac arrhythmias, seizures). Monitor for infection and provide appropriate antimicrobial therapy if indicated. To reduce risk of neutropenia-associated infection, consider administration of granulocyte-colony stimulating factor (e.g., filgrastim). Monitor for toxicities if discontinuation of CYP3A inhibitors, P-gp inhibitors is unavoidable. Monitor I&O. Assess hydration status.

**Patient/family teaching**

• Treatment may depress your immune system and reduce your ability to fight infection. Report symptoms of infection such as body aches, chills, cough, fatigue, fever. Avoid those with active infection.
• Therapy may cause tumor lysis syndrome (a condition caused by the rapid breakdown of cancer cells), which can cause kidney failure and may lead to death. Report decreased urination, amber-colored urine, confusion, difficulty breathing, fatigue, fever, muscle or joint pain, palpitations, seizures, vomiting.
• Drink at least 6–8 glasses of water every day.
• Avoid pregnancy. Female and male pts of childbearing potential should use effective contraception during treatment and for at least 30 days after last dose. Do not breastfeed.
• Treatment may impair fertility.
• Avoid grapefruit products, Seville oranges, starfruit, herbal supplements.
• Do not take newly prescribed medications unless approved by prescriber who originally started therapy.
• Do not receive live vaccines.

**venlafaxine**

**ven-la-fax-een**

**Apo-Venlafaxine XR* Effexor XR**

**CLASSIFICATION**

**PHARMACOTHERAPEUTIC:** Serotonin-norepinephrine reuptake inhibitor (SNRI).
**Uses**

Treatment of depression. Treatment of generalized anxiety disorder (GAD), social anxiety disorder (SAD). Treatment of panic disorder, with or without agoraphobia. **OFF-LABEL:** Treatment of attention-deficit hyperactivity disorder (ADHD), obsessive-compulsive disorder (OCD), hot flashes, diabetic neuropathy, post-traumatic stress disorder (PTSD).

**Precautions**

**Contraindications:** Hypersensitivity to venlafaxine. Use of MAOIs intended to treat psychiatric disorders concurrently or within 14 days of discontinuing MAOI. Initiation of MAOI to treat psychiatric disorder within 7 days of discontinuing venlafaxine, initiation in pts receiving linezolid or IV methylene blue. **Cautions:** Seizure disorder, renal/hepatic impairment, pts at high risk for suicide, recent MI, mania, volume-depleted pts, narrow-angle glaucoma, HF, hyperthyroidism, abnormal platelet function, elderly pts.

**Action**

Potentiates CNS neurotransmitter activity by inhibiting reuptake of serotonin, norepinephrine, and, to lesser degree, DOPamine. **Therapeutic Effect:** Relieves depression.

**Pharmacokinetics**

Well absorbed from GI tract. Protein binding: 25%–30%. Metabolized in liver. Primarily excreted in urine. Not removed by hemodialysis. **Half-life:** 3–7 hrs; metabolite, 9–13 hrs (increased in hepatic/renal impairment).
Lifespan considerations

Pregnancy/Lactation: Unknown if distributed in breast milk. Children: Children, adolescents are at increased risk for suicidal ideation and behavior, worsening depression, esp. during first few mos of therapy. Elderly: Use caution.

Interactions

**DRUG:** CYP3A4 inhibitors (e.g., clarithromycin, ketoconazole) may increase concentration/effects. MAOIs (e.g., phenelzine, selegiline) may cause neuroleptic malignant syndrome, autonomic instability (including rapid fluctuations of vital signs), extreme agitation, hyperthermia, altered mental status, myoclonus, rigidity, coma. Triptans (e.g., almotriptan, SUMAtriptan), selegiline, SSRIs, traZODone, tricyclic antidepressants (e.g., amitriptyline, doxepin) may increase risk of serotonin syndrome. May increase risk of bleeding with NSAIDs (e.g., ibuprofen, ketorolac, naproxen), aspirin, warfarin. HERBAL: Gotu kola, kava kava, St. John’s wort, valerian may increase CNS depression. St. John’s wort may increase risk of serotonin syndrome. **FOOD:** Grapefruit products may increase concentration/effect. **LAB VALUES:** May increase serum cholesterol CPK, LDH, prolactin, GGT.

Availability (Rx)

**Tablets:** 25 mg, 37.5 mg, 50 mg, 75 mg, 100 mg.
**Capsules (Extended-Release [Effexor XR]):** 37.5 mg, 75 mg, 150 mg.
**Capsules (Extended-Release [Effexor XR]):** 37.5 mg, 75 mg, 150 mg. **Tablets (Extended-Release):** 37.5 mg, 75 mg, 150 mg, 225 mg.

Administration/handling

**PO**

- Give with food.
- Scored tablet may be crushed.
- Do not break, crush, dissolve, or divide extended-release tablets.
- May open capsule, sprinkle on applesauce. Give immediately without chewing and follow with full glass of water.
Indications/routes/dosage

Depression
PO: *(Immediate-Release)*: ADULTS, ELDERLY: Initially, 37.5–75 mg/day in 2–3 divided doses with food. May increase up to 75 mg/day at intervals of 4 days or longer. Usual dose: 75–225 mg/day. **Maximum:** 375 mg/day in 3 divided doses.

PO: *(Extended-Release)*: ADULTS, ELDERLY: Initially, 37.5–75 mg/day as single dose with food. May increase by 75 mg/day at intervals of 4 days or longer. Usual dose: 75–225 mg once daily. **Maximum:** 225 mg/day.

Generalized Anxiety Disorder (GAD)
PO: *(Extended-Release)*: ADULTS, ELDERLY: Initially, 37.5–75 mg/day. May increase by 75 mg/day at 4-day intervals up to 225 mg/day.

Panic Disorder
PO: *(Extended-Release)*: ADULTS, ELDERLY: Initially, 37.5 mg/day. May increase to 75 mg after 7 days followed by increases of 75 mg/day at 7-day intervals up to 225 mg/day.

Social Anxiety Disorder (SAD)
PO: *(Extended-Release)*: ADULTS, ELDERLY: 75 mg once daily.

Dosage in Renal/Hepatic Impairment
Consider decreasing venlafaxine dosage by 50% in pts with moderate hepatic impairment, 25% in pts with mild to moderate renal impairment, 50% in pts on dialysis (withhold dose until completion of dialysis). When discontinuing therapy, taper dosage slowly over 2 wks.

Side effects

**Frequent (greater than 20%):** Nausea, drowsiness, headache, dry mouth. **Occasional (20%–10%):** Dizziness, insomnia, constipation, diaphoresis, nervousness, asthenia, ejaculatory disturbance, anorexia. **Rare (less than 10%):** Anxiety, blurred vision, diarrhea, vomiting, tremor, abnormal dreams,
impotence.

**Adverse effects/toxic reactions**

Sustained increase in diastolic B/P of 10–15 mm Hg occurs occasionally. Serotonin syndrome (agitation, confusion, hallucinations, hyperreflexia), neuroleptic malignant syndrome (muscular rigidity, fever, cognitive changes), suicidal ideation have occurred.

**Nursing considerations**

**Baseline assessment**

Obtain initial weight, B/P. Assess appearance, behavior, speech pattern, level of interest, mood. Assess risk of suicide.

**Intervention/evaluation**

Monitor signs/symptoms of depression, B/P, weight. Assess sleep pattern for evidence of insomnia. Check during waking hours for drowsiness, dizziness, anxiety; provide assistance as necessary. Assess appearance, behavior, speech pattern, level of interest, mood for therapeutic response. Monitor for suicidal ideation (esp. at initiation of therapy or changes in dosage).

**Patient/family teaching**

- Take with food to minimize GI distress.
- Do not increase, decrease, suddenly stop medication.
- Avoid tasks that require alertness, motor skills until response to drug is established.
- Report if breastfeeding, pregnant, or planning to become pregnant.
- Avoid alcohol.
- Report worsening depression, suicidal ideation, unusual changes in behavior.

| verapamil |
| ver-ap-a-mil |
| Apo-Verap | Calan |
Calan SR
Isoptin SR
Novo-Veramil SR
Verelan
Verelan PM

Fixed-Combination(s)

Tarka: verapamil/trandolapril (an ACE inhibitor): 240 mg/1 mg, 180 mg/2 mg, 240 mg/2 mg, 240 mg/4 mg.

CLASSIFICATION
PHARMACOTHERAPEUTIC:  Calcium channel blocker (non-dihydropyridine).
CLINICAL: Antihypertensive, antianginal, antiarrhythmic (class IV), hypertrophic cardiomyopathy therapy adjunct.

Do not confuse Calan with Covera-HS or Verelan with Voltaren.

Uses

Parenteral: Management of supraventricular tachyarrhythmias (SVT), temporary control of rapid ventricular rate in atrial flutter/fibrillation. **PO:** Treatment of hypertension, angina pectoris, supraventricular tachyarrhythmias (SVT), atrial fibrillation/flutter (rate control).

Precautions

Contraindications: Hypersensitivity to verapamil. Atrial fibrillation/flutter in presence of accessory bypass tract (e.g., Wolff-Parkinson-White, Lown-Ganong-Levine syndromes), severe left ventricular dysfunction, cardiogenic shock, second- or third-degree heart block (except with pacemaker), hypotension (SBP less than 90 mm Hg), sick sinus syndrome (except with pacemaker). **IV (additional):** Current use of IV beta-blocking agents, ventricular tachycardia. **Cautions:** Renal/hepatic impairment, concomitant use of beta blockers and/or digoxin, myasthenia gravis, elderly pts, hypertrophic cardiomyopathy. Avoid use in HF.
**Action**

Inhibits calcium ion entry across cardiac, vascular smooth-muscle cell membranes, dilating coronary arteries, peripheral arteries, arterioles. **Therapeutic Effect:** Decreases heart rate, myocardial contractility; slows SA, AV conduction. Decreases total peripheral vascular resistance by vasodilation.

**Pharmacokinetics**

**Lifespan considerations**

**Pregnancy/Lactation:** Drug crosses placenta; distributed in breast milk. Breastfeeding not recommended. **Children:** No age-related precautions noted. **Elderly:** Age-related renal impairment may require dosage adjustment.

**Interactions**

**DRUG:** Beta blockers (e.g., carvedilol, metoprolol) may have additive negative effects on heart rate, AV conduction, or contractility. **Statins** (e.g., simvastatin) may increase risk of myopathy, rhabdomyolysis. May increase concentration of cycloSPORINE, carBAMazepine. May increase digoxin concentration. **CYP3A4 inducers** (e.g., carBAMazepine, phenytoin, rifAMPin) may decrease concentration/effects. **HERBAL:** St. John’s wort may decrease concentration/effects. **FOOD:** Grapefruit products may increase concentration. **LAB VALUES:** EKG may show prolonged PR interval. **Therapeutic serum level:** 0.08–0.3 mcg/mL; **toxic serum level:** N/A.

**Availability (Rx)**

**Injection Solution:** 2.5 mg/mL. **Tablets:** 40 mg, 80 mg, 120 mg. **Capsules (Extended-Release):** 100 mg, 120 mg, 180 mg, 200 mg, 240 mg, 300 mg, 360 mg.
Capsules (Extended-Release): 100 mg, 120 mg, 180 mg, 200 mg, 240 mg, 300 mg, 360 mg. Tablets (Extended-Release): 120 mg, 180 mg, 240 mg.

Administration/handling

IV

Reconstitution
• May give undiluted.

Rate of Administration
• Administer IV push over 2 min for adults, children; give over 3 min for elderly.
• Continuous EKG monitoring during IV injection is required for children, recommended for adults.
• Monitor EKG for rapid ventricular rate, extreme bradycardia, heart block, asystole, prolongation of PR interval. Notify physician of any significant changes.
• Monitor B/P q5–10min.
• Pt should remain recumbent for at least 1 hr after IV administration.

Storage
• Store vials at room temperature.

PO
• Do not give with grapefruit products.
• Do not crush or cut extended-release tablets, capsules. Give extended-release tablets with food.
• Sustained-release capsules may be opened and sprinkled on applesauce, then swallowed immediately (do not chew).

IV incompatibilities
Albumin, amphotericin B complex (Abelcet, AmBisome, Amphotec), nafcillin (Nafcil), propofol (Diprivan), sodium bicarbonate.

IV Compatibilities
Amiodarone (Cordarone), calcium chloride, calcium gluconate, dexamethasone
(Decadron), digoxin (Lanoxin), DOBUTamine (Dobutrex), DOPamine (Intropin), furosemide (Lasix), heparin, HYDROMorphone (Dilaudid), lidocaine, magnesium sulfate, metoclopramide (Reglan), milrinone (Primacor), morphine, multivitamins, nitroglycerin, norepinephrine (Levophed), potassium chloride, potassium phosphate, procainamide (Pronestyl), propranolol (Inderal).

Indications/routes/dosage

Supraventricular Tachyarrhythmias (SVT)

**IV: ADULTS, ELDERLY:** Initially, 2.5–5 mg over 2 min. May give 5–10 mg 15–30 min after initial dose. **Maximum total dose:** 20–30 mg. **CHILDREN 1–15 YRS:** 0.1–0.3 mg/kg over 2 min. **Maximum initial dose:** 5 mg. May repeat in 30 min. **Maximum second dose:** 10 mg.

Angina, Unstable Angina, Chronic Stable Angina

**PO:** (Immediate-Release): **ADULTS:** Initially, 80–120 mg 3 times/day. For elderly pts, those with hepatic dysfunction, initially 40 mg 3 times/day. Titrate to optimal dose. **Maintenance:** 240–480 mg/day in 3–4 divided doses. Usual range: 80–160 mg 3 times/day.

Atrial Fibrillation (rate control)

**IV: ADULTS, ELDERLY:** Initially, 0.075–0.15 mg/kg (usual: 5–10 mg) over 2 min. May repeat with 10 mg after 15–30 min. **PO:** (Immediate-Release): 240–480 mg/day in 3–4 divided doses.

Hypertension

**PO:** (Immediate-Release): **ADULTS, ELDERLY:** Initially, 40–80 mg 3 times/day. Range: 240–480 mg/day in divided doses.

**PO:** (Extended-Release [Calan SR]): **ADULTS, ELDERLY:** Initially, 120–180 mg once daily. May increase at wkly intervals to 240 mg once daily, then 180 mg twice daily. **Maximum:** 240 mg twice daily.

**PO:** (Extended-Release [Verelan]): **ADULTS, ELDERLY:** Initially, 120–240 mg once daily. May increase dose at wkly intervals to 240 mg/day, then 360 mg/day, then 480 mg/day maximum.

**PO:** (Extended-Release [Verelan PM]): **ADULTS, ELDERLY:** Initially, 100–
200 mg once daily at bedtime. May increase dose at wkly intervals to 300 mg once daily, then 400 mg once daily maximum.

**Chronic Atrial Fibrillation (Rate Control), SVT**

**PO: (Immediate-Release):** ADULTS, ELDERLY: 240–480 mg/day in 3–4 divided doses. Usual range: 120–360 mg/day.

**Dosage for Renal Impairment**

**CrCl less than 10 mL/min:** Dose reduction (50%–75%) of normal dose recommended.

**Dosage in Hepatic Impairment**

Dose reduction (20%–50%) of normal dose recommended.

**Side effects**

**Frequent (7%):** Constipation. **Occasional (4%–2%):** Dizziness, light-headedness, headache, asthenia, nausea, peripheral edema, hypotension. **Rare (less than 1%):** Bradycardia, dermatitis, rash.

**Adverse effects/toxic reactions**

Rapid ventricular rate in atrial flutter/fibrillation, marked hypotension, extreme bradycardia, HF, asystole, second- or third-degree AV block occur rarely.

**Nursing considerations**

**Baseline assessment**

Obtain baseline EKG. Record onset, type (sharp, dull, squeezing), radiation, location, intensity, duration of anginal pain, precipitating factors (exertion, emotional stress). Check B/P for hypotension, pulse for bradycardia immediately before giving medication.

**Intervention/evaluation**

Assess pulse for quality, rate, rhythm. Monitor B/P. Monitor EKG for cardiac
changes, particularly prolongation of PR interval. Notify physician of any significant EKG interval changes. Assist with ambulation if dizziness occurs. Assess for peripheral edema. For those taking oral form, monitor daily pattern of bowel activity, stool consistency. Therapeutic serum level: 0.08–0.3 mcg/mL; toxic serum level: N/A.

**Patient/family teaching**

- Do not abruptly discontinue medication.
- Compliance with therapy regimen is essential to control anginal pain.
- Go from lying to standing slowly.
- Avoid tasks that require alertness, motor skills until response to drug is established.
- Limit caffeine.
- Avoid or limit alcohol.
- Report continued, persistent angina pain, irregular heartbeats, shortness of breath, swelling, dizziness, constipation, nausea, hypotension.
- Avoid grapefruit products.

---

**vilazodone**

vil-az-oh-done

**Viibryd**

♦ **CLASSIFICATION**

**PHARMACOTHERAPEUTIC**: Selective serotonin reuptake inhibitor.

**CLINICAL**: Antidepressant.

■ **BLACK BOX ALERT** ■ Increased risk of suicidal ideation and behavior in children, adolescents, and young adults 18–24 yrs of age with major depressive disorder, other psychiatric disorders.

**Uses**

Treatment of major depressive disorder.

**Precautions**
**Contraindications:** Hypersensitivity to vilazodone. Use of MAOIs intended to treat psychiatric disorders (with or within 14 days of stopping vilazodone or MAOI), starting vilazodone in pts receiving linezolid or methylene blue. **Cautions:** Seizure disorder, pts at risk for suicide, hepatic impairment, elderly pts.

**Action**

Enhances serotonergic activity in CNS by selectively inhibiting reuptake of serotonin. **Therapeutic Effect:** Relieves depression.

**Pharmacokinetics**

**Lifespan considerations**

**Pregnancy/Lactation:** Unknown if drug crosses placenta or is excreted in breast milk. **Children:** Safety and efficacy not established. **Elderly:** No age-related precautions noted.

**Interactions**

**DRUG:** Aspirin, NSAIDs (e.g., ibuprofen, ketorolac, naproxen), warfarin may increase risk of bleeding. **Strong CYP3A4 inhibitors** (e.g., ketoconazole, nefazodone, ritonavir) may increase concentration. Almotriptan, busPIRone, eletriptan, naratriptan, SNRIs (e.g., venlafaxine), SSRIs (e.g., sertraline), SUMAtriptan, traMADol, tryptophan may increase risk of serotonin syndrome. **HERBAL:** St. John’s wort may increase risk of serotonin syndrome. **FOOD:** None known. **LAB VALUES:** None significant.

**Availability (Rx)**

**Tablets:** 10 mg, 20 mg, 40 mg.

**Administration/handling**
PO
• Give with food (administration without food can result in inadequate drug concentration, may diminish effectiveness).

Indications/routes/dosage

Depression
PO: ADULTS, ELDERLY: Initially, 10 mg once daily for 7 days, followed by 20 mg once daily. May increase to 40 mg once daily after a minimum of 7 days. Note: When discontinuing treatment, reduce dose gradually. From 40 mg/day: taper to 20 mg/day for 4 days, then 10 mg/day for 3 days. From 20 mg/day: taper to 10 mg/day for 7 days.

Concomitant Moderate/Strong CYP3A4 Inhibitors
PO: ADULTS, ELDERLY: 20 mg/day.

Concomitant Strong CYP3A4 Inducers
May increase dose to 80 mg/day when used concomitantly for more than 14 days.

Dosage in Renal/Hepatic Impairment
No dose adjustment.

Side effects
Frequent (28%–23%): Diarrhea, nausea. Occasional (9%–3%): Dizziness, dry mouth, insomnia, vomiting, decreased libido, abnormal dreams, fatigue, sweating. Rare (2%): Dyspepsia, flatulence, paresthesia, restlessness, arthralgia, abnormal orgasm, delayed ejaculation, increased appetite, palpitations, tremor.

Adverse effects/toxic reactions
Serotonin syndrome (agitation, confusion, hallucinations, hyperreflexia), neuroleptic malignant syndrome (fever, muscular rigidity, cognitive changes).
Nursing considerations

Baseline assessment
Assess behavior, appearance, emotional status, response to environment, speech pattern, thought content, risk of suicide.

Intervention/evaluation
Monitor B/P, heart rate, weight. Monitor for suicidal ideation (esp. at initiation of therapy or changes in dosage). Assess for therapeutic response (greater interest in surroundings, improved self-care, increased ability to concentrate, relaxed facial expression).

Patient/family teaching
• Avoid tasks that may require alertness, motor skills until response to drug is established (may cause dizziness).
• Slowly go from lying to standing.
• Take with food.
• Do not suddenly stop taking medication; withdraw gradually.
• Report suicidal ideation, signs of mania/hypomania. Avoid alcohol.

vinBLASTine

vin-blas-teen

CLASSIFICATION
PHARMACOTHERAPEUTIC: Vinca alkaloid.
CLINICAL: Antineoplastic.

BLACK BOX ALERT ■ Must be administered by personnel trained in administration/handling of chemotherapeutic agents. For IV use only. Fatal if given intrathecally (ascending paralysis, death). Vesicant; avoid extravasation.

Do not confuse vinBLASTine with vinCRIStine or vinorelbine.

Uses
Treatment of Hodgkin’s lymphoma, lymphocytic lymphoma, histiocytic
lymphoma, advanced stage of mycosis fungoides, advanced testicular carcinoma, Kaposi’s sarcoma, Letterer-Siwe disease, breast carcinoma, choriocarcinoma. **OFF-LABEL:** Treatment of bladder, ovarian cancer; non–small-cell lung cancer; soft tissue sarcoma, melanoma.

**Precautions**

**Contraindications:** Hypersensitivity to vinBLASTine. Bacterial infection, significant granulocytopenia (unless as a result of condition being treated). **Cautions:** Hepatic impairment, severe leukopenia, neurotoxicity, recent exposure to radiation therapy, chemotherapy, ischemic heart disease, preexisting pulmonary disease.

**Action**

Binds to tubulin, inhibiting microtubule formation; may interfere with nucleic acid, protein synthesis. **Therapeutic Effect:** Inhibits cell division by disrupting mitotic spindle.

**Pharmacokinetics**

Does not cross blood-brain barrier. Protein binding: 99%. Metabolized in liver. Primarily excreted in feces. **Half-life:** 24.8 hrs.

**Lifespan considerations**

**Pregnancy/Lactation:** If possible, avoid use during pregnancy, esp. during first trimester. Breastfeeding not recommended. Aspermia has been reported in males. **Children/Elderly:** No age-related precautions noted.

**Interactions**

**DRUG:** May decrease concentration/anticonvulsant effects of **phenytoin.** **CYP3A4 inhibitors (e.g., erythromycin, ketoconazole)** may increase level/toxicity. **Bone marrow depressants** may increase myelosuppression. **Live virus vaccines** may potentiate virus replication, increase vaccine side effects, decrease pt’s antibody response to vaccine. **HERBAL:** St. John’s wort may decrease concentration. Avoid **black cohosh, dong quai** in estrogen-dependent
tumors. **FOOD:** None known. **LAB VALUES:** May increase serum uric acid.

### Availability (Rx)

**Injection, Powder for Reconstitution:** 10 mg. **Injection Solution:** 1 mg/mL.

### Administration/handling

**Alert:** May be carcinogenic, mutagenic, teratogenic. Handle with extreme care during preparation and administration. Give by IV injection. Leakage from IV site into surrounding tissue may produce extreme irritation. Avoid eye contact with solution (severe eye irritation, possible corneal ulceration may result). If eye contact occurs, immediately irrigate eye with water.

### IV

**Note:** In order to prevent inadvertent intrathecal administration, dispense as a piggyback. (not a syringe).

**Reconstitution**

- Reconstitute 10-mg vial with 10 mL 0.9% NaCl to provide concentration of 1 mg/mL. Using 1 mg/ml solution, further dilute in 25–50 mL $D_5W$ or 0.9% NaCl.

**Rate of Administration**

- Infuse over 5–15 min. Prolonged administration time and/or increased volume may increase risk of vein irritation and extravasation.

**Storage**

- Refrigerate unopened vials.
- Solution appears clear, colorless.
- Following dilution, solution is stable for up to 21 days if protected from light (consult manufacturer prescribing information).
- Discard if solution is discolored or precipitate forms.

### IV Incompatibility

Furosemide (Lasix).

### IV Compatibilities

Allopurinol (Aloprim), CISplatin (Platinol AQ), cyclophosphamide (Cytoxan), DOXOrubicin (Adriamycin), etoposide (VePesid), 5-fluorouracil, gemcitabine
(Gemzar), granisetron (Kytril), heparin, leucovorin, methotrexate, ondansetron (Zofran), PACLItaxel (Taxol), vinorelbine (Navelbine).

**Indications/routes/dosage**

*Alert*: Dosage individualized based on clinical response, tolerance to adverse effects. When used in combination therapy, consult specific protocols for optimum dosage, sequence of drug administration.

**Usual Dosage**

**IV: ADULTS, ELDERLY:** Initially, 3.7 mg/m\(^2\) (adjust dose q7days based on WBC response) up to 5.5 mg/m\(^2\) (second wk), 7.4 mg/m\(^2\) (third wk), 9.25 mg/m\(^2\) (fourth wk), and 11.1 mg/m\(^2\) (fifth wk). **Maximum:** 18.5 mg/m\(^2\). **CHILDREN:** 3–6 mg/m\(^2\) q7–14days. **Maximum:** 12.5 mg/m\(^2\)/wk.

**Dosage in Renal Impairment**

No dose adjustment.

**Dosage in Hepatic Impairment**

**Direct serum bilirubin concentration 1.5–3 mg/dL:** Reduce dose by 50%. **Greater than 3 mg/dL:** Avoid use.

**Side effects**

**Frequent:** Nausea, vomiting, alopecia. **Occasional:** Constipation, diarrhea, rectal bleeding, headache, paresthesia (occur 4–6 hrs after administration, persist for 2–10 hrs), malaise, asthenia, dizziness, pain at tumor site, jaw/face pain, depression, dry mouth. **Rare:** Dermatitis, stomatitis, phototoxicity, hyperuricemia.

**Adverse effects/toxic reactions**

Hematologic toxicity manifested most commonly as leukopenia, less frequently as anemia. WBC reaches its nadir 4–10 days after initial therapy, recovers within 7–14 days (high dosage may require 21-day recovery period). Thrombocytopenia is usually mild and transient, with recovery occurring in a few days. Hepatic insufficiency may increase risk of toxicity. Acute shortness of
breath, bronchospasm may occur, particularly when administered concurrently with mitoMYcin.

**Nursing considerations**

**Baseline assessment**
Nausea, vomiting easily controlled by antiemetics. Discontinue therapy if WBC, platelet counts fall abruptly (unless drug is clearly destroying tumor cells in bone marrow). Obtain CBC wkly or before each dosing. Offer emotional support.

**Intervention/evaluation**
If neutrophils fall below 2,000 cells/mm$^3$, assess diligently for signs of infection. Assess for stomatitis; maintain strict oral hygiene. Monitor for hematologic toxicity: infection (fever, sore throat, signs of local infection), unusual bruising/bleeding from any site, symptoms of anemia (excessive fatigue, weakness). Monitor daily pattern of bowel activity, stool consistency. Avoid constipation. Extravasation may result in cellulitis, phlebitis. Large amount of extravasation may result in tissue sloughing. If extravasation occurs, give local injection of hyaluronidase, apply warm compresses.

**Patient/family teaching**
- Immediately report any pain/burning at injection site during administration.
- Pain at tumor site may occur during or shortly after injection.
- Do not have immunizations without physician approval (drug lowers resistance).
- Avoid crowds, those with infection.
- Promptly report fever, sore throat, signs of local infection, unusual bruising/bleeding from any site.
- Hair loss is reversible, but new hair growth may have different color, texture.
- Report persistent nausea/vomiting.
- Avoid constipation by increasing fluids, bulk in diet, exercise as tolerated.

**vinCRISTine**
**vin-cris-teen**
**Marqibo**
Vincasar PFS

**CLASSIFICATION**

**PHARMACOTHERAPEUTIC:** Vinca alkaloid.

**CLINICAL:** Antineoplastic.

**BLACK BOX ALERT**

Must be administered by personnel trained in administration/handling of chemotherapeutic agents. For IV use only. Fatal if given intrathecally (ascending paralysis, death). Vesicant; avoid extravasation. Marqibo and Vincasar are not interchangeable.

Do not confuse vinCRISTine with vinBLASTine.

**Uses**

**Vincasar:** Treatment of acute lymphocytic leukemia (ALL), Hodgkin’s lymphoma, advanced non-Hodgkin’s lymphomas, neuroblastoma, rhabdomyosarcoma, Wilms tumor. **Marqibo:** Relapsed Philadelphia chromosome negative (Ph−) ALL in adults whose disease has progressed after 2 or more antileukemic therapies. **OFF-LABEL:** **Vincasar:** Treatment of multiple myeloma, chronic lymphocytic leukemia (CLL), brain tumors, small cell lung cancer, ovarian germ cell tumors, Ewing’s sarcoma, gestational trophoblastic tumors, retinoblastoma.

**Precautions**

**Contraindications:** Hypersensitivity to vinCRISTine. Demyelinating form of Charcot-Marie-Tooth syndrome. Intrathecal administration. **Caution:** Hepatic impairment, pts receiving radiation therapy through ports (including liver), neurotoxicity, preexisting neuromuscular disease, hepatobiliary dysfunction, elderly.

**Action**

Binds to tubulin, inhibiting microtubule formation; may interfere with nucleic acid/protein synthesis. **Therapeutic Effect:** Inhibits cell division by disrupting mitotic spindle.
Pharmacokinetics

Does not cross blood-brain barrier. Protein binding: 75%. Metabolized in liver. Primarily excreted in feces by biliary system. **Half-life:** 24 hrs. Marqibo: 45 hrs.

Lifespan considerations

Pregnancy/Lactation: If possible, avoid use during pregnancy, esp. first trimester. May cause fetal harm. Breastfeeding not recommended. **Children:** No age-related precautions noted. **Elderly:** More susceptible to neurotoxic effects.

Interactions

**DRUG:** May decrease concentration/anticonvulsant effects of phenytoin. Itraconazole may increase severity of neuromuscular side effects. **Live virus vaccines** may potentiate virus replication, increase vaccine side effects, decrease pt’s antibody response to vaccine. **HERBAL:** St. John’s wort, echinacea may decrease concentration. **FOOD:** None known. **LAB VALUES:** May increase serum uric acid.

Availability (Rx)

**Injection Solution (Vincasar):** 1 mg/mL. **Injection Suspension (Marqibo):** 5 mg/31 mL.

Administration/handling

**Note:** In order to prevent inadvertent intrathecal administration, dispense as a piggyback. (not a syringe).

**IV**

**Alert** May be carcinogenic, mutagenic, teratogenic. Handle with extreme care during preparation and administration. Use extreme caution in calculating, administering vinCRIStine. Overdose may result in serious or fatal outcome.

**Vincasar**

Reconstitution

• Dilute in 25–50 mL D₅W or 0.9% NaCl.
**Rate of Administration**
- Administer as 5–10 min infusion (preferred).
- Do not inject into extremity with impaired, potentially impaired circulation caused by compression or invading neoplasm, phlebitis, varicosity.

**Storage**
- Refrigerate unopened vials.
- Solution appears clear, colorless.
- Discard if solution is discolored or precipitate forms.
- Diluted solutions are stable for 7 days refrigerated or 2 days at room temperature.

**Marqibo**

**Note:**
- Calculate dose of vinCRIStine and remove volume equal to volume of intended solution from 100 mL 0.9% NaCl or D₅W infusion bag. Inject vinCRIStine into infusion bag (total volume: 100 mL).

**Rate of Administration**
- Administer over 60 min.

**Storage**
- Solution must be administered within 12 hrs of preparation.

---

**IV incompatibilities**
Furosemide (Lasix), IDArubicin (Idamycin).

**IV Compatibilities**
Allopurinol (Aloprim), CISplatin (Platinol AQ), cyclophosphamide (Cytoxan), cytarabine (Ara-C, Cytosar), DOXOrubicin (Adriamycin), etoposide (VePesid), 5-fluorouracil, gemcitabine (Gemzar), granisetron (Kytril), leucovorin, methotrexate, ondansetron (Zofran), PACLitaxel (Taxol), vinorelbine (Navelbine).

**Indications/routes/dosage**
Usual Dosage (Vincasar)

**IV: ADULTS, ELDERLY:** 1.4 mg/m\(^2\), frequency may vary based on protocol. **CHILDREN WEIGHING MORE THAN 10 KG:** 1.5–2 mg/m\(^2\), frequency may vary based on protocol. **CHILDREN WEIGHING LESS THAN 10 KG:** 0.05 mg/kg once wkly. **Maximum:** 2 mg.

Dosage in Renal Impairment

No dose adjustment.

Dosage in Hepatic Impairment

<table>
<thead>
<tr>
<th>Bilirubin</th>
<th>Dosage</th>
</tr>
</thead>
<tbody>
<tr>
<td>Bilirubin greater than 3 mg/dL</td>
<td>50% of normal</td>
</tr>
</tbody>
</table>

All (Marqibo)

**IV: ADULTS, ELDERLY:** 2.25 mg/m\(^2\) q7days. Infuse over 1 hr.

Dosage in Renal/Hepatic Impairment (Marqibo)

No dose adjustment.

Side effects

**Expected:** Peripheral neuropathy (occurs in nearly every pt; first clinical sign is depression of Achilles tendon reflex). **Frequent:** Peripheral paresthesia, alopecia, constipation/obstipation (upper colon impaction with empty rectum), abdominal cramps, headache, jaw pain, hoarseness, diplopia, ptosis/drooping of eyelid, urinary tract disturbances. **Occasional:** Nausea, vomiting, diarrhea, abdominal distention, stomatitis, fever. **Rare:** Mild leukopenia, mild anemia, thrombocytopenia.

Adverse effects/toxic reactions

Acute dyspnea, bronchospasm may occur, esp. when administered concurrently with mitoMYcin. Prolonged or high-dose therapy may produce foot/wrist drop, difficulty walking, slapping gait, ataxia, muscle wasting. Acute uric acid nephropathy may occur.
Nursing considerations

Baseline assessment
Obtain baseline CBC, LFT. Offer emotional support. Question history of hepatic impairment, neuromuscular disease.

Intervention/evaluation

Patient/family teaching
• Immediately report any pain/burning at injection site during administration.
• Hair loss is reversible, but new hair growth may have different color/texture.
• Report persistent nausea/vomiting.
• Report signs of peripheral neuropathy (burning/numbness of bottom of feet, palms of hands).
• Report fever, sore throat, unusual bleeding/bruising, shortness of breath.

vinorelbine
vin-oh-rel-been
Navelbine

CLASSIFICATION
PHARMACOTHERAPEUTIC: Vinca alkaloid.
CLINICAL: Antineoplastic.

BLACK BOX ALERT Must be administered by personnel trained in administration/handling of chemotherapeutic agents. For IV use only. Fatal if given intrathecally (ascending paralysis, death). Extravasation produces thrombophlebitis, local tissue necrosis. May produce severe granulocytopenia. Granulocyte counts should be 1,000 cells/mm³ or greater prior to initiation.
**Do not confuse vinorelbine with vinBLAStine or vinCRISTine.**

**Uses**

**Precautions**

**Contraindications:** Hypersensitivity to vinorelbine. Granulocyte count before treatment of less than 1,000 cells/mm³. **Cautions:** Compromised marrow reserve due to prior chemotherapy/radiation therapy; hepatic impairment, neurotoxicity, neuropathy, pulmonary impairment.

**Action**

Binds to tubulin, inhibiting microtubule formation; may interfere with nucleic acid protein synthesis. **Therapeutic Effect:** Prevents cellular division by disrupting formation of mitotic spindle.

**Pharmacokinetics**

Widely distributed after IV administration. Protein binding: 80%–90%. Metabolized in liver. Primarily excreted in feces by biliary system. **Half-life:** 28–43 hrs.

**Lifespan considerations**

**Pregnancy/Lactation:** If possible, avoid use during pregnancy, esp. during first trimester. May cause fetal harm. Unknown if distributed in breast milk. Breastfeeding not recommended. **Children:** Safety and efficacy not established. **Elderly:** No age-related precautions noted.

**Interactions**

**DRUG:** Bone marrow depressants may increase risk of myelosuppression.
CISplatin significantly increases risk of granulocytopenia. Live virus vaccines may potenti ate virus replication, increase vaccine side effects, decrease pt’s antibody response to vaccine. MitoMYcin may produce an acute pulmonary reaction. PACLitaxel may increase neuropathy. CYP3A4 inhibitors (e.g., erythromycin, ketoconazole) may increase concentration/effects. HERBAL: St. John’s wort may decrease concentration. FOOD: None known. LAB VALUES: May increase serum bilirubin, alkaline phosphatase, ALT, AST.

Availability (Rx)

Injection Solution: 10 mg/mL (1-mL, 5-mL vials).

Administration/handling

IV

IV needle, catheter must be correctly positioned before administration. Leakage into surrounding tissue produces extreme irritation, local tissue necrosis, thrombophlebitis. Handle drug with extreme care during administration; wear protective clothing per protocol. If solution comes in contact with skin/mucosa, immediately wash thoroughly with soap, water.

Reconstitution

• Must be diluted and administered via syringe or IV bag.

SYRINGE DILUTION

• Dilute calculated vinorelbine dose with D₅W or 0.9% NaCl to concentration of 1.5–3 mg/mL.

IV BAG DILUTION

• Dilute calculated vinorelbine dose with D₅W, 0.45% or 0.9% NaCl, 5% dextrose and 0.45% NaCl, Ringer’s or lactated Ringer’s to concentration of 0.5–2 mg/mL.

Rate of Administration

• Administer diluted vinorelbine over 6–10 min into side port of free-flowing IV closest to IV bag followed by flushing with 75–125 mL of one of the solutions.
• If extravasation occurs, stop injection immediately; give remaining portion of dose into another vein.

Storage

• Refrigerate unopened vials.
• Protect from light.
• Unopened vials are stable at room temperature for 72 hrs.
• Do not administer if particulate has formed.
• Diluted vinorelbine may be used for up to 24 hrs under normal room light when stored in polypropylene syringes or polyvinyl chloride bags at room temperature.

### IV incompatibilities

Acyclovir (Zovirax), allopurinol (Aloprim), amphotericin B (Fungizone), amphotericin B complex (Abelcet, AmBisome, Amphotec), ampicillin (Omnipen), ceFAZolin (Ancef), cefTRIAXone (Rocephin), cefuroxime (Zinacef), 5-fluorouracil (5-FU), furosemide (Lasix), ganciclovir (Cytovene), methylPREDNISolone (Solu-Medrol), sodium bicarbonate.

### IV Compatibilities

Calcium gluconate, CARBOplatin (Paraplatin), CIStplatin (Platinol AQ), cyclophosphamide (Cytoxan), cytarabine (ARA-C, Cytosar), dacarbazine (DTIC), DAUNOribcin (Cerubidine), dexamethasone (Decadron), diphenhydramINE (Benadryl), DOXOrubicin (Adriamycin), etoposide (VePesid), gemcitabine (Gemzar), granisetron (Kytril), HYDROMorphone (Dilaudid), IDArubicin (Idamycin), methotrexate, morphine, ondansetron (Zofran), vinBLAStine (Velban), vinCRIStine (Oncovin).

### Indications/routes/dosage

**Alert** Dosage adjustments should be based on granulocyte count obtained on the day of treatment, as follows:

<table>
<thead>
<tr>
<th>Granulocyte Count (cells/mm³) on Day of Treatment</th>
<th>Dosage</th>
</tr>
</thead>
<tbody>
<tr>
<td>1,500 or higher</td>
<td>100% of starting dose</td>
</tr>
<tr>
<td>1,000–1,499</td>
<td>50% of starting dose</td>
</tr>
<tr>
<td>Less than 1,000</td>
<td>Do not administer</td>
</tr>
</tbody>
</table>

**NSCLC Monotherapy**

**IV Injection:** **ADULTS, ELDERLY:** 30 mg/m² administered wkly over 6–10 min.
NSCLC Combination Therapy with CISplatin

IV Injection: ADULTS, ELDERLY: 25–30 mg/m\(^2\) every wk.

Dosage in Renal Impairment

No dose adjustment. **HD:** Decrease dose to 20 mg/m\(^2\)/wk given post-HD or on non-HD days.

Dosage in Hepatic Impairment

<table>
<thead>
<tr>
<th>Bilirubin</th>
<th>Dosage</th>
</tr>
</thead>
<tbody>
<tr>
<td>2 mg/dL or less</td>
<td>100% of dose</td>
</tr>
<tr>
<td>2.1–3 mg/dL</td>
<td>50% of dose</td>
</tr>
<tr>
<td>Greater than 3 mg/dL</td>
<td>25% of dose</td>
</tr>
</tbody>
</table>

Side effects

**Frequent (35%–12%):** Asthenia, nausea, constipation, erythema, pain, vein discoloration at injection site, fatigue, peripheral neuropathy manifested as paresthesia, hyperesthesia, diarrhea, alopecia. **Occasional (10%–5%):** Phlebitis, dyspnea, loss of deep tendon reflexes. **Rare:** Chest pain, jaw pain, myalgia, arthralgia, rash.

Adverse effects/toxic reactions

Bone marrow depression is manifested mainly as granulocytopenia (may be severe). Other hematologic toxicities (neutropenia, thrombocytopenia, leukopenia, anemia) increase risk of infection, bleeding. Acute shortness of breath, severe bronchospasm occur infrequently, particularly in pts with preexisting pulmonary dysfunction. Hepatic toxicity may occur.

Nursing considerations

Baseline assessment

Review medication history. Obtain CBC prior to each dose. Granulocyte count should be at least 1,000 cells/mm\(^3\) before vinorelbine administration. Granulocyte nadirs occur 7–10 days following dosing. Do not give hematologic
growth factors within 24 hrs before administration of chemotherapy or earlier than 24 hrs following cytotoxic chemotherapy. Advise women of childbearing potential to avoid pregnancy during drug therapy. Offer emotional support.

**Intervention/evaluation**
Diligently monitor injection site for swelling, redness, pain. Frequently monitor for myelosuppression during and following therapy (infection [fever, sore throat, signs of local infection], unusual bleeding/bruising, anemia [excessive fatigue, weakness]). Monitor pts developing severe granulocytopenia for evidence of infection, fever. Crackers, dry toast, sips of cola may help relieve nausea. Monitor daily pattern of bowel activity, stool consistency. Question for tingling, burning, numbness of hands/feet (peripheral neuropathy). Pt complaint of "walking on glass" is sign of hyperesthesia.

**Patient/family teaching**
- Immediately report redness, swelling, pain at injection site.
- Avoid crowds, those with infection.
- Do not have immunizations without physician’s approval.
- Promptly report fever, signs of infection, unusual bruising/bleeding from any site, difficulty breathing.
- Avoid pregnancy.
- Hair loss is reversible, but new hair growth may have different color, texture.

---

**vismodegib**

**vis-moe-deg-ib**

> Erivedge

**CLASSIFICATION**

**PHARMACOTHERAPEUTIC:** Hedgehog pathway inhibitor.

**CLINICAL:** Antineoplastic.

■ **BLACK BOX ALERT** ■ May result in embryo-fetal death or severe birth defects including missing digits, midline defects, irreversible malformations due to embryotoxic and teratogenic properties. Verify pregnancy status prior to initiation. Advise use of effective contraception in female pts. Advise male pts of potential exposure risk through seminal fluid.
**Uses**
Treatment of adult pts with metastatic basal cell carcinoma, locally advanced basal cell carcinoma with recurrence after surgery, or pts who are not candidates for surgery or radiation.

**Precautions**

⚠️ Do not donate blood products for at least 7 mos after discontinuation.

**Contraindications:** Hypersensitivity to vismodegib. **Cautions:** Hepatic/renal impairment. History of significant cardiac disease.

**Action**
An inhibitor of Hedgehog pathway, binding to and inhibiting smoothened, a transmembrane protein involved in Hedgehog signal transduction. **Therapeutic Effect:** Inhibits tumor cell growth and metastasis of basal cell carcinoma.

**Pharmacokinetics**
Metabolized in liver. Protein binding: 99%. Excreted in feces (82%), urine (4%). **Half-life:** 4 days (daily dosing), 12 days (single dose).

🔍 **Lifespan considerations**

**Pregnancy/Lactation:** May cause fetal harm. Not recommended in nursing mothers. Must either discontinue drug or discontinue breastfeeding. Unknown if distributed in breast milk. Contraception recommended prior to first dose, during treatment and up to 24 mos after discontinuation. During treatment (including interruption) and for 3 mos after treatment, male pts should not donate sperm and should use condoms with spermicide if partner is of childbearing potential. **Children:** Safety and efficacy not established. **Elderly:** Safety and efficacy not established.

**Interactions**

**DRUG:** P-glycoprotein inhibitors (e.g., clarithromycin, erythromycin) may
increase concentration/effects. **Antacids, H₂ blockers (e.g., famotidine), proton pump inhibitors (e.g., pantoprazole)** may decrease concentration/effect. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** May decrease potassium, sodium, GFR. May increase serum BUN, creatinine.

### Availability (Rx)

**Capsules:** 150 mg.

### Administration/handling

**PO**

- Give without regard to food.
- Give whole. Do not break, crush, or open capsule.

### Indications/routes/dosage

**Advanced or Metastatic Basal Cell Carcinoma**

**PO:** **ADULTS/ELDERLY:** 150 mg once daily. Continue until disease progression or unacceptable toxicity.

### Dosage in Renal/Hepatic Impairment

No dose adjustment.

### Side effects

**Frequent (71%–40%):** Muscle spasm, alopecia, dysgeusia, weight loss, fatigue. **Occasional (30%–11%):** Nausea, amenorrhea, diarrhea, anorexia, constipation, vomiting, arthralgia, loss of taste.

### Adverse effects/toxic reactions

May cause spontaneous abortion, fetal demise, birth defects. Azotemia (renal impairment) reported in 2% of pts.
Nursing considerations

Baseline assessment
Obtain negative pregnancy test (urine/serum) before initiation, BMP. Question current breastfeeding status. Assess skin, moles for other possible malignancies. Offer emotional support.

Intervention/evaluation
Obtain STAT human chorionic gonadotropin (HCG) level if pregnancy suspected, BMP if electrolyte imbalance or renal impairment suspected. Encourage fluid intake if diarrhea occurs. Offer antiemetics for nausea/vomiting. Report oliguria, dark or concentrated urine.

Patient/family teaching
• Avoid pregnancy.
• May cause birth defects or miscarriage.
• Do not breastfeed.
• Male pts must use condoms with spermicide during sexual activity, despite history of vasectomy.
• Female pts must use contraception for at least 7 mos after stopping treatment.
• Immediately report suspected pregnancy.
• Do not donate blood for at least 7 mos after stopping treatment.
• Swallow capsules whole; do not break, crush, or open.
• Hair loss is an expected side effect.
• Strictly monitor menstrual cycle.
• Report dark-colored urine or decreased urine output despite hydration.

<table>

<td>calcitriol</td>
</tr>
<tr>
<td>kal-si-trye-ole</td>
</tr>
<tr>
<td>Calcijex</td>
</tr>
<tr>
<td>Rocaltrol</td>
</tr>
</tbody>
</table>
**CLASSIFICATION**

**PHARMACOTHERAPEUTIC:** Fat-soluble vitamin.

**CLINICAL:** Vitamin D analogue.

### Uses

**Calcitriol:** Manage hypocalcemia in pts on chronic renal dialysis, secondary hypoparathyroidism in chronic kidney disease (CKD), manage hypocalcemia in hypoparathyroidism. (**Topical**): Treatment of mild to moderate plaque psoriasis.

**Doxercalciferol:** Treatment of secondary hyperparathyroidism in CKD.

**Ergocalciferol:** Treatment of refractory rickets, hypophosphatemia, hypoparathyroidism, dietary supplement. **Paricalcitol:** (**Intravenous**): Treatment/prevention of secondary hyperparathyroidism associated with stage 5 CKD. (**PO**): Treatment/prevention of secondary hyperparathyroidism associated with stage 3 and 4 CKD and stage 5 CKD pts on hemodialysis or peritoneal dialysis. **OFF-LABEL:** **Calcitriol:** Vitamin D–dependent rickets. **Ergocalciferol:** Prevention/treatment of vitamin D deficiency in pts with CKD, osteoporosis prevention.
Precautions

Action

Calcitriol: Stimulates calcium transport in intestines, resorption in bones, and tubular reabsorption in kidney; suppresses parathyroid hormone (PTH) secretion/synthesis. Doxercalciferol: Regulates blood calcium levels, stimulates bone growth, suppresses PTH secretion/synthesis. Ergocalciferol: Promotes active absorption of calcium and phosphorus, increasing serum levels to allow bone mineralization; mobilizes calcium and phosphate from bone, increases reabsorption of calcium and phosphate by renal tubules. Paricalcitol: Suppresses PTH secretion/synthesis. Therapeutic Effect: Essential for absorption, utilization of calcium, phosphate, control of PTH levels.

Pharmacokinetics

*Lifespan considerations

Pregnancy/Lactation: Unknown if drug crosses placenta. Infant risk cannot be excluded. Children/Elderly: No age-related precautions noted.

Interactions

DRUG: Magnesium-containing antacids may increase risk of hypermagnesemia. Calcium-containing products, concurrent vitamin D (or derivatives) may increase risk of hypercalcemia. May increase digoxin toxicity due to hypercalcemia (may cause arrhythmias). HERBAL: None significant. FOOD: None known. LAB VALUES: May increase serum cholesterol,
calcium, magnesium, phosphate, ALT, AST, BUN, creatinine.

**Availability (Rx)**

**Calcitriol**
- **Capsules, Softgel (Rocaltrol):** 0.25 mcg, 0.5 mcg. **Injection Solution:** 1 mcg/mL. **Oral Solution (Rocaltrol):** 1 mcg/mL.

**Doxercalciferol**
- **Capsules, Softgel (Hectorol):** 0.5 mcg, 1 mcg, 2.5 mcg. **Injection Solution (Hectorol):** 2 mcg/mL.

**Ergocalciferol**
- **Capsules (Drisdol):** 50,000 units (1.25 mg). **Liquid, Oral (Drisdol):** 8,000 units/mL (200 mcg/mL). **Tablets:** 400 units.

**Paricalcitol**
- **Capsules, Gelatin (Zemplar):** 1 mcg, 2 mcg, 4 mcg. **Injection Solution (Zemplar):** 2 mcg/mL.

**Administration/handling**

**Calcitriol**
- **PO**
  - May take without regard to food.
- **IV**
  - May give as IV bolus at end of dialysis.

**Doxercalciferol**
- **PO**
  - May take without regard to food.
• May give as IV bolus via catheter at end of dialysis.

**Ergocalciferol**

**PO**

• May take without regard to food.

**Paricalcitol**

**PO**

• May take without regard to food.
• For 3 times/wk dosing, give no more frequently than every other day.

• Give bolus anytime during dialysis.
• Do not give more frequently than every other day.

## Indications/routes/dosage

**Calcitriol**

**Hypocalcemia on Chronic Renal Dialysis**

**PO: ADULTS, ELDERLY: (ROCALTROL):** Initially, 0.25 mcg/day or every other day. May increase by 0.25 mcg/day at 4- to 8-wk intervals. Range: 0.5–1 mcg/day.

**IV: ADULTS, ELDERLY: 1–2 mcg 3 times/wk. Adjust dose at 2- to 4-wk intervals. Range: 0.5–4 mcg 3 times/wk.**

**Hypocalcemia in Hypoparathyroidism**

**PO: ADULTS, CHILDREN 6 YRS AND OLDER: (ROCALTROL):** Initially, 0.25 mcg/day. May increase at 2- to 4-wk intervals. Range: 0.5–2 mcg/day. **CHILDREN 1–5 YRS:** 0.25–0.75 mcg once daily. **CHILDREN YOUNGER THAN 1 YR:** 0.04–0.08 mcg/kg once daily. **NEONATES:** 1 mcg
once daily first 5 days of life.

**Secondary Hyperparathyroidism Associated with Moderate to Severe CKD Not on Dialysis**

**PO: ADULTS, ELDERLY, CHILDREN 3 YRS AND OLDER:** (ROCALTROL): Initially, 0.25 mcg/day. May increase to 0.5 mcg/day. **CHILDREN YOUNGER THAN 3 YRS:** Initially, 0.01–0.015 mcg/kg/day.

**Doxercalciferol**

**Secondary Hyperparathyroidism (Dialysis)**

**PO: ADULTS, ELDERLY:** Initial dose (intact parathyroid hormone [iPTH] greater than 400 pg/mL): 10 mcg 3 times/wk at dialysis. Dose titrated to lower iPTH to 150–300 pg/mL, with dosage adjustments made at 8-wk intervals. **Maximum:** 20 mcg 3 times/wk.

**IV: ADULTS, ELDERLY:** Initial dose (iPTH greater than 400 pg/mL): 4 mcg 3 times/wk after dialysis, given as bolus dose. Dose titrated to lower iPTH to 150–300 pg/mL, with dosage adjustments made at 8-wk intervals. **Maximum:** 18 mcg/wk.

**Secondary Hyperparathyroidism (Predialysis)**

**PO: ADULTS, ELDERLY:** Initially, 1 mcg/day. Titrate dose to lower iPTH to 35–70 pg/mL for stage 3 CKD and 70–110 pg/mL for stage 4 CKD. **Maximum:** 3.5 mcg/day.

**Ergocalciferol**

**Dietary Supplement**

**PO: ADULTS, ELDERLY, CHILDREN:** 10 mcg (400 units)/day. **NEONATES:** 10–20 mcg (400–800 units)/day.

**Hypoparathyroidism**

**PO: ADULTS, ELDERLY:** 625 mcg–5 mg (25,000–200,000 units)/day (with calcium supplements). **CHILDREN:** 1.25–5 mg (50,000–200,000 units)/day (with calcium supplements).
Nutritional Rickets, Osteomalacia

PO: ADULTS, ELDERLY, CHILDREN: 25–125 mcg (1,000–5,000 units)/day for 8–12 wks. ADULTS, ELDERLY (WITH MALABSORPTION SYNDROME): 250–7,500 mcg (10,000–300,000 units)/day. CHILDREN (WITH MALABSORPTION SYNDROME): 250–625 mcg (10,000–25,000 units)/day.

Vitamin D–Dependent Rickets

PO: ADULTS, ELDERLY: 250 mcg–1.5 mg (10,000–60,000 units)/day. CHILDREN: 75–125 mcg (3,000–5,000 units)/day. Maximum: 1,500 mcg (60,000 units)/day.

Vitamin D–Resistant Rickets

PO: ADULTS, ELDERLY, CHILDREN: 300 mcg–12.5 mg (12,000–500,000 units)/day.

Hypophosphatemia

PO: ADULTS, ELDERLY: 250–1,500 mcg (10,000–60,000 units)/day with phosphate supplements. CHILDREN: 1,000–2,000 mcg (40,000–80,000 units)/day with phosphate supplements.

Plaque Psoriasis

Topical: ADULTS, ELDERLY: Apply to affected area twice daily.

Paricalcitol

Secondary Hyperparathyroidism in Stage 5 CKD

IV: ADULTS, ELDERLY, CHILDREN 5 YRS AND OLDER: Initially, 0.04–0.1 mcg/kg given as bolus dose no more frequently than every other day at any time during dialysis. May increase by 2–4 mcg every 2–4 wks. Dose is based on serum iPTH levels.

Secondary Hyperparathyroidism in Stages 3 and 4 CKD

Note: Initial dose based on baseline serum iPTH levels. Dose adjusted q2wks based on iPTH levels relative to baseline.
PO: ADULTS, ELDERLY: (iPTH 500 PG/ML OR LESS): 1 mcg/day or 2 mcg 3 times/wk. (iPTH GREATER THAN 500 PG/ML): 2 mcg/day or 4 mcg 3 times/wk.

Dosage in Renal/Hepatic Impairment
No dose adjustment.

Side effects
Frequencies not defined. Calcitriol: Cardiac arrhythmias, headache, pruritus, hypercalcemia, polydipsia, abdominal pain, metallic taste, nausea, vomiting, myalgia, soft tissue calcification. Doxercalciferol: Edema, pruritus, nausea, vomiting, headache, dizziness, dyspnea, malaise, hypercalcemia. Ergocalciferol: Hypercalcemia, hypervitaminosis D, decreased renal function, soft tissue calcification, bone demineralization, nausea, constipation, weight loss. Paricalcitol: Edema, nausea, vomiting, hypercalcemia.

Adverse effects/toxic reactions
Early signs of overdose manifested as weakness, headache, drowsiness, nausea, vomiting, dry mouth, constipation, muscle/bone pain, metallic taste. Later signs of overdose evidenced by polyuria, polydipsia, anorexia, weight loss, nocturia, photophobia, rhinorrhea, pruritus, disorientation, hallucinations, hyperthermia, hypertension, cardiac dysrhythmias.

Nursing considerations

Baseline assessment
Obtain baseline serum calcium, ionized calcium, phosphorus, alkaline phosphatase, creatinine, PTH.

Intervention/evaluation
Patient/family teaching

- Adequate calcium intake should be maintained.
- Dietary phosphorus may need to be restricted (foods high in phosphorus include beans, dairy products, nuts, peas, whole-grain products).
- Oral formulations may cause hypersensitivity reactions. Avoid excessive doses.
- Report signs/symptoms of hypercalcemia (headache, weakness, drowsiness, nausea, vomiting, dry mouth, constipation, metallic taste, muscle or bone pain).
- Maintain adequate hydration.
- Avoid changes in diet or supplemental calcium intake (unless directed by health care professional).
- Avoid magnesium-containing antacids in pts with renal failure.

vorapaxar

vor-a-pax-ar

Zontivity

CLASSIFICATION

PHARMACOTHERAPEUTIC: Protease-activated receptor-1 antagonist.
CLINICAL: Antiplatelet.

BLACK BOX ALERT

Avoid use in pts with history of CVA, intracranial hemorrhage (ICH), TIA or with active pathologic bleeding. Antiplatelet agents increase risk of bleeding, including ICH and fatal bleeding.

Uses

To reduce thrombotic cardiovascular events in pts with history of MI or peripheral artery disease (PAD). Reduces rate of a combined endpoint of cardiovascular death, CVA, MI, and urgent coronary revascularization.

Precautions

Contraindications: Hypersensitivity to vorapaxar. History of stroke, intracranial hemorrhage, transient ischemic attack; active bleeding. Cautions: Hepatic impairment, pts at increased risk of bleeding (anticoagulant use, elderly, low
body weight, trauma) or with history of bleeding disorders.

**Action**

Inhibits thrombin-induced and thrombin receptor agonist peptide (TRAP)--induced platelet aggregation. **Therapeutic Effect:** Inhibits platelet aggregation, reduces incidence of thrombus.

**Pharmacokinetics**

Readily absorbed. Widely distributed. Metabolized in liver. Protein binding: greater than 99%. Peak plasma concentration: 1 hr. Steady state reached in 21 days. Excreted in feces (58%), urine (25%). **Half-life:** 5–13 days.

**Lifespan considerations**

**Pregnancy/Lactation:** Unknown if distributed in breast milk. **Children:** Safety and efficacy not established. **Elderly:** May have increased risk of bleeding.

**Interactions**

**DRUG:** Aspirin, anticoagulants (e.g., warfarin), fibrinolytics (e.g., tissue plasminogen activator), NSAIDs (e.g., ibuprofen, ketorolac, naproxen), serotonin norepinephrine reuptake inhibitors (e.g., DULoxetine), SSRIs (e.g., PARoxetine) may increase risk of bleeding. Strong CYP3A4 inducers (e.g., rifAMPin) may decrease concentration/effects; CYP3A4 inhibitors (e.g., clarithromycin, ketoconazole) may increase concentration/effects. **HERBAL:** St. John’s wort may decrease concentration/effects. **FOOD:** None known. **LAB VALUES:** May decrease Hbg, Hct; serum iron.

**Availability (Rx)**

**Tablets:** 2.08 mg.

**Administration/handling**

**PO**

- Give without regard to meals.
Indications/routes/dosage

Reduction of Thrombotic Cardiovascular Events (Pts with PAD, MI)

**PO: ADULTS, ELDERLY:** 2.08 mg once daily (in combination with aspirin and/or clopidogrel).

**Dosage in Renal Impairment**
No dose adjustment.

**Dosage in Hepatic Impairment**
- **Mild to moderate impairment:** No dose adjustment.
- **Severe impairment:** Not recommended.

Side effects

**Rare (2%):** Depression, rash, skin eruptions, exanthemas.

Adverse effects/toxic reactions

Hemorrhagic events (25% of pts) including fatal bleeding (less than 1%), GI bleeding (4%), ICH (less than 1%) have been reported. Vorapaxar increases risk of moderate to severe bleeding by 55%.

Nursing considerations

**Baseline assessment**
Obtain baseline CBC, PFA level. Question history of CVA, intracranial hemorrhage (ICH), transient ischemic attack (TIA) (therapy contraindicated); anemia, bleeding ulcers, GI/genitourinary (GU) bleeding, recent surgery, spinal punctures, open wounds; hepatic impairment. Receive full medication history including herbal products.

**Intervention/evaluation**
Monitor CBC. Question for increased menstrual bleeding/discharge. Monitor for
confusion, headache, hemiparesis, vision change (may indicate ICH); hematuria, GI bleeding. Assess peripheral pulses; skin for ecchymosis, petechiae. Check for excessive bleeding from minor cuts, scratches, skin tears. Consider transfusion of platelets or RBCs if severe bleeding occurs.

**Patient/family teaching**

- It may take longer to stop bleeding.
- Bruising may occur more easily.
- Report unexpected, prolonged, excessive bleeding of any kind, or blood in sputum, stool, urine, or vomitus.
- Avoid alcohol, over-the-counter anti-inflammatories such as aspirin, ibuprofen, or naproxen.
- Consult doctor before any planned surgery, dental work.
- Use electric razor, soft toothbrush to prevent bleeding.
- Report confusion, headache, one-sided weakness, trouble speaking, or vision problems; may indicate life-threatening bleeding of brain.

---

**voriconazole**

vor-i-kon-a-azole

Vfend

Apo-Voriconazole

CLASSIFICATION

PHARMACOTHERAPEUTIC: Triazole derivative.

CLINICAL: Antifungal.

*Do not confuse voriconazole with fluconazole.*

---

**Uses**

Precautions

Contraindications: Hypersensitivity to voriconazole. Concurrent administration of barbiturates (long acting), carBAMazepine, efavirenz (400 mg/day or greater), ergot alkaloids, pimozide, quiNIDine (may cause prolonged QT interval, torsades de pointes), rifabutin, rifAMPin, ritonavir (800 mg/day or greater), sirolimus, St. John’s wort. **Cautions:** Severe renal/hepatic impairment, hypersensitivity to other azole antifungal agents. Pts at risk for acute pancreatitis, pts with fructose intolerance, glucose-galactose malabsorption; concomitant nephrotoxic medications; hypokalemia, hypomagnesemia, hypocalcemia. May prolong QT interval; use caution in pts with history of QT syndrome, concomitant medications that prolong QT interval, electrolyte imbalance.

Action

Interferes with fungal cytochrome activity, decreasing ergosterol synthesis, inhibiting fungal cell membrane formation. **Therapeutic Effect:** Damages fungal cell wall membrane.

Pharmacokinetics

Rapidly, completely absorbed after PO administration. Widely distributed. Protein binding: 58%. Metabolized in liver. Primarily excreted as metabolite in urine. **Half-life:** Variable, dose dependent.

**Lifespan considerations**

**Pregnancy/Lactation:** May cause fetal harm. **Children:** Safety and efficacy not established in pts younger than 12 yrs. **Elderly:** No age-related precautions noted.

Interactions

**DRUG:** May increase concentration, risk of toxicity of ALPRAZolam, calcium channel blockers (e.g., dilTIAZem, verapamil), cycloSPORINE, efavirenz, ergot alkaloids, HMG-CoA reductase inhibitors (e.g., lovastatin), methadone, midazolam, protease inhibitors (e.g., amprenavir, saquinavir),
rifabutin, sirolimus, tacrolimus, triazolam, warfarin. CarBAmazepine, rifabutin, rifAMPin, ritonavir may decrease concentration/effect. QT interval–prolonging medications (e.g., amiodarone, azithromycin, ceritinib, haloperidol, moxifloxacin) may increase risk of QT interval prolongation, cardiac arrhythmias. HERBAL: St. John’s wort may significantly decrease concentration. FOOD: Grapefruit products may increase concentration. LAB VALUES: May increase serum alkaline phosphatase, ALT, AST, bilirubin, creatinine. May decrease potassium.

Availability (Rx)

Injection, Powder for Reconstitution: 200 mg. Powder for Oral Suspension: 200 mg/5 mL. Tablets: 50 mg, 200 mg.

Administration/handling

IV

Reconstitution
• Reconstitute 200-mg vial with 19 mL Sterile Water for Injection to provide concentration of 10 mg/mL. Further dilute with 0.9% NaCl or D₅W to provide concentration of 0.5–5 mg/mL.

Rate of Administration
• Infuse over 1–2 hrs at a rate not to exceed 3 mg/kg/hr.
• Do not infuse concomitantly into same line with other drug infusions.
• Do not infuse concomitantly even in separate lines with concentrated electrolyte solutions or blood products.

Storage
• Store powder for injection at room temperature.
• Use reconstituted solution immediately.
• Do not use after 24 hrs when refrigerated.

PO
• Give 1 hr before or 1 hr after a meal.
• Do not mix oral suspension with any other medication or flavoring agent.
• Shake suspension for about 10 sec before use.
**IV incompatibility**
Tigecycline (Tygacil).

**IV Compatibilities**
Anidulafungin, caspofungin, ceftaroline, doripenem.

**Indications/routes/dosage**

**Invasive Aspergillosis**
**IV: ADULTS, ELDERLY, CHILDREN 12 YRS AND OLDER:** Initially, 6 mg/kg q12h for 2 doses, then 4 mg/kg q12h, then oral maintenance dose. **(LESS THAN 40 KG):** 100 mg q12h **(Maximum: 300 mg/day). (40 KG OR GREATER):** 200 mg q12h **(Maximum: 400 mg/day). CHILDREN 3–11 YRS OF AGE: (HIV exposed):** Initially, 9 mg/kg **(Maximum: 400 mg) q12h for 2 doses, then 8 mg/kg **(Maximum: 200 mg) q12h. **(Non–HIV exposed):** 8 mg/kg/dose q12h.

**PO: (HIV exposed):** Initially, 9 mg/kg **(Maximum: 400 mg) q12h for 2 doses, then 7 mg/kg **(Maximum: 200 mg) q12h. **(Non–HIV exposed):** 9 mg/kg/dose q12h.

**Candidemia, Other Deep Tissue Candida Infections**
**IV: ADULTS, ELDERLY, CHILDREN 12 YRS AND OLDER:** Initially, 6 mg/kg q12h for 2 doses, then 3–4 mg/kg q12h, then oral maintenance dose. **LESS THAN 40 KG:** 100 mg q12h **(Maximum: 300 mg/day). 40 KG OR GREATER:** 200 mg q12h **(Maximum: 600 mg/day).**

**Esophageal Candidiasis**
**PO: ADULTS, ELDERLY WEIGHING 40 KG OR MORE:** 200 mg q12h for minimum of 14 days, then at least 7 days following resolution of symptoms. **Maximum: 600 mg/day. ADULTS, ELDERLY WEIGHING LESS THAN 40 KG:** 100 mg q12h for minimum of 14 days, then at least 7 days following resolution of symptoms. **Maximum: 300 mg/day.**

**Dosage in Pts Receiving Phenytoin**
IV: Increase maintenance dose to 5 mg/kg q12h.

PO: Increase 200 mg q12h to 400 mg q12h (pts weighing 40 kg or more) or 100 mg q12h to 200 mg q12h (pts weighing less than 40 kg).

Dosage in Pts Receiving Efavirenz
Increase dose to 400 mg q12h and reduce efavirenz to 300 mg/day.

Dosage in Renal Impairment
No dose adjustment. IV dosing not recommended in pts with CrCl 50 mL/min or less.

Dosage in Hepatic Impairment
Mild to moderate impairment: Reduce maintenance dose by 50%.
Severe impairment: Use only if benefits outweigh risks. Monitor closely for toxicity.

Side effects
Frequent (20%–6%): Abnormal vision, fever, nausea, rash, vomiting.
Occasional (5%–2%): Headache, chills, hallucinations, photophobia, tachycardia, hypertension.

Adverse effects/toxic reactions
Hepatotoxicity (jaundice, hepatitis, hepatic failure), acute renal failure have occurred in severely ill pts.

Nursing considerations
Baseline assessment
Obtain baseline serum hepatic/renal function tests; EKG. Correct electrolyte deficiencies prior to initiating treatment. Receive full medication history and screen for interactions. Question medical history as listed in Precautions.

Intervention/evaluation
Monitor serum renal function, LFT. Monitor visual function (visual acuity, visual field, color perception) for drug therapy lasting longer than 28 days.

**Patient/family teaching**

- Take at least 1 hr before or 1 hr after a meal.
- Avoid grapefruit products.
- Avoid driving at night.
- Report visual changes (blurred vision, photophobia, yellowing of skin/eyes).
- Avoid performing hazardous tasks if changes in vision occur.
- Avoid direct sunlight.
- Women of childbearing potential should use effective contraception.

---

**vorinostat**

**vor-in-o-stat**

**Zolinza**

**CLASSIFICATION**

**PHARMACOTHERAPEUTIC**: Histone deacetylase inhibitor.

**CLINICAL**: Antineoplastic.

*Do not confuse vorinostat with Votrient.*

---

**Uses**

Treatment of cutaneous manifestations in pts with cutaneous T-cell lymphoma (CTCL) with progressive, persistent, or recurrent disease, on or following two systemic therapies.

---

**Precautions**

**Contraindications**: Hypersensitivity to vorinostat. **Cautions**: History of deep vein thrombosis (DVT), diabetes mellitus, hepatic impairment, preexisting hypokalemia, hypomagnesemia, pts with history of QT prolongation or medications that prolong QT interval. Use caution during perioperative period in pts requiring bowel surgery.

---

**Action**
Inhibits activity of histone deacetylase enzymes that catalyze removal of acetyl groups of proteins, causing accumulation of acetylated histones. **Therapeutic Effect:** Terminates cell growth, causes apoptosis.

**Pharmacokinetics**

Protein binding: 71%. Metabolized to inactive metabolites. Excreted in urine. **Half-life:** 2 hrs.

**Lifespan considerations**

**Pregnancy/Lactation:** May cause fetal harm. Unknown if distributed in breast milk. **Children:** Safety and efficacy not established. **Elderly:** No age-related precautions noted.

**Interactions**

**DRUG:** May increase effect of warfarin. Valproic acid increases risk of GI bleeding, thrombocytopenia. **QT interval–prolonging medications** (e.g., amiodarone, azithromycin, ceritinib, haloperidol, moxifloxacin) may increase risk of QT interval prolongation, cardiac arrhythmias. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** May decrease serum calcium, potassium, sodium, phosphate, platelet count. May increase serum glucose, creatinine; urine protein.

**Availability (Rx)**

**Capsules:** 100 mg.

**Administration/handling**

**PO**

- Do not break, crush, dissolve, or divide capsules.
- Give with food.
- Maintain adequate hydration during treatment.

**Indications/routes/dosage**
Cutaneous T-Cell Lymphoma (CTCL)

**PO: ADULTS, ELDERLY:** 400 mg once daily with food. Continue until disease progression or unacceptable toxicity.

**Dose Modification**

**Intolerance or Toxicity:** Reduce dose to 300 mg once daily. **Unable to tolerate daily dose:** May further reduce to 300 mg once daily for 5 consecutive days per wk (5 out of 7 days).

**Dosage in Renal Impairment**

Use caution.

**Dosage in Hepatic Impairment**

**Mild to moderate impairment:** 300 mg once daily.

**Severe impairment:** 100–200 mg once daily.

**Side effects**

**Frequent (50%–24%):** Fatigue, diarrhea, nausea, altered taste, anorexia.

**Occasional (21%–11%):** Weight decrease, muscle spasms, alopecia, dry mouth, chills, vomiting, constipation, dizziness, peripheral edema, headache, pruritus, cough, fever.

**Adverse effects/toxic reactions**

Thrombocytopenia occurs in 25% of pts, anemia in 15%. Pulmonary embolism occurs in 4% of pts. Deep vein thrombosis (DVT) occurs rarely.

**Nursing considerations**

**Baseline assessment**

Obtain baseline EKG. Baseline PT, INR, CBC, serum chemistry tests, esp. serum potassium, calcium, magnesium, glucose, creatinine should be obtained prior to therapy and every 2 wks during first 2 mos of therapy and monthly thereafter. Inform women of childbearing potential of risk to fetus if pregnancy occurs.
Intervention/evaluation
Monitor CBC, serum electrolytes; PT/INR q2wks for 2 mos, then monthly. Monitor signs/symptoms of DVT. Encourage fluid intake, approximately 2 L/day input. Assess for evidence of dehydration. Provide antiemetics to control nausea/vomiting. Monitor daily pattern of bowel activity, stool consistency.

Patient/family teaching
• Drink at least 2 L/day of fluids to prevent dehydration.
• Report persistent vomiting, diarrhea.
• Report shortness of breath, pain in any extremity.

vortioxetine
vor-tye-ox-e-teen
Trintellix
CLASSIFICATION
PHARMACOTHERAPEUTIC: Selective serotonin reuptake inhibitor (SSRI).
CLINICAL: Antidepressant.

BLACK BOX ALERT Antidepressants have an increased risk of suicidal ideation and behavior in children, adolescents, and young adults. Monitor closely for worsening or emergence of suicidal thoughts and behaviors.

Do not confuse vortioxetine with FLUoxetine, PARoxetine, or venlafaxine.

Uses
Treatment of major depressive disorder.

Precautions
Contraindications: Hypersensitivity to vortioxetine. Use of monoamine oxidase inhibitors (MAOIs). Do not use MAOIs within 21 days of stopping vortioxetine; do not use vortioxetine within 14 days of stopping an MAOI. Initiation of
vortioxetine in pts receiving linezolid or intravenous methylene blue. **Cautions:** History of angioedema, dehydration, hyponatremia, pts at risk for bleeding, hepatic impairment, seizure disorder, elderly pts, pts at high risk of suicide, family history of bipolar disorder, mania, hypomania.

**Action**

Blocks reuptake of neurotransmitter serotonin at CNS presynaptic membranes, increasing availability at postsynaptic receptor sites. **Therapeutic Effect:** Relieves depression.

**Pharmacokinetics**

Readily absorbed following PO administration. Metabolized in liver, primarily through oxidation. Protein binding: 98%. Peak plasma concentration: 7–11 hrs. Steady state reached within 2 wks. Excreted in urine (59%), feces (26%). **Half-life:** 66 hrs.

**Lifespan considerations**

**Pregnancy/Lactation:** May cause fetal harm when administered in third trimester. Unknown if distributed in breast milk. Exposed neonates are at increased risk of apnea, cyanosis, prolonged hospitalization, pulmonary hypertension, seizures, serotonin syndrome. **Children:** Safety and efficacy not established in pediatric population. **Elderly:** May have increased risk of dehydration, hyponatremia.

**Interactions**

**DRUG:** Strong CYP inducers (e.g., carBAMazepine, phenytoin, rifAMPin) may decrease concentration/effects. Strong CYP2D6 inhibitors (e.g., buPROPion, FLUoxetine, PARoxetine) may increase concentration/effect. MAOIs contraindicated; may cause malignant hyperthermia, hypertensive crisis, hyperreflexia, seizures, serotonin syndrome. **Serotonergic drugs** (e.g., busPIRone, fentaNYL, linezolid, traMADol, tricyclic antidepressants, triptans) may increase risk of serotonin syndrome. **Anticoagulants, antiplatelets, NSAIDs** may increase risk of bleeding. **Diuretics** may increase risk of hyponatremia. **HERBAL:** **St. John’s wort** may increase risk of serotonin
syndrome. **FOOD:** None known. **LAB VALUES:** May decrease serum sodium.

### Availability (Rx)

**Tablets:** 5 mg, 10 mg, 20 mg.

### Administration/handling

**PO**
- Give without regard to meals. May administer with milk or food if GI upset occurs.

### Indications/routes/dosage

#### Major Depressive Disorder

**PO: ADULTS/ELDERLY:** Initially, 10 mg once daily. May increase to 20 mg as tolerated. **Maintenance:** 5–20 mg once daily.

### Dose Modification

**Concomitant Use of Strong CYP2D6 Inhibitors:** Reduce dose by half of intended therapy. **Maximum:** 10 mg once daily. **Concomitant Use of Strong CYP Inducers:** If coadministered for more than 14 days, consider increasing vortioxetine dose. **Maximum:** Do not exceed more than 3 times original dose. **CYP2D6 poor metabolizers: Maximum:** 10 mg once daily.

**Discontinuation:**
Gradually taper dose to minimize incidence of withdrawal symptoms and to allow detection of re-emerging symptoms.

### Dosage in Renal Impairment

No dose adjustment.

### Dosage in Hepatic Impairment

**Mild to moderate impairment:** No dose adjustment. **Severe impairment:** Not recommended.
Side effects

**Frequent (32%–22%):** Nausea, sexual dysfunction. **Occasional (10%–3%):** Diarrhea, dizziness, dry mouth, constipation, vomiting, flatulence, abnormal dreams, pruritus.

Adverse effects/toxic reactions

Life-threatening serotonin syndrome may include mental status changes (agitation, hallucinations, delirium, coma), autonomic instability (tachycardia, labile blood pressure, dizziness, sweating, flushing, hyperthermia), neuromuscular symptoms (tremor, rigidity, myoclonus [localized muscle twitching], hyperactive reflexes, incoordination), seizures, GI symptoms (nausea, vomiting, diarrhea). May increase risk of bleeding events such as ecchymosis, hematoma, epistaxis (nosebleed), petechiae. Mania/hypomania may indicate baseline bipolar disorder. Syndrome of inappropriate antidiuretic hormone (SIADH), also known as water intoxication or dilutional hyponatremia, may induce seizures, coma, or death. Angioedema, dyspnea, rash may indicate allergic reaction. May increase risk of suicidal ideation and behavior once treatment is therapeutic. May alter sexual drive, ease of arousal, ease of reaching orgasm, or cause erectile dysfunction in men or decreased lubrication in women.

Nursing considerations

**Baseline assessment**

Obtain baseline electrolytes. Note serum sodium level. Assess appearance, behavior, speech pattern, level of interest, mood. Screen for history of bipolar disorder, bleeding events, SIADH, prior allergic reactions to drug class. Receive full medication history including herbal products.

**Intervention/evaluation**

Monitor serum sodium levels. Screen for signs of SIADH (confusion, seizures). Offer emotional support. Assess mental status for depression, suicidal ideation (esp. during first few mo of therapy or with dosage change), anxiety, social function. Monitor daily pattern of bowel activity, stool consistency. Assist with ambulation if dizziness occurs. Monitor pt for symptoms of serotonin syndrome,

**Patient/family teaching**

- Dry mouth may be relieved with sugarless gum, sips of water.
- Report neurologic changes: confusion, excessive talking, hallucinations, headache, hyperactivity, insomnia, racing thoughts, seizure-like activity, tremors; sexual dysfunction; fever; or any type of allergic reaction
- Avoid tasks that require alertness, motor skills until response to drug is established (may cause dizziness, drowsiness).
- Take with food if nausea occurs.
- Report pregnancy.
- Avoid alcohol.
- Do not take OTC medications such as aspirin or ibuprofen without consulting physician.
- Immediately report thoughts of suicide, self-destructive behavior, or violence.
- Sexual dysfunction such as inability to reach orgasm, difficulty maintaining an erection, or lack of sexual drive may occur.
- Do not suddenly stop treatment. Dose must be gradually reduced over time.

Canadian trade name

High Alert drug

*underlined* underlined – top prescribed drug
warfarin
war-far-in
Apo-Warfarin

Coumadin
Jantoven
Novo-Warfarin

CLASSIFICATION
PHARMACOTHERAPEUTIC: Vitamin K antagonist.
CLINICAL: Anticoagulant.

■ BLACK BOX ALERT ■ May cause major or fatal bleeding. Risk factors include history of GI bleeding, hypertension, cerebrovascular disease, heart disease, malignancy, trauma, anemia, renal insufficiency, age 65 yrs and older, high anticoagulation factor (INR greater than 4). Consider cardiac/hepatic function, age, nutritional status, concurrent medications, risk of bleeding when dosing warfarin. Genetic variations have been identified as factors associated with dosage and bleeding risk. Genotyping tests are available.

Do not confuse Coumadin with Kemadrin, or Jantoven with Janumet or Januvia.

Uses

Prophylaxis, treatment of thromboembolic disorders and embolic complications arising from atrial fibrillation or valve replacement. Risk reduction of systemic embolism following MI (e.g., recurrent MI, stroke). OFF-LABEL: Adjunct treatment in transient ischemic attacks.
Precautions

Contraindications: Hypersensitivity to warfarin. Hemorrhagic tendencies (e.g., cerebral aneurysms, bleeding from GI tract), recent or potential surgery of eye or CNS, neurosurgical procedures, open wounds, severe uncontrolled or malignant hypertension, spinal puncture procedures, uncontrolled bleeding, ulcers, unreliable or noncompliant pts, unsupervised pts, blood dyscrasias, pericarditis or pericardial effusion, pregnancy (except in women with mechanical heart valves at high risk for thromboembolism), bacterial endocarditis, threatened abortion. Major regional lumbar block anesthesia or traumatic surgery, eclampsia/preeclampsia. Cautions: Active tuberculosis, acute infection, diabetes, heparin-induced thrombocytopenia and deep vein thrombosis, pts at risk for hemorrhage, moderate to severe renal impairment, moderate to severe hypertension, thyroid disease, polycythemia vera, vasculitis, open wound, menstruating and postpartum women, indwelling catheters, trauma, prolonged dietary deficiencies, disruption of GI normal flora, history of peptic ulcer disease, protein C deficiency, elderly.

Action

Interferes with hepatic synthesis of vitamin K–dependent clotting factors, resulting in depletion of coagulation factors II, VII, IX, X. Therapeutic Effect: Prevents further extension of formed existing clot; prevents new clot formation, secondary thromboembolic complications.

Lifespan considerations

Interactions

DRUG: Amiodarone, azole antifungals, cimetidine, disulfiram, fluvoxamine, sulfamethoxazole-trimethoprim, levothyroxine, metronidazole, NSAIDs (e.g., ibuprofen, ketorolac, naproxen), omeprazole, platelet aggregation inhibitors (e.g., clopidogrel), salicylates (e.g., aspirin), thrombolytic agents (e.g., alteplase), thyroid hormones may increase effect. Griseofulvin, CYP3A inducers (e.g., carbamazepine, phenytoin, rifampin), vitamin K may decrease effects. Alcohol may enhance anticoagulant effect. HERBAL: Cat’s claw, dong quai, evening primrose, feverfew, garlic, ginger, ginkgo biloba, ginseng possess antiplatelet activity, may increase risk of bleeding. Ginseng, St. John’s wort may decrease effect. FOOD: Foods rich in vitamin K (e.g., spinach, brussels sprouts, meat) may decrease effect. Cranberry juice may increase effect. LAB VALUES: None known.

Availability (Rx)

Tablets (Coumadin, Jantoven): 1 mg, 2 mg, 2.5 mg, 3 mg, 4 mg, 5 mg, 6 mg, 7.5 mg, 10 mg.

Administration/handling

PO

• Give without regard to food. Give with food if GI upset occurs.
• Give at same time each day.

Indications/routes/dosage

<alert> Initial dosing must be individualized.

Anticoagulant

PO: ADULTS, ELDERLY: Initially, 2–5 mg/daily for 2 days OR 5–10 mg daily for 1–2 days, adjusting the dose based on INR results. Usual maintenance dose: 2–10 mg/day, but may vary outside these guidelines. CHILDREN: Initially, 0.2 mg/kg/day. Maximum: 10 mg. Maintenance: Adjust based on INR.
Dosage in Renal/Hepatic Impairment
No dose adjustment. Closely monitor INR.

Side effects
Occasional: GI distress (nausea, anorexia, abdominal cramps, diarrhea). Rare: Hypersensitivity reaction (dermatitis, urticaria), esp. in those sensitive to aspirin.

Adverse effects/toxic reactions
Bleeding complications ranging from local ecchymoses to major hemorrhage (intracranial hemorrhage, GI/GU/nasal/oral/rectal bleeding) may occur. Hepatotoxicity, blood dyscrasias, necrosis, vasculitis, local thrombosis occur rarely. Antidote: Vitamin K. Amount based on INR, significance of bleeding. Range: 2.5–10 mg given orally or slow IV infusion (see Appendix J for dosage).

Nursing considerations

Baseline assessment
Cross-check dose with co-worker. Obtain CBC, PT/INR before administration and daily following therapy initiation. When stabilized, follow with INR determination q4–6wks. Obtain genotyping prior to initiating therapy if available. Screen for major active bleeding. Question recent history of bleeding, recent trauma, surgical procedures, epidural anesthesia.

Intervention/evaluation
Monitor INR diligently. Assess CBC for anemia; urine/stool for occult blood. Be alert to complaints of abdominal/back pain, severe headache, confusion, seizures, hemiparesis, aphasia (may be sign of hemorrhage). Decrease in B/P, increase in pulse rate may be sign of hemorrhage. Question for increase in amount of menstrual discharge. Assess peripheral pulses; skin for ecchymoses, petechiae. Check for excessive bleeding from minor cuts, scratches. Assess gums for erythema, gingival bleeding.

Patient/family teaching
• Take medication at same time each day.
• Blood levels will be monitored routinely.
• Do not take, discontinue any other medication except on advice of physician.
• Avoid alcohol, aspirin, drastic dietary changes.
• Consult with physician before surgery, dental work.
• Urine may become red-orange.
• Falls, subtle injuries, esp. head or abdominal trauma, can be life-threatening.
• Report bleeding, bruising, red or brown urine, black stools.
• Use electric razor, soft toothbrush to prevent bleeding.
• Report coffee-ground vomitus, blood-tinged mucus from cough.
• Do not use any OTC medication without physician approval (may interfere with platelet aggregation).
• Seek immediate medical attention for stroke-like symptoms (confusion, difficulty speaking, headache, one-sided weakness); bloody stool or urine.
Zafirlukast
za-fir-loo-kast
Accolate

**CLASSIFICATION**
PHARMACOTHERAPEUTIC: Leukotriene receptor antagonist.
CLINICAL: Antiasthma.
*Do not confuse Accolate with Accupril, Accutane, or Aclovate.*

**Uses**
Prophylaxis, chronic treatment of bronchial asthma in adults and children 5 yrs and older. **OFF-LABEL:** Chronic urticaria.

**Precautions**
**Contraindications:** Hypersensitivity to zafirlukast. Hepatic impairment.  
**Cautions:** Elderly pts. Not approved for acute asthma attacks, status asthmaticus.

**Action**
Competitive antagonist of leukotriene receptor. Leukotriene production and receptor occupation are associated with pathophysiology of asthma.  
**Therapeutic Effect:** Reduces airway edema, smooth muscle constriction; alters cellular activity associated with inflammatory process. Reduces signs/symptoms of asthma.

**Pharmacokinetics**
Rapidly absorbed after PO administration (food reduces absorption). Protein binding: 99%. Metabolized in liver. Primarily excreted in feces. Unknown if removed by hemodialysis. **Half-life:** 10 hrs.

### Lifespan considerations

**Pregnancy/Lactation:** Drug is distributed in breast milk. Do not administer to breastfeeding women. **Children:** Safety and efficacy not established in pts younger than 5 yrs. **Elderly:** No age-related precautions noted.

### Interactions

**DRUG:** Erythromycin, theophylline may decrease concentration/effect. **Aspirin** may increase concentration/effects. May increase effects of warfarin (increases INR). **HERBAL:** None significant. **FOOD:** Food decreases bioavailability by 40%. **LAB VALUES:** None significant.

### Availability (Rx)

**Tablets:** 10 mg, 20 mg.

### Administration/handling

**PO**

- Give 1 hr before or 2 hrs after meals.

### Indications/routes/dosage

**Bronchial Asthma**

**PO:** **ADULTS, ELDERLY, CHILDREN 12 YRS AND OLDER:** 20 mg twice daily. **CHILDREN 5–11 YRS:** 10 mg twice daily.

**Dosage in Renal Impairment**

No dose adjustment.

**Dosage in Hepatic Impairment**
Contraindicated.

**Side effects**

*Frequent (13%):* Headache. *Occasional (3%):* Nausea, diarrhea. *Rare (Less Than 3%):* Generalized pain, asthenia, myalgia, fever, dyspepsia, vomiting, dizziness.

**Adverse effects/toxic reactions**

Concurrent administration of inhaled corticosteroids increases risk of upper respiratory tract infection.

**Nursing considerations**

**Baseline assessment**

Obtain medication history. Assess LFT. Auscultate lung sounds.

**Intervention/evaluation**

Monitor rate, depth, rhythm, type of respiration; quality, rate of pulse. Assess lung sounds for rhonchi, wheezing, rales. Monitor LFT.

**Patient/family teaching**

- Increase fluid intake (decreases lung secretion viscosity).
- Take as prescribed, even during symptom-free periods.
- Do not use for acute asthma episodes.
- Do not alter, stop other asthma medications.
- Do not breastfeed.
- Report nausea, jaundice, abdominal pain, flu-like symptoms, worsening of asthma.

zanamivir
zan-am-i-veer
Relenza Diskhaler
CLASSIFICATION
PHARMACOTHERAPEUTIC: Neuraminidase inhibitor.
CLINICAL: Antiviral, anti-influenza.

Uses

Treatment of uncomplicated acute illness due to influenza virus A and B in adults, children 7 yrs and older who have been symptomatic for less than 2 days. Prevention of influenza A and B in adults and children 5 yrs and older.

Precautions

Contraindications: Hypersensitivity to zanamivir. Cautions: Not recommended in respiratory disease (e.g., COPD, asthma), renal/hepatic impairment.

Action

Inhibits influenza virus enzyme neuraminidase, essential for viral replication. Therapeutic Effect: Prevents viral release from infected cells.

Pharmacokinetics

Systemically absorbed, approximately 4%–17%. Protein binding: less than 10%. Not metabolized. Excreted unchanged in urine. Half-life: 2.5–5.1 hrs.

Lifespan considerations

Pregnancy/Lactation: Unknown if drug crosses placenta or is distributed in breast milk. Children: Safety and efficacy not established in pts younger than 7 yrs (treatment) or younger than 5 yrs (prevention). Elderly: No age-related precautions noted.

Interactions

DRUG: May decrease levels/effect of influenza virus vaccine. HERBAL: None significant. FOOD: None known. LAB VALUES: None significant.

Availability (Rx)
Powder for Inhalation: 5 mg/blister.

Administration/handling

Inhalation
- Instruct pt to use Diskhaler device provided, exhale completely; then, holding mouthpiece 1 inch away from lips, inhale and hold breath as long as possible before exhaling.
- Rinse mouth with water immediately after inhalation (prevents mouth/throat dryness).
- Store at room temperature.

Indications/routes/dosage

Treatment of Influenza Virus

Inhalation: ADULTS, ELDERLY, CHILDREN 7 YRS AND OLDER: 2 inhalations (one 5-mg blister per inhalation for total dose of 10 mg) twice daily (approximately 12 hrs apart) for 5 days.

Prevention of Influenza Virus

Inhalation: ADULTS, ELDERLY, CHILDREN 5 YRS AND OLDER: 2 inhalations (10 mg) once daily for duration of exposure period (10 days for household exposure, 28 days for community exposure).

Dosage in Renal/Hepatic Impairment

No dose adjustment.

Side effects

Occasional (3%–2%): Diarrhea, sinusitis, nausea, bronchitis, cough, dizziness, headache. Rare (Less Than 1.5%): Malaise, fatigue, fever, abdominal pain, myalgia, arthralgia, urticaria.

Adverse effects/toxic reactions
May produce neutropenia. Bronchospasm may occur in those with history of COPD, bronchial asthma. Neuropsychiatric events (e.g., confusion, seizures, hallucinations) have been reported.

## Nursing considerations

### Baseline assessment
Pts requiring an inhaled bronchodilator at same time as zanamivir should use the bronchodilator before zanamivir administration.

### Intervention/evaluation
Provide assistance if dizziness occurs. Monitor daily pattern of bowel activity, stool consistency.

### Patient/family teaching
- Follow manufacturer guidelines for use of delivery device.
- Avoid contact with those who are at high risk for influenza.
- Continue treatment for full 5-day course.
- Doses should be evenly spaced.
- In pts with respiratory disease, an inhaled bronchodilator should be readily available.

### Fixed-Combination(s)

**Combivir:** zidovudine/lamivudine (an antiviral): 300 mg/150 mg. **Trizivir:** zidovudine/lamivudine/abacavir (an antiviral): 300 mg/150 mg/300 mg.

### CLASSIFICATION
**PHARMACOTHERAPEUTIC:** Nucleoside reverse transcriptase inhibitors.
**Uses**

Treatment of HIV infection in combination with at least two other antiretroviral agents. Prevention of maternal/fetal HIV transmission. **OFF-LABEL:** Prophylaxis in health care workers at risk for acquiring HIV after occupational exposure (part of multidrug regimen).

**Precautions**

**Contraindications:** Potentially life-threatening allergic reactions to zidovudine or its components. **Cautions:** Bone marrow compromise, renal/hepatic dysfunction. Combination with interferon with or without ribavirin in HIV/hepatitis C virus (HCV) co-infection.

**Action**

Interferes with viral RNA-dependent DNA polymerase, an enzyme necessary for viral HIV replication. **Therapeutic Effect:** Slows HIV replication, reducing progression of HIV infection.

**Pharmacokinetics**

Rapidly, completely absorbed from GI tract. Protein binding: 25%–38%. Metabolized in liver. Crosses blood-brain barrier and is widely distributed, including to CSF. Primarily excreted in urine. Minimal removal by hemodialysis. **Half-life:** 0.5–3 hrs (increased in renal impairment).

**Lifespan considerations**

**CLINICAL:** Antiretroviral.

**BLACK BOX ALERT** Neutropenia, severe anemia may occur. Lactic acidosis, severe hepatomegaly with steatosis (fatty liver), including fatalities, have occurred. Symptomatic myopathy, myositis associated with prolonged use.

Do not confuse Retrovir with acyclovir or ritonavir.
**Pregnancy/Lactation:** Unknown if drug crosses placenta or is distributed in breast milk. Unknown if fetal harm or effects on fertility can occur. **Children:** No age-related precautions noted. **Elderly:** Information not available.

**Interactions**

**DRUG:** Bone marrow depressants, ganciclovir may increase myelosuppression. May be antagonistic with DOXOrubicin. Hematologic toxicities may occur with interferon alfa. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** May increase mean corpuscular volume (MCV).

**Availability (Rx)**

- **Capsules (Retrovir):** 100 mg. **Injection Solution (Retrovir):** 10 mg/mL. **Syrup (Retrovir):** 50 mg/5 mL. **Tablets:** 300 mg.

**Administration/handling**

**IV**

- **Reconstitution**
  - Must dilute before administration.
  - Remove calculated dose from vial and add to D₅W to provide concentration no greater than 4 mg/mL.

- **Rate of Administration**
  - Infuse over 1 hr. May infuse over 30 min in neonates.

- **Storage**
  - After dilution, IV solution is stable for 24 hrs at room temperature; 48 hrs if refrigerated.
  - Use within 8 hrs if stored at room temperature or 24 hrs if refrigerated to minimize potential for microbial-contaminated solution.
  - Do not use if solution is discolored or precipitate forms.

**PO**

- Keep capsules in cool, dry place. Protect from light.
- May administer without regard to food.
- Space doses evenly around the clock.
- Pt should maintain an upright position when given medication to prevent
esophageal ulceration.

- **IV incompatibilities**

  None known.

- **IV Compatibilities**

  Dexamethasone (Decadron), DOBUTamine (Dobutrex), DOPamine (Intropin), heparin, LORazepam (Ativan), morphine, potassium chloride.

**Indications/routes/dosage**

**HIV Infection**

**PO:** ADULTS, ELDERLY: 300 mg q12h. CHILDREN 4 WKS TO 18 YRS WEIGHING 30 KG OR MORE: 300 mg q12h. WEIGHING 9–29 KG: 9 mg/kg q12h. WEIGHING 4–8 KG: 12 mg/kg q12h. PREMATURE NEONATES, GA 35 WKS OR GREATER: 4 mg/kg q12h, increase to 12 mg/kg q12h after 4 wks of age. GA 30–34 WKS: 2 mg/kg q12h for 2 wks, then 3 mg/kg q12h, then 12 mg/kg q12h after 6–8 wks. GA LESS THAN 30 WKS: 2 mg/kg q12h, then 3 mg/kg q12h at 4 wks of age, then 12 mg/kg q12h after 8–10 wks of age.

**IV:** ADULTS, ELDERLY, CHILDREN OLDER THAN 12 YRS: 1 mg/kg/dose q4h around the clock. CHILDREN 12 YRS AND YOUNGER, FULL-TERM NEONATES: 3 mg/kg/dose q12h. PREMATURE NEONATES: 1.5–2.3 mg/kg/dose q12h based on gestation at birth.

**Prevention of Maternal/Fetal HIV Transmission**

**Note:** Zidovudine should be given IV near delivery regardless of antepartum regimen or mode of delivery in women with HIV RNA level greater than 1,000 copies/mL (or unknown status). Other antiretrovirals should be continued orally. Zidovudine IV is not required in pts receiving HIV therapy with HIV RNA level less than 1,000 copies/mL near delivery.

**IV (During Labor and Delivery):** 2 mg/kg loading dose, then IV infusion of 1 mg/kg/hr until delivery. For scheduled cesarean section, begin IV zidovudine 3 hrs before surgery. **NEONATAL:** Begin 6–12 hrs after birth and continue for
first 6 wks of life. Use IV route only until oral therapy can be administered.

**PO: FULL-TERM INFANTS:** 4 mg/kg/dose q12h (IV: 3 mg/kg/dose q12h).

**INFANTS 30–34 WKS’ GESTATION:** 2 mg/kg/dose q12h; increase to 3 mg/kg/dose at 2 wks of age (IV: 1.5 mg/kg/dose q12h; increase to 2.3 mg/kg/dose q12h at 2 wks of age). **INFANTS LESS THAN 30 WKS’ GESTATION:** 2 mg/kg/dose q12h; increase to 3 mg/kg/dose at 4 wks of age (IV: 1.5 mg/kg/dose q12h; increase to 2.3 mg/kg/dose q12h at 4 wks of age).

**Dosage in Renal Impairment**

**ADULTS, ELDERLY:** CrCl less than 15 mL/min, including hemodialysis or peritoneal dialysis: **PO:** 100 mg q8h or 300 mg once daily. **IV:** 1 mg/kg q6–8hr.

**INFANTS OLDER THAN 6 WKS, CHILDREN, ADOLESCENTS:** GFR 10 mL/min/1.73m² or greater: No adjustment. GFR less than 10 mL/min/1.73m²: Administer 50% of dose q8h.

**Dosage in Hepatic Impairment**

No dose adjustment.

**Side effects**

**Expected (46%–42%):** Nausea, headache. **Frequent (20%–16%):** Abdominal pain, asthenia, rash, fever, acne. **Occasional (12%–8%):** Diarrhea, anorexia, malaise, myalgia, drowsiness. **Rare (6%–5%):** Dizziness, paresthesia, vomiting, insomnia, dyspnea, altered taste.

**Adverse effects/toxic reactions**

Anemia (occurring most commonly after 4–6 wks of therapy), granulocytopenia are particularly significant in pts with pretherapy low baselines. Neurotoxicity (ataxia, fatigue, lethargy, nystagmus, seizures) may occur.

**Nursing considerations**

**Baseline assessment**

Avoid drugs that are nephrotoxic, cytotoxic, myelosuppressive; may increase risk of toxicity. Obtain specimens for viral diagnostic tests before starting
therapy (therapy may begin before results are obtained). Check hematology reports for accurate baseline.

**Intervention/evaluation**

**Patient/family teaching**
• Doses should be evenly spaced around the clock.
• Zidovudine is not a cure for HIV infection, nor does it reduce risk of transmission to others. Acts to reduce symptoms and slows or arrests progress of disease.
• Do not take any medications without physician’s approval.
• Bleeding from gums, nose, rectum may occur and should be reported to physician immediately.
• Blood counts are essential because of bleeding potential.
• Dental work should be done before therapy or after blood counts return to normal (often wks after therapy has stopped).
• Inform physician if muscle weakness, difficulty breathing, headache, inability to sleep, unusual bleeding, rash, signs of infection occur.

---

**ziprasidone**
zi-pras-i-done

**Geodon**

**Zeldox**

CLASSIFICATION

PHARMACOTHERAPEUTIC: Second-generation (atypical) antipsychotic.

CLINICAL: Antipsychotic.

BLACK BOX ALERT Increased risk of mortality in elderly pts with dementia-related psychosis, mainly due to pneumonia, HF.
Do not confuse ziprasidone with traZODone.

**Uses**

Treatment of schizophrenia, acute agitation in pts with schizophrenia. Treatment of acute mania or mixed episodes associated with bipolar disorder with or without psychosis. Maintenance treatment of bipolar disorder as adjunct to lithium or valproic acid. **OFF-LABEL:** Major depressive disorder (adjunct to antidepressants).

**Precautions**

**Contraindications:** Hypersensitivity to ziprasidone. Conditions associated with risk of prolonged QT interval, congenital long QT syndrome, concurrent use of other QT-prolongation medications (e.g., amiodarone, moxifloxacin, tacrolimus, thioridazine). Uncompensated HF. Recent MI. **Cautions:** Pts with bradycardia, hypokalemia, hypomagnesemia may be at greater risk for torsades de pointes. History of MI or unstable heart disease, seizures, cardiac arrhythmias, disorders in which CNS depression is a feature; pts at risk for aspiration pneumonia, hypotension, suicide; elderly, diabetes, hepatic impairment, Parkinson’s disease, pts with breast cancer or other prolactin-dependent tumors.

**Action**

Exact mechanism unknown. Antagonizes alpha-adrenergic, DOPamine, histamine, serotonin receptors; inhibits reuptake of serotonin, norepinephrine. **Therapeutic Effect:** Diminishes symptoms of schizophrenia, depression.

**Pharmacokinetics**

**Lifespan considerations**

**Pregnancy/Lactation:** Unknown if drug crosses placenta or is distributed in breast milk. **Children:** Safety and efficacy not established. **Elderly:** No age-
related precautions noted. Use caution.

Interactions

**DRUG:** Alcohol, other CNS depressants (e.g., LORazepam, morphine, zolpidem) may increase CNS depression. CarbAMazepine may decrease concentration. Ketoconazole may increase concentration. QT interval–prolonging medications (e.g., amiodarone, azithromycin, ceritinib, haloperidol, moxifloxacin) may increase risk of QT interval prolongation, cardiac arrhythmias. HERBAL: Gotu kola, kava kava, St. John’s wort, valerian may increase CNS depression. St. John’s wort may decrease concentration. FOOD: All foods enhance bioavailability. LAB VALUES: May prolong QT interval. May increase serum glucose, prolactin levels.

Availability (Rx)

**Capsules:** 20 mg, 40 mg, 60 mg, 80 mg. **Injection, Powder for Reconstitution:** 20 mg.

Administration/handling

**IM**

• Store vials at room temperature; protect from light.
• Reconstitute each vial with 1.2 mL Sterile Water for Injection to provide concentration of 20 mg/mL.
• Reconstituted solution stable for 24 hrs at room temperature or 7 days if refrigerated.

**PO**

• Give with food containing at least 500 calories (increases bioavailability).

Indications/routes/dosage

**Alert** Dosage greater than 80 mg twice daily is not recommended in most pts. **To discontinue therapy:** Gradually discontinue to avoid withdrawal symptoms, minimize risk of relapses.
Schizophrenia

**PO: ADULTS, ELDERLY:** Initially, 20 mg twice daily with food. Titrate at intervals of no less than 2 days based on response and tolerability. **Maintenance:** 40–100 mg twice daily.

**Acute Agitation (Schizophrenia)**

**IM: ADULTS, ELDERY:** 10 mg q2h or 20 mg q4h. **Maximum:** 40 mg/day. Switch to oral therapy as soon as possible.

**Bipolar Disorder (acute and maintenance as adjunct to lithium or valproate)**

**PO: ADULTS, ELDERLY (Acute):** Initially, 40 mg twice daily. May increase to 60–80 mg twice daily on second day of treatment. **Maintenance:** 40–80 mg twice daily.

Dosage in Renal Impairment

**Oral:** No dose adjustment. **IM:** Use caution.

**Dosage in Hepatic Impairment**

Use caution.

Side effects

**Frequent (30%-16%):** Headache, drowsiness, dizziness. **Occasional:** Rash, orthostatic hypotension, weight gain, restlessness, constipation, dyspepsia. **Rare:** Hyperglycemia, priapism.

Adverse effects/toxic reactions

Prolongation of QT interval (as seen on EKG) may produce torsades de pointes, a form of ventricular tachycardia. Pts with bradycardia, hypokalemia, hypomagnesemia are at increased risk.

Nursing considerations
**Baseline assessment**

Assess pt's behavior, appearance, emotional status, response to environment, speech pattern, thought content. EKG should be obtained to assess for QT prolongation before instituting medication. Blood chemistry for serum magnesium, potassium should be obtained before beginning therapy and routinely thereafter.

**Intervention/evaluation**

Assess for therapeutic response (greater interest in surroundings, improved self-care, increased ability to concentrate, relaxed facial expression). Monitor weight.

**Patient/family teaching**

- Avoid tasks that require alertness, motor skills until response to drug is established.
- Avoid alcohol.
- Report chest pain, shortness of breathing, irregular heartbeats, fainting, palpitations.

---

**ziv-aflibercept**

ziv-a-flib-er-sept

**Zaltrap**

**CLASSIFICATION**

**PHARMACOTHERAPEUTIC:** Vascular endothelial growth factor (VEGF) inhibitor.

**CLINICAL:** Antineoplastic.

■ **BLACK BOX ALERT** ■  Severe, and sometimes fatal, hemorrhagic events including GI hemorrhage were reported in pts receiving concomitant FOLFIRI therapy. Do not initiate in pts with severe hemorrhage. Fatal GI perforation may occur. Discontinue treatment in pts with impaired wound healing. Withhold treatment for at least 4 wks prior to elective surgery. Do not resume treatment for at least 4 wks after major surgery until wound is fully healed.

Do not confuse ziv-aflibercept with abatacept, Aricept, or etanercept.
**Uses**

Treatment of metastatic colorectal cancer (mCRC) (in combination with 5-fluorouracil, leucovorin, irinotecan [FOLFIRI]) in pts resistant to or has progressed following an oxaliplatin-containing regimen.

**Precautions**

**Contraindications:** Hypersensitivity to ziv-afilbercept. **Cautions:** Baseline hematologic cytopenias, (neutropenia, leukopenia, thrombocytopenia), conditions predisposing to infection (e.g., diabetes, renal failure, immunocompromised pts, open wounds), pts at risk for bleeding (e.g., history of intracranial/GI/GU bleeding, coagulation disorders, recent trauma; concomitant use of anticoagulants, antiplatelet medication, NSAIDS), hypertension, elderly pts, history of arterial/venous thrombosis (e.g., CVA, DVT, MI, pulmonary embolism), GI perforation or hemorrhage.

**Action**

A recombinant fusion protein, comprising portions of binding domains of vascular endothelial growth factor (VEGF) receptors. Acts as a decoy receptor that prevents VEGF receptor binding/activation. **Therapeutic Effect:** Produces anti-angiogenesis/tumor regression.

**Pharmacokinetics**

**Half-life:** 6 days. (Range: 4–7 days).

**Lifespan considerations**

**Pregnancy/Lactation:** Avoid pregnancy; may cause fetal harm. Females of reproductive potential and males should use effective contraception during therapy and for at least 3 mos after discontinuation. Unknown if distributed in breast milk. **Children:** Safety and efficacy not established. **Elderly:** May have increased risk of side effects, esp. diarrhea, dehydration, dizziness, weakness, weight loss.

**Interactions**
DRUG: May decrease therapeutic effect of BCG (intravesical). Anticoagulants (e.g., heparin, warfarin), antiplatelets (e.g., aspirin, clopidogrel), NSAIDS (e.g., diclofenac, ibuprofen, naproxen), thrombolytic therapy (e.g., tPA) may increase risk of bleeding in pts with treatment-induced thrombocytopenia. HERBAL: None significant. FOOD: None known. LAB VALUES: May increase serum ALT, AST, serum creatinine; urine protein. May decrease leukocytes, neutrophils, platelets.

Availability (Rx)

Injection, Solution: 100 mg/4 mL (25mg/mL), 200 mg/8mL (25 mg/mL).

Administration/handling

IV

Preparation
• Visually inspect for particulate matter or discoloration. Solution should appear clear, colorless to pale yellow in color. Discard if solution is cloudy, discolored, or if visible particles are observed.
• Withdraw proper dose from vial and dilute in 0.9% NaCl or D₃W to a final concentration of 0.6–8 mg/mL. Use polyvinyl chloride (PVC) infusion bags containing bis (2-ethylhexyl) phthalate (DEHP) or polyolefin.
• Mix by gentle inversion.
• Do not shake or agitate.
• Discard unused portions.

Rate of Administration
• Infuse over 60 min via dedicated IV line using an in-line 0.2-micron polyethersulfone filter and an infusion set made of one of the following: polypropylene, polyethylene-lined PVC, polyurethane, DEHP-free PVC-containing trioctyl-trimellitate (TOTM), PVC containing DEHP.
• Do not use in-line filters made of polyvinylidene fluoride (PVDF) or nylon.
• Do not administer as IV push or bolus.

Storage
• Refrigerate unused vials.
• Do not shake.
• Protect from light.
• May refrigerate diluted solution for up to 24 hrs or at controlled room
temperature for up to 8 hrs.

- **IV incompatibilities**
  Do not infuse with other medications or solutions.

**Indications/Routes/Dosage**

**Note:** Delay treatment until ANC 1,500/mm$^3$ or greater.

**Metastatic Colorectal Cancer**

**IV: ADULTS, ELDERLY:** 4 mg/kg q2wks (in combination with 5-fluorouracil, leucovorin, and irinotecan). Continue until disease progression or unacceptable toxicity.

**Dose Modification**

**Hypertension (Treatment-Induced)**

Severe hypertension, recurrent hypertension: Withhold treatment until hypertension is controlled, then permanently reduce to 2 mg/kg q2wks.

**Proteinuria**

Urine protein greater than or equal to 2 g/24 hrs: Withhold treatment until urine protein less than 2 g/24 hrs, then resume at previous dose. **Recurrent urine protein greater than 2 g/24 hrs:** Withhold treatment until urine protein less than 2 g/24hrs, then resume with a permanent reduction to 2 mg/kg q2wks.

**Permanent Discontinuation**

Permanently discontinue if severe hemorrhage, GI perforation, impaired wound healing, fistula formation, hypertensive crisis, arterial thromboembolism, nephrotic syndrome, thrombotic microangiopathy, reversible posterior leukoencephalopathy occurs.

**Dosage in Renal/Hepatic Impairment**

No dose adjustment.
Side Effects

**Frequent (57%–24%)**: Diarrhea, fatigue, stomatitis, abdominal pain, decreased appetite. **Occasional (13%–9%)**: Asthenia, dyspnea, headache. **Rare (3%–2%)**: Skin hyperpigmentation, dystonia, oropharyngeal pain, dehydration, rhinorrhea, hemorrhoids, proctalgia.

Adverse Effects/Toxic Reactions

Leukopenia, neutropenia, thrombocytopenia are expected responses to therapy, but more severe reactions including bone marrow depression, febrile neutropenia may be life-threatening. Severe, sometimes fatal, hemorrhagic events including intracranial/GI/GU/nasal/postprocedural hemorrhage may occur. GI perforations occurred in less than 1% of pts. May cause impaired wound healing or wound dehiscence requiring medical intervention, GI or non-GI fistula formation, severe hypertension, severe proteinuria, nephrotic syndrome, severe diarrhea, dehydration. Arterial thromboembolism including CVA, MI, TIA reported in up to 3% of pts. Reversible posterior leukoencephalopathy syndrome (RPLS) may present as aphasia, altered mental status, paralysis, vision loss, weakness. UTI reported in 6% of pts. Palmar-plantar erythrodysesthesia syndrome (PPES), a chemotherapy-induced skin condition that presents with redness, swelling, numbness, skin sloughing of the hands and feet, reported in 4% of pts. Immunogenicity (auto-ziv-afilbercept antibodies) occurred in up to 3% of pts.

Nursing Considerations

**Baseline Assessment**

Obtain CBC, BUN, serum creatinine, LFT; urine protein; vital signs. Obtain pregnancy test in females of reproductive potential. Question for recent surgeries, dental procedures. Question history of thromboembolism (CVA, DVT, MI, pulmonary embolism), hypertension, hemorrhagic events. Screen for active infection. Screen for home medications that may increase risk of hemorrhage. Conduct dermatologic exam; assess for open wounds, lesions, surgical incisions. Obtain dietary consult. Assess hydration status. Offer emotional support.

**Intervention/Evaluation**
Monitor ANC, CBC for myelosuppression prior to each cycle; renal function test, LFT, urine protein periodically. Monitor B/P at least q2wks. Persistent diastolic hypertension may indicate hypertensive crisis. If urine dipstick proteinuria is greater than or equal to 2+, obtain 24-hr urine protein test. Withhold treatment for at least 4 wks prior to elective surgery or for at least 4 wks after major surgery and until wound is fully healed. Due to high risk for arterial occlusions, be vigilant when screening for CVA (aphasia, confusion, paresthesia, hemiparesis, seizures), MI (chest pain, diaphoresis, left arm/jaw pain, increased serum troponin, ST segment elevation). RPLS should be considered in pts with altered mental status, confusion, headache, seizures, visual disturbances. Report abdominal pain, fever, hemoptysis, melena (may indicate GI perforation/fistula formation). Monitor skin for impaired wound healing, new skin lesions, rash, sloughing. Monitor for decreased urine output, renal dysfunction, nephrotic syndrome. Encourage fluid intake. Monitor daily pattern of bowel activity, stool consistency.

**Patient/Family Teaching**

- Life-threatening blood clots of the arteries and veins have occurred; report symptoms of heart attack (chest pain, difficulty breathing, jaw pain, nausea, pain that radiates to the left arm, sweating), stroke (blindness, confusion, one-sided weakness, loss of consciousness, trouble speaking, seizures), DVT (swelling, pain, hot feeling in the arms or legs), lung embolism (difficulty breathing, chest pain, rapid heart rate). Report liver problems (abdominal pain, bruising, clay-colored stool, amber or dark-colored urine, yellowing of the skin or eyes); skin changes (sloughing, rash, poor healing of wounds).
- Life-threatening bleeding may occur; report bloody stool or urine, rectal bleeding, nosebleeds, vomiting up blood.
- Treatment may depress your immune system response and reduce your ability to fight infection. Report symptoms of infection such as body aches, chills, cough, fatigue, fever. Avoid those with active infection.
- Avoid pregnancy; treatment may cause birth defects. Females and males of childbearing potential should use effective contraception during treatment and for at least 3 mos after last dose.
- Nervous system changes, including altered mental status, seizures, headache, blurry vision, high blood pressure, trouble speaking, one-sided weakness, may indicate stroke, high blood pressure crisis, life-threatening brain dysfunction/swelling.
• Notify physician before any planned surgeries/dental procedures.
• Severe diarrhea may lead to dehydration; drink plenty of fluids.

### zoledronic acid

**zoe-le-dron-ik as-id**

**Aclasta**

**Reclast**

**Zometa**

**CLASSIFICATION**

**PHARMACOTHERAPEUTIC:** Bisphosphonate.

**CLINICAL:** Calcium regulator, bone resorption inhibitor.

**Do not confuse Zometa with Zofran or Zoladex.**

### Uses

### Precautions

**Contraindications:** Hypersensitivity to zoledronic acid, other bisphosphonates (e.g., alendronate, risedronate). **Reclast Only:** CrCl less than 35 mL/min, acute renal impairment, hypocalcemia. **Cautions:** Elderly. **(Oncology Indications):** History of aspirin-sensitive asthma, mild to moderate renal impairment. **(Non-Oncology Indications):** Pts with disturbances of calcium and mineral metabolism (e.g., hypoparathyroidism, malabsorption syndrome).

### Action
Inhibits bone resorption by action on osteoclasts. Inhibits osteoclast activity/skeletal calcium release induced by tumors; inhibits osteoclast-mediated resorption. Therapeutic Effect: (Tumor): Increases urinary calcium, phosphorus excretion; decreases serum calcium, phosphorus levels. (Osteoporosis): Reduces bone turnover.

Lifespan considerations

Pregnancy/Lactation: Unknown if drug crosses placenta or is distributed in breast milk. Recommend discontinuation of therapy as early as possible prior to a planned pregnancy. Children: Safety and efficacy not established. Elderly: Age-related renal impairment may require dosage adjustment.

Interactions

DRUG: Loop diuretics (e.g., furosemide) may increase risk for hypocalcemia. Nephrotoxic drugs (e.g., IV contrast dye, furosemide, lisinopril, rifAMPin) may increase risk for nephrotoxicity. HERBAL: None significant. FOOD: None known. LAB VALUES: May decrease serum magnesium, calcium, phosphate.

Availability (Rx)

Injection Solution: 4 mg/5 mL vial, 4 mg/100 mL single-use ready-to-use bottle. 5 mg diluted in 100 mL ready-to-infuse solution.

Administration/handling

Pt should be adequately rehydrated before administration of zoledronic acid.

IV (Zometa)

Reconstitution

• Further dilute Zometa with 100 mL 0.9% NaCl or D₅W.

Rate of Administration

• Adequate hydration is essential in conjunction with zoledronic acid.
• Administer as IV infusion over not less than 15 min (increases risk of deterioration in renal function).

Storage
• Store intact vials at room temperature.
• Infusion of solution must be completed within 24 hrs.

IV (Reclast)
• Administer as IV infusion over not less than 15 min.
• Follow infusion with a 10-mL 0.9% NaCl flush of IV line.

IV incompatibilities
Do not mix with other medications.

Indications/routes/dosage

Hypercalcemia Malignancy (Zometa)
**IV Infusion:** ADULTS, ELDERLY: 4 mg IV infusion given over no less than 15 min. Retreatment may be considered, but at least 7 days should elapse to allow for full response to initial dose.

Multiple Myeloma, Osteolytic Lesions, Bone Metastases from Solid Tumors (Zometa)
**IV:** ADULTS, ELDERLY: 4 mg q3–4wks.

Paget’s Disease (Reclast)
**IV:** ADULTS, ELDERLY: 5 mg as a single dose. Data about retreatment not available (seldom required within 5 yrs).

Osteoporosis Treatment (Reclast)
**IV:** ADULTS, ELDERLY: 5 mg once yearly. Consider discontinuing after 3–5 yrs in pts with low risk of fractures.

Treatment/Prevention of Glucocorticoid-Induced Osteoporosis (Reclast)
**IV:** ADULTS, ELDERLY: 5 mg once yearly.
Prevention of Postmenopausal Osteoporosis (Reclast)

**IV: ADULTS, ELDERLY:** 5 mg once q2yrs.

**Dosage in Renal Impairment**

*(Reclast):* CrCl less than 35 mL/min: Contraindicated.

*(Zometa):* (Multiple Myeloma, Metastatic Bone Lesions of Solid Tumors)

*(Zometa):* (Hypercalcemia of Malignancy)

**Mild to moderate impairment:** No adjustment. **Severe impairment:** (SCr greater than 4.5 mg/dL): Use caution only after considering risk versus benefit.

**Dosage in Hepatic Impairment**

No dose adjustment.

**Side effects**

**Frequent (44%–26%):** Fever, nausea, vomiting, constipation. **Occasional (15%–10%):** Hypotension, anxiety, insomnia, flu-like symptoms (fever, chills, bone pain, myalgia, arthralgia). **Rare:** Conjunctivitis.

**Adverse effects/toxic reactions**

Renal toxicity may occur if IV infusion is administered in less than 15 min.

**Nursing considerations**

**Baseline assessment**

Prior to initiation, obtain dental exam for pts at risk for osteonecrosis. Establish baseline serum electrolytes, renal function test.

**Intervention/evaluation**

**ZOLMItriptan**

zole-mi-trip-tan

**Zomig**

Zomig Rapimelt

Zomig-ZMT

**CLASSIFICATION**

**PHARMACOTHERAPEUTIC**: Serotonin 5-HT$_1$ receptor agonist.

**CLINICAL**: Antimigraine.

Do not confuse ZOLMItriptan with almotriptan, rizatriptan or sumatriptan.

**Uses**

**Oral**: Treatment of acute migraine attack with or without aura in adults. **Nasal**: Treatment of acute migraine with or without aura in adults and children 12 yrs and older. **OFF-LABEL**: Short-term prevention of menstrual migraines.

**Precautions**

**Contraindications**: Hypersensitivity to ZOLMItriptan. Arrhythmias associated with conduction disorders (e.g., Wolff-Parkinson-White syndrome), basilar or hemiplegic migraine, coronary artery disease, ischemic heart disease (including angina pectoris, history of MI, silent ischemia, Prinzmetal’s angina), uncontrolled hypertension, use within 24 hrs of ergotamine-containing preparations or another serotonin receptor agonist, MAOI used within 14 days.

**Additional for nasal spray**: Cerebrovascular syndromes (e.g., stroke), peripheral vascular disease. **Cautions**: Hepatic impairment, pt profile suggesting cardiovascular risks (e.g., hypertension, hypercholesterolemia, smoker, obesity, diabetes), elderly.
**Action**

Binds selectively to serotonin receptors, producing vasoconstrictive effect on cranial blood vessels. **Therapeutic Effect:** Relieves migraine headache.

**Pharmacokinetics**

Well absorbed after PO administration. Protein binding: 25%. Metabolized in liver. Excreted in urine (60%), feces (30%). **Half-life:** 2.8–3.7 hrs.

**Lifespan considerations**

**Pregnancy/Lactation:** Unknown if drug is distributed in breast milk. **Children:** Safety and efficacy not established in pts younger than 12 yrs. **Elderly:** No age-related precautions noted.

**Interactions**

**DRUG:** Ergotamine-containing medications may produce vasospastic reaction. **FLUvoxetine, fluvoxamine, PARoxetine, sertraline** may produce hyperreflexia, incoordination, weakness. **MAOIs (e.g., phenelzine, selegiline)** may dramatically increase concentration. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** None significant.

**Availability (Rx)**

- **Nasal Spray (Zomig):** 2.5 mg, 5 mg. **Tablets:** 2.5 mg, 5 mg.
- **Tablets (Orally Disintegrating [Zomig-ZMT]):** 2.5 mg, 5 mg.

**Administration/handling**

**PO**

- Give without regard to food. Tablets may be broken.

**Orally Disintegrating Tablet (ODT)**

- Give whole; do not break, crush, cut.
- Place on pt’s tongue; allow to dissolve.
- Not necessary to administer with liquid.
Nasal

• Instruct pt to clear nasal passages as much as possible before use.
• With head upright, pt should close one nostril with index finger, breathe out gently through mouth.
• Instruct pt to insert nozzle into open nostril about %1/2 inch, close mouth, and while taking a breath through nose, release spray dosage by firmly pressing plunger.
• Have pt remove nozzle from nose, gently breathe in through nose and out through mouth for 15–20 sec. Tell pt to avoid breathing in deeply.

Indications/routes/dosage

Acute Migraine Attack

PO: ADULTS, ELDERLY, CHILDREN OLDER THAN 18 YRS: Initially, 1.25–2.5 mg (maximum: 5 mg). If headache returns, may repeat dose after 2 hrs. Maximum: 10 mg/24 hrs.

Orally Disintegrating Tablet: ADULTS, ELDERLY: Initially, 2.5 mg (maximum: 5 mg) at onset of migraine headache. If headache returns, may repeat dose after 2 hrs. Maximum: 10 mg/24 hrs.

Intranasal: ADULTS, ELDERLY, CHILDREN 12 YRS AND OLDER: Initially, 2.5 mg (maximum: 5 mg). If headache returns, may repeat dose after 2 hrs. Maximum: 10 mg/24 hrs.

Dosage in Renal Impairment

No dose adjustment.

Dosage in Hepatic Impairment

Nasal/ODT: Mild impairment: No dose adjustment. Moderate to severe impairment: Not recommended. Tablet: Mild: No dose adjustment. Moderate to severe impairment: Initially, 1.25 mg. (Maximum daily dose: 5 mg in severe impairment.)

Side effects

Frequent (8%–6%): PO: Dizziness, paresthesia, neck/throat/jaw pressure,
drowsiness. **Nasal:** Altered taste, paresthesia. **Occasional (5%–3%): PO:** Warm/hot sensation, asthenia, chest pressure. **Nasal:** Nausea, drowsiness, nasal discomfort, dizziness, asthenia, dry mouth. **Rare (2%–1%):** Diaphoresis, myalgia.

**Adverse effects/toxic reactions**

Cardiac events (ischemia, coronary artery vasospasm, MI), noncardiac vasospasm-related reactions (hemorrhage, stroke) occur rarely, particularly in pts with hypertension, diabetes, strong family history of coronary artery disease; pts who are obese; smokers; males older than 40 yrs; postmenopausal women.

**Nursing considerations**

**Baseline assessment**

Question for history of peripheral vascular disease, coronary artery disease, renal/hepatic impairment, MAOI use. Question pt regarding onset, location, duration of migraine, possible precipitating factors.

**Intervention/evaluation**

Monitor for evidence of dizziness. Monitor B/P, esp. in pts with hepatic impairment. Assess for relief of migraine headache, migraine potential for photophobia, phonophobia (sound sensitivity, light sensitivity, nausea, vomiting).

**Patient/family teaching**

• Take single dose as soon as symptoms of actual migraine attack appear.
• Medication is intended to relieve migraine, not to prevent or reduce number of attacks.
• Lie down in dark, quiet room for additional benefit after taking medication.
• Avoid tasks that require alertness, motor skills until response to drug is established.
• Report chest pain; palpitations; tightness in throat; edema of face, lips, eyes; rash; easy bruising; blood in urine or stool; pain or numbness in arms or legs.
zole-pi-dem

**Ambien**

**Ambien CR**

**Edluar**

**Intermezzo**

**Sublinox**

**Zolpimist**

**CLASSIFICATION**

PHARMACOTHERAPEUTIC: Hypnotic, miscellaneous (Schedule IV).

CLINICAL: Sedative-hypnotic.

Do not confuse Ambien with ativan, or zolpidem with zaleplon.

---

**Uses**

**Ambien, Edluar, Zolpimist:** Short-term treatment of insomnia (with difficulty of sleep onset). **Ambien CR:** Treatment of insomnia (with difficulty of sleep onset and/or sleep maintenance). **Intermezzo:** Treatment of insomnia characterized by middle-of-the-night awakening followed by difficulty returning to sleep in pts with 4 or more hrs of sleep time remaining.

**Precautions**

**Contraindications:** Hypersensitivity to zolpidem. **Cautions:** Hepatic impairment, pts with depression, history of drug dependence, sleep apnea, COPD, respiratory disease, myasthenia gravis, debilitated pts, elderly.

**Action**

Enhances action of inhibitory neurotransmitter gamma-aminobutyric acid (GABA). **Therapeutic Effect:** Induces sleep with fewer nightly awakenings, improves sleep quality.

**Pharmacokinetics**
<table>
<thead>
<tr>
<th>Route</th>
<th>Onset</th>
<th>Peak</th>
<th>Duration</th>
</tr>
</thead>
<tbody>
<tr>
<td>PO</td>
<td>30 min</td>
<td>N/A</td>
<td>6–8 hrs</td>
</tr>
</tbody>
</table>

Rapidly absorbed from GI tract. Protein binding: 92%. Metabolized in liver; excreted in urine. Not removed by hemodialysis. **Half-life:** 1.4–4.5 hrs (increased in hepatic impairment).

**Lifespan considerations**

**Pregnancy/Lactation:** Drug crosses placenta and is distributed in breast milk. **Children:** Safety and efficacy not established. **Elderly:** More likely to experience falls or confusion; decreased initial doses recommended. Age-related hepatic impairment may require dosage adjustment.

**Interactions**

**DRUG:** Alcohol, other CNS depressants (e.g., gabapentin, LORazepam, morphine) may increase CNS depression. **HERBAL:** Gotu kola, kava kava, valerian may increase CNS depression. **St. John’s wort** may decrease concentration/effect. **FOOD:** None known. **LAB VALUES:** None significant.

**Availability (Rx)**

**Oral Solution (Zolpimist):** 5 mg/actuation. **Tablets:** 5 mg, 10 mg. **Tablets (Sublingual [Edluar]):** 5 mg, 10 mg. **(Intermezzo):** 1.75 mg, 3.5 mg. **Tablets (Extended-Release):** 6.25 mg, 12.5 mg.

**Administration/handling**

**PO**

- For faster sleep onset, do not give with or immediately after a meal.
- Do not break, crush, dissolve, or divide Ambien CR tablets; give whole.
- Edluar sublingual tablets to be placed under tongue and allowed to disintegrate. Do not swallow or administer with water.
- Spray Zolpimist directly into mouth over tongue.

**Indications/routes/dosage**

**Note:** Dosage adjustment is recommended for female pts.
Insomnia

PO, Spray, Sublingual:  *(Edluar, Zolpimist):  ADULTS:  (males) 10 mg, (females) 5 mg immediately before bedtime.  ELDERSLY, DEBILITATED: 5 mg immediately before bedtime.  *(Intermezzo):  ADULTS, ELDERSLY:  (males) 3.5 mg, (females) 1.75 mg, taken once in middle of night with 4 or more hrs of expected sleep yet to come.  PO:  *(Extended-Release):  ADULTS:  (males) 6.25–12.5 mg, (females) 6.25 mg immediately before bedtime.  ELDERSLY, DEBILITATED:  6.25 mg immediately before bedtime.

Dosage in Renal Impairment

No dose adjustment; use caution.

Dosage in Hepatic Impairment

Severe impairment:  Avoid use.

Side effects

Occasional (7%):  Headache, change in appetite.  Rare (less than 2%):  Dizziness, nausea, diarrhea, muscle pain, sleepwalking.

Adverse effects/toxic reactions

Overdose may produce severe ataxia (clumsiness, unsteadiness), bradycardia, diplopia, severe drowsiness, nausea, vomiting, difficulty breathing, unconsciousness.  Abrupt withdrawal following long-term use may produce weakness, facial flushing, diaphoresis, vomiting, tremor.  Drug tolerance/dependence may occur with prolonged use of high dosages.  May cause amnesic events that include cooking, sleepwalking, sexual activity, driving.

Nursing considerations

Baseline assessment
Assess B/P, pulse, respirations, mental status, sleep patterns. Raise bed rails, provide call light. Provide environment conducive to sleep (back rub, quiet environment, low lighting). Do not give unless a full night of sleep is planned.

**Intervention/evaluation**

Monitor sleep pattern of pt. Evaluate for therapeutic response to insomnia: decrease in number of nocturnal awakenings, increase in length of sleep. Monitor daytime alertness, respiratory rate, behavior profile.

**Patient/family teaching**

- Do not abruptly discontinue medication after long-term use.
- Avoid alcohol and tasks that require alertness, motor skills until response to drug is established.
- Tolerance, dependence may occur with prolonged use of high dosages.
- Do not break, chew, crush, dissolve, or divide Ambien CR tablets; swallow whole.
- Therapy may need to be discontinued if cooking, driving, sleepwalking occurs without recollection.
- Do not take unless a full 8 hrs of sleep is planned.

| zonisamide |
| zoe-nis-a-mide |

**Zonegran**

**CLASSIFICATION**

PHARMACOTHERAPEUTIC: Anticonvulsant, miscellaneous.

CLINICAL: Anticonvulsant.

Do not confuse Zonegran with SINEquan, or zonisamide with lacosamide.

**Uses**

Adjunctive therapy in treatment of partial seizures in adults, children older than 16 yrs with epilepsy. OFF-LABEL: Bipolar disorder.

**Precautions**
**Contraindications:** Hypersensitivity to zonisamide. Allergy to sulfonamides.  
**Cautions:** Renal/hepatic impairment, pts at high risk for suicide or metabolic acidosis (e.g., severe respiratory disease).

**Action**
Exact mechanism unknown. May stabilize neuronal membranes, suppress neuronal hypersynchronization by blocking sodium, calcium channels.  
**Therapeutic Effect:** Reduces seizure activity.

**Pharmacokinetics**
Well absorbed after PO administration. Metabolized in liver. Extensively bound to RBCs. Protein binding: 40%. Primarily excreted in urine. **Half-life:** 63 hrs (plasma), 105 hrs (RBCs).

**Lifespan considerations**
**Pregnancy/Lactation:** Crosses placenta. Unknown if distributed in breast milk.  
**Children:** Safety and efficacy not established in pts younger than 16 yrs.  
**Elderly:** No age-related precautions noted, but lower dosages recommended.

**Interactions**
**DRUG:** Alcohol, other CNS depressants (e.g., LORazepam, morphine, zolpidem) may increase sedative effect.  
**CYP3A4 inducers** (e.g., carBAMazepine, PHENobarbital, phenytoin, valproic acid) may increase metabolism, decrease effect.  
**HERBAL:** None significant.  
**FOOD:** None known.  
**LAB VALUES:** May increase serum BUN, creatinine.

**Availability (Rx)**
**Capsules:** 25 mg, 50 mg, 100 mg.

**Administration/handling**
**PO**  
• May give with or without food.
• Do not crush, break capsules. Give capsules whole.
• Do not give to pts allergic to sulfonamides.

Indications/routes/dosage

Note: Do not use if CrCl is less than 50 mL/min.

Partial Seizures

PO: ADULTS, ELDERLY, CHILDREN OLDER THAN 16 YRS: Initially, 100 mg/day. May increase to 200 mg/day after 2 wks. Further increases to 300 mg/day and 400 mg/day can be made with minimum of 2 wks between adjustments. Range: 100–600 mg/day.

Dosage in Renal Impairment

Not recommended with CrCl less than 50 mL/min.

Dosage in Hepatic Impairment

Use with caution.

Side effects

Frequent (17%–9%): Drowsiness, dizziness, anorexia, headache, agitation, irritability, nausea. Occasional (8%–5%): Fatigue, ataxia, confusion, depression, impaired memory/concentration, insomnia, abdominal pain, diplopia, diarrhea, speech difficulty. Rare (4%–3%): Paresthesia, nystagmus, anxiety, rash, dyspepsia, weight loss.

Adverse effects/toxic reactions

Overdose characterized by bradycardia, hypotension, respiratory depression, coma. Leukopenia, anemia, thrombocytopenia occur rarely.

Nursing considerations

Baseline assessment

Review history of seizure disorder (intensity, frequency, duration, level of
consciousness). Initiate seizure precautions. CBC, LFT should be performed before therapy begins and periodically during therapy.

**Intervention/evaluation**

Observe frequently for recurrence of seizure activity. Assess for clinical improvement (decrease in intensity, frequency of seizures). Assist with ambulation if dizziness occurs.

**Patient/family teaching**

- Strict maintenance of drug therapy is essential for seizure control.
- Avoid tasks that require alertness, motor skills until response to drug is established.
- Avoid alcohol.
- Report if rash, back/abdominal pain, blood in urine, fever, sore throat, ulcers in mouth, easy bruising occur.
- Report worsening depression, unusual behavior, suicidal ideation.

Canadian trade name

*underlined* underlined – top prescribed drug
Calculation of Doses

Frequently, dosages ordered do not correspond exactly to what is available and must be calculated.

**Ratio/Proportion:**
A pt is to receive 65 mg of a medication. It is available as 80 mg/2 mL. What volume (mL) needs to be administered to the patient?

**STEP 1:** Set up ratio.

$$\frac{80 \text{ mg}}{2 \text{ mL}} = \frac{65 \text{ mg}}{x \text{ (mL)}}$$

**STEP 2:** Cross multiply and divide each side by the number with x to determine volume to be administered.

$$80 \text{ mg} \times (x) \text{ mL} = 65 \text{ mg} \times 2 \text{ mL}$$

$$80x = 150$$

$$x = \frac{150}{80} = 1.625 \text{ mL}$$

**Calculations in Micrograms Per Kilogram Per Minute (mcg/kg/min):**
A 63-year-old pt (weight 165 lb) is to receive medication A at a rate of 8 mcg/kg/min. Given a solution containing medication A in a concentration of 500
mg/250 mL, at what rate (mL/hr) would you infuse this medication?

STEP 1: Convert to same units. In this problem, the dose is expressed in mcg/kg; therefore, convert weight to kg (2.2 lb = 1 kg) and drug concentration to mcg/mL (1 mg = 1,000 mcg).

\[
\text{165 lb divided by 2.2 = 75 kg}
\]

\[
\frac{500 \text{ mg}}{250 \text{ mL}} \times \frac{2 \text{ mg}}{2 \text{ mL}} = \frac{2,000 \text{ mcg}}{\text{ mL}}
\]

STEP 2: Number of mcg/hr.

\[
(75 \text{ kg}) \times 8 \text{ mcg/kg/min} = 600 \text{ mcg/min or 36,000 mcg/hr}
\]

STEP 3: Number of mL/hr.

\[
36,000 \text{ mcg/hr divided by 2,000 mcg/mL = 18 mL/hr}
\]
Controlled Drugs (United States)

**Schedule I:** Medications having no legal medical use. These substances may be used for research purposes with proper registration (e.g., heroin, LSD).

**Schedule II:** Medications having a legitimate medical use but are characterized by a very high abuse potential and/or potential for severe physical and psychic dependency. Emergency telephone orders for limited quantities of these drugs are authorized, but the prescriber must provide a written, signed prescription order (e.g., morphine, amphetamines, hydrocodone, oxycodone).

**Schedule III:** Medications having significant abuse potential (less than Schedule II). Telephone orders are permitted (e.g., codeine in combination with other substances such as butalbital).

**Schedule IV:** Medications having a low abuse potential. Telephone orders are permitted (e.g., benzodiazepines, tramadol, zolpidem).

**Schedule V:** Medications having the lowest abuse potential of the controlled substances. Some Schedule V products may be available without a prescription (e.g., certain cough preparations containing limited amounts of an opiate).
A wound is any process that disrupts the normal structure and function of tissues. Wounds can be closed (e.g., bruise, sprain) or open (e.g., abrasion, surgical wound). The most common chronic wounds are nonhealing surgical wounds, pressure ulcers, diabetic foot ulcers, and venous ulcers.

## Types of Open Wounds

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Superficial</td>
<td>Damage only to the epithelium; heals rapidly via regeneration of epithelial cells.</td>
</tr>
<tr>
<td>Partial thickness</td>
<td>Involves the dermal layer and is associated with blood vessel damage.</td>
</tr>
<tr>
<td>Full thickness</td>
<td>Involves subcutaneous fat and deeper layers (e.g., muscle, bone).</td>
</tr>
<tr>
<td></td>
<td>Requires the longest time to heal.</td>
</tr>
<tr>
<td></td>
<td>Connective tissue needs to regenerate; contraction occurs during the healing process.</td>
</tr>
</tbody>
</table>

## Wound Healing

Wound healing is a complex process resulting in restored cell structure and tissue layers after an injury. When skin is damaged, it begins to heal from the bottom layer up and from the outside inward. Wound healing involves cellular, physiologic, biochemical, and molecular processes. They are interdependent and overlapping. An acute wound usually heals within several wks, whereas chronic wounds take 6 wks or longer to heal. Additionally, other factors can delay the healing process. These include trauma/edema, infection, necrosis, lack of oxygen delivery to the tissues, advanced age, obesity, chronic diseases (e.g., diabetes, anemia), vascular insufficiency, immobility, pressure necrosis, and immunodeficiency.

Wound healing can be divided into three phases: inflammation, proliferation, and maturation.

<table>
<thead>
<tr>
<th>Inflammation</th>
<th>Occurs within seconds of the injury and can last up to 3 days.</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Associated with redness, heat, swelling, and pain.</td>
</tr>
</tbody>
</table>
Immediate vasoconstriction of damaged blood vessels and coagulation limiting blood loss occurs. Following vasoconstriction, histamine and other chemical mediators are released from damaged cells, causing vasodilation and release of growth factors essential for wound healing (e.g., increased capillary permeability and release of exudate).

| Proliferation | Granulation tissue composed of macrophages, fibroblasts, immature collagen, blood vessels, and ground substance is formed. Fibroblasts stimulate production of collagen and elastin, increasing the strength of the wound and stimulating growth of new blood vessels. As granulation fills the wound site, the edges of the wound pull together, decreasing the surface of the wound. |
| Maturation | Epithelialization then occurs: Epithelial cells migrate from the wound edge, covering the wound and resulting in scar formation. This phase usually lasts 2 to 3 wks. Collagen fibers cross link and reorganize, increasing the strength of scar. This process can take anywhere from 3 wks to 2 yrs. |

### Wound Dressings

Dressings play a major role in wound management. They protect the wound, keeping it moist, and thus promote healing (only diabetic, dry, gangrenous toes require a moisture-free environment for effective healing). Hydrocolloid, hydrogel, film, and foam dressing can handle large amounts of exudate and promote auto-debridement. Alginate and collagen-based dressings promote granulation of tissue. Silver and iodine dressings are used to avoid infections, which may delay wound healing.

### Wound Care Products

<table>
<thead>
<tr>
<th>Description</th>
<th>General Uses</th>
<th>Comments</th>
</tr>
</thead>
<tbody>
<tr>
<td>Alginate dressings: Spun fibers of brown seaweed that act as ion exchange mechanisms to absorb serous fluid or exudate, forming a gel-like covering that conforms to the shape of the wound. Facilitate autolytic debridement and maintain a moist wound environment.</td>
<td>Abrasions/ lacerations/skin tears Arterial/venous ulcers Deep and tunneling wounds Diabetic ulcers Pressure ulcers Second-degree burns Odorous wounds Contaminated and infected wounds</td>
<td>Good for moderately to heavily exudative wounds and hemorrhagic wounds Can be left in place until soaked with exudate Requires a secondary dressing (e.g., transparent film, foam, hydrocolloids) Do not moisten prior to use</td>
</tr>
<tr>
<td>Products: Algicell, Carra Sorb. Available as ropes, pads.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Collagenase ointment: Sterile enzymatic de-briding ointment that possesses the ability to digest collagen in necrotic tissue. <strong>Products:</strong> Santyl.</td>
<td>Debriding chronic dermal ulcers and severely burned areas.</td>
<td>Can be used for infected wounds. Gauze is used as a secondary dressing. Discontinue when granulation tissue is present. Optimal pH for enzymatic action is 6-8. Avoid acidic agents for cleansing; avoid detergents and agents containing heavy metal (e.g., mercury or silver), which may adversely affect enzymatic activity.</td>
</tr>
<tr>
<td>---</td>
<td>---</td>
<td>---</td>
</tr>
<tr>
<td><strong>Trypsin, castor oil, Peru balsam:</strong> <strong>Trypsin</strong> is a mild debriding agent that helps shed damaged skin cells. <strong>Castor oil</strong> acts as a lubricant to protect tissue. <strong>Peru balsam</strong> increases blood flow to a wound area, reduces wound odor. <strong>Products:</strong> Granulex, Xenaderm. Available as gel, ointment, spray.</td>
<td>Promotes healing/treatment of decubitus ulcers, varicose ulcer, and dehiscent wounds.</td>
<td>Can be used for infected wounds. Avoid concurrent use of silver-containing products (may reduce efficacy). Promotes healing and relieves pain caused by bed sores and other skin ulcers.</td>
</tr>
<tr>
<td><strong>Hydrophilic polyurethane foam:</strong> Also called open cell foam dressings. Sheets of foamed solutions of polymers containing variably sized open cells that can hold wound exudate away from wound bed. Maintains moist wound environment. <strong>Products:</strong> Curafoam, Lyo-foam. Available as sheets in a wide variety of sizes.</td>
<td>Moderate to heavy exudative wounds with or without a clean granular wound.</td>
<td>Contraindicated for use in third-degree burns. Not recommended.</td>
</tr>
<tr>
<td>Hydrocolloids: Formulations of elastomeric, adhesive, and gelling agents; the most common absorbent ingredient is carboxymethylcellulose. Most hydrocolloids are backed with a semi-occlusive film layer. The wound side of the dressing is adhesive, adhering to a moist surface as well as to dry skin but not to the moist wound bed. As wound fluid is absorbed, the hydrocolloid forms a viscous gel in the wound bed, enhancing a moist wound environment. <strong>Products:</strong> Hydrocol, Tegasorb. Available as dressings, granules, patches, paste.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>---</td>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>Minimal to moderate exudate in partial and full thickness wounds</strong> Cuts and abrasions First- and second-degree burns Pressure ulcers Stasis ulcers</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Not for wounds producing heavy exudate, infected wounds, dry eschar-covered wounds May provide pain relief Good for chronic wounds that are epithelializing Can be left in place for up to 7 days Contraindicated for third-degree burns Can shower while wearing</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Hydrogels: Glycerin- or water-based dressings designed to hydrate the wound. May absorb small amounts of exudate. <strong>Products:</strong> Curacel, Duo Derm, Intra Site. Available as gel, sheets, gauze.</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Partial and full thickness wounds</strong> Dry to minimal exudate Cuts and abrasions First- and second-degree burns Pressure ulcers Stasis ulcers</td>
</tr>
<tr>
<td>Not for wounds producing moderate to heavy exudate Not for infected wounds May provide pain relief Good for wounds that are debriding Good for keeping a dry wound moist Can be left in place for 1-3 days</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Iodine compounds: <strong>Cadexomer iodine:</strong> Iodine is complexed with a polymeric cadexomer starch vehicle, forming a topical gel or paste. The</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Chronic nonhealing,</strong> Requires use of a secondary</td>
</tr>
</tbody>
</table>
Cadexomer moiety absorbs exudate and debris and releases iodine for antimicrobial activity.  
**Products:** Iodosorb, Iodoflex. Available as gel, dressing, ointment, powder.

| Products: Iodosorb, Iodoflex. Available as gel, dressing, ointment, powder. | Iodine dressing | Contraindicated in pts with iodine sensitivity, Hashimoto’s thyroiditis, nontoxic nodular goiter, children  
Dressing to be changed when it turns white, indicating that the iodine has been depleted  
Do not use on dry necrotic tissue |
| --- | --- |

| Silver compounds Silver sulfadiazine cream: Silver possesses bactericidal properties. Has been shown to reduce bacterial density, vascular margination, migration of inflammatory cells. Enhances rate of re-epithelialization.  
**Products:** Silvadene, SSD, Thermazene. | Prevent infection in second- and third-degree burns  
Prevent or treat infection in chronic wounds | May have cytotoxic effects that could delay wound healing  
Allergic reactions may occur  
Use should be limited to a 2- to 4-wk period  
Bacteria may become resistant with prolonged use  
Avoid use with collagenase- or trypsin-containing debriding agents |
| --- | --- |

| Transparent film dressings: Polyurethane sheets coated on one side with an adhesive that is inactivated by moisture and will not adhere to a moist surface such as the wound bed. Have no absorbent capacity and are impermeable to fluids and bacteria but are semipermeable to oxygen and water vapor.  
**Products:** Bioclusive, CarraFilm, Tegaderm HP. Available in a variety of sizes and features. | Prophylaxis on high-risk intact skin  
Superficial wounds with minimal or no exudate  
Wounds on elbows, heels, or flat surfaces; covering of blisters; and retention of primary dressing | Prevents wound desiccation and contamination by bacteria  
Contraindicated in third-degree burns  
Promotes autolysis of necrotic tissue in the wound; maintains moist environment  
Avoid in arterial ulcers and infected wounds requiring |

Equianalgesic Dosing

Guidelines for equianalgesic dosing of commonly used analgesics are presented in the following table. The dosages are approximate to 10 mg of morphine intramuscularly. These guidelines are for the management of acute pain in the opioid-naïve pt. Dosages may vary for the opioid-tolerant pt and for the management of chronic pain. Dosing adjustments for renal or hepatic insufficiency may also be necessary. Clinical response is the criterion that must be applied for each pt with titration to desired response.

Herbals: Common Natural Medicines

The use of herbal therapies is increasing in the United States. Because of the rise in the use of herbal therapy, the following is presented to provide some basic information on some of the more popular herbs. Please note this is not an all-inclusive list, which is beyond the scope of this handbook.

<table>

</thead>
</table>
| Aloe vera        | Orally: osteoarthritis, inflammatory bowel diseases (e.g., ulcerative colitis), fever, itching, inflammation.  
Topically: burns, wound healing, psoriasis, sunburn, frostbite, cold sores. | Well tolerated. Orally can cause abdominal pain, cramps; topically can cause burning, itching, contact dermatitis.  
May lower blood glucose levels and have additive effects with antidiabetic medications. |
| Bilberry         | Orally: improve visual acuity (e.g., night vision, cataracts), atherosclerosis, chronic fatigue syndrome, venous insufficiency, varicose veins, hemorrhoids.  
Topically: mild inflammation of mouth and throat mucous membranes. | Can inhibit platelet aggregation, increase risk of bleeding when combined with antiplatelet or anticoagulant medications (e.g., aspirin, clopidogrel, enoxaparin, warfarin).  
May lower blood glucose. |
| Bitter orange    | Orally: appetite stimulant, dyspepsia.  
Topically: inflammation of the eyelid, conjunctiva, retina. | May cause hypertension, cardiovascular toxicity.  
May increase concentration/effects of midazolam; concurrent use with MAOIs may increase blood pressure (avoid use); combination with caffeine can increase blood pressure, heart rate. |
| Black cohosh     | Orally: symptoms of menopause, premenstrual syndrome (PMS), dysmenorrhea, dyspepsia, inducing labor in pregnant women, anxiety, fever, cough, cardiovascular disease, cognitive function, infertility, osteoarthritis, osteoporosis, rheumatoid arthritis.  
Topically: acne, mole, and wart removal; improve skin appearance. | Can cause GI upset, rash, headache, dizziness, increased weight, cramping, breast tenderness, vaginal spotting/bleeding.  
May decrease effects of cisplatin; may increase risk of hepatic damage with hepatotoxic medications. |
| Capsicum (cayenne pepper) | Orally: dyspepsia, flatulence, diarrhea, cramps, toothache, hyperlipidemia.  
Topically: pain of shingles, osteoarthritis, rheumatoid arthritis, postherpetic neuralgia, diabetic neuralgia, trigeminal neuralgia. | Orally can cause upper abdominal discomfort (e.g., gas, bloating, nausea, diarrhea, belching); topically can cause burning, stinging, erythema.  
May increase effects/adverse effects of antiplatelet medications. |
<p>| Chamomile        | Prepared as a tea and used as a mild sedative, relaxant, and sleeping aid; used for indigestion, itching, and inflammation. | Large amounts may cause vomiting. |
| Chastberry       | Orally: menstrual irregularities (e.g., dysmenorrhea, amenorrhea, metrorrhagia). | Can cause GI upset, headache, diarrhea, nausea, itching, urticaria, rash, insomnia, increased |</p>

<tr>
<td>Clove oil</td>
<td>O: dyspepsia, expectorant, diarrhea, halitosis, flatulence, nausea, vomiting. T: toothache, mouth and throat inflammation.</td>
<td>T: can cause tissue irritation, allergic dermatitis.</td>
</tr>
<tr>
<td>Co-enzyme Q-10</td>
<td>H: heart failure, angina, diabetes, hypertension.</td>
<td>Can cause GI side effects (e.g., nausea, vomiting, diarrhea, appetite suppression, heartburn, epigastric discomfort). Can decrease blood pressure and have an additive effect with antihypertensive medications; may reduce anticoagulant effects of warfarin.</td>
</tr>
<tr>
<td>Cranberry</td>
<td>P/T: prevention/treatment of urinary tract infections, neurogenic bladder, urinary deodorizer in incontinence, kidney stones, prevention of urinary catheter blockage.</td>
<td>Usually well tolerated. Large amounts can cause GI upset, diarrhea, nausea, vomiting. Greater than 1,000 mL daily can increase risk of uric acid, kidney stone formation.</td>
</tr>
<tr>
<td>DHEA</td>
<td>S: slow or reverse aging, weight loss, metabolic syndrome, increase immune and cognitive function.</td>
<td>At high dose can cause acne, hirsutism, hair loss, voice deepening, insulin resistance, altered menstrual pattern. May interfere with antiestrogen effects of anastrozole, letrozole, or other aromatase inhibitors; may overcome estrogen receptor antagonist activity of tamoxifen in estrogen receptor positive cancer cells.</td>
</tr>
<tr>
<td>Dong quai</td>
<td>D: dysmenorrhea, premenstrual syndrome, menopausal symptoms.</td>
<td>May cause photosensitivity and photodermatitis. May increase effect/risk of bleeding with antiplatelet and anticoagulant medications (e.g., aspirin, warfarin).</td>
</tr>
<tr>
<td>Echinacea</td>
<td>T/P: treat/prevent common cold, influenza, other upper respiratory tract infections.</td>
<td>Usually well tolerated. Can cause GI effects (e.g., nausea, abdominal pain, diarrhea, vomiting). Stimulates immune function—may exacerbate autoimmune diseases (e.g., multiple sclerosis, rheumatoid arthritis, systemic lupus erythematosus).</td>
</tr>
<tr>
<td>Eucalyptus</td>
<td>O: infections, fever, dyspepsia, expectorant for coughs. T: inflammation of respiratory tract mucous membranes, rheumatoid arthritis, nasal stuffiness.</td>
<td>Orally: GI effects (e.g., nausea, vomiting, diarrhea). Topically (prolonged exposure/ large amounts): agitation, drowsiness, muscle weakness, ataxia.</td>
</tr>
<tr>
<td>Evening primrose oil</td>
<td>P: premenstrual syndrome (PMS), endometriosis, symptoms of menopause (e.g., hot flashes).</td>
<td>May increase risk of bruising/bleeding with antiplatelet/anti-coagulant medications (e.g., aspirin, clopidogrel, enoxaparin, warfarin).</td>
</tr>
<tr>
<td>Feverfew</td>
<td>O: fever, headaches, prevention of migraines, menstrual irregularities. T: toothaches, antiseptic.</td>
<td>Orally: GI effects (e.g., heartburn, nausea, diarrhea, constipation, abdominal pain, bloating, flatulence). Topically: contact dermatitis. May have additive effects, increase risk of bleeding with antiplatelet medications.</td>
</tr>
<tr>
<td>Fish oil</td>
<td>H: hyperlipidemia, hypertriglyceridemia, hypertension, stroke, depression, rheumatoid arthritis, osteoporosis, psoriasis, Crohn’s disease.</td>
<td>Can cause a fishy aftertaste, halitosis, heartburn, dyspepsia, nausea, loose stools, rash. May have additive effect with antihypertensive medication.</td>
</tr>
<tr>
<td>Herb</td>
<td>Conditions</td>
<td>Side effects</td>

</tr>
<tr>
<td>Garlic</td>
<td>Hypertension, hyperlipidemia, age-related vascular changes, atherosclerosis, chronic fatigue syndrome, menstrual disorders, coronary heart disease, peripheral arterial disease.</td>
<td>Dose-related effects including breath/body odor, mouth and GI burning/irritation, heartburn, flatulence, nausea, vomiting, diarrhea. May increase effects of antiplatelets (e.g., aspirin, clopidogrel, enoxaparin), anticoagulants (e.g., warfarin); may decrease effects of oral contraceptives, cyclosporine, protease inhibitors, and non-nucleoside reverse transcriptase inhibitors (NNRTIs).</td>
</tr>
<tr>
<td>Ginger</td>
<td>Motion sickness, morning sickness, dyspepsia, rheumatoid arthritis, osteoarthritis, loss of appetite, migraine headache, diarrhea, flatulence, irritable bowel syndrome, dysmenorrhea.</td>
<td>Usually well tolerated. At high doses of 5 g/day may cause abdominal discomfort, heartburn, diarrhea, irritant effect in mouth and throat. May increase risk of bleeding with antiplatelet medications and anticoagulants (e.g., aspirin, clopidogrel, enoxaparin, warfarin).</td>
</tr>
<tr>
<td>Ginkgo</td>
<td>Dementia (including Alzheimer’s), vascular dementia, mixed dementia.</td>
<td>Mild GI upset, headache, dizziness, constipation, palpitations, allergic skin reactions. Large doses can cause diarrhea, nausea, vomiting, weakness. Decreases platelet aggregation; may increase risk of bleeding with antiplatelet and anticoagulants (e.g., aspirin, clopidogrel, enoxaparin, warfarin).</td>
</tr>
<tr>
<td>Ginseng</td>
<td>Increases resistance to environmental stress, improves well-being, boosts energy, diuretic.</td>
<td>May cause insomnia, vaginal bleeding, headache, hypertension, hypotension, decreased appetite, edema. May decrease effectiveness of warfarin.</td>
</tr>
<tr>
<td>Glucosamine</td>
<td>Osteoarthritis, glaucoma, temporomandibular joint arthritis.</td>
<td>May cause mild GI effects (e.g., nausea, heartburn, diarrhea, constipation). May increase risk of bleeding with anticoagulants (e.g., warfarin).</td>
</tr>
<tr>
<td>Gotu kola</td>
<td>Reduce fatigue, anxiety, depression, improve memory and intelligence.</td>
<td>May cause GI upset, nausea, drowsiness. May cause additive sedative effects/side effects with CNS depressants (e.g., clonazepam, lorazepam, zolpidem).</td>
</tr>
<tr>
<td>Grapefruit</td>
<td>Hyperlipidemia, atherosclerosis, weight loss and obesity.</td>
<td>May increase concentrations/effects of benzodiazepines, calcium channel blockers, carbamazepine, carvedilol, clomipramine, cyclosporine, estrogens, lovastatin, simvastatin, atorvastatin.</td>
</tr>
<tr>
<td>Green tea</td>
<td>Improves cognitive performance and mental alertness.</td>
<td>Can cause nausea, vomiting, abdominal bloating, dyspepsia, flatulence, diarrhea. Higher doses can cause dizziness, insomnia, fatigue, agitation. May increase effects of amphetamines, caffeine.</td>
</tr>
<tr>
<td>Kava kava</td>
<td>Anxiety disorders, stress, attention-deficit hyperactivity disorder (ADHD), insomnia, restlessness.</td>
<td>GI upset, headache, dizziness, drowsiness, enlarged pupils and disturbances of oculomotor equilibrium and accommodation, dry mouth, allergic skin reactions. May increase drowsiness, motor reflex depression with alcohol, benzodiazepines, other CNS depressants.</td>
</tr>
<tr>

<tr>
<td>L-carnitine</td>
<td>Treatment of primary L-carnitine deficiency, acute myocardial infarction, supplement to total parenteral nutrition, L-carnitine deficiency in those requiring hemodialysis.</td>
<td>Can cause nausea, vomiting, abdominal cramps, heartburn, gastritis, diarrhea, body odor, seizures.</td>
</tr>
<tr>
<td>Licorice</td>
<td>Gastric and duodenal ulcers, sore throat, bronchitis, dyspepsia, cough, osteoarthritis, chronic gastritis, menopausal symptoms, osteoporosis, bacterial/viral infections.</td>
<td>Excessive ingestion can cause pseudohyperaldosteronism with sodium and water retention, hypokalemia, alkalosis. May lead to hypertension, edema, arrhythmias. May reduce effect of antihypertensive medication therapy, warfarin.</td>
</tr>
<tr>
<td>Melatonin</td>
<td>Jet lag, insomnia, shift-work disorder.</td>
<td>Can cause daytime drowsiness, headache, dizziness. May increase effect of antiplatelets, anticoagulants (e.g., aspirin, clopidogrel, enoxaparin, warfarin). May cause additive sedation with CNS depressants (e.g., alcohol, benzodiazepines).</td>
</tr>
<tr>
<td>Milk thistle</td>
<td>Liver disorders, chronic inflammatory liver disease, hepatic cirrhosis, chronic hepatitis.</td>
<td>Usually well tolerated. Can cause nausea, diarrhea, dyspepsia, flatulence, abdominal bloating, anorexia.</td>
</tr>
<tr>
<td>Nettle</td>
<td>Urinary disorders associated with benign prostatic hyperplasia (e.g., nocturia, frequency, dysuria, urinary retention).</td>
<td>Generally well tolerated. May cause GI complaints, sweating, allergic skin reactions. May decrease effects of warfarin.</td>
</tr>
<tr>
<td>Peppermint</td>
<td>Common cold, cough, inflammation of mouth and pharynx, sinusitis, fever, cramps of upper GI tract, dyspepsia, flatulence, irritable bowel syndrome (IBS), fever, tension headache.</td>
<td>Can cause heartburn, nausea, vomiting, allergic reactions including flushing and headache. May increase concentration/effects of cyclosporine.</td>
</tr>
<tr>
<td>Red yeast</td>
<td>Maintain desirable cholesterol levels in healthy people; reduce cholesterol in hyperlipidemia; indigestion; diarrhea; improve blood circulation.</td>
<td>Can cause abdominal discomfort, heartburn, flatulence, dizziness. May increase cyclosporine concentration.</td>
</tr>
<tr>
<td>SAMe</td>
<td>Depression, anxiety, heart disease, fibromyalgia, osteoarthritis, tendonitis, dementia, Alzheimer’s disease, Parkinson’s disease.</td>
<td>Higher doses can cause flatulence, nausea, vomiting, diarrhea, constipation, headache, mild insomnia, anorexia, sweating, dizziness, nervousness. May have additive adverse effects with MAOIs including hypertension, hyperthermia, agitation, confusion, coma. May have additive serotonergic effects and serotonin syndromelike effects (e.g., agitation, tremors, tachycardia, diarrhea, hyperreflexia, shivering, diaphoresis) with antidepressants.</td>
</tr>
<tr>
<td>Saw palmetto</td>
<td>Symptoms of benign prostatic hyperplasia (BPH).</td>
<td>Can cause dizziness, headache, GI complaints (e.g., nausea, vomiting, constipation, diarrhea). May increase effect of antiplatelets, anticoagulants (e.g., aspirin, clopidogrel, enoxaparin, warfarin). May interfere with contraceptives.</td>
</tr>
<tr>
<td>St. John’s wort</td>
<td>Depression, anxiety, heart palpitations; mood disturbances associated with menopause, ADHD, obsessive-compulsive disorder (OCD), seasonal affective disorder (SAD), premenstrual syndrome (PMS), social phobia.</td>
<td>Usually well tolerated. Can cause insomnia, vivid dreams, restlessness, agitation, irritability, GI discomfort, diarrhea, fatigue, dry mouth, dizziness, headache. May decrease effect of alprazolam, amitriptyline, oral contraceptives, cyclosporine, imatinib, irinotecan, NNRTIs, phenytoin,</td>
</tr>
<tr>
<td>Herb</td>
<td>Conditions</td>
<td>Interactions</td>

<tr>
<td>Valerian</td>
<td>Insomnia, anxiety-associated restlessness, sleeping disorders.</td>
<td>Can cause headache, excitability, insomnia, gastric discomfort, dry mouth, vivid dreams, morning drowsiness. May have additive sedative effects with alcohol, benzodiazepines, other CNS depressants.</td>
</tr>
<tr>
<td>Yohimbe</td>
<td>Aphrodisiac, impotence, exhaustion, angina, hypertension, diabetic neuropathy, postural hypotension.</td>
<td>Can cause excitation, tremors, insomnia, anxiety, hypertension, tachycardia, dizziness, irritability, headache, fluid retention, rash, nausea, vomiting. High doses can cause respiratory depression. May have additive effects with MAOIs. Tyramine-containing foods increase risk of hypertensive crisis.</td>
</tr>
</tbody>
</table>
Lifespan

Drug therapy is unique to pts of different ages. Age-specific competencies involve understanding the development and health needs of the various age groups. Pregnant pts, children, and elderly people represent different age groups with important considerations during drug therapy.

Children

In pediatric drug therapy, drug administration is guided by the age of the child, weight, level of growth and development, and height. The dosage ordered is to be given either by kilogram of body weight or by square meter of body surface area, which is based on the height and weight of the child. Many dosages based on these calculations must be individualized based on pediatric response. If the oral route of administration is used, often syrup or chewable tablets are given. Additionally, sometimes medication is added to liquid or mixed with foods. Remember to never force a child to take oral medications because choking or emotional trauma may ensue. If an intramuscular injection is ordered, the vastus lateralis muscle in the midlateral thigh is used because the gluteus maximus is not developed until walking occurs and the deltoid muscle is too small. For intravenous medications, administer very slowly in children. If given too quickly, high serum drug levels will occur with the potential for toxicity.

Pregnancy

Women of childbearing years should be asked about the possibility of pregnancy before any drug therapy is initiated. Advise a woman who is either planning a...
pregnancy or believes she may be pregnant to inform her physician immediately. During pregnancy, medications given to the mother pass to the fetus via the placenta. Teratogenic (fetal abnormalities) effects may occur. Breastfeeding while the mother is taking certain medications may not be recommended due to the potential for adverse effects on the newborn.

The choice of drug ordered for pregnant women is based on the stage of pregnancy because the fetal organs develop during the first trimester. Cautious use of drugs in women of reproductive age who are sexually active and who are not using contraceptives is essential to prevent the potential for teratogenic or embryotoxic effects.

**Elderly**

Elderly people are more likely to experience an adverse drug reaction owing to physiologic changes (e.g., visual, hearing, mobility changes, chronic diseases) and cognitive changes (short-term memory loss or alteration in the thought process) that may lead to multiple medication dosing. In chronic disease states such as hypertension, glaucoma, asthma, or arthritis, the daily ingestion of multiple medications increases the potential for adverse reactions and toxic effects.

Decreased renal or hepatic function may lower the metabolism of medications in the liver and reduce excretion of medications, thus prolonging the half-life of the drug and the potential for toxicity. Dosages in elderly people should initially be smaller than for the general adult population and then slowly titrated based on pt response and therapeutic effect of the medication.

**Culture**

The term *ethnopharmacology* was first used to describe the study of medicinal plants used by indigenous cultures. More recently, it is being used as a reference to the action and effects of drugs in people from diverse racial, ethnic, and cultural backgrounds. Although there are insufficient data from investigations involving people from diverse backgrounds that would provide reliable information on ethnic-specific responses to all medications, there is growing evidence that modifications in dosages are needed for some members of racial and ethnic groups. There are wide variations in the perception of side effects by pts from diverse cultural backgrounds. These differences may be related to
metabolic differences that result in higher or lower levels of the drug, individual
differences in the amount of body fat, or cultural differences in the way
individuals perceive the meaning of side effects and toxicity. Nurses and other
health care providers need to be aware that variations can occur with side effects,
adverse reactions, and toxicity so that pts from diverse cultural backgrounds can
be monitored.
Some cultural differences in response to medications include the following:
**African Americans:** Generally, African Americans are less responsive to beta
blockers (e.g., propranolol [Inderal]) and angiotensin-converting enzyme (ACE)
inhibitors (e.g., enalapril [Vasotec]).
**Asian Americans:** On average, Asian Americans have a lower percentage of
body fat, so dosage adjustments must be made for fat-soluble vitamins and other
drugs (e.g., vitamin K used to reverse the anticoagulant effect of warfarin).
**Hispanic Americans:** Hispanic Americans may require lower dosages and may
experience a higher incidence of side effects with tricyclic antidepressants (e.g.,
amitriptyline).
**Native Americans:** Alaskan Eskimos may suffer prolonged muscle paralysis
with the use of succinylcholine when administered during surgery.
There has been a desire to exert more responsibility over one’s health and, as a
result, a resurgence of self-care practices. These practices are often influenced by
folk remedies and the use of medicinal plants. In the United States, there are
several major ethnic population subgroups (white, black, Hispanic, Asian, and
Native Americans). Each of these ethnic groups has a wide range of practices
that influence beliefs and interventions related to health and illness. At any given
time, in any group, treatment may consist of the use of traditional herbal therapy,
a combination of ritual and prayer with medicinal plants, customary dietary and
environmental practices, or the use of Western medical practices.

**African Americans**

Many African Americans carry the traditional health beliefs of their African
heritage. Health denotes harmony with nature of the body, mind, and spirit,
whereas illness is seen as disharmony that results from natural causes or divine
punishment. Common practices to the art of healing include treatments with
herbals and rituals known empirically to restore health. Specific forms of healing
include using home remedies, obtaining medical advice from a physician, and
seeking spiritual healing.
Examples of healing practices include the use of hot baths and warm compresses
for rheumatism, the use of herbal teas for respiratory illnesses, and the use of kitchen condiments in folk remedies. Lemon, vinegar, honey, saltpeter, alum, salt, baking soda, and Epsom salt are common kitchen ingredients used. Goldenrod, peppermint, sassafras, parsley, yarrow, and rabbit tobacco are a few of the herbals used.

**Hispanic Americans**

The use of folk healers, medicinal herbs, magic, and religious rituals and ceremonies are included in the rich and varied customs of Hispanic Americans. This ethnic group believes that God is responsible for allowing health or illness to occur. Wellness may be viewed as good luck, a reward for good behavior, or a blessing from God. Praying, using herbals and spices, wearing religious objects such as medals, and maintaining a balance in diet and physical activity are methods considered appropriate in preventing evil or poor health. Hispanic ethnopharmacology is more complementary to Western medical practices. After the illness is identified, appropriate treatment may consist of home remedies (e.g., use of vegetables and herbs), use of over-the-counter patent medicines, and use of physician-prescribed medications.

**Asian Americans**

For Asian Americans, harmony with nature is essential for physical and spiritual well-being. Universal balance depends on harmony among the elemental forces: fire, water, wood, earth, and metal. Regulating these universal elements are two forces that maintain physical and spiritual harmony in the body: the *yin* and the *yang*. Practices shared by most Asian cultures include meditation, special nutritional programs, herbology, and martial arts. Therapeutic options available to traditional Chinese physicians include prescribing herbs, meditation, exercise, nutritional changes, and acupuncture.

**Native Americans**

The theme of total harmony with nature is fundamental to traditional Native American beliefs about health. It is dependent on maintaining a state of equilibrium among the physical body, the mind, and the environment. Health practices reflect this holistic approach. The method of healing is determined traditionally by the medicine man, who diagnoses the ailment and recommends the appropriate intervention.
Treatment may include heat, herbs, sweat baths, massage, exercise, diet changes, and other interventions performed in a curing ceremony.

**European Americans**

Europeans often use home treatments as the front-line interventions. Traditional remedies practiced are based on the magical or empirically validated experience of ancestors. These cures are often practiced in combination with religious rituals or spiritual ceremonies.

Household products, herbal teas, and patent medicines are familiar preparations used in home treatments (e.g., saltwater gargle for sore throat).

**Pharmacogenomics**

Traditionally, medications are prescribed using a “one size fits all” philosophy. In general, the genetic makeup is similar in all humans, regardless of race or sex. However, people inherit variations in their genes, which can affect the way a person responds to a medication. A genetic variation may make a medication stay in the body longer, causing serious side effects, or a variation may make the medication less potent.

For example, two people taking the same cancer medication may have very different responses. One may have severe, life-threatening side effects, whereas the second may have few, if any, side effects. The drug may shrink a tumor in one person but not in another.

**Pharmacogenomics** examines how a person’s genetic makeup affects response to medications. Although widespread application still lies in the future, pharmacogenomics has the potential to personalize medical therapies. Physicians eventually will be able to prescribe medications based on an individual’s genotype, thereby maximizing effectiveness and minimizing side effects.

**Pharmacogenomics**

Pharmacogenomics is an expanding field that explores the effect of inter-individual genetic differences on pharmacokinetics, pharmacodynamics, drug efficiency, and safety of drug treatments. Pharmacogenomic biomarkers (proteins) can provide predictive tools for improving drug response and reducing adverse drug reactions. These biomarkers mainly originate from genes encoding drug-metabolizing enzymes, drug transporters, drugs targets, and human
leukocyte antigens. Currently, more than 100 drugs contain pharmacogenomic information in the package labeling. The goal is to develop personalized genetic-based strategies that will optimize therapeutic outcomes. Personalized treatments are especially warranted when prescribing medications with a narrow therapeutic index or when toxicity can be life threatening. Antineoplastics, anticoagulants, and anti-HIV therapies are often administered at maximum tolerated doses. This approach can result in toxicity and/or produce a poor response to therapy. Severe adverse drug reactions are one of the most common reasons for hospital admissions. Genetic testing for drug responses is expected to decrease hospitalizations by as much as 30%.

**Carbamazepine (Tegretol)** has been linked to dose-dependent side effects and life-threatening adverse effects. It is metabolized by enzymes encoded by the CYP3A4 gene to its active metabolite. An association has been found between the HLA-B*1502 allele and risk of Stevens-Johnson syndrome/toxic epidermal necrolysis, particularly in Asians. Before initiating carbamazepine treatment in high-risk patients, genetic testing for the HLA-B*1502 allele is recommended by the Food and Drug Administration (FDA).

Tumor cells carry the same genetic polymorphisms of normal cells. However, malignant cells are genetically unstable and can produce genetic changes that can alter disposition of active drug at the tumor site. Genetic analysis of tumors can help predict therapeutic benefit (or lack thereof) of targeted biologics such as **trastuzumab (Herceptin)** for ERBB2 (HER2)-amplified breast cancers or **erlotinib (Tarceva)** for epidermal growth factor receptor (EGFR)-overexpressing lung cancers.

Genetic mutations in tumors can also predict resistance to treatment, as noted in colorectal cancers, where activating mutations in KRAS are known to be a predictive marker for resistance to the EGFR-specific monoclonal antibodies **cetuximab (Erbitux)** and **panitumumab (Vectibix)**.

By utilizing the information provided by pharmacogenomic testing, drug therapy is changing to a more individualized approach. Anticipated benefits of pharmacogenomics include creation of better vaccines, safer medications targeted to specific diseases, and more appropriate dosing of medications at the onset of therapy. Ultimately, we may see a decrease in health care costs due to more efficient clinical trials, reduced adverse drug reactions, and less time needed to find effective therapy for patients.

Most drugs are eliminated from the body, at least in part, by being changed chemically to a less lipid-soluble product (i.e., metabolized) and thus more likely to be excreted from the body via the kidney or bile. Drugs may go through two different metabolic processes: phase 1 and phase 2 metabolism.

In phase 1 metabolism, hepatic microsomal enzymes found in the endothelium of liver cells metabolize drugs via hydrolysis and oxidation and reduction reactions. These chemical reactions make the drug more water soluble. In phase 2 metabolism, large water-soluble substances (e.g., glucuronic acid, sulfate) are attached to the drug, forming inactive, or significantly less active, water-soluble metabolites. Phase 2 processes include glucuronidation, sulfation, conjugation, acetylation, and methylation.

Virtually any of the phase 1 and phase 2 enzymes can be inhibited, and some of these enzymes can be induced by drugs. Inhibiting the activity of metabolic enzymes results in increased concentrations of the drug (substrate), whereas inducing metabolic enzymes results in decreased concentrations of the drug (substrate).

The term “cytochrome P450” (CYP enzymes) refers to a family of more than 100 enzymes in the human body that modulate various physiologic functions. First identified in the 1950s, the CYP enzyme system contains two large subgroups: steroidogenic and xenobiotic enzymes. Only the xenobiotic group is involved in the metabolism of drugs. The xenobiotic group includes four major enzyme families: CYP1, CYP2, CYP3, and CYP4. The primary role of these families is the metabolism of drugs. These families are further subdivided into subfamilies designated by a capital letter and given a specific enzyme number (1, 2, 3, etc.) according to the similarity in amino acid sequence it shares with other enzymes (e.g., CYP1A2).

The key CYP450 enzymes include CYP1A2, CYP2C9, CYP2C19, CYP2D6, and CYP3A4 and may be responsible for metabolism of 75% of all drugs, with the CYP3A subfamily responsible for nearly half of this activity.

The CYP enzymes are found in the endoplasmic reticulum of cells in a variety of
human tissue but are primarily concentrated in the liver and intestine. CYP enzymes can be both inhibited and induced, leading to increased or decreased serum concentration of the drug (along with its effects).

The following tables of CYP substrates, inhibitors, and inducers provide a perspective on drugs that are affected by, or affect, cytochrome P450 (CYP) enzymes. CYP substrate includes drugs reported to be metabolized, at least in part, by one or more CYP enzymes. CYP inhibitor includes drugs reported to inhibit one or more CYP enzymes. CYP inducer contains drugs reported to induce one or more CYP enzymes.

**P450 Enzymes: Substrates, Inhibitors, Inducers**

**CYP1A2 Enzyme**

<table>
<thead>
<tr>
<th>CYP1A2 Substrates</th>
<th>CYP1A2 Inhibitors</th>
<th>CYP1A2 Inducers</th>
</tr>
</thead>
<tbody>
<tr>
<td>Caffeine</td>

<td></td>
<td></td>
</tr>
<tr>
<td>Tizanidine (Zanaflex)</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

• CYP1A2 enzyme is increasingly involved in drug interactions.
• More potent inhibitors include cimetidine, ciprofloxacin, and fluvoxamine.
• Smoking is the most important inducer, but rifampin and barbiturates also can increase enzyme activity.
• Example of reaction: Tizanidine plasma concentrations increased more than 30-fold when the inhibitor fluvoxamine was given concurrently.

**CYP2C9 Enzyme**

<table>
<thead>
<tr>
<th>CYP2C9 Substrates</th>

<td></td>
</tr>
</tbody>
</table>
• More potent inhibitors include amiodarone, metronidazole, and sulfamethoxazole.
• All of the inducers can substantially increase enzyme activity.
• Both warfarin and oral hypoglycemics are of serious concern with regard to drug interactions. Substrates warranting attention include warfarin and oral hypoglycemics.

### CYP2C19 Enzyme

<table>
<thead>
<tr>

<tr>
<td>Sertraline (Zoloft)</td>
<td>Modafinil (Provigil)</td>
<td></td>
</tr>
</tbody>
</table>

• Inhibition by itself does not frequently cause adverse effects compared with other CYP enzymes because many of the substrates do not have serious toxicity.
• Inhibition or induction of the enzyme nonetheless may result in an adverse drug interaction.
• Racial background is important in the likelihood of being deficient in this enzyme (e.g., 3%–5% of Caucasians and 12%–23% of Asians are poor metabolizers of this enzyme).

### CYP2D6 Enzyme

<table>
<thead>
<tr>
<th>CYP2D6 Substrates</th>

</tbody>
</table>
Paroxetine (Paxil)
Risperidone (Risperdal)
Tamoxifen (Nolvadex)
Tolterodine (Detrol)
Tramadol (Ultram)
Venlafaxine (Effexor)

- Potent inhibitors include fluoxetine and paroxetine.
- Evidence suggests that this enzyme is not very susceptible to enzyme induction.
- Genetics, rather than drug therapy, accounts for most ultra-rapid metabolizers (e.g., Greeks, Portuguese, Saudis, and Ethiopians have high enzyme activity).

### CYP3A4 Enzyme

<td></td>
</tr>
<tr>
<td>Simvastatin (Zocor)</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Tadalafil (Cialis)</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

- This enzyme metabolizes about half of all medications on the market.
- Drug toxicity of CYP3A4 substrates due to inhibition of CYP3A4 is relatively common.
- This enzyme is very sensitive to induction, tending to lower plasma concentrations of substrates, resulting in reduced efficacy of the substrate.
- Most potent inhibitors include clarithromycin, itraconazole, and ketoconazole.
- Rifampin is a potent inducer and may reduce serum concentrations of substrates by as much as 90%.
## Antidote/Reversal Agents

Preventing Medication Errors and Improving Medication Safety

Medication safety is a high priority for the health care professional. Prevention of medication errors and improved safety for the pt are important, esp. in today’s health care environment when today’s pt is older and sometimes sicker and the drug therapy regimen can be more sophisticated and complex.

A medication error is defined by the National Coordinating Council for Medication Error Reporting and Prevention (NCC MERP) as “any preventable event that may cause or lead to inappropriate medication use or pt harm while the medication is in the control of the health care professional, pt, or consumer.”

Most medication errors occur as a result of multiple, compounding events as opposed to a single act by a single individual.

Use of the wrong medication, strength, or dose; confusion over sound-alike or look-alike drugs; administration of medications by the wrong route; miscalculations (esp. when used in pediatric pts or when administering medications intravenously); and errors in prescribing and transcription all can contribute to compromising the safety of the pt. The potential for adverse events and medication errors is definitely a reality and is potentially tragic and costly in both human and economic terms.

Health care professionals must take the initiative to create and implement procedures to prevent medication errors from occurring and implement methods to reduce medication errors. The first priority in preventing medication errors is to establish a multidisciplinary team to improve medication use. The goal for this team would be to assess medication safety and implement changes that would make it difficult or impossible for mistakes to occur. Some important criteria in making improved medication safety successful include the following:

• Promote a nonpunitive approach to reducing medication errors.
• Increase the detection and the reporting of medication errors, near misses, and potentially hazardous situations that may result in medication errors.
• Determine root causes of medication errors.
• Educate about the causes of medication errors and ways to prevent these errors.
• Make recommendations to allow organization-wide, system-based changes to prevent medication errors.
• Learn from errors that occur in other organizations and take measures to prevent similar errors.

Some common causes and ways to prevent medication errors and improve safety include the following:

**Handwriting:** Poor handwriting can make it difficult to distinguish between two medications with similar names. Also, many drug names sound similar, esp. when the names are spoken over the telephone, poorly enunciated, or mispronounced.
• Take time to write legibly.
• Keep phone or verbal orders to a minimum to prevent misinterpretation.
• Repeat back orders taken over the telephone.
• When ordering a new or rarely used medication, print the name.
• Always specify the drug strength, even if only one strength exists.
• Express dosages for oral liquids only in metric weights or volumes (e.g., mg or mL), not by teaspoon or tablespoon.
• Print generic and brand names of look-alike or sound-alike medications.

**Zeros and decimal points:** Hastily written orders can present problems even if the name of the medication is clear.
• Never leave a decimal point “naked.” Place a zero before a decimal point when the number is less than a whole unit (e.g., use 0.25 mg or 250 mcg, not .25 mg).
• Never have a trailing zero following a decimal point (e.g., use 2 mg, not 2.0 mg).

**Abbreviations:** Errors can occur because of a failure to standardize abbreviations. Establishing a list of abbreviations that should never be used is recommended.
• Never abbreviate unit as “U”; spell out “unit.”
• Do not abbreviate “once daily” as OD or QD or “every other day” as QOD; spell it out.
• Do not use D/C, as this may be misinterpreted as either discharge or discontinue.
• Do not abbreviate drug names; spell out the generic and/or brand names.

**Ambiguous or incomplete orders:** These types of orders can cause confusion or misinterpretation of the writer’s intention. Examples include situations when the route of administration, dose, or dosage form has not been specified.
• Do not use slash marks—they may be read as the number one (1).
• When reviewing an unusual order, verify the order with the person writing the order to prevent any misunderstanding.
• Read over orders after writing.
• Encourage that the drug’s indication for use be provided on medication orders.
• Provide complete medication orders—do not use “resume preop” or “continue previous meds.”
• Provide the age and, when appropriate, the weight of the pt.

**High-alert medications:** Medications in this category have an increased risk of causing significant pt harm when used in error. Mistakes with these medications may or may not be more common but may be more devastating to the pt if an error occurs. A list of high-alert medications can be obtained from the Institute for Safe Medication Practices (ISMP) at www.ismp.org.

**Technology** available today that can be used to address and help solve potential medication problems or errors includes the following:
• Electronic prescribing systems—This refers to computerized prescriber order entry systems. Within these systems is the capability to incorporate medication safety alerts (e.g., maximum dose alerts, allergy screening). Additionally, these systems should be integrated or interfaced with pharmacy and laboratory systems to provide drug-drug and drug-disease interactions alerts and include clinical order screening capability.
• Bar codes—These systems are designed to use bar-code scanning devices to validate identity of pts, verify medications administered, document administration, and provide safety alerts.
• “Smart” infusion pumps—These pumps allow users to enter drug infusion protocols into a drug library along with predefined dosage limits. If a dosage is outside the limits established, an alarm is sounded and drug delivery is halted, informing the clinician that the dose is outside the recommended range.
• Automated dispensing systems; point-of-use dispensing system—These systems should be integrated with information systems, esp. pharmacy systems.
• Pharmacy order entry system—This should be fully integrated with an electronic prescribing system with the capability of producing medication safety alerts. Additionally, the system should generate a computerized medication administration record (MAR), which would be used by the nursing staff while administering medications.

**Medication reconciliation:** Medication errors generally occur at transition points in the pt’s care (admission, transfer from one level of care to another [e.g.,
Critical care to general care area), and discharge. Incomplete documentation can account for up to 60% of potential medication errors. Therefore, it becomes necessary to accurately and completely reconcile medication across the continuum of care. This includes the name, dosage, frequency, and route of medication administration.

Medication reconciliation programs are a process of identifying the most accurate list of all medications a pt is taking and using this list to provide correct medications anywhere within the health care system. The focus is on not only compiling a list but using the list to reduce medication errors and provide quality pt care.

**Additional Strategies to Reduce Medication Errors**

The ISMP, FDA, and other agencies have identified high-risk areas associated with medication errors. They include the following:

**At-risk population:** At-risk populations primarily include pediatric and geriatric pts. For both, this risk is due to altered pharmacokinetic parameters with little published information regarding medication use in these groups. Additionally, in the pediatric population, the risk is due to the need for calculating doses based on age and weight, lack of available dosage forms, and concentrations for smaller children.

In a USP report, more than one-third of medication errors reaching the pt occurred in pts 65 yrs of age and older. Almost 40% of people 60 yrs and older take at least five medications. More than 50% of fatal hospital medication errors involve seniors. In the senior population, age-related physiologic changes (e.g., decreased renal function, reduced muscle mass) increase the risk for adverse events.

**Avoid abbreviations and nomenclature:** The confusion caused by abbreviations has prompted the ISMP to develop a list of abbreviations that should be avoided (see back cover of handbook).

**Recognize prescription look-alike and sound-alike medications:** The ISMP has developed an extensive list of confused drug names (see [www.jointcommission.org](http://www.jointcommission.org)). See individual monographs for DO NOT CONFUSE information.

**Focus on high alert medications:** High alert medications are medications that bear a heightened risk of causing significant pt harm if incorrectly used. High alert medications in the handbook have a colored background for the entire monograph.

**Look for duplicate therapies and interactions:** Drug interactions and duplicate
therapies can increase risk of adverse reactions. Refer to individual monographs for significant interaction information (drug, herbal, food).

**Report errors to improve process:** This action plays an important role in preventing further errors. The intent is to identify system failures that can be altered to prevent further errors.
Parenteral Fluid Administration

Replacing fluids in the body is based on body fluid needs. Water comprises approximately 60% of the adult body. Approximately 40% is intracellular fluid and 20% is extracellular fluid, of which 15% is interstitial (tissues) and 5% is intravascular. The walls separating these compartments are porous, allowing water to move freely between them. Small particles such as sodium and chloride can pass through the walls, but larger molecules such as proteins and starches usually are unable to pass through the walls.

Hydrostatic and osmotic pressures are forces that move water and regulate the body’s water. Intravenous fluid manipulates these two pressures. Hydrostatic pressure reflects the weight and volume of water. The greater the volume, the higher the blood pressure.

**Effects of Osmotic Pressure:** *Osmosis* is the diffusion of water across a semipermeable membrane from an area of high concentration to an area of low concentration (water moves into the compartment of higher concentration of particles, or solute). This is similar to the action of a sponge soaking up water. This pull is referred to as *osmotic pressure*. It is the number of particles in each compartment that keeps water where it is supposed to be. By administering fluids with more (or fewer) particles than blood plasma, fluid is pulled into the compartment where it is needed the most.

How do we know where the water is needed? To assess water balance, measure the *osmolality* of blood plasma (number of particles [osmoles] in a kilogram of fluid). *Osmolarity* is the number of particles in a liter of fluid. Normal serum osmolality is approximately 300 milliosmoles (mOsm) per liter.

Crystalloids are made of substances that form crystals (e.g., sodium chloride) and are small, so easy movement between compartments is possible. Crystalloids are categorized by their tonicity (a synonym for osmolality). An isotonic solution has the same number of particles (osmolality) as plasma and will not promote a shift of fluids into or out of cells. Examples of isotonic crystalloid solutions are 0.9% sodium chloride and lactated Ringer’s solution. Dextrose 5% in water is another isotonic crystalloid. However, it is quickly metabolized, and the fluid
quickly becomes hypotonic. Hypotonic solutions (e.g., D5W, 0.45% sodium chloride) are a good source of free water, causing a shift out of the vascular bed and into cells by way of osmosis. Hypotonic solutions are given to correct cellular dehydration and hypernatremia. Hypertonic solutions have more particles than body water and pull water back into the circulation, which can shrink cells.

**Sodium Chloride**

**Uses**
- Extracellular fluid replacement when chloride loss is greater than or equal to sodium loss
- Treatment of metabolic alkalosis in the presence of fluid loss; chloride ions cause a compensatory decrease of bicarbonate ions
- Sodium depletion, extracellular fluid volume deficit with sodium deficit
- Initiation and termination of blood transfusion, preventing hemolysis of RBCs (occurs with dextrose in water solutions)

**Side Effects/Abnormalities**
- Hypernatremia
- **Acidosis:** 0.9% sodium chloride contains one-third more chloride ions than is present in extracellular fluid; excess chloride ions cause loss of bicarbonate, resulting in acidosis
- **Hypokalemia:** Increased potassium excretion at the same time extracellular fluid is increasing, which further decreases potassium concentration in extracellular fluid
- Circulatory overload

**Dextrose (Glucose)**

**Effects**
- Provides calories for essential energy
- Improves hepatic function because it is converted into glycogen
- Spares body protein, preventing unnecessary breakdown of protein tissue
- Prevents ketosis
• Stored in the liver as glycogen, causing a shift of potassium from extracellular to intracellular fluid compartment

**Uses**
• Dehydration
• Hyponatremia
• Hyperkalemia
• Vehicle of drug delivery and nutrition

**Note:** Once infused, dextrose is rapidly metabolized to water and carbon dioxide, becoming hypotonic rather than isotonic.

**Side Effects/Abnormalities**
• Dehydration: Osmotic diuresis occurs if dextrose is given faster than the pt’s ability to metabolize it
• Hypokalemia (see Effects)
• Hyperinsulinism due to rapid infusion of hypertonic solution
• Water intoxication due to an imbalance based on increase in extracellular fluid volume from water alone

---

### Selected Parenteral Fluids

<table>
<thead>
<tr>
<th>Solution</th>
<th>Comments</th>
</tr>
</thead>
</table>
| Dextrose 5% in water (D5W)       | Supplies approximately 170 cal/L and free water to aid in renal excretion of solutes  
|                                  | Avoid excessive volumes in pts with increased antidiuretic hormone activity or to replace fluids in hypovolemic pts |
| 0.9% Sodium chloride (0.9% NaCl) | Isotonic fluid commonly used to expand extracellular fluid in presence of hypovolemia  
|                                  | Can be used to treat mild metabolic alkalosis                                |
| 0.45% Sodium chloride (0.45% NaCl)| Hypotonic solution that provides sodium, chloride, and free water; sodium and chloride allow kidneys to select and retain needed amounts  
|                                  | Free water is desirable as aid to kidneys in elimination of solutes          |
| 3% Sodium chloride               | Used only to treat severe hyponatremia                                      |
| Lactated Ringer’s solution       | Isotonic solution that contains sodium, potassium, calcium, and chloride in approximately the same concentrations as found in plasma  
|                                  | Used to treat hypovolemia, burns, and fluid loss as bile or diarrhea       |
APPENDIX M

Common Terminology Criteria for Adverse Events (Ctcae)

The Common Terminology Criteria for Adverse Events (CTCAE) is descriptive terminology used for reporting an adverse event (AE) in a concise and standardized manner. It is supported by the U.S. Department of Health and Human Services, National Institutes of Health, and National Cancer Institute. An AE term is a unique representation of a specific event that can be used for medical documentation and scientific analyses. Along with cancer medications, other drugs may use the CTCAE system for dose and treatment modifications. CTCAE terms are grouped by system organ classes, such as Blood/Lymphatic, GI, Nervous, Renal, and Respiratory disorders. Within each system organ class, AEs are listed and accompanied by a brief description. A grading scale is then provided for each AE term, and each grade refers to a specific severity. The CTCAE grading scale displays grades 1–5 with particular descriptions and/or recommendations. The severity for each AE is based on the following generalized guidelines: Grade 1: Asymptomatic or mild symptoms; clinical or diagnostic observations only; intervention not indicated. Grade 2: Moderate; minimal, local, or noninvasive intervention indicated; limiting age-appropriate instrumental activity of daily living (ADL). Grade 3: Severe or medically significant but not immediately life threatening; hospitalization or prolonged hospitalization indicated; disabling; limiting self-care ADL. Grade 4: Life-threatening consequences; urgent intervention indicated. Grade 5: Death related to AE.

</table>
Dangerous Abbreviations
The 2004 National Patient Safety Goals of The Joint Commission (TJC) requires the elimination of dangerous abbreviations in an effort to promote patient safety by reducing medication errors. To achieve this goal, TJC developed a list of abbreviations, acronyms, and symbols that health care organizations must include in their “do not use” list. An abbreviation on the “do not use” list should not be used in any of its forms—uppercase or lowercase, with or without periods. For example, if Q.D. is on the organization’s list, health care
organizations cannot use QD or qd because any of those variations are confusing and can be misinterpreted.

<table>
<thead>
<tr>
<th>Abbreviation</th>
<th>Potential Problem</th>
<th>Preferred Term</th>
</tr>
</thead>
<tbody>
<tr>
<td>U (for unit)</td>
<td>Mistaken as zero, four, or cc</td>
<td>Write “unit”</td>
</tr>
<tr>
<td>IU (for international unit)</td>
<td>Mistaken as IV (intravenous) or 10 (ten)</td>
<td>Write “international unit”</td>
</tr>
<tr>
<td>Q.D., QD, q.d., qd (daily)</td>
<td>Mistaken for each other</td>
<td>Write “daily”</td>
</tr>
<tr>
<td>Q.O.D., QOD, q.o.d., qod (every other day)</td>
<td>Period after “Q” mistaken for “I” and the “O” mistaken for “I”</td>
<td>Write “every other day”</td>
</tr>
<tr>
<td>Trailing zero (e.g., 5.0 mg); lack of leading zero (e.g., .5 mg)</td>
<td>Decimal point is missed</td>
<td>Always write a zero before a decimal point (0.5 mg) and never write a zero by itself after a decimal point (5 mg)</td>
</tr>
<tr>
<td>MS, MSO₄, MgSO₄</td>
<td>Confused for one another; can mean morphine sulfate or magnesium sulfate</td>
<td>Write “morphine sulfate” or “magnesium sulfate”</td>
</tr>
</tbody>
</table>

In addition, TJC requires an organization to identify and apply at least another three “do not use” abbreviations, acronyms, or symbols of its own choosing. The following list was developed by TJC for organizations to consider including on their list.

<table>
<thead>
<tr>
<th>Abbreviation</th>
<th>Potential Problem</th>
<th>Preferred Term</th>
</tr>
</thead>
<tbody>
<tr>
<td>µg (for micrograms)</td>
<td>Mistaken for mg (milligrams) resulting in one thousand-folding overdose</td>
<td>Write “mcg”</td>
</tr>
<tr>
<td>H.S. (for half-strength or Latin abbreviation for bedtime)</td>
<td>Mistaken for either half-strength or hour of sleep (at bedtime); q.H.S. mistaken for every hour; all can result in dosing error</td>
<td>Write “half-strength” or “at bedtime”</td>
</tr>
<tr>
<td>T.I.W. (for three times per week)</td>
<td>Mistaken for three times per day or twice weekly, resulting in an overdose</td>
<td>Write “3 times weekly” or “three times weekly”</td>
</tr>
<tr>
<td>S.C. or S.Q. (for subcutaneous)</td>
<td>Mistaken as SL for sublingual, or “5 every”</td>
<td>Write “Sub-Q,” “subQ,” or “subcutaneously”</td>
</tr>
<tr>
<td>D/C (for discharge)</td>
<td>Interpreted as discontinue whatever medications follow (typically discharge meds)</td>
<td>Write “discharge”</td>
</tr>
<tr>
<td>c.c. (for cubic centimeter)</td>
<td>Mistaken for U (units) when poorly written</td>
<td>Write “ml” for milliliters</td>
</tr>
<tr>
<td>A.S., A.D., A.U. (Latin abbreviation for left, right, or both ears)</td>
<td>Mistaken for OS, OD, OU, etc.</td>
<td>Write “left ear,” “right ear,” or “both ears”</td>
</tr>
<tr>
<td>&gt; (greater than)</td>
<td>Misinterpreted as number 7 or letter “L”</td>
<td>Write “greater than” or “less than”</td>
</tr>
<tr>
<td>&lt; (less than)</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Abbreviations for drug names</td>
<td>Misinterpreted due to similar abbreviations for multiple drugs</td>
<td>Write drug names in full</td>
</tr>
</tbody>
</table>
Evolve

**aclidinium**

a-kli-din-ee-um

**Tudorza**

CLASSIFICATION

PHARMACOTHERAPEUTIC: Long-acting antimuscarinic, anticholinergic.

CLINICAL: Bronchodilator.

**Uses**

Long-term maintenance treatment of airflow obstruction in pts with chronic obstructive pulmonary disease (COPD), including chronic bronchitis and emphysema.

**Precautions**

Not indicated for use as a rescue medication. Contact physician if paradoxical bronchospasm, worsening of narrow-angle glaucoma, urinary retention, or immediate hypersensitivity occurs.

**Contraindications:** Hypersensitivity to aclidinium. **Cautions:** Prostatic hyperplasia, urinary retention, bladder-neck obstruction, narrow-angle glaucoma; hypersensitivity to milk proteins, atropine.

**Action**

Inhibits $M_1$ to $M_5$ muscarinic receptors in smooth muscle of airway, preventing acetylcholine-induced bronchospasm. **Therapeutic Effect:** Bronchodilation.
Pharmacokinetics

Peak plasma levels noted within 10 min following inhalation. Extensively metabolized via hydrolysis, both chemically and enzymatically by esterases. Primarily excreted in urine, with a smaller amount excreted in feces. **Half-life:** 5–8 hrs.

_xlim

*Lifespan considerations*

**Pregnancy/Lactation:** May produce teratogenic effects. May be excreted in breast milk; do not breastfeed. **Children:** Safety and efficacy not established. **Elderly:** No age-related precautions noted.

Interactions

**DRUG:** May increase effects of anticholinergic agents (e.g., atropine, glycopyrrolate). **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** None known.

Availability (Rx)

**Powder for Inhalation:** 400 mcg/inhalation.

Administration/handling

**Inhalation**

- Remove inhaler from pouch; allows 60 doses for oral inhalation.
- The inhaler is a white and green device with a dose indicator, a storage unit containing drug product formulation, and a mouthpiece covered by a green protective cap.
- Each actuation delivers 375 mcg of medication from the mouthpiece.
- Follow manufacturer guidelines for assembly of plastic dosing mechanism and proper use of inhaler.

**Storage**

- Store pouch at room temperature; inhaler should be stored inside the sealed pouch and opened only immediately before use.
- Discard inhaler 45 days after opening the pouch, after the marking “0” with a red background shows in middle of dose indicator, or when the device locks out,
Indications/routes/dosage

Maintenance Therapy:
Inhalation: ADULTS, ELDERLY: 400 mcg twice daily.

Side effects
Occasional (7%–3%): Headache, nasopharyngitis, cough, diarrhea. Rare (2%–1%): Sinusitis, rhinitis, toothache, vomiting.

Adverse effects/toxic reactions
Severe dyspnea may indicate paradoxical bronchospasm. Acute narrow-angle glaucoma (eye pain or discomfort, blurred vision, visual halos, or colored images in association with red eyes from conjunctival congestion and corneal edema) occurs rarely. Signs and symptoms of prostatic hyperplasia or bladder-neck obstruction (difficulty passing urine, painful urination) have been observed. Hypersensitivity reaction has been noted rarely. May cause acute kidney injury related to crystal-induced nephropathy.

Nursing considerations

Baseline assessment

Intervention/evaluation
Assess lung sounds. Observe for sudden shortness of breath, wheezing (pulmonary bronchospasm). Routinely monitor BMP, blood glucose, O₂ saturation. Evaluate EKG for palpitation, tachycardia. Monitor for hypokalemia. Monitor for acute urinary retention. Question for eye pain or discomfort,
changes in vision, conjunctival congestion (worsening of narrow-angle glaucoma).

**Patient/family teaching**
- The inhaler contains 60 doses of medication, with the number 60 on dose indicator.
- As each dose is used, the dose indicator will display down in intervals of 10.
- The marking “0” with a red background shows in the middle of the dose indicator.
- Discard pouch after 45 days, after the marking “0” with a red background shows in the middle of the dose indicator, or when device locks out, whichever comes first.
- Observe pt using inhaler to verify correct use.
- Increase fluid intake (decreases lung secretion viscosity).
- Report difficulty breathing, pain or difficulty in passing urine, visual changes.

---

**alogliptin**  
**al-oh-glip-tin**  
**Nesina**

**CLASSIFICATION**

**PHARMACOTHERAPEUTIC**: Dipeptidyl peptidase-4 (DDP-4) inhibitor.  
**CLINICAL**: Antidiabetic.

*Do not confuse alogliptin with linagliptin, SAXagliptin, or SITagliptin.*

**Fixed-combination(s)**

**Kazano**: alogliptin/metFORMIN (an antidiabetic): 12.5 mg/500 mg, 12.5 mg, 1,000 mg.  
**Oseni**: alogliptin/pioglitazone (an antidiabetic): 12.5 mg/15 mg, 12.5 mg/30 mg, 12.5 mg/45 mg, 25 mg/15 mg, 25 mg/30 mg, 25 mg/45 mg.

**Uses**

Adjunctive treatment to diet and exercise to improve glycemic control in pts with type 2 diabetes mellitus.

**Precautions**
**Contraindications:** Hypersensitivity to alogliptin, other DD4 inhibitors.

**Cautions:** Concurrent use of other hypoglycemic medication, cholelithiasis, hepatic or renal impairment. History of pancreatitis. Not recommended in type 1 diabetes or ketoacidosis. Possible increased risk for HF.

**Action**

Slows inactivation of incretin hormones by inhibiting DDP-4 enzyme. **Therapeutic Effect:** Incretin hormones increase insulin synthesis/release from pancreas and decrease glucagon secretion. Lowers serum glucose levels.

**Pharmacokinetics**

Rapidly absorbed following PO administration. Metabolized in liver. Protein binding: 20%. Minimal metabolism (60%–70% excreted unchanged). Peak plasma concentration: 1–2 hrs. Primarily excreted in urine. **Half-life:** 21 hrs.

**Lifespan considerations**

**Pregnancy/Lactation:** Unknown if distributed in breast milk. **Children:** Safety and efficacy not established. **Elderly:** May have increased risk of hypoglycemia.

**Interactions**

**DRUG:** Insulin, oral hypoglycemics (e.g., glyburide, metformin) may increase risk of hypoglycemia. **HERBAL:** Herbal supplements having hypoglycemic effects may increase risk of hypoglycemia. **FOOD:** None known. **LAB VALUES:** May decrease serum glucose. May increase serum ALT, AST.

**Availability (Rx)**

**Tablets:** 6.25 mg, 12.5 mg, 25 mg.

**Administration/handling**

**PO**

• May give without regard to food.
Indications/routes/dosage

Type 2 Diabetes Mellitus
PO:ADULTS/ELDERLY: 25 mg once daily.

Dosage in Renal Impairment
Creatinine clearance 30–59 mL/min: 12.5 mg once daily. Creatinine clearance less than 30 mL/min: 6.25 mg once daily.

Dosage in Hepatic Impairment
No dose adjustment.

Side effects
Occasional (4%): Nasopharyngitis, cough, headache, upper respiratory tract infections.

Adverse effects/toxic reactions
Hypoglycemia reported in 1.5% of pts (5% specifically in elderly). Concomitant use of hypoglycemic medication may increase hypoglycemic risk. Pancreatitis reported in less than 1%. Hypersensitivity reactions including angioedema (tongue/lip swelling), urticaria, bronchospasm occur rarely. Hepatic failure (fatal vs. nonfatal) reported in less than 2% of pts.

Nursing considerations

Baseline assessment
Obtain baseline serum chemistries, capillary blood glucose, Hgb A1c level. Assess pt’s understanding of diabetes management, routine home glucose monitoring. Receive full medication history, including herbal products. Question history of co-morbidities, esp. alcohol dependency, renal or hepatic impairment.

Intervention/evaluation
Monitor blood glucose, Hgb A1c level, hepatic/renal function tests. Assess for
hypoglycemia, hyperglycemia, hypersensitivity reaction. Screen for glucose-altering conditions: fever, increased activity or stress, surgical procedures. Obtain dietary consult for nutritional education. Severe abdominal pain, nausea may indicate pancreatitis.

**Patient/family teaching**

- Diabetes mellitus requires lifelong control. Diet and exercise are principal parts of treatment; do not skip or delay meals.
- Test blood glucose regularly.
- When taking combination drug therapy or when glucose demands are altered (e.g., fever, infection, trauma, stress, heavy physical activity), have hypoglycemic treatment (glucagon, oral dextrose) available.
- Report suspected pregnancy or plans of breastfeeding.
- Monitor daily calorie intake.
- Avoid alcohol.
- Report abdominal pain, yellowing of the skin or eyes, fatigue, loss of appetite, dark urine, or decreased urine output.

### arsenic trioxide

*ar-sen-ik tri-ox-ide*

**Trisenox**

**CLASSIFICATION**

PHARMACOTHERAPEUTIC: Antineoplastic.

CLINICAL: Antineoplastic.

- **BLACK BOX ALERT** May prolong QT interval. May lead to multiform ventricular tachycardia (torsades de pointes) or complete AV block. May cause retinoic acid–acute promyelocytic leukemia (RA-APL) syndrome or acute promyelocytic leukemia.

### Uses

Induction of remission and consolidations in pts with relapsed or refractory acute promyelocytic leukemia (APL). **OFF-LABEL**: Treatment of myelodysplastic syndrome; initial treatment of APL.
**Precautions**

**Contraindications:** Hypersensitivity to arsenic. **Cautions:** Renal/hepatic impairment, preexisting QT-interval prolongation, concomitant medications that prolong QT interval. HF, history of torsades de pointes, conditions causing hypokalemia/hypomagnesemia.

**Action**

Produces morphologic changes and DNA fragmentation in promyelocytic leukemia cells. **Therapeutic Effect:** Induces apoptosis in APL cells.

**Pharmacokinetics**

Distributed in liver, kidneys, heart, lungs, hair, and nails. Metabolized in liver. Eliminated by kidneys. **Half-life:** Not available.

**Lifespan considerations**

**Pregnancy/Lactation:** Distributed in breast milk. May cause fetal harm. **Children:** Safety and efficacy not established in pts younger than 5 yrs. **Elderly:** Age-related renal impairment may require dosage adjustment.

**Interactions**

**DRUG:** May prolong QT interval in pts taking antiarrhythmics, moxifloxacin, thioridazine. Amphotericin B, cycloSPORINE, diuretics (e.g., furosemide, HCTZ) may produce electrolyte abnormalities. **HERBAL:** Bilberry, fenugreek, garlic, ginger, ginseng may worsen hypoglycemia. **FOOD:** None known. **LAB VALUES:** May decrease WBC count, Hgb, platelet count, serum magnesium, calcium. May increase serum ALT, AST. Higher risk of hypokalemia than hyperkalemia, hyperglycemia than hypoglycemia.

**Availability (Rx)**

**Injection Solution:** 1 mg/mL (10 mL).

**Administration/handling**
Central venous line is not required for drug administration.

Reconstitution
• After withdrawing drug from ampule, dilute with 100–250 mL D5W or 0.9% NaCl.

Rate of Administration
• Infuse over 1–2 hrs.
• Duration of infusion may be extended up to 4 hrs if acute vasomotor reactions occur.

Storage
• Store at room temperature.
• Diluted solution is stable for 24 hrs at room temperature, 48 hrs if refrigerated.

IV incompatibilities
Do not mix with any other medications.

Indications/routes/dosage
Note: Obtain baseline 12-lead EKG, electrolytes, creatinine prior to treatment.

Acute Promyelocytic Leukemia
IV: ADULTS, ELDERLY, CHILDREN 5 YRS AND OLDER: Induction: 0.15 mg/kg/day until bone marrow remission. Do not exceed 60 induction doses. Consolidation: Beginning 3–6 wks after completion of induction therapy, 0.15 mg/kg/day for maximum 25 doses over a period of up to 5 wks.

Dosage in Renal Impairment

Dosage in Hepatic Impairment
Use caution. Monitor for toxicity.

Side effects
Expected (75%–50%): Nausea, cough, fatigue, fever, headache, vomiting, abdominal pain, tachycardia, diarrhea, dyspnea. Frequent (43%–30%): Dermatitis, insomnia, edema, rigors, prolonged QT interval, sore throat, pruritus, arthralgia, paresthesia, anxiety. Occasional (28%–20%): Constipation, myalgia, hypotension, epistaxis, anorexia, dizziness, sinusitis. (15%–8%): Ecchymosis, nonspecific pain, weight gain, herpes simplex infections, wheezing, flushing, diaphoresis, tremor, hypertension, palpitations, dyspepsia, eye irritation, blurred vision, asthenia (loss of strength, energy), adventitious or diminished breath sounds (crackles). Rare: Confusion, petechiae, dry mouth, oral candidiasis, incontinence, pulmonary rhonchi.

Adverse effects/toxic reactions

Seizures, GI hemorrhage, renal impairment or failure, pleural or pericardial effusion, hemoptysis, sepsis occur rarely. Prolonged QT interval, complete AV block, unexplained fever, dyspnea, weight gain, effusion are evidence of arsenic toxicity. Treatment should be halted, steroid therapy instituted.

Nursing considerations

Baseline assessment

Assess CBC, BMP, LFT before and frequently during treatment. Obtain baseline EKG. Question breastfeeding status.

Intervention/evaluation

Monitor CBC, BMP, LFT. Monitor for arsenic toxicity syndrome (fever, dyspnea, weight gain, confusion, muscle weakness, seizures).

Patient/family teaching

• Avoid crowds, those with known infection.
• Avoid tasks that require alertness, motor skills until response to drug is established.
• Report high fever, vomiting, difficulty breathing, or rapid heart rate.

asparaginase
as-par-a-jin-ace
Erwinaze
Kidrolase

**CLASSIFICATION**
**PHARMACOTHERAPEUTIC:** Enzyme.
**CLINICAL:** Antineoplastic.
**Do not confuse asparaginase with pegasparagase.**

**Uses**
Treatment of ALL in pts with hypersensitivity to *E. coli*–derived asparaginase.
**OFF-LABEL:** Treatment of chronic lymphoblastic leukemia (CLL).

**Precautions**
**Contraindications:** History of hypersensitivity to asparaginase. History of serious thrombosis, pancreatitis, or hemorrhagic events with prior asparaginase therapy. **Cautions:** Underlying coagulopathy, preexisting hepatic impairment.

**Action**
Inhibits DNA, RNA, protein synthesis by breaking down asparagine, depriving tumor cells of this essential amino acid. Cell cycle–specific for G₁ phase of cell division. **Therapeutic Effect:** Toxic to leukemic cells.

**Pharmacokinetics**
Metabolized by reticuloendothelial system through slow sequestration. **Half-life:** IM: 39–49 hrs; IV: 8–30 hrs.

**Lifespan considerations**
**Pregnancy/Lactation:** If possible, avoid use during pregnancy, esp. first trimester. Breastfeeding not recommended. **Children/Elderly:** No age-related precautions noted.

**Interactions**
**DRUG:** May increase level of **dexamethasone.** **HERBAL:** None significant.  
**FOOD:** None known. **LAB VALUES:** May increase serum alkaline phosphatase, ALT, AST, ammonia, bilirubin, BUN, glucose, uric acid; partial thromboplastin time (PTT), platelet count, prothrombin time (PT), thrombin time (TT). May decrease blood clotting factors (plasma fibrinogen, antithrombin, plasminogen), serum albumin, calcium, cholesterol.

### Availability (Rx)

**Injection, Powder for Reconstitution:** 10,000 international units.

### Administration/handling

**Alert** May be carcinogenic, mutagenic, teratogenic. Handle with extreme care during preparation/administration. Handle voided urine as infectious waste. Powder, solution may irritate skin on contact. Wash area for 15 min if contact occurs.

### IV

**Reconstitution**
- Reconstitute 10,000 international units vial with 5 mL Sterile Water for Injection or 0.9% NaCl to provide a concentration of 2,000 international units/mL.
- Shake gently to ensure complete dissolution (vigorous shaking produces foam, some loss of potency). Further dilute in 50–250 mL D$_5$W or 0.9% NaCl.

**Rate of Administration**
- Infuse over at least 30 min.

**Storage**
- Refrigerate powder for reconstitution.
- Reconstituted solution stable for 8 hrs if refrigerated.
- Gelatinous fiber-like particles may develop (remove via 5-micron filter during administration).

### IM

- Add 2 mL 0.9% NaCl injection to 10,000 international units vial to provide a concentration of 5,000 international units/mL.
- Administer no more than 2 mL into large muscle mass.
**IV Compatibilities**
Methotrexate, sodium bicarbonate.

**Indications/routes/dosage**

**Usual Dosage**

**IM: ADULTS, ELDERLY, CHILDREN:** As a substitute for pegasparagase: 25,000 units/m² 3 times/wk for 6 doses. As a substitute for pegasparagase (*E. coli*): 25,000 units/m² for each planned dose.

**Dosage in Renal/Hepatic Impairment**
No dose adjustment.

**Side effects**

**Frequent:** Allergic reaction (rash, urticaria, arthralgia, facial edema, hypotension, respiratory distress), pancreatitis (severe abdominal pain, nausea and vomiting). **Occasional:** CNS effects (confusion, drowsiness, depression, anxiety, fatigue), stomatitis, hypoalbuminemia or uric acid nephropathy (manifested as pedal or lower extremity edema), hyperglycemia. **Rare:** Hyperthermia (including fever or chills), thrombosis, seizures.

**Adverse effects/toxic reactions**
Hepatotoxicity usually occurs within 2 wks of initial treatment. Risk of allergic reaction, including anaphylaxis, increases after repeated therapy. Myelosuppression may be severe.

**Nursing considerations**

**Baseline assessment**
CBC, BMP, LFT should be performed before therapy begins and when 1 or more wks have elapsed between doses. Before giving medication, agents for adequate airway and allergic reaction (antihistamine, EPINEPHrine, O₂, IV corticosteroid) should be readily available. Assess baseline CNS functions.
**Intervention/evaluation**

Monitor CBC, BMP, LFT, coagulation profiles capillary glucose, uric acid. Monitor vital signs. Discontinue medication at first sign of renal dysfunction (oliguria, anuria), pancreatitis. Monitor for hematologic toxicity (fever, sore throat, signs of local infection, unusual bruising/bleeding), symptoms of anemia, hypersensitivity reaction.

**Patient/family teaching**

- Increase fluid intake (protects against renal impairment).
- Nausea may decrease during therapy.
- Do not have immunizations without physician’s approval (drug lowers body’s resistance).
- Avoid contact with those who have recently received a live virus vaccine.
- Notify physician if abdominal pain, rash, nausea, vomiting occurs.

---

**atovaquone**  
*a-toe-va-kwone*

**Mepron**

**CLASSIFICATION**

**PHARMACOTHERAPEUTIC:** Systemic anti-infective.  
**CLINICAL:** Antiprotozoal.

---

**Uses**

Treatment or prevention of mild to moderate *Pneumocystis jiroveci* pneumonia (PCP) in pts intolerant to trimethoprim-sulfamethoxazole (TMP-SMZ). **OFF-LABEL:** Treatment of babesiosis. Prophylaxis in HIV pts at high risk for developing *Toxoplasma gondii* encephalitis.

---

**Precautions**

**Contraindications:** Development or history of potentially life-threatening allergic reaction to the drug. **Cautions:** Elderly, pts with severe PCP, chronic diarrhea, malabsorption syndromes, severe hepatic impairment.
Action

Inhibits mitochondrial electron transport system at the cytochrome bc1 complex (Complex III), interrupting nucleic acid, adenosine triphosphate synthesis. **Therapeutic Effect:** Antiprotozoal, antipneumocystic activity.

Interactions

**DRUG:** Rifabutin, rifAMPin may decrease concentration. May increase rifAMPin concentration. **HERBAL:** Bilberry, fenugreek, garlic, ginger, ginseng may enhance risk of hypoglycemia. **FOOD:** High-fat meals increase absorption. **LAB VALUES:** May elevate serum ALT, AST, alkaline phosphatase, amylase. May decrease serum sodium.

Availability (Rx)

**Suspension, Oral:** 750 mg/5 mL.

Administration/handling

**PO**

- Must give with food or high-fat meals. Shake gently prior to using.

Indications/routes/dosage

*Pneumocystis jiroveci* Pneumonia (PCP)

**PO:** **ADULTS, CHILDREN OLDER THAN 12 YRS:** 750 mg twice daily with food for 21 days. **CHILDREN 4–24 MOS:** 45 mg/kg/day in 2 divided doses with food. **Maximum:** 1,500 mg/day. **CHILDREN 1–3 MOS OR OLDER THAN 24 MOS:** 30–40 mg/kg/day in 2 divided doses with food. **Maximum:** 1,500 mg/day. **NEONATES:** 30–40 mg/kg/day in 2 divided doses.

Prevention of PCP

**PO:** **ADULTS, CHILDREN OLDER THAN 12 YRS:** 1,500 mg once daily with food. **CHILDREN 4–24 MOS:** 45 mg/kg/day as single dose. **Maximum:** 1,500 mg/day. **CHILDREN 1–3 MOS OR OLDER THAN 24 MOS:** 30
mg/kg/day as single dose. **Maximum:** 1,500 mg/day.

**Dosage in Renal/Hepatic Impairment**
No dose adjustment.

**Side effects**
**Frequent (greater than 10%):** Rash, nausea, diarrhea, headache, vomiting, fever, insomnia, cough. **Occasional (less than 10%):** Abdominal discomfort, thrush, asthenia, anemia, neutropenia.

**Adverse effects/toxic reactions**
None known.

**Nursing considerations**

**Baseline assessment**
Obtain baseline lab studies, esp. LFT.

**Intervention/evaluation**

**Patient/family teaching**
- Continue therapy for full length of treatment.
- Do not take any other medications unless approved by physician.
- Report rash, diarrhea, or other new symptoms.
- Must be taken with high-fat meal or food.

*bexarotene*
beks-ar-oh-teen
Targretin
Uses

**PO:** Treatment of cutaneous T-cell lymphoma (CTCL) in pts refractory to at least one prior systemic therapy. **Topical:** Treatment of cutaneous lesions in pts with refractory CTCL (stage 1A and 1B) or not tolerant of other therapies.

Precautions

**Contraindications:** Hypersensitivity to bexarotene. Pregnancy. **Cautions:** Hepatic impairment, diabetes mellitus, lipid abnormalities, excessive alcohol consumption, biliary tract disease.

Action

Binds to and activates retinoid X receptor subtypes that regulate the genes controlling cellular differentiation and proliferation. **Therapeutic Effect:** Inhibits growth of tumor cell lines of hematopoietic and squamous cell origin, induces tumor regression.

Pharmacokinetics

Moderately absorbed from GI tract. Protein binding: greater than 99%. Metabolized in liver. Primarily eliminated through the hepatobiliary system. **Half-life:** 7 hrs.

Lifespan considerations

**Pregnancy/Lactation:** May cause fetal harm. Unknown if distributed in breast milk. **Children:** Safety and efficacy not established. **Elderly:** No age-related precautions noted.
Interactions

DRUG: Bone marrow depressants, medications causing blood dyscrasias may have adverse additive effects. CYP3A4 inducers (e.g., PHENobarbital, phenytoin, rifAMPin) may decrease plasma concentration. CYP3A4 inhibitors (e.g., erythromycin, gemfibrozil, itraconazole, ketoconazole) may increase plasma concentration. May reduce tamoxifen concentration. HERBAL: Dong quai, St. John’s wort may decrease plasma concentration, cause photosensitization. FOOD: Grapefruit products may increase concentration/toxicity. LAB VALUES: May increase serum ALT, AST, bilirubin, cholesterol, glucose, potassium, triglycerides, total cholesterol, LDL. May decrease HDL. CA-125 in ovarian cancer may be increased.

Availability (Rx)

Capsules (Soft Gelatin [Targretin]): 75 mg. Topical Gel (Targretin): 1%.

Administration/handling

PO
• Give following a high-fat meal.
• Swallow whole. Do not chew or dissolve.

Topical
• Generously coat lesions with gel.
• Allow to dry before covering.
• Avoid applying gel to normal skin surrounding lesions or near mucosal surfaces.
• Use of occlusive dressings not recommended.

Indications/routes/dosage

Cutaneous T-Cell Lymphoma Refractory to at Least One Prior Systemic Therapy

PO: ADULTS: 300 mg/m²/day. If no tumor response after 8 wks and initial dose is well tolerated, may increase to 400 mg/m²/day. If not tolerated, may decrease
to 200 mg/m²/day, then to 100 mg/m²/day, or temporarily suspend to manage toxicity. **Topical: ADULTS:** Initially, apply once every other day for first wk. May increase at weekly intervals to once daily, then twice daily, then 3 times/day, up to 4 times/day based on tolerance.

**Dosage in Renal/Hepatic Impairment**
No dose adjustment.

**Side effects**
**Frequent (79%–20%):** Hyperlipidemia, headache, hypothyroidism, asthenia (loss of strength, energy). **Occasional (17%–7%):** Rash, nausea, peripheral edema, dry skin, abdominal pain, chills, exfoliative dermatitis, diarrhea.

**Adverse effects/toxic reactions**
Pancreatitis, hepatic failure, pneumonia occur rarely.

**Nursing considerations**

**Baseline assessment**
Assess baseline lipid profile, WBC, LFT, thyroid function. Question for possibility of pregnancy.

**Intervention/evaluation**
Monitor serum cholesterol, triglycerides, CBC, hepatic, thyroid function tests.

**Patient/family teaching**
- Do not use medicated, drying, abrasive soaps; wash with gentle, bland soap.
- Inform physician if pregnant or planning to become pregnant.
- Warn women of childbearing age about potential fetal risk if pregnancy occurs.
- Instruct on need for use of 2 reliable forms of contraceptives concurrently during therapy and for 1 mo after discontinuation of therapy, even in infertile, premenopausal women.

cabozantinib
ka-boe-zan-ti-nib

Cabometyx

Cometriq

CLASSIFICATION
PHARMACOTHERAPEUTIC: Tyrosine kinase inhibitor.
CLINICAL: Antineoplastic.

Uses

Cabometyx: Treatment of advanced renal cell carcinoma (RCC) in pts who received prior antiangiogenic therapy. Cometriq: Treatment of progressive, metastatic medullary thyroid cancer.

Precautions

Contraindications: Hypersensitivity to cabozantinib. Cautions: Moderate to severe hepatic impairment; baseline thrombocytopenia, anemia, neutropenia; recent surgery or dental procedures, open wounds, chronic electrolyte imbalance, dehydration, hypertension; recent history of hemorrhagic events, hemoptysis.

Action

Inhibits tyrosine kinase activity in tumor cells. Inhibits cell migration, proliferation, survival, and angiogenesis (new blood vessel formation). Therapeutic Effect: Inhibits tumor cell growth and metastasis.

Pharmacokinetics

Well absorbed after PO administration. Metabolized in liver. Protein binding: 99%. Peak plasma concentration: 2–5 hrs. Excreted in feces (54%), urine (27%). Half-life: 55 hrs.

Lifespan considerations

Pregnancy/Lactation: May cause fetal harm. Breastfeeding not recommended. Must either discontinue drug or discontinue breastfeeding. Unknown if distributed in breast milk. Female pts of reproductive potential must use
effective contraception during treatment and up to 4 mos after discontinuation. **Children:** Safety and efficacy not established. **Elderly:** No age-related precautions noted.

**Interactions**

**DRUG:** Strong CYP3A4 inhibitors (e.g., clarithromycin, ketoconazole, voriconazole) may increase concentration/effect. **Strong CYP3A4 inducers** (e.g., carBAMazepine, phenytoin, rifAMPin) may decrease concentration/effect. **HERBAL:** St John’s wort may decrease effect. **FOOD:** Grapefruit products may increase concentration/effect. **High-fat meals** may increase absorption/exposure. **LAB VALUES:** May decrease lymphocytes, neutrophils, platelets; serum calcium, magnesium, phosphorus, potassium, sodium. May increase serum ALT, AST, bilirubin, lipase, TSH, urine protein.

**Availability (Rx)**

- **Cabometyx (Tablets):** 20 mg, 40 mg, 60 mg.
- **Cometriq (Capsules):** 20 mg, 80 mg.

**Administration/handling**

**PO**

- Give on empty stomach only; do not administer 2 hrs before or 1 hr after meal.
- Give with water.
- Administer capsules whole; do not break, cut, dissolve, or divide. Do not crush tablets.

**Indications/routes/dosages**

**Metastatic Medullary Thyroid Cancer**

**PO:** **(Cometriq):** ADULTS, ELDERLY: 140 mg once daily.

Cometriq
Dose Modification

**Hematologic/Nonhematologic Reaction, Drug Intolerance**
Interrupt treatment until resolved, then resume at 100 mg once daily (if previously taking 140 mg) or 60 mg once daily (if previously taking 100 mg). If previously taking 60 mg/day, resume 60-mg dose once toxic effects resolve.

**Renal Cell Carcinoma**

PO: *(Cabometyx)*: ADULTS, ELDERLY: 60 mg once daily.

**Cabometyx**

Dose Modification

Withhold for Common Terminology Criteria for Adverse Events (CTCAE) grade 4 adverse reactions; grade 3 or intolerable grade 2 adverse reaction not managed with a dose reduction after resolution/improvement. *Previous dose of 60 mg daily:* Resume at 40 mg daily. *Previous dose of 40 mg daily:* Resume at 20 mg daily. *Previous 20 mg daily:* Resume at 20 mg if tolerated; otherwise discontinue.

**Dosage in Renal Impairment**

*Mild to moderate impairment:* No dose adjustment. **Severe impairment:** Use caution.

**Dosage in Hepatic Impairment**

*Mild to moderate impairment:* No dose adjustment. **Severe impairment:** Not recommended.

**Side effects**

**Frequent (63%–34%):** Diarrhea, stomatitis, weight loss, decreased appetite, nausea, fatigue, oral pain, dysgeusia. **Occasional (27%–7%):** Constipation, abdominal pain, vomiting, asthenia, dysphonia, dry skin, headache, alopecia, dizziness, arthralgia, dysphagia, muscle spasms, erythema, dyspepsia, anxiety, musculoskeletal pain, paresthesia, peripheral neuropathy, hyperkeratosis.
Adverse effects/toxic reactions

May cause GI perforation (3% of pts), GI fistula formation (1% of pts), severe GI hemorrhaging (3% of pts). Malignant hypertension may occur despite continued medical management. Thromboembolic events including venous/arterial thromboembolism, cerebral infarction, MI have been reported. May cause ineffective wound healing or wound dehiscence requiring medical intervention. Osteonecrosis of the jaw may present as mandibular pain, jaw bone erosion, periodontal/gingival infection or ulceration, osteomyelitis, slow healing of the mouth after dental procedures. Palmar-planter erythrodysesthesia syndrome (PPES), a chemotherapy-induced skin condition that presents as redness, swelling, numbness, skin sloughing of the hands and feet, may occur. Reversible posterior leukoencephalopathy syndrome (RPLS) reported in less than 1% of pts. Proteinuria may indicate nephrotic syndrome.

Nursing considerations

Baseline assessment

Obtain CBC with differential, BMP, LFT, serum magnesium, phosphate, ionized calcium; urinalysis; vital signs. Assess for recent surgeries, dental procedures. Obtain negative urine pregnancy before initiating treatment. Receive full medication history, including herbal products. Question history of hypertension, hepatic impairment, hemorrhagic events, thromboembolic events such as CVA, DVT, MI. Assess for open wounds, skin lesions.

Intervention/evaluation

**Patient/family teaching**

- Blood levels will be routinely monitored.
- Strictly avoid pregnancy. Contraception should be utilized during treatment and up to 4 mos after last dose.
- Report any yellowing of skin or eyes, abdominal pain, bruising, black/tarry stools, dark urine, decreased urine output, skin changes.
- Neurologic changes, including confusion, seizures, headache, blurry vision, trouble speaking, one-sided weakness, may indicate stroke, high blood pressure crisis, or life-threatening brain swelling.
- Do not take herbal products.
- Report any jaw pain or oral lesions, skin changes including dermal sloughing, rash, or poor healing of open wounds.
- Notify physician before any planned surgeries or dental procedures.
- Do not ingest grapefruit products.
- Do not take with food. Do not eat at least 2 hrs before or 1 hr after any dose.
- Severe diarrhea may lead to dehydration; drink plenty of fluids.

---

**cholestyramine**

kke-lee-s**y**e-ra-meen

**Novo-Cholamine**

**Prevalite**

**Questran**

**Questran Lite**

**CLASSIFICATION**

**PHARMACOTHERAPEUTIC**: Bile acid sequestrant.

**CLINICAL**: Antihyperlipoproteinemic.

---

**Uses**

Adjunct to diet to decrease elevated serum cholesterol levels in pts with primary hypercholesterolemia. Relief of pruritus associated with elevated levels of bile acids. Regression of arteriosclerosis. **OFF-LABEL**: Treatment of diarrhea (due to bile acids), binding toxicologic agents.
Precautions

**Contraindications:** Hypersensitivity to cholestyramine. Complete biliary obstruction. **Cautions:** GI dysfunction (esp. constipation), recent abdominal surgery, renal impairment, dehydration, concurrent spironolactone therapy.

Action

Binds with bile acids in intestine, forming insoluble complex. Binding results in partial removal of bile acid from enterohepatic circulation. **Therapeutic Effect:** Removes LDL cholesterol from plasma.

Pharmacokinetics

Not absorbed from GI tract. Decreases in serum LDL apparent in 5–7 days and in serum cholesterol in 1 mo. Serum cholesterol returns to baseline about 1 mo after drug discontinuation.

**Lifespan considerations**

**Pregnancy/Lactation:** Not systemically absorbed. May interfere with maternal absorption of fat-soluble vitamins. **Children:** No age-related precautions noted. Limited experience in pts younger than 10 yrs. **Elderly:** Increased risk of GI side effects, adverse nutritional effects.

Interactions

**DRUG:** May increase effects of *anticoagulants (e.g., warfarin)* by decreasing vitamin K level. May decrease *warfarin* absorption. May bind with, decrease absorption of *digoxin, folic acid, penicillins, propranolol, tetracyclines, thiazides, thyroid hormones, oral vancomycin.* **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** May increase serum alkaline phosphatase, magnesium, ALT, AST. May decrease serum calcium, potassium, sodium. May prolong PT.

Availability (Rx)

**Powder for Oral Suspension:** 4 g.
Administration/handling

PO
• Give other drugs at least 1 hr before or 4–6 hrs following cholestyramine (capable of binding drugs in GI tract).
• Do not give in dry form (highly irritating). Mix with 3–6 oz water, milk, fruit juice, soup.
• Place powder on surface for 1–2 min (prevents lumping), then mix thoroughly.
• Excessive foaming with carbonated beverages reported; use extra large glass, stir slowly.
• Administer with meals.

Indications/routes/dosage

Hypercholesterolemia
PO: ADULTS, ELDERLY: Initially, 4 g 1–2 times/day. Gradually increase over at least 1-mo intervals. Maintenance: 8–16 g/day in divided doses. Maximum: 24 g/day, 6 doses/day. CHILDREN: 80 mg/kg 3 times/day. Maximum: 8 g/day.

Pruritus
PO: ADULTS, ELDERLY: Initially, 4 g 1–2 times/day. Maintenance: 4–16 g/day in divided doses. Maximum: 24 g/day.

Dosage in Renal/Hepatic Impairment
No dose adjustment.

Side effects
Frequent: Constipation (may lead to fecal impaction), nausea, vomiting, abdominal pain, indigestion. Occasional: Diarrhea, belching, bloating, headache, dizziness. Rare: Gallstones, peptic ulcer disease, malabsorption syndrome.

Adverse effects/toxic reactions
GI tract obstruction, hyperchloremic acidosis, or osteoporosis secondary to calcium excretion may occur. High dosage may interfere with fat absorption, resulting in steatorrhea.

**Nursing considerations**

**Baseline assessment**
Question for history of hypersensitivity to cholestyramine, tartrazine, aspirin. Obtain baseline serum cholesterol, triglycerides, electrolytes, LFT.

**Intervention/evaluation**
Monitor daily pattern of bowel activity, stool consistency. Evaluate food tolerance, abdominal discomfort, flatulence. Monitor cholesterol, triglycerides, PT, LFT, serum electrolytes. Encourage several glasses of water between meals.

**Patient/family teaching**
- Complete full course of therapy; do not stop or change doses.
- Take other drugs at least 1 hr before or 4–6 hrs after cholestyramine.
- Never take in dry form; mix with 3–6 oz water, milk, fruit juice, soup (place powder on surface for 1–2 min to prevent lumping, then mix well).
- Use extra-large glass, stir slowly when mixing with carbonated beverages due to foaming.
- Take with meals; drink several glasses of water between meals.
- Eat high-fiber foods (whole-grain cereals, fruits, vegetables) to reduce potential for constipation.

---

**ciclesonide**

sye-kles-oh-nide

Alvesco

Omnaris

Zetonna

**CLASSIFICATION**

PHARMACOTHERAPEUTIC: Glucocorticoid.

CLINICAL: Anti-inflammatory.
Uses

**Intranasal:** Management of seasonal or perennial allergic rhinitis. **Oral Inhalation:** Prophylactic management of bronchial asthma. **OFF-LABEL:** Nasal: Adjunct to antibiotics in empiric treatment of acute bacterial rhinosinusitis.

Precautions

**Contraindications:** Hypersensitivity to ciclesonide. Acute asthma or status asthmaticus, moderate to severe bronchiectasis. **Cautions:** Pts with respiratory TB, untreated systemic infections, ocular herpes simplex.

Action

Inhibits accumulation of inflammatory cells, decreases and prevents tissues from responding to inflammatory process. **Therapeutic Effect:** Relieves symptoms of allergic rhinitis, asthma.

Pharmacokinetics

Minimally absorbed from nasal tissue, moderately absorbed from inhalation. Protein binding: 99%. Metabolized in liver. Excreted in feces (66%), urine (20% or less). **Half-life:** 2–3 hrs.

Lifespan considerations

**Pregnancy/Lactation:** Unknown if drug crosses placenta or distributed in breast milk. **Children:** Safety and efficacy not established in pts younger than 12 yrs. **Elderly:** No age-related precautions noted.

Interactions

**DRUG:** Ketoconazole may increase concentration/effect. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** None significant.

Availability (Rx)

Administration/handling

Inhalation

• Shaking not necessary.
• Wait 2 min before inhaling second dose (allows for deeper bronchial penetration).
• Rinse mouth with water immediately after inhalation (prevents mouth/throat dryness).

Intranasal

• Instruct pt to clear nasal passages before use.
• Tilt head slightly forward.
• Insert spray tip into nostril, pointing toward nasal passages, away from nasal septum.
• Spray into one nostril while pt holds other nostril closed, concurrently inspires through nose to permit medication as high into nasal passages as possible.

Indications/routes/dosage

Perennial Allergic Rhinitis
Intranasal: ADULTS, ELDERLY, CHILDREN 12 YRS AND OLDER: (Omnaris): 2 sprays (100 mcg) in each nostril once a day. Maximum: 200 mcg/day. (Zetonna): 1 spray (37 mcg) in each nostril daily. Maximum: 74 mcg/day.

Seasonal Allergic Rhinitis
Intranasal: ADULTS, ELDERLY, CHILDREN 6 YRS AND OLDER: (Omnaris): 2 sprays (100 mcg) in each nostril once a day. Maximum: 200 mcg/day. (Zetonna): 1 spray (37 mcg) in each nostril daily. Maximum: 74 mcg/day.

Asthma
Inhalation: ADULTS, ELDERLY, CHILDREN 12 YRS AND OLDER (PREVIOUS THERAPY WITH BRONCHODILATORS ALONE): Initially, 80 mcg 2 times daily. **Maximum:** 320 mcg 2 times daily. (PREVIOUS THERAPY WITH INHALED STEROIDS): Initially, 80 mcg twice daily. **Maximum:** 640 mcg/day. (PREVIOUS THERAPY WITH ORAL STEROIDS): Initially, 320 mcg twice daily. **Maximum:** 640 mcg/day.

**Dosage in Renal/Hepatic Impairment**
No dose adjustment.

**Side effects**

Occasional (6%–4%): Headache, epistaxis, nasopharyngitis. Rare (2%): Ear pain.

**Adverse effects/toxic reactions**

Excessive doses over prolonged periods may result in systemic hypercortisolism.

**Nursing considerations**

**Baseline assessment**
Question for hypersensitivity to any corticosteroids. Establish baseline history of asthma, rhinitis.

**Intervention/evaluation**

**Patient/family teaching**
- Improvement noted in 24–48 hrs, but full effect may take 1–2 wks for seasonal allergic rhinitis, 5 wks for perennial allergic rhinitis.
- Improvement in asthma may take 4 wks or longer.
- Oral inhalation not indicated for acute asthma attacks.
- Report if no improvement in symptoms, sneezing or nasal irritation occurs.
cimetidine
sy-\textit{met}-i-deen

Apo-Cimetidine
Novo-Cimetidine
Tagamet HB 200

\textbf{CLASSIFICATION}

\textbf{PHARMACOTHERAPEUTIC}: $H_2$-receptor antagonist.

\textbf{CLINICAL}: Antiulcer, gastric acid secretion inhibitor.

\textit{Do not confuse cimetidine with simethicone.}

\section*{Uses}

\section*{Precautions}

\textbf{Contraindications}: Hypersensitivity to cimetidine, other $H_2$ antagonists.

\textbf{Cautions}: Renal/hepatic impairment, elderly. Concurrent administration of medications utilizing P450 system.

\section*{Action}
Inhibits histamine action at histamine-2 ($H_2$)-receptor sites of gastric parietal cells. \textbf{Therapeutic Effect}: Reduces gastric acid secretion, gastric volume, hydrogen ion concentration.

\section*{Pharmacokinetics}
Half-life: 2 hrs (increased in renal impairment).

Lifespan considerations

Pregnancy/Lactation: Distributed in breast milk. Possible adverse effects on fetal development. Children: Long-term use may induce cerebral toxicity, affect hormonal system. Elderly: More likely to experience confusion, esp. pts with renal impairment.

Interactions

DRUG: May increase concentration, decrease metabolism of warfarin, phenytoin, propranolol, tricyclic antidepressants (e.g., amitriptyline, doxepin, nortriptyline). May decrease concentration/effect of itraconazole, ketoconazole. HERBAL: St. John’s wort may decrease concentration. FOOD: None known. LAB VALUES: Interferes with skin tests using allergen extracts. May increase serum prolactin, creatinine, ALT, AST. May decrease parathyroid hormone concentration.

Availability (Rx)

Liquid, Oral: 300 mg/5 mL. Tablets: 200 mg (OTC), 300 mg, 400 mg, 800 mg.

Administration/handling

PO

• Give without regard to food.
• Best given with meals and at bedtime.
• Do not administer within 1 hr of antacids.

Indications/routes/dosage

Active Duodenal Ulcer

PO: ADULTS, ELDERLY: 300 mg 4 times/day or 400 mg twice daily or 800 mg at bedtime for up to 8 wks.

Prevention of Duodenal Ulcer
PO: ADULTS, ELDERLY: 400 mg at bedtime.

Gastric Hypersecretory Secretions
PO: ADULTS, ELDERLY: 300–600 mg q6h. Maximum: 2,400 mg/day.

Gastroesophageal Reflux Disease (GERD)
PO: ADULTS, ELDERLY: 800 mg twice daily or 400 mg 4 times/day for 12 wks.

OTC Use
PO: ADULTS, ELDERLY: 200 mg up to 30 min before meals. Maximum: 400 mg/day.

Usual Pediatric/Neonatal Dosage
CHILDREN: 20–40 mg/kg/day in divided doses q6h. INFANTS: 10–20 mg/kg/day in divided doses q6–12h. NEONATES: 5–10 mg/kg/day in divided doses q8–12h.

Dosage in Renal Impairment
Dosage is modified based on creatinine clearance.

Dosage in Hepatic Impairment
Caution in severe impairment.

Side effects
Occasional (4%–2%): Headache. Elderly, pts with renal impairment,
**severely ill pts:** Confusion, agitation, psychosis, depression, anxiety, disorientation, hallucinations. Effects reverse 3–4 days after discontinuance. **Rare (less than 2%):** Diarrhea, dizziness, drowsiness, nausea, vomiting, gynecomastia, rash, impotence.

**Adverse effects/toxic reactions**

None known.

**Nursing considerations**

**Baseline assessment**

Obtain baseline renal function test in pts with renal impairment; LFT in pts with hepatic impairment.

**Intervention/evaluation**

Assess for GI bleeding: hematemesis, blood in stool. Monitor for changes in mental status in elderly, severely ill, those with renal impairment.

**Patient/family teaching**

• Do not take antacids within 1 hr of cimetidine administration.
• Avoid tasks that require alertness, motor skills until response to drug is established.
• Avoid smoking, excessive amounts of caffeine.
• Report any blood in vomitus/stool, or dark, tarry stool.

---

**cladribine**

klad-ree-bine

**CLASSIFICATION**

PHARMACOTHERAPEUTIC: Antimetabolite.

CLINICAL: Antineoplastic.

■ **BLACK BOX ALERT** ■ Must be administered by personnel trained in administration/handling of chemotherapeutic agents. Myelosuppression, neurologic toxicity, acute nephrotoxicity have been reported.

Do not confuse cladribine with clevidipine, clofarabine, or fludarabine.
Uses

Treatment of active hairy cell leukemia defined by clinically significant anemia, neutropenia, thrombocytopenia. **OFF-LABEL:** Treatment of chronic lymphocytic leukemia, non-Hodgkin’s lymphoma, acute myeloid leukemia.

Precautions

**Contraindications:** Hypersensitivity to cladribine. **Cautions:** Renal/hepatic impairment. Preexisting hematologic or immunologic abnormalities; those with high tumor burden. Use of live vaccines.

Action

Disrupts cellular metabolism by incorporating into DNA of dividing cells. Cytotoxic to both actively dividing and quiescent lymphocytes, monocytes. **Therapeutic Effect:** Prevents DNA synthesis.

Pharmacokinetics

Protein binding: 20%. Metabolized in liver. Primarily excreted in urine. **Half-life:** 5.4 hrs.

*Lifespan considerations*

**Pregnancy/Lactation:** May produce fetal harm; may be embryotoxic, fetotoxic; potential for serious reactions in breastfed infants. **Children:** Safety and efficacy not established. **Elderly:** No age-related precautions noted.

Interactions

**DRUG:** Bone marrow depressants may increase myelosuppression. **Live virus vaccines** may potentiate virus replication, increase vaccine side effects, decrease pt’s antibody response to vaccine. **HERBAL:** Echinacea may decrease effect. **FOOD:** None known. **LAB VALUES:** May decrease platelets, Hgb, Hct, neutrophils during initial dose of therapy. Resolution of anemia, neutropenia, thrombocytopenia indicates disease progression.
Availability (Rx)

Injection Solution: 1 mg/mL (10 mL).

Administration/handling

_iv_ • Wear gloves, protective clothing during handling; if contact with skin, rinse with copious amounts of water.

Reconstitution
• Must dilute before administration.
• Add calculated dose (0.09 mg/kg) to 500 mL 0.9% NaCl.

Rate of Administration
• Infuse over 0.5–2 hrs.

Storage
• Refrigerate unopened vials.
• May refrigerate diluted solution for no more than 8 hrs.
• Diluted solution is stable for at least 24 hrs at room temperature.
• Discard unused portion.

iv incompatibilities

None known.

iv Compatibilities

Dexamethasone (Decadron), granisetron (Kytril), ondansetron (Zofran).

Indications/routes/dosage

Hairy Cell Leukemia

IV Infusion: ADULTS, CHILDREN: 0.09–0.1 mg/kg/day as continuous infusion for 7 days.

Dosage in Renal Impairment
<table>

<td>—</td>
</tr>
</tbody>
</table>

**Dosage in Hepatic Impairment**
No dose adjustment.

**Side effects**

**Frequent (69%–13%)**: Fever, fatigue, nausea, rash, headache, injection site reactions, anorexia, vomiting. **Occasional (10%–5%)**: Diarrhea, cough, purpura, chills, diaphoresis, constipation, dizziness, petechiae, myalgia, shortness of breath, malaise, pruritus, erythema, insomnia, edema, tachycardia, abdominal/trunk pain, epistaxis, arthralgia.

**Adverse effects/toxic reactions**

Myelosuppression characterized as severe neutropenia (WBC less than 500 cells/mm$^3$), severe anemia (Hgb less than 8.5 g/dL), thrombocytopenia occurs commonly. High-dose treatment may produce acute nephrotoxicity (increased serum BUN, creatinine levels), neurotoxicity (irreversible motor weakness of upper/lower extremities).

**Nursing considerations**

**Baseline assessment**
Obtain baseline CBC, serum chemistries. Offer emotional support. Perform neurologic exam before chemotherapy. Use strict asepsis; protect pt from infection.

**Intervention/evaluation**
Monitor vital signs during infusion, esp. during first hour. Observe for hypotension, bradycardia (both do not usually occur during same course). Immediately discontinue if severe hypersensitivity reaction occurs. Monitor for

**Patient/family teaching**

- There is a narrow margin between therapeutic and toxic response.
- Avoid crowds, persons with known infections; report signs of infection at once (fever, flu-like symptoms).
- Do not have immunizations without physician’s approval (drug lowers resistance).
- Avoid contact with those who have recently received live virus vaccine.
- Avoid pregnancy.

<table>

</tbody>
</table>

**CLASSIFICATION**

**PHARMACOTHERAPEUTIC**: Adrenocortical steroid.

**CLINICAL**: Diagnostic agent.

*Do not confuse Cortrosyn with colchicine, cortisone, or Cotazym.*

**Uses**

Diagnostic testing of adrenocortical function.

**Precautions**

*Contraindications*: Hypersensitivity to cosyntropin, corticotropin. *Cautions*: Preexisting allergies, history of allergic reaction to corticotropin.

**Action**

Stimulates secretion of adrenal steroids from adrenal cortex. *Therapeutic Effect*: Increases endogenous corticoid synthesis.

Ξ **Lifespan considerations**
Pregnancy/Lactation: Unknown if distributed in breast milk. 
Children/Elderly: No age-related precautions noted.

Interactions
DRUG: None significant. HERBAL: None significant. FOOD: None known. LAB VALUES: None significant.

Availability (Rx)
Powder for Injection: 0.25 mg. Injection, Solution: 0.25 mg/mL.

Administration/handling
Reconstitution
IM:
• Reconstitute with 1 mL 0.9% NaCl.
• Give as 0.25 mg/mL concentration.

IV Push:
• Dilute with 2–5 mL 0.9% NaCl over 2 min.

Storage
Powder:
• Room temperature.

Solution:
• Refrigerate.

Indications/routes/dosage

Adrenocortical Insufficiency (Diagnostic Use)
IM, IV: ADULTS, ELDERLY, CHILDREN OLDER THAN 2 YRS: 0.25–0.75 mg. CHILDREN 2 YRS AND YOUNGER: 0.125 mg. NEONATES: 0.015 mg/kg/dose.

IV Infusion: ADULTS, ELDERLY, CHILDREN OLDER THAN 2 YRS: 0.25 mg over 6 hrs at 0.04 mg/hr.

Side effects
Occasional: Nausea, vomiting. Rare: Hypersensitivity reaction (fever, pruritus).

**Adverse effects/toxic reactions**
None known.

**Nursing considerations**

**Baseline assessment**
Hold cortisone, hydrocortisone, spironolactone the day prior to and the day of the test. Ensure that baseline plasma cortisol concentration has been drawn before start of test or 24-hr urine for 17-KS or 17-OHCS is initiated.

**Intervention/evaluation**
Adhere to time frame for blood draws; monitor urine collection if indicated.

**Patient/family teaching**
• Explain procedure, purpose of test.

</tr>
<tr>
<td><strong>Do not confuse dapagliflozin with canagliflozin or empagliflozin.</strong></td>
</tr>
</tbody>
</table>

**Fixed-combination(s)**
**Xigduo XR**: dapagliflozin/metformin (an antidiabetic): 5 mg/500 mg, 5 mg/1,000 mg, 10 mg/500 mg, 10 mg/1,000 mg.
Adjunctive treatment to diet and exercise to improve glycemic control in pts with type 2 diabetes mellitus.

**Precautions**

**Contraindications:** Hypersensitivity to dapagliflozin, other SGLT2 inhibitors; severe renal impairment, dialysis, end-stage renal disease. **Cautions:** Baseline hypotension, mild to moderate renal impairment, elderly, hypovolemia/dehydration (correct before initiating treatment), hx of genital mycotic infection. Not recommended in pts with active bladder cancer, diabetic ketoacidosis, type 1 diabetes mellitus. Concurrent use of loop diuretics.

**Action**

Increases excretion of urinary glucose by inhibiting reabsorption of glucose in kidneys by inhibiting SGLT2 in proximal renal tubule. **Therapeutic Effect:** Lowers serum glucose levels, Hgb A1c.

**Pharmacokinetics**

Rapidly absorbed following PO administration. Metabolized in liver. Protein binding: 91%. Peak plasma concentration: 2 hrs. Eliminated in urine (75%), feces (21%). Unknown if removed by hemodialysis. **Half-life:** 12.9 hrs.

**Lifespan considerations**

**Pregnancy/Lactation:** Unknown if distributed in breast milk. Must either discontinue drug or discontinue breastfeeding. **Children:** Safety and efficacy not established in pts younger than 18 yrs. **Elderly:** May have increased adverse effects related to renal impairment/volume depletion.

**Interactions**

**DRUG:** Loop diuretics (e.g., bumetanide, furosemide) may increase risk of dehydration, hypotension, hypovolemia. **Antihypertensives** (e.g., amlodipine, clonidine, hydralazine, valsartan) may increase risk of hypotension in pts with volume depletion. **Beta blockers** (e.g., carvedilol, metoprolol) may mask symptoms of hypoglycemia. **Acyclovir, captopril, gentamicin, vancomycin**
may increase risk of nephrotoxicity. **Hypoglycemic agents (e.g., glyburide, insulin, metformin)** may cause additive hypoglycemic effects. **HERBAL:** Fenugreek, flaxseed, garlic, ginkgo, ginger, gotu kola, ginseng may increase hypoglycemic effect. **FOOD:** None known. **LAB VALUES:** May increase Hct, low-density lipoprotein cholesterol (LDL-C) levels; serum creatinine, phosphate. May decrease eGFR. Expected to decrease Hgb A1c; may yield positive urine glucose test.

**Availability (Rx)**

(HTTPs) Tablets: 5 mg, 10 mg.

**Administration/handling**

**PO**

• May give without regard to meals.

**Indications/routes/dosage**

**Type 2 Diabetes Mellitus**

**PO: ADULTS/ELDERLY:** Initially, 5 mg once daily in the morning. May increase to 10 mg once daily.

**Dosage in Renal Impairment**

Mild to moderate impairment (eGFR greater than 60 mL/min): No dose adjustment necessary; use caution. **Severe impairment (eGFR less than 60 mL/min):** Avoid use. **Development of renal impairment during treatment:** Discontinue if eGFR is persistently less than 60 mL/min.

**Dosage in Hepatic Impairment**

No dose adjustment.

**Concomitant Use of Insulin or Insulin Secretagogue**

Consider lowering dose of insulin or insulin secretagogue to reduce risk of hypoglycemia.
**Side effects**

**Occasional (6%–3%):** Nasopharyngitis, back pain, increased urination, nausea.  **Rare (2%):** Constipation, extremity pain, discomfort with urination.

**Adverse effects/toxic reactions**

Orthostatic hypotension, postural dizziness, symptomatic hypotension, syncope, volume depletion may occur; pts who are elderly, use loop diuretics, or have baseline renal impairment have increased risk. Genital mycotic (yeast) infections occurred in 6% of pts; most reported cases were vulvovaginal infections in women and balanitis in men. Hypoglycemic events reported in 1.5% of pts (5% in elderly). Hypersensitivity reactions including anaphylaxis, angioedema (tongue/lip swelling), erythema, rash, pruritus, urticaria have occurred. Newly diagnosed bladder cancer occurs rarely. Genitourinary infections including cystitis, kidney infection, prostatitis, pyelonephritis, trigonitis, urethritis, UTI occurred in 5.7% of pts.

**Nursing considerations**

**Baseline assessment**

**Intervention/evaluation**

**Patient/family teaching**
• Diabetes mellitus requires lifelong control. Diet and exercise are principal parts of treatment; do not skip or delay meals.
• Test blood sugar regularly.
• When taking combination drug therapy or when glucose demands are altered (fever, infection, trauma, stress), have low blood sugar treatment available (glucagon, oral dextrose).
• Monitor daily calorie intake.
• Report suspected pregnancy. Do not breastfeed.
• Genital itching or discharge may indicate yeast infection.
• Therapy may increase risk for dehydration/low blood pressure, esp. in pts who are elderly, on low-salt diet, have low blood pressure, or take water pills (diuretics). Drink plenty of fluids.
• Report any decrease in urine output, dark-colored urine, painful urination, or flank pain.
• Therapy may increase risk of bladder cancer; report any blood in urine or painful urination.
• May rarely cause allergic reaction; report itching, hives, difficulty breathing, wheezing.

**desloratadine**
**des-lor-a-ta-deen**
Aerius
Clarinex
Clarinex Redi-Tabs

**Fixed-Combination(s)**

**Clarinex-D 24 Hour**: desloratadine/pseudoephedrine (a sympathomimetic): 5 mg/240 mg. **Clarinex-D 12 Hour**: desloratadine/pseudoephedrine: 2.5 mg/120 mg.

**CLASSIFICATION**
PHARMACOTHERAPEUTIC: H₁ antagonist.
CLINICAL: Nonsedating antihistamine.
Do not confuse Clarinex with CeleBREX or Claritin.
Uses
Relief of nasal/non-nasal symptoms of seasonal and perennial rhinitis (sneezing, rhinorrhea, itching/tearing of eyes, stuffiness), chronic idiopathic urticaria (hives).

Precautions

Contraindications: Hypersensitivity to desloratadine or loratidine. Cautions: Renal/hepatic impairment, breastfeeding.

Action
Exhibits selective peripheral histamine H<sub>1</sub> receptor blocking action. Therapeutic Effect: Prevents allergic response mediated by histamine (rhinitis, urticaria).

Pharmacokinetics
Rapidly absorbed from GI tract. Distributed mainly in liver, lungs, GI tract, bile. Protein binding: 82%. Metabolized in liver. Eliminated in urine, feces. Half-life: 27 hrs (increased in elderly, renal/hepatic impairment).

Lifespan considerations
Pregnancy/Lactation: Excreted in breast milk. Children/Elderly: More sensitive to anticholinergic effects (e.g., dry mouth, nose, throat).

Interactions
DRUG: Erythromycin, ketoconazole, fluconazole, clarithromycin may increase concentration. HERBAL: None significant. FOOD: None known. LAB VALUES: May suppress wheal, flare reactions to antigen skin testing unless antihistamines are discontinued 4 days before testing.

Availability (Rx)
Syrup (Clarinex): 2.5 mg/5 mL. Tablets (Clarinex): 5 mg. Tablet, Oral Dispersible: 2.5 mg, 5 mg.
Administration/handling

PO

• May give with or without food.
• May take with or without water.

Indications/routes/dosage

Allergic Rhinitis, Urticaria

PO: ADULTS, ELDERLY, CHILDREN OLDER THAN 12 YRS: 5 mg once daily. CHILDREN 6–12 YRS: 2.5 mg once daily. CHILDREN 1–5 YRS: 1.25 mg once daily. CHILDREN 6–11 MOS: 1 mg once daily.

Dosage in Hepatic/Renal Impairment
Dosage is decreased to 5 mg every other day.

Side effects

Frequent (12%): Headache. Occasional (3%): Dry mouth, drowsiness. Rare (less than 3%): Fatigue, dizziness, diarrhea, nausea.

Adverse effects/toxic reactions
None known.

Nursing considerations

Baseline assessment
Assess lung sounds for wheezing; skin for urticaria, hives.

Intervention/evaluation
For upper respiratory allergies, increase fluids to decrease viscosity of secretions, offset thirst, replace any loss of fluids. Monitor symptoms for therapeutic response.
Patient/family teaching

• Drink plenty of water (may cause dry mouth).
• Avoid tasks that require alertness, motor skills until response to drug is established (may cause drowsiness).
• Avoid alcohol.

**desvenlafaxine**

des-ven-la-fax-een
Khedezia
Pristiq

♦ CLASSIFICATION
PHARMACOTHERAPEUTIC: Serotonin-norepinephrine reuptake inhibitor.
CLINICAL: Antidepressant.

■ BLACK BOX ALERT ■ Increased risk of suicidal thinking and behavior in children, adolescents, young adults 18–24 yrs with major depressive disorder, other psychiatric disorders.

**Uses**

Treatment of major depression disorder (MDD).

**Precautions**

**Contraindications:** Hypersensitivity to desvenlafaxine or venlafaxine. Use of MAOIs within 14 days or in those currently taking MAOIs (may cause neuroleptic malignant syndrome). Allow at least 7 days after discontinuation before starting an MAOI. Initiation in pts taking linezolid or methylene blue. **Cautions:** Renal impairment, history of seizures, bipolar disorder, pts with suicidal ideation and behavior, increased intraocular pressure, untreated hypertension, narrow-angle glaucoma, cardiovascular or cerebrovascular disease, elderly.
**Action**

Appears to inhibit serotonin and norepinephrine reuptake at CNS neuronal presynaptic membranes (weakly inhibits DOPamine reuptake). **Therapeutic Effect:** Produces antidepressant effect.

**Pharmacokinetics**

Well absorbed from GI tract. Protein binding: 30%. Excreted primarily in urine. Steady state reached in 4–5 days. **Half-life:** 9–11 hrs.

**Lifespan considerations**

**Pregnancy/Lactation:** Distributed in breast milk. **Children:** Safety and efficacy not established. **Elderly:** No age-related precautions noted.

**Interactions**

**DRUG:** Concurrent use of **MAOIs** (e.g., phenelzine, selegiline) may cause neuroleptic malignant syndrome: hyperthermia, rigidity, myoclonus, autonomic instability (including rapid fluctuations of vital signs), mental status changes, coma, extreme agitation. **Alcohol** may increase CNS depressant effects. May decrease **midazolam** concentration. May increase **desipramine** concentration. **Aspirin,** NSAIDs (e.g., ibuprofen, ketorolac, naproxen), **warfarin** increase risk of bleeding. **Ketoconazole** may increase concentration/effect. **HERBAL:** Gotu kola, kava kava, St. John’s wort, valerian may increase CNS depressant effects. **FOOD:** None known. **LAB VALUES:** May increase total serum cholesterol, LDL cholesterol, triglycerides, ALT, AST, prolactin level.

**Availability (Rx)**

**Tablets (Extended-Release):** 25 mg, 50 mg, 100 mg.

**Administration/handling**

**PO**

• Give without regard to food.
• Give with food or milk if GI distress occurs.
• Do not break, crush, dissolve, or divide tablets.
• Must be swallowed whole, with fluid.

Indications/routes/dosage

Major Depressive Disorder
PO: ADULTS: 50 mg once daily. Maximum: 400 mg/day.

Dosage in Renal Impairment
CrCl 30–50 mL/min: 50 mg once daily (Maximum). CrCl less than 30 mL/min: 25 mg once daily or 50 mg every other day (Maximum). HD: 25 mg once daily or 50 mg every other day (Maximum).

Dosage in Hepatic Impairment
Mild impairment: No dosage adjustment. Moderate to severe impairment: 50 mg once daily. Maximum: 100 mg/day.

Side effects
Frequent (22%–20%): Nausea, headache. Occasional (13%–7%): Dizziness, dry mouth, diarrhea, sweating, constipation, insomnia, fatigue. Rare (5%–2%): Anorexia, drowsiness, decreased libido, erectile dysfunction in men, anxiety, blurred vision, vomiting, decreased weight, tremor, paresthesia, irritability, abnormal dreams, blurred vision, tinnitus.

Adverse effects/toxic reactions
Seizures, syncope, extrapyramidal disorder, depersonalization, hypomania, epistaxis occur rarely. Ischemic cardiac events, including myocardial ischemia, MI, coronary occlusion requiring revascularization, may occur. Sustained increase in diastolic B/P (10–15 mm Hg) occurs occasionally.

Nursing considerations
Baseline assessment
Obtain initial weight, B/P. Assess appearance, behavior, speech pattern, level of interest, mood, sleep pattern.

Intervention/evaluation
For pts on long-term therapy, LFT should be performed periodically. Monitor B/P. Assess sleep pattern for evidence of insomnia. Monitor for suicidal ideation (esp. at initiation of therapy or changes in dosage). Assess appearance, behavior, speech pattern, level of interest, mood for therapeutic response.

Patient/family teaching
• Take with food to minimize GI distress.
• Do not chew, crush, dissolve, or divide tablets.
• Do not increase, decrease, or suddenly discontinue medication.
• Therapeutic effect may be noted within 1–4 wks.
• Avoid tasks that require alertness, motor skills until response to drug is established.
• Avoid alcohol.
• Report worsening depression, suicidal ideation, unusual changes in behavior.

dexmethylphenidate
dex-meth-il-fen-i-date
Focalin
Focalin XR

CLASSIFICATION
PHARMACOTHERAPEUTIC: Cerebral cortex stimulator (Schedule II).
CLINICAL: CNS stimulant.

BLACK BOX ALERT Chronically use can lead to marked tolerance, psychological dependence. Severe depression may occur during drug withdrawal.

Do not confuse dexmethylphenidate with methadone.
**Uses**

Treatment of ADHD.

**Precautions**

**Contraindications:** Hypersensitivity to dexamfetamine or methylphenidate. Diagnosis or family history of Tourette’s syndrome, glaucoma, history of marked agitation, anxiety, tension, motor tics, use of MAOIs within 14 days. **Cautions:** Cardiovascular disease (HF, recent MI), seizure disorder, psychosis, emotional instability, acute stress reactions, hyperthyroidism. Avoid use in pts with history of alcohol or substance abuse.

**Action**

Blocks reuptake of norepinephrine, DOPamine into presynaptic neurons, increasing release of these neurotransmitters into synaptic cleft. **Therapeutic Effect:** Decreases motor restlessness, fatigue; increases motor activity, mental alertness, attention span; elevates mood.

**Pharmacokinetics**

Readily absorbed from GI tract. Metabolized in liver. Excreted in urine. **Half-life:** 2.2 hrs.

**Lifespan considerations**

**Pregnancy/Lactation:** Unknown if excreted in breast milk. **Children:** May be more susceptible to developing anorexia, insomnia, abdominal pain, weight loss. Chronic use may inhibit growth. In psychotic children, may exacerbate symptoms of behavior disturbance, thought disorder. **Elderly:** No age-related precautions noted.

**Interactions**

**DRUG:** May enhance effects of antihypertensives (e.g., amlodipine, lisinopril, valsartan). May inhibit metabolism of PHEnobarbital, phenytoin, primidone, tricyclic antidepressants (e.g., amitriptyline, doxepin, nortriptyline); decreased dosages may be necessary. May alter effects of warfarin.
HERBAL: Ephedra may cause hypertension, arrhythmias. **Yohimbe** may increase CNS stimulation. **FOOD**: None known. **LAB VALUES**: None known.

**Availability (Rx)**

**Tablets (Focalin)**: 2.5 mg, 5 mg, 10 mg.

**Capsules (Extended-Release [Focalin XR])**: 5 mg, 10 mg, 15 mg, 20 mg, 25 mg, 30 mg, 35 mg, 40 mg.

**Administration/handling**

**PO**

- Do not give drug in afternoon or evening (causes insomnia).
- Tablets may be crushed.
- Give without regard to food.
- Administer extended-release capsules whole; do not cut or crush.
- May sprinkle contents of extended-release capsules on small amount of applesauce.
- Give extended-release capsules once each day in the morning, before breakfast.

**Indications/routes/dosage**

**Note**: If pt taking methylphenidate, initially use one half the dose of methylphenidate for conversion to dexmethylphenidate. Maximum immediate-release dose: 20 mg/day. Maximum extended-release dose: 30 mg/day.

**ADHD**

(Dosage for pts not currently taking methylphenidate)

**Capsules (Extended-Release)**

**PO**: **ADULTS, ELDERLY**: Initially, 10 mg/day. May increase in increments of 10 mg/day at wkly intervals. **Maximum**: 40 mg/day. **CHILDREN 6 YRS AND OLDER**: Initially, 5 mg/day. May increase in increments of 5 mg/day at wkly intervals. **Maximum**: 30 mg/day.

**Tablets (Immediate-Release)**
**PO: ADULTS, ELDERLY, CHILDREN 6 YRS AND OLDER:** Initially, 2.5 mg 2 times/day. Doses should be given at least 4 hrs apart. May increase in increments of 2.5–5 mg at wkly intervals. **Maximum:** 20 mg/day.

**Dosage in Renal/Hepatic Impairment**
No dose adjustment.

**Side effects**
**Frequent:** Abdominal pain, nausea, anorexia, fever. **Occasional:** Tachycardia, arrhythmias, palpitations, insomnia, twitching. **Rare:** Blurred vision, rash, arthralgia.

**Adverse effects/toxic reactions**
Withdrawal after prolonged therapy may unmask symptoms of underlying disorder. May lower seizure threshold in pts with history of seizures. Overdose produces excessive sympathomimetic effects (vomiting, tremor, hyperreflexia, seizures, confusion, hallucinations, diaphoresis). Prolonged administration to children may delay growth. Neuroleptic malignant syndrome occurs rarely.

**Nursing considerations**

**Baseline assessment**
Screen for medical history as listed in Precautions. Obtain baseline vital signs, CBC.

**Intervention/evaluation**
CBC, B/P, heart rate should be performed routinely during therapy. If paradoxical return of ADHD occurs, dosage should be reduced or discontinued. Weigh, measure pediatric pt regularly to detect delayed growth.

**Patient/family teaching**
- Report any increase in seizures, chest pain, unexplained syncope.
- Avoid caffeine.
- Last dose should be given in morning to prevent insomnia.
• Report anxiety, fever.

<table>
<thead>
<tr>
<th>dinoprostone</th>
</tr>
</thead>
<tbody>
<tr>
<td>dye-noe-pros-tone</td>
</tr>
</tbody>
</table>

**Cervidil**

**Prepidil**

**Prostin E2**

**CLASSIFICATION**

**PHARMACOTHERAPEUTIC:** Prostaglandin.

**CLINICAL:** Oxytocic, abortifacient.

- ■ BLACK BOX ALERT ■ To be used only by personnel medically trained in dinoprostone-specific drug effects in a hospital setting.

**Do not confuse Cervidil or Prepidil with bepridil.**

**Uses**

**Vaginal suppository (Prostin E₂):** To induce abortion from wk 12 through wk 20 of pregnancy, to evacuate uterine contents in missed abortion or intrauterine fetal death up to 28 wks gestational age (as calculated from first day of last normal menstrual period), benign hydatidiform mole. **Gel: (Prepidil)** Promote cervical ripening in pregnant women at or near term with medical/obstetric need for labor induction. **Vaginal insert: (Cervidil)** Initiation and/or continuation of cervical ripening in pts at or near term with medical indication for induction of labor.

**Precautions**

**Contraindications:** Hypersensitivity to dinoprostone. **Gel:** Active cardiac, hepatic, pulmonary, renal disease; acute pelvic inflammatory disease (PID); fetal malpresentation; grand multiparae with 6 or more previous term pregnancy cases with nonvertex presentation; history of cesarean section, major uterine surgery; history of difficult labor, traumatic delivery; hypersensitivity to other prostaglandins; placenta previa, unexplained vaginal bleeding during this
pregnancy; pts for whom vaginal delivery is not indicated (vasa previa, active herpes genitalia); significant cephalopelvic disproportion. **Vaginal Suppository:** Active cardiac, hepatic, pulmonary, renal disease; acute PID. **Cautions:** Renal/hepatic impairment, asthma, glaucoma, cardiovascular or pulmonary disease, epilepsy. **Endocervical gel:** With ruptured membrane. **Vaginal gel:** With ruptured membrane, nonvertex or nonsingleton pregnancy, previous uterine pregnancy. **Suppository:** History of hypotension/hypertension, anemia, jaundice, diabetes, compromised uteri, cervicitis, endocervical infections or acute vaginitis.

**Action**

**Abortifacient:** Stimulates uterine contractions. **Labor Induction:** Relaxes smooth muscle at the cervix. **Therapeutic Effect:** Stimulates myometrial contractions in gravid uterus.

**Pharmacokinetics**

<table>
<thead>
<tr>
<th>Onset</th>
<th>Peak</th>
<th>Duration</th>
</tr>
</thead>
<tbody>
<tr>
<td>Uterine stimulation</td>
<td>10 min (contractions begin)</td>
<td>1–2 hrs (abortion time)</td>
</tr>
</tbody>
</table>

Undergoes rapid enzymatic deactivation primarily in maternal lungs. Protein binding: 73%. Primarily excreted in urine. **Half-life:** Less than 5 min.

**Lifespan considerations**

**Pregnancy/Lactation:** **Suppository:** Teratogenic, therefore abortion must be complete. **Gel:** Sustained uterine hyperstimulation may affect fetus (e.g., abnormal heart rate). **Children/Elderly:** Not used in these pt populations.

**Interactions**

**DRUG:** Oxytocics may cause uterine contractions, possibly resulting in uterine rupture, cervical laceration. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** May alter B/P, heart rate. May increase body temperature.

**Availability (Rx)**

**Endocervical Gel (Prepidil):** 0.5 mg/3 g syringe. **Vaginal Inserts (Cervidil):**
10 mg. **Vaginal Suppositories (Prostin E₂):** 20 mg.

**Administration/handling**

**Gel**

- Refrigerate.
- Use caution in handling; prevent skin contact. Wash hands thoroughly with soap and water following administration.
- Bring to room temperature just before use (avoid forcing the warming process).
- Assemble dosing apparatus as described in manufacturer’s insert.
- Place pt in dorsal position with cervix visualized using a speculum.
- Introduce gel into cervical canal just below level of internal os.
- Have pt remain in supine position at least 15–30 min (minimizes leakage from cervical canal).
- Wait 6–12h after gel administration before initiating oxytocin therapy.

**Suppository, Vaginal Inserts**

- Keep frozen (−4°F); bring to room temperature just before use.
- Administer only in hospital setting with emergency equipment available.
- Warm suppository to room temperature before removing foil wrapper.
- Avoid skin contact (risk of absorption).
- Insert high into vagina.
- Pt should remain supine for 10 min after administration of suppository, 2 hrs after vaginal insert.
- Wait at least 30 min after removing insert before initiating oxytocin therapy.

**Indications/routes/dosage**

**Abortifacient**

**Intravaginal:** **ADULTS (VAGINAL SUPPOSITORY):** 20 mg (one suppository) high into vagina. May repeat at 3- to 5-hr intervals until abortion occurs. Do not administer for longer than 2 days.

**Ripening of Unfavorable Cervix**

**Intracervical (Prepidil):** **ADULTS (ENDOCERVICAL GEL):** Using catheter
supplied, insert 0.5 mg into cervical canal. May repeat 0.5-mg dose q6h prn. **Maximum:** 1.5 mg (7.5 mL) for a 24-hr period. **Intracervical** (Cervidil): ADULTS (VAGINAL INSERT): 10 mg transversely into posterior fornix of the vagina (remove upon onset of active labor or 12 hrs after insertion).

**Side effects**

**Frequent** (66%–33%): Vomiting, diarrhea, nausea. **Occasional** (10%): Headache, chills/shivering, urticaria, bradycardia, increased uterine pain accompanying abortion, peripheral vasoconstriction. **Rare:** Flushing of skin, vulvar edema.

**Adverse effects/toxic reactions**

Overdose may cause uterine contractions with spasm and tetanic contraction, leading to cervical laceration/perforation, uterine rupture/hemorrhage.

**Nursing considerations**

**Baseline assessment**

Offer emotional support. **Suppository:** Obtain orders for antiemetics, antidiarrheals, meperidine, other pain medication for abdominal cramps. Assess any uterine activity, vaginal bleeding. **Gel:** Assess Bishop score. Assess degree of effacement (determines size of shielded endocervical catheter).

**Intervention/evaluation**

**Suppository:** Check strength, duration, frequency of contractions. Monitor vital signs q15min until stable, then hourly until abortion complete. Check resting uterine tone. Administer medications for relief of GI effects if indicated or for abdominal cramps. **Gel:** Monitor uterine activity (onset of uterine contractions), fetal status (heart rate), character of cervix (dilation, effacement). Have pt remain recumbent 12 hrs after application with continuous electronic monitoring of fetal heart rate, uterine activity. Record maternal vital signs at least hourly in presence of uterine activity. Reassess Bishop score.
Patient/family teaching

• Suppository: Report promptly fever, chills, foul-smelling/increased vaginal discharge, uterine cramps, pain.

<tr>
<td>Selax</td>
</tr>
<tr>
<td>Soflax</td>
</tr>
</tbody>
</table>

CLASSIFICATION
PHARMACOTHERAPEUTIC: Surfactant.
CLINICAL: Stool softener.
Do not confuse Colace with Calan or Cozaar.

Fixed-combination(s)
Peri-Colace, Senokot-S: colace/senna (a laxative): 50 mg/8.6 mg.

Uses
Prevention of straining during defecation; constipation associated with hard, dry stools. Relief of occasional constipation.

Precautions
Contraindications: Hypersensitivity to docusate. Acute abdominal pain, concomitant use of mineral oil, intestinal obstruction, nausea, vomiting. Cautions: Do not use for longer than 1 wk.

Action
Decreases surface film tension by mixing liquid with bowel contents. **Therapeutic Effect:** Increases infiltration of liquid to form softer stool.

**Pharmacokinetics**

Minimal absorption from GI tract. Acts in small and large intestines. Results usually occur 1–2 days after first dose but may take 3–5 days.

**Lifespan considerations**

**Pregnancy/Lactation:** Unknown if drug is distributed in breast milk. **Children:** Not recommended in pts younger than 6 yrs. **Elderly:** No age-related precautions noted.

**Interactions**

**DRUG:** None significant. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** None significant.

**Availability (OTC)**

**Capsules:** 50 mg, 100 mg, 250 mg. **Liquid:** 50 mg/5 mL. **Syrup:** 60 mg/15 mL.

**Administration/handling**

• Drink 6–8 glasses of water a day (aids stool softening).
• Give each dose with full glass of water, fruit juice.
• Administer docusate liquid with milk, fruit juice, infant formula (masks bitter taste).

**Indications/routes/dosage**

**Stool Softener**

**PO:** **ADULTS, ELDERLY, CHILDREN 12 YRS AND OLDER:** 50–500 mg/day once daily or in divided doses. **CHILDREN 2–11 YRS:** 50–150 mg/day once daily or in divided doses.
Side effects

**Occasional:** Mild GI cramping, throat irritation (with liquid preparation). **Rare:** Rash.

Adverse effects/toxic reactions

None known.

Nursing considerations

**BASELINE ASSESSMENT**

Question usual stool frequency, consistency. Screen for intestinal obstruction. Assess hydration status.

**Intervention/evaluation**

**Patient/family teaching**

• Take measures to promote defecation: increase fluid intake, exercise, high-fiber diet.
• Do not use for longer than 1 wk.

evolocumab
e-voie-lok-ue-mab
Repatha

**CLASSIFICATION**

PHARMACOTHERAPEUTIC: Proprotein convertase subtilisin kexin 9 (PCSK9) inhibitor.

CLINICAL: Antihyperlipidemic, monoclonal antibody.

**BLACK BOX ALERT** Do not confuse evolocumab with alirocumab or raxibacumab.
Uses
Adjunct to diet and maximally tolerated statin therapy for the treatment of adults with heterozygous familial hypercholesterolemia or clinical atherosclerotic cardiovascular disease, who require additional lowering of low-density lipoprotein cholesterol (LDL-C). Adjunct to diet and other LDL-lowering therapies (e.g., statins, ezetimibe, LDL apheresis) in pts with homozygous familial hypercholesterolemia who requires additional lowering of LDL-C.

Precautions
Contraindications: Hypersensitivity to evolocumab. Caution: Active infection.

Action
Binds to and inhibits circulating PCSK9 from binding to LDL receptor (LDLR), preventing LDLR degradation and allowing LDLR to recycle back to the liver surface. Increases number of LDLR available to clear LDL from the blood. Therapeutic Effect: Lowers LDL-C levels.

Pharmacokinetics

Lifespan considerations
Pregnancy/Lactation: May cross placental barrier, esp. during second and third trimester. Unknown if distributed in breast milk; however, human immunoglobulin G is present breast milk. Must either discontinue drug or discontinue breastfeeding. Children: Safety and efficacy not established in pts with homozygous familial hypercholesterolemia who are younger than 13 yrs. Safety and efficacy not established in pts with heterozygous familial hypercholesterolemia or primary hypercholesterolemia. Elderly: No age-related precautions noted.
Interactions

**DRUG:** None known. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** Expected to decrease serum LDL-C levels.

Availability (Rx)

**Injection Solution:** 140 mg/mL in single-use prefilled syringe, auto-injector. 420 mg/3.5 mL single-use Pushtronex system (on-body infusor with prefilled cartridge).

Administration/handling

Subcutaneous

- Remove auto-injector/prefilled syringe from refrigerator and allow to passively warm to room temperature.
- Visually inspect for particulate matter or discoloration. Solution should appear clear to opalescent, colorless to pale yellow in color. Do not use if solution is cloudy, discolored, or contains particles; if the auto-injector/prefilled syringe has been dropped; or if the cap is missing or not securely attached.
- Once cap is removed, subcutaneously insert needle into abdomen, outer thigh, or upper arm region, and inject solution.
- Do not inject into areas of active skin disease or injury such as sunburns, skin rashes, inflammation, or skin infections.
- If using auto-injector, depress gray button until a click is heard, and allow 15 sec to pass to ensure that solution is fully injected.
- Rotate injection sites.

Storage

- Refrigerate auto-injector/prefilled syringe in original carton.
- May store at room temperature for no more than 30 days.
- Protect from direct light.
- Do not freeze.

Indications/routes/dosage

**Heterozygous Familial Hypercholesterolemia**
SQ: ADULTS, ELDERLY: 140 mg q2wks or 420 mg once monthly. Give 420-mg dose as 3 separate injections within 30 min. If switching between regimens, give the first dose of the new regimen on the next scheduled date of the prior regimen. If a q2wk or once-monthly dose is missed, administer as soon as possible if there are more than 7 days until the next scheduled dose or skip the missed dose and administer the next dose according to the original schedule.

Homozygous Familial Hypercholesterolemia

SQ: ADULTS, ELDERLY: 420 mg once monthly as 3 separate injections within 30 min. If a once-monthly dose is missed, administer as soon as possible if there are more than 7 days until the next scheduled dose or skip the missed dose according to the original schedule.

Dosage in Renal/Hepatic Impairment

Mild to moderate impairment: No dose adjustment. Severe impairment: Not studied; use caution.

Side effects

Occasional (6%–3%): Back pain, injection site reactions (bruising, erythema, localized pain), cough, headache, myalgia, dizziness, musculoskeletal pain, hypertension, diarrhea.

Adverse effects/toxic reactions

Serious hypersensitivity reactions (e.g., pruritus, rash, urticaria) reported in (5.1% of pts). Infectious processes such as gastroenteritis (3% of pts), influenza (7.5% of pts), nasopharyngitis (10.5% of pts), sinusitis (4.2% of pts), upper respiratory tract infection (9.3% of pts), UTI (4.5% of pts) have occurred. Musculoskeletal events including arthralgia, back pain, myalgia reported in 14% of pts. Immunogenicity (auto-evolocumab antibodies) occurred in less than 1% of pts.

Nursing considerations

Baseline assessment
Obtain baseline LDL-C level. Verify whether pt is positive for heterozygous or homozygous familial hypercholesterolemia. Question history of hypersensitivity reaction. Assess potential injection sites for sunburns, skin rashes, inflammation, skin infections. Verify pregnancy status.

**Intervention/evaluation**

Obtain LDL-C level within 4–8 wks after initiation or with any change in dosage. Monitor for hypersensitivity reaction. If hypersensitivity reaction occurs, discontinue therapy and treat symptoms accordingly; monitor until symptoms resolve. Monitor for respiratory infections, musculoskeletal events.

**Patient/family teaching**

- A health care provider will show you how to properly mix and inject your medication. You must demonstrate correct preparation and injection techniques before using medication at home.
- Inject dose under the skin (SQ) of your outer thigh, abdomen, or upper arm; do not inject into muscle or vein.
- Rotate injection sites.
- Discard used needles using regulated sharps containers.
- Treatment may cause serious allergic reactions such as difficulty breathing, itching, hives, rash. If allergic reaction occurs, seek immediate medical attention.
- Do not reuse auto-injector/prefilled syringes.
- Report symptoms of infection.

---

**Fludarabine**

floo-dar-a-been

Fludara

◆ **CLASSIFICATION**

PHARMACOTHERAPEUTIC: Antimetabolite.

CLINICAL: Antineoplastic.

- **BLACK BOX ALERT** - Must be administered by certified chemotherapy personnel. Severe neurologic toxicity reported. Life-threatening hemolytic anemia, autoimmune thrombocytopenic purpura, hemophilia have occurred. Risk of severe myelosuppression (anemia, thrombocytopenia, neutropenia). Concurrent use with pentostatin may
produce severe/fatal pulmonary toxicity.

Do not confuse Fludara with FUDR, or fludarabine with cladribine or Flumadine.

Uses

Treatment of progressive or refractory B-cell chronic lymphocytic leukemia (CLL) in pts who have not responded to or have not progressed with another standard alkylating agent. **OFF-LABEL:** Treatment of non-Hodgkin’s lymphoma, relapsed acute lymphocytic leukemia (ALL) or acute myeloid leukemia (AML) in children, Waldenström’s macroglobulinemia, reduced-intensity conditioning regimens prior to allogeneic hematopoietic stem-cell transplantation.

Precautions

**Contraindications:** Hypersensitivity to fludarabine. **Cautions:** Renal insufficiency, preexisting hematological disorders (e.g., granulocytopenia), seizure disorder, spasticity, peripheral neuropathy, infection, fever before administration, immunodeficiency.

Action

Inhibits DNA synthesis by interfering with DNA polymerase alpha, ribonucleotide reductase, DNA primase. **Therapeutic Effect:** Induces cell death.

Pharmacokinetics

Rapidly dephosphorylated in serum, then phosphorylated intracellularly to active triphosphate. Primarily excreted in urine. **Half-life:** 7–20 hrs.

Lifespan considerations

**Pregnancy/Lactation:** If possible, avoid use during pregnancy, esp. first trimester. May cause fetal harm. Unknown if distributed in breast milk. Breastfeeding not recommended. **Children:** Safety and efficacy not established.
Elderly: Age-related renal impairment may require dosage adjustment.

Interactions

**DRUG:** Pentostatin may increase risk of pulmonary toxicity. **Bone marrow depressants** may increase risk of myelosuppression. **Live virus vaccines** may potentiate virus replication, increase vaccine side effects, decrease pt’s antibody response to vaccine. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** May increase serum alkaline phosphatase, AST, uric acid.

Availability (Rx)

**Injection, Powder for Reconstitution (Fludara):** 50 mg. **Injection, Solution:** 25 mg/mL.

Administration/handling

- Give by IV infusion. Do not add to other IV infusions. Avoid small veins; swollen, edematous extremities; areas overlying joints, tendons.

★ IV

**Reconstitution**
- Handle with extreme care during preparation/administration. If contact with skin or mucous membranes occurs, wash thoroughly with soap and water; rinse eyes profusely with plain water.
- Reconstitute 50-mg vial with 2 mL Sterile Water for Injection to provide concentration of 25 mg/mL.
- Further dilute with 100–125 mL 0.9% NaCl or D₅W.

**Rate of Administration**
- Infuse over 30 min.

**Storage**
- Store in refrigerator.
- Reconstituted vials stable for 16 days at room temperature or refrigerated.
- Diluted solutions stable for 48 hrs at room temperature or refrigerated.

★ IV incompatibilities

Acyclovir (Zovirax), amphotericin B (Fungizone), DAUNOrubicin,
hydrOXYzine (Vistaril), prochlorperazine (Compazine).

**IV Compatibilities**

Heparin, HYDROmorphine (Dilaudid), LORazepam (Ativan), magnesium sulfate, morphine, multivitamins, potassium chloride.

**Indications/routes/dosage**

**Chronic Lymphocytic Leukemia**

**IV: ADULTS:** 25 mg/m² daily for 5 consecutive days. Continue for up to 3 additional cycles. Begin each course of treatment every 28 days.

**Dosage in Renal Impairment**

<table>

**Dosage in Hepatic Impairment**

No dose adjustment.

**Side effects**

**Frequent (60%–11%):** Fever, nausea/vomiting, chills. **Occasional (20%–10%):** Fatigue, generalized pain, rash, diarrhea, cough, asthenia, stomatitis, dyspnea, peripheral edema. **Rare (7%–3%):** Anorexia, sinusitis, dysuria, myalgia, paresthesia, headache, visual disturbances.

**Adverse effects/toxic reactions**

Pneumonia occurs frequently. Severe hematologic toxicity (anemia, thrombocytopenia, neutropenia), GI bleeding may occur. Tumor lysis syndrome may begin with flank pain, hematuria; may also include hypercalcemia,
hyperphosphatemia, hyperuricemia, resulting in renal failure. High-dosage therapy may produce acute leukemia, blindness, coma. Neurotoxicity (progressive demyelinating encephalopathy, mental status deterioration) occurs rarely.

Nursing considerations

Baseline assessment
Assess baseline CBC, BMP, LFT, uric acid and monitor during treatment. Drug should be discontinued if intractable vomiting, diarrhea, stomatitis, GI bleeding occurs. Question history of seizure disorder, neuropathy, immunocompromised conditions, renal impairment, hematologic cytopenias. Offer emotional support.

Intervention/evaluation

Patient/family teaching
• Avoid crowds, exposure to infection.
• Maintain strict oral hygiene.
• Promptly report fever, sore throat, signs of local infection, unusual bruising/bleeding from any site.
• Report persistent nausea/vomiting, bloody urine or stool, decreased urinary output; blindness, confusion, nerve pain, seizure activity, weakness.

foscarnet
foss-kar-net
Foscavir
◆ CLASSIFICATION
PHARMACOTHERAPEUTIC: Phosphonic acid derivative.
CLINICAL: Antiviral.
Renal toxicity occurs to some degree in majority of pts. For use only in immunocompromised pts with cytomegalovirus (CMV) retinitis and mucocutaneous acyclovir-resistant herpes simplex virus (HSV) infection. Seizures due to electrolyte/mineral imbalance may occur.

Uses

Treatment of acyclovir-resistant mucocutaneous HSV in immunocompromised pts; treatment of CMV retinitis in HIV pts. **OFF-LABEL:** Other CMV infections (e.g., colitis, esophagitis); CMV prophylaxis for cancer pts receiving alemtuzumab or allogenic stem cell transplant.

Precautions

**Contraindications:** Hypersensitivity to foscarnet. **Cautions:** Neurologic/cardiac abnormalities, history of hepatic/renal impairment, altered calcium, other electrolyte imbalances.

Action

Selectively inhibits binding sites on virus-specific DNA polymerase, HIV reverse transcriptase. **Therapeutic Effect:** Inhibits replication of herpes virus. Virustatic.

Pharmacokinetics

Sequestered into bone, cartilage. Protein binding: 14%–17%. Primarily excreted unchanged in urine. Removed by hemodialysis. **Half-life:** 3.3–6.8 hrs (increased in renal impairment).

Lifespan considerations

**Pregnancy/Lactation:** Unknown if distributed in breast milk. **Children:** Safety and efficacy not established. **Elderly:** Age-related renal impairment may require dosage adjustment.
Interactions

**DRUG:** Nephrotoxic medications (e.g., lisinopril, IV contrast dye, vancomycin) may increase risk of renal toxicity. **Pentamidine** (IV) may cause reversible hypocalcemia, hypomagnesemia, nephrotoxicity. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** May increase serum alkaline phosphatase, bilirubin, creatinine, ALT, AST. May decrease serum magnesium, potassium. May alter serum calcium, phosphate.

Availability (Rx)

**Injection Solution:** 24 mg/mL (250 mL).

Administration/handling

#### IV

**Reconstitution**
- Standard 24 mg/mL solution may be used without dilution when central venous catheter is used for infusion; 24 mg/mL solution *must* be diluted to maximum concentration of 12 mg/mL when peripheral vein catheter is being used.
- Dilute only with D₅W or 0.9% NaCl solution.

**Rate of Administration**
- Because dosage is calculated on body weight, unneeded quantity should be removed before start of infusion to avoid overdosage. Aseptic technique must be used and solution administered within 24 hrs of first entry into sealed bottle.
- Do not give by IV injection or rapid infusion (increases toxicity).
- Administer at rate not exceeding 1 mg/kg/min.
- To minimize toxicity and phlebitis, use central venous lines or veins with adequate blood flow to permit rapid dilution, dissemination.
- Use IV infusion pump to prevent accidental overdose.

**Storage**
- Store parenteral vials at room temperature.
- After dilution, stable for 24 hrs at room temperature.
- Do not use if solution is discolored or particulate forms.

#### IV incompatibilities
Acyclovir (Zovirax), amphotericin B (Fungizone), calcium, co-trimoxazole (Bactrim), diazepam (Valium), digoxin (Lanoxin), diphenhydramine (Benadryl), DOBUTamine (Dobutrex), ganciclovir (Cytovene), haloperidol (Haldol), leucovorin, magnesium, midazolam (Versed), pentamidine (Pentam IV), prochlorperazine (Compazine), vancomycin (Vancocin).

IV Compatibilities
DOPamine (Intropin), heparin, HYDROMorphone (Dilaudid), LOrazepam (Ativan), morphine, potassium chloride.

Indications/routes/dosage

Cytomegalovirus (CMV) Retinitis
IV: ADULTS, ELDERLY, ADOLESCENTS: Initially, 60 mg/kg q8h or 90 mg/kg q12h for 2–3 wks. Maintenance: 90–120 mg/kg/day as a single IV infusion.

Herpes Simplex Infection
IV: ADULTS, ELDERLY, ADOLESCENTS: 40 mg/kg q8–12h for 2–3 wks or until healed.

Dosage in Renal Impairment
Dosages are individualized based on creatinine clearance. Refer to dosing guide provided by manufacturer.

Dosage in Hepatic Impairment
No dose adjustment.

Side effects
Frequent (65%–30%): Fever, nausea, vomiting, diarrhea. Occasional (29%–5%): Anorexia, pain/inflammation at injection site, rigors, malaise, altered B/P, headache, paresthesia, dizziness, rash, diaphoresis, abdominal pain. Rare (4%–1%): Back/chest pain, edema, flushing, pruritus, constipation, dry mouth.
Adverse effects/toxic reactions

Nephrotoxicity occurs to some extent in most pts. Seizures, serum mineral/electrolyte imbalances may be life-threatening.

Nursing considerations

Baseline assessment
Obtain baseline CBC, serum electrolyte levels, renal function test, vital signs. Risk of renal impairment can be reduced by sufficient fluid intake to ensure diuresis prior to and during therapy.

Intervention/evaluation

Patient/family teaching
• Report perioral tingling, numbness in extremities, paresthesia during or following infusion (may indicate electrolyte abnormalities).
• Tremors should be reported promptly due to potential for seizures.

Fulvestrant
ful-vest-rant
Faslodex

CLASSIFICATION
PHARMACOTHERAPEUTIC: Estrogen antagonist.
CLINICAL: Antineoplastic.
Do not confuse Faslodex with Fosamax.

Uses
Treatment of hormone receptor–positive metastatic breast cancer in
postmenopausal women with disease progression following antiestrogen therapy.

**Precautions**

**Contraindications:** Hypersensitivity to fulvestrant. **Cautions:** Thrombocytopenia, bleeding diathesis, anticoagulant therapy, hepatic impairment, reduced hepatic blood flow, pregnancy.

**Action**

Competes with endogenous estrogen at estrogen receptor binding sites. **Therapeutic Effect:** Inhibits tumor growth.

**Pharmacokinetics**

Extensively, rapidly distributed after IM administration. Protein binding: 99%. Metabolized in liver. Eliminated by hepatobiliary route; excreted in feces. **Half-life:** 40 days in postmenopausal women. Peak serum levels occur in 7–9 days.

**Lifespan considerations**

**Pregnancy/Lactation:** Do not administer to pregnant women. Unknown if excreted in breast milk. May cause fetal harm. **Children:** Not used in this pt population. **Elderly:** No age-related precautions noted.

**Interactions**

**DRUG:** None significant. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** May increase ALT, AST.

**Availability (Rx)**

**Injection, Solution:** 50 mg/mL.

**Administration/handling**

**IM**

- Administer slowly into upper, outer quadrant or ventrogluteal area of buttock
as two injections, one in each buttock over 1–2 min.

**Indications/routes/dosage**

**Breast Cancer**

**IM:** **ADULTS, ELDERLY:** Initially, 500 mg (two 250-mg injections) on days 1, 15, and 29. **Maintenance:** 500 mg once monthly thereafter.

**Dosage in Renal Impairment**

No dose adjustment.

**Dosage in Hepatic Impairment**

**Mild impairment:** No dose adjustment. **Moderate impairment:** Reduce initial and maintenance dose to 250 mg. **Severe impairment:** Use caution (not studied).

**Side effects**

**Frequent (26%–13%):** Nausea, hot flashes, pharyngitis, asthenia, vomiting, vasodilation, headache. **Occasional (12%–5%):** Injection site pain, constipation, diarrhea, abdominal pain, anorexia, dizziness, insomnia, paresthesia, bone/back pain, depression, anxiety, peripheral edema, rash, diaphoresis, fever. **Rare (2%–1%):** Vertigo, weight gain.

**Adverse effects/toxic reactions**

UTI occurs occasionally. Vaginitis, anemia, thromboembolic phenomena, leukopenia occur rarely.

**Nursing considerations**

**Baseline assessment**

Estrogen receptor assay should be done before beginning therapy. Baseline radiologic testing should be performed initially and periodically thereafter for evidence of tumor regression. Offer emotional support. Screen for history of
depression.

**Intervention/evaluation**

Monitor serum chemistries, plasma lipids. Be alert to increased bone pain, ensure adequate pain relief. Check for edema, esp. of dependent areas. Monitor for and assist with ambulation if asthenia or dizziness occurs. Assess for headache. Offer antiemetic for nausea/vomiting.

**Patient/family teaching**

- Notify physician if nausea/vomiting, asthenia (loss of strength, energy), hot flashes become unmanageable.
- Report symptoms of depression.

---

**guaiFENesin**

gwy-e-fen-e-sin

**Mucinex**

**Robitussin**

---

**Fixed-Combination(s)**

- **Mucinex D:** guaiFENesin/pseudoephedrine (a sympathomimetic): 600 mg/60 mg, 1,200 mg/120 mg. **Mucinex DM:** guaiFENesin/dextromethorphan (a cough suppressant): 600 mg/30 mg, 1,200 mg/60 mg. **Robitussin AC:** guaiFENesin/codeine (a narcotic analgesic): 100 mg/10 mg, 75 mg/2.5 mg per 5 mL. **Robitussin DM:** guaiFENesin/dextromethorphan (a cough suppressant): 100 mg/10 mg per 5 mL.

*Do not confuse guaiFENesin with guanFACINE, or Mucinex with Mucomyst.*

---

**Classification**

**PHARMACOTHERAPEUTIC:** Respiratory expectorant. **CLINICAL:** Expectorant.

---

**Uses**
Helps loosen phlegm (mucus) and thin bronchial secretions, making cough more productive.

**Precautions**

**Contraindications:** Hypersensitivity to guaIFENesin. **Cautions:** Avoid OTC use in children younger than 2 yrs.

**Action**

Stimulates respiratory tract secretions by decreasing adhesiveness, viscosity of mucus. **Therapeutic Effect:** Promotes removal of viscous mucus.

**Pharmacokinetics**

Well absorbed from GI tract. Metabolized in liver. Excreted in urine. **Half-life:** 1 hr.

* Lifespan considerations
  
  **Pregnancy/Lactation:** Unknown if drug crosses placenta or is distributed in breast milk. **Children:** Caution advised in pts younger than 2 yrs with persistent cough. **Elderly:** No age-related precautions noted.

**Interactions**

**DRUG:** None significant. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** None significant.

**Availability (OTC)**

**Liquid:** 100 mg/5 mL. **Syrup:** 100 mg/5 mL. **Tablets:** 200 mg, 400 mg. **Tablets, Extended-Release:** (Mucinex) 600 mg, 1,200 mg.

**Administration/handling**

**PO**

• Store syrup, liquid, tablets at room temperature.
• Give without regard to meals.
• Do not break, crush, dissolve, or divide extended-release tablet.

Indications/routes/dosage

Expectorant

PO: ADULTS, ELDERLY, CHILDREN OLDER THAN 12 YRS: 200–400 mg q4h. Maximum: 2.4 g/day. CHILDREN 6–12 YRS: 100–200 mg q4h. Maximum: 1.2 g/day. CHILDREN 2–5 YRS: 50–100 mg q4h. Maximum: 600 mg/day. CHILDREN 6 MOS–2 YRS: 25–50 mg q4h. Maximum: 300 mg/day.

PO (Extended-Release): ADULTS, ELDERLY, CHILDREN OLDER THAN 12 YRS: 600–1,200 mg q12h. Maximum: 2.4 g/day.

Side effects

Rare: Dizziness, headache, rash, diarrhea, nausea, vomiting, abdominal pain.

Adverse effects/toxic reactions

Overdose may produce nausea, vomiting.

Nursing considerations

Baseline assessment

Assess type, severity, frequency of cough.

Intervention/evaluation

Initiate deep breathing, coughing exercises, particularly in pts with pulmonary impairment. Assess for clinical improvement; record onset of relief of cough. Increase fluid intake, environmental humidity to lower viscosity of lung secretions.

Patient/family teaching

• Avoid tasks that require alertness, motor skills until response to drug is
• Do not take for chronic cough.
• Report persistent cough if fever, rash, headache, sore throat is present with cough.
• Maintain adequate hydration.

**guanFACINE**

*gwan*-fah-seen

Intuniv

Do not confuse guanFACINE with guaiFENesin or guanidine.

**Classification**

**PHARMACOTHERAPEUTIC:** Alpha\textsubscript{2A}-adrenergic agonist. **CLINICAL:** Psychotherapeutic agent.

**Uses**

Treatment of attention-deficit/hyperactivity disorder (ADHD). **OFF-LABEL:** Tic disorder, aggression, Tourette’s syndrome.

**Precautions**

**Contraindications:** Hypersensitivity to guanFACINE. **Cautions:** Renal/hepatic impairment.

**Action**

Interacts with alpha\textsubscript{2A}-adrenergic receptors in prefrontal cortex of brain. Reduces sympathetic outflow. Behaviors (inattention, hyperactivity, impulsiveness) related to ADHD may be controlled in this part of the brain. **Therapeutic Effect:** Improves symptoms of ADHD.

**Pharmacokinetics**

Readily absorbed from GI tract. Protein binding: 70%. Metabolized in liver. Excreted in urine. **Half-life:** 14–22 hrs.
Lifespan considerations

Interactions

DRUG: CYP3A4 inhibitors (e.g. clarithromycin, ketoconazole, saquinavir) may increase risk of hypotension, bradycardia, sedation. RifAMPin may decrease concentration. May increase valproic acid concentration. Increased risk of cardiovascular effects with antihypertensives (e.g., amlodipine, lisinopril, valsartan). Alcohol, antipsychotics, barbiturates (e.g., PHENobarbital), benzodiazepines (e.g., LORazepam), sedative/hypnotics (e.g., zolpidem) may produce additive sedative effects. HERBAL: None significant. FOOD: High-fat meals may increase concentration. LAB VALUES: None significant.

Availability (Rx)

Tablets: 1 mg, 2 mg. Tablets, Extended-Release: 1 mg, 2 mg, 3 mg, 4 mg.

Administration/handling

PO

• Do not give with high-fat meal.
• Do not break, crush, dissolve or divide extended-release tablets.

Indications/routes/dosage

Dosing should be considered on a mg/kg basis.

ADHD

PO: CHILDREN 6 YRS AND OLDER, (IMMEDIATE-RELEASE)
GREATER THAN 45 KG: Initially, 1 mg once daily at bedtime. May increase by 1 mg/day q3–4 days. Maximum: 4 mg/day. 45 KG OR LESS: Initially, 0.5 mg once daily at bedtime. May increase by 0.5 mg/day q3–4 days. Maximum: 27–40.5 kg: 2 mg/day; 40.6–45 kg: 3 mg/day. (EXTENDED-RELEASE): Begin at dose of 1 mg/day and adjust in increments of no more than 1 mg/wk until clinical response and tolerability are observed. Maintain dose within range of 1–4 mg once daily. If switching from immediate-release guanFACINE, discontinue that treatment and titrate with extended-release guanFACINE. When discontinuing, taper dose in decrements of no more than 1 mg every 3–7 days.

Dosage in Renal/Hepatic Impairment
Use caution.

Side effects
Frequent (38%–10%): Lethargy, headache, fatigue, upper abdominal pain. Occasional (6%–3%): Nausea, lethargy, dizziness, irritability, hypotension or decreased B/P, decreased appetite, dry mouth, constipation. Rare (2%–1%): Dyspepsia, asthenia, increased B/P, increased weight, orthostatic hypotension, increased urinary frequency.

Adverse effects/toxic reactions
Abrupt discontinuation may produce infrequent, transient elevations in B/P above original baseline (taper dose in decrements of no more than 1 mg every 3–7 days). Abrupt withdrawal following prolonged administration of high dosage may produce extreme fatigue (may last for wks). Prolonged administration to children may produce suppression of weight and/or height patterns. AV block, bradycardia, arrhythmias occur rarely.

Nursing considerations
Baseline assessment
Obtain baseline vital signs, serum chemistries. Measure pulse, B/P prior to initiation of therapy, following dose increases, and periodically during therapy.
### Intervention/evaluation

Assist with ambulation if sedation, dizziness, fatigue, lethargy occur. Be alert to mood changes. Assess for nausea, headache. Monitor B/P, serum chemistries, particularly renal/hepatic function for change from baseline. Monitor daily pattern of bowel activity, stool consistency.

### Patient/family teaching

- Avoid tasks that require alertness, motor skills until response to drug is established.
- Avoid alcohol.
- Dry mouth may be relieved with sugarless gum, sips of water.
- Advise pts to avoid becoming dehydrated, overheated.
- Do not substitute for immediate-release guanFACINE tablets.
- Swallow extended-release tablets whole; do not chew, crush, dissolve, or divide.
- Do not take with high-fat meal.

#### CLASSIFICATION

**PHARMACOTHERAPEUTIC**: Aminoquinoline.

**CLINICAL**: Antimalarial, antirheumatic.

#### BLACK BOX ALERT

Should be given by physicians familiar with prescribing information before use.

**Do not confuse hydroxychloroquine with hydrocortisone or hydrOXYzine, or Plaquenil with Platinol.**

### Uses

Suppression and treatment of acute attacks of malaria. Treatment of systematic lupus erythematosus, rheumatoid arthritis (RA). **OFF-LABEL**: Porphyria,
treatment of Q fever.

**Precautions**

**Contraindications:** Hypersensitivity to hydroxychloroquine. Porphyria, psoriasis, retinal or visual field changes. **Cautions:** Alcoholism, hepatic disease, G6PD deficiency. Concomitant use of hepatotoxic medications. Children are esp. susceptible to hydroxychloroquine fatalities.

**Action**

Concentrates in parasite acid vesicles, interfering with parasite protein (DNA/RNA) synthesis. Inhibits movement of neutrophils and chemotaxis of eosinophils. **Therapeutic Effect:** Inhibits parasite growth. Reduces symptom severity of RA.

**Pharmacokinetics**

Variable rate of absorption. Widely distributed in body tissues (eyes, kidneys, liver, lungs). Protein binding: 45%. Partially metabolized in liver. Partially excreted in urine. **Half-life:** 32 days (in plasma), 50 days (in blood).

**Lifespan considerations**

**Pregnancy/Lactation:** Crosses placenta; distributed in breast milk. **Children:** Long-term therapy not recommended. **Elderly:** No age-related precautions noted.

**Interactions**

**DRUG:** May increase concentration of dapsone. **HERBAL:** Echinacea may decrease concentration. **FOOD:** None known. **LAB VALUES:** None significant.

**Availability (Rx)**

**Tablets:** 200 mg (155 mg base).

**Administration/handling**
PO

- Give with food or milk.

## Indications/routes/dosage

### Treatment of Acute Malaria

**PO:**

<table>
<thead>
<tr>
<th>Dose</th>
<th>Times</th>
<th>Adults/Elderly</th>
<th>Children</th>
</tr>
</thead>
<tbody>
<tr>
<td>Initial</td>
<td>Day 1</td>
<td>800 mg</td>
<td>13 mg/kg</td>

</tr>
<tr>
<td>Fourth</td>
<td>Day 3</td>
<td>400 mg</td>
<td>6.5 mg/kg</td>
</tr>
</tbody>
</table>

### Suppression of Malaria

**PO:** **ADULTS, ELDERLY:** 400 mg base wkly on same day each wk, beginning 2 wks before entering an endemic area and continuing for 4–6 wks after leaving the area. **CHILDREN:** 6.5 mg/kg/wk, beginning 2 wks before entering an endemic area and continuing for 4–6 wks after leaving the area. If therapy is not begun before exposure, administer a loading dose of 13 mg/kg in 2 equally divided doses 6 hrs apart and continue treatment for 8 wks.

### Rheumatoid Arthritis (RA)

**PO:** **ADULTS, ELDERLY:** Initially, 400–600 mg (310–465 mg base) daily, gradually increase to optimum response level. **Maintenance (usually within 4–12 wks):** Decrease dose by 50% and then continue at maintenance dose of 200–400 mg (155–310 mg base) daily. Maximum effect may not be seen for several mos.

### Lupus Erythematosus

**PO:** **ADULTS, ELDERLY:** Initially, 400 mg (310 mg base) once or twice daily for several wks or mos. **Maintenance:** 200–400 mg/day (155–310 mg base).

### Dosage in Renal/Hepatic Impairment
Use caution.

**Side effects**

**Frequent:** Transient headache, anorexia, nausea, vomiting. **Occasional:** Visual disturbances, anxiety, fatigue, pruritus (esp. palms, soles, scalp), irritability, personality changes, diarrhea, photosensitivity. **Rare:** Stomatitis, dermatitis, impaired hearing.

**Adverse effects/toxic reactions**

Ocular toxicity (esp. retinopathy) may progress even after drug is discontinued. **Prolonged therapy:** Peripheral neuritis, neuromyopathy, hypotension, EKG changes, agranulocytosis, aplastic anemia, thrombocytopenia, seizures, psychosis. **Overdosage:** Headache, vomiting, visual disturbances, drowsiness, seizures, hypokalemia followed by cardiovascular collapse, death.

**Nursing considerations**

**Baseline assessment**

Evaluate CBC, LFT vision. Question history of porphyria, psoriasis. Question history of hepatic impairment, use of hepatotoxic medications.

**Intervention/evaluation**

**Patient/family teaching**

- Avoid exposure to direct sunlight.
- Avoid alcohol.
- Regular eye exams should be obtained q3mos with prolonged therapy.
- Immediately report any new visual difficulties, muscular weakness, impaired hearing, tinnitus, numbness, tremors, rash, persistent diarrhea, emotional changes.
**hyoscyamine**

**hye-oh-sye-a-meen**

Anaspaz

Hyosyne

Levbid

Levsin

Levsin S/L

Nu-Lev

Symax SL

Symax SR

**CLASSIFICATION**

PHARMACOTHERAPEUTIC: Anticholinergic.

CLINICAL: Antimuscarinic, antispasmodic.

Do not confuse Anaspaz with Anaprox, or Levbid with Lithobid or Lopid.

**Fixed-combination(s)**

*Donnatal:* hyoscyamine/atropine (anticholinergic)/PHENobarbital (sedative)/scopolamine (anticholinergic): 0.1037 mg/0.0194 mg/16.2 mg/0.0065 mg.

**Uses**

Adjunctive therapy for relief of biliary/renal colic; control of acute episodes of gastric secretion, hypermotility in spastic colitis, pylorospasm, and abdominal cramps; relieve symptoms of infant colic; control hypermotility in spastic bladder and cystitis; adjunctive therapy in treatment of neurogenic bladder.

**Precautions**

**Contraindications:** Hypersensitivity to hyoscyamine. GI/GU obstruction, myasthenia gravis, narrow-angle glaucoma, paralytic ileus, severe ulcerative colitis. **Cautions:** Hyperthyroidism, HF, cardiac arrhythmias, prostatic...
hypertrophy, neuropathy, chronic lung disease, biliary tract disease, children with spastic paralysis.

**Action**

Inhibits action of acetylcholine at postganglionic (muscarinic) receptor sites. **Therapeutic Effect:** Decreases secretions (bronchial, salivary, sweat gland, gastric juices). Reduces motility of GI, urinary tracts.

**Pharmacokinetics**

<table>
<thead>
<tr>
<th>Route</th>

</tbody>
</table>

Well absorbed following PO administration. Protein binding: 50%. Metabolized in liver. Excreted in urine. Removed by hemodialysis. **Half-life:** 3.5 hrs (immediate-release); 7 hrs (sustained-release).

**Lifespan considerations**

**Pregnancy/Lactation:** Crosses placenta; distributed in breast milk. **Children:** Safety and efficacy not established. **Elderly:** No age-related precautions noted.

**Interactions**

**DRUG:** Antacids may decrease absorption. **Other anticholinergics (e.g., atropine, glycopyrrolate)** may increase effects. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** None significant.

**Availability (Rx)**

- **Capsules, Timed-Release:** 0.375 mg.
- **Elixir (Hyosyne, Levsin):** 0.125 mg/5 mL.
- **Injection, Solution:** 0.5 mg/mL.
- **Solution, Oral Drops:** 0.125 mg/mL.
- **Tablets:** 0.125 mg.
- **Tablets, Orally Disintegrating:** 0.125 mg.
- **Tablets, Sublingual:** 0.125 mg.
- **Tablets, Extended-Release:** 0.375 mg.

**Administration/handling**
PO

• Give before meals.
• Immediate-release tablets may be crushed, chewed.
• Extended-release tablet should be administered whole.
• Allow orally disintegrating tablet placed on tongue to dissolve before swallowing; may give with or without water.
• Sublingual: Place under tongue.

Parenteral

• May give undiluted.

Indications/routes/dosage

GI Tract Disorders

PO (Immediate-Release): ADULTS, ELDERLY, CHILDREN 12 YRS AND OLDER: 0.125–0.25 mg q4h as needed. Maximum: 1.5 mg/day. CHILDREN 2–11 YRS: 0.0625–0.125 mg q4h as needed. Maximum: 0.75 mg/day. ADULTS, ELDERLY: (Extended-Release): 0.375–0.75 mg q12h. Maximum: 1.5 mg/day.

IV, IM: ADULTS, ELDERLY, CHILDREN 12 YRS AND OLDER: 0.25–0.5 mg. May repeat as needed up to 4 times/day at 4-hr intervals.

Hypermotility of Lower Urinary Tract

PO (Sublingual): ADULTS, ELDERLY: 0.15–0.3 mg 4 times/day. (Extended-Release): 0.375 mg q12h.

Infant Colic

PO: INFANTS: Drops dosed q4h as needed (based on weight): 2.3 kg: 3 drops; 3.4 kg: 4 drops; 5 kg: 5 drops; 7 kg: 6 drops; 10 kg: 8 drops; 15 kg: 11 drops.

Dosage in Renal/Hepatic Impairment

No dose adjustment.

Side effects
**Frequent:** Dry mouth, decreased diaphoresis, constipation. **Occasional:** Blurred vision, bloated feeling, urinary hesitancy, drowsiness (with high dosage), headache, intolerance to light, loss of taste, anxiety, flushing, insomnia, impotence, mental confusion or excitement (particularly in elderly, children), temporary light-headedness (with parenteral form), local irritation (with parenteral form). **Rare:** Dizziness, faintness.

**Adverse effects/toxic reactions**

Overdose may produce temporary paralysis of ciliary muscle, pupillary dilation, tachycardia, palpitations, hot/dry/flushed skin, absence of bowel sounds, hyperthermia, increased respiratory rate, EKG abnormalities, nausea, vomiting, rash over face/upper trunk, CNS stimulation, psychosis (agitation, restlessness, rambling speech, visual hallucinations, paranoid behavior, delusions) followed by depression.

**Nursing considerations**

**Baseline assessment**

Before giving medication, instruct pt to void (reduces risk of urinary retention). Question history of myasthenia gravis, narrow-angle glaucoma, BPH, ulcerative colitis, hypothyroidism, pulmonary disease.

**Intervention/evaluation**

**Patient/family teaching**

- May cause dry mouth; maintain proper oral hygiene (lack of saliva may increase risk of cavities).
- Report rash, eye pain, difficulty in urinating, constipation.
- Avoid tasks that require alertness, motor skills until response to drug is established.
• Avoid hot baths, saunas.

*IDArubicin
eye-da-rue-bi-sin
Idamycin PFS

CLASSIFICATION
PHARMACOTHERAPEUTIC: Anthracycline antibiotic. CLINICAL: Antineoplastic.

BLACK BOX ALERT ■ Cardiotoxicity (HF, arrhythmias, cardiomyopathy) may occur. Severe myelosuppressant. Must be administered by personnel trained in administration/handling of chemotherapeutic agents. Severe local tissue damage, necrosis if extravasation occurs. Dosage reduction recommended with renal/hepatic impairment.

Do not confuse Idamycin with Adriamycin, or IDArubicin with DAUNOrubicin, DOXOrubicin, or epiRUBicin.

Uses

Precautions
Contraindications: Hypersensitivity to IDArubicin. Cautions: Renal/hepatic impairment, concurrent radiation therapy, anemia, bone marrow depression, active infections, arrhythmias, cardiomyopathy, severe HF.

Action
Inhibits DNA/RNA synthesis by intercalating between DNA base pairs. Therapeutic Effect: Produces apoptosis of rapidly dividing cells.

Pharmacokinetics

**Lifespan considerations**

**Pregnancy/Lactation:** If possible, avoid use during pregnancy (may be embryotoxic). Unknown if drug is distributed in breast milk (advise to discontinue breastfeeding before drug initiation). **Children:** Safety and efficacy not established. **Elderly:** Cardiotoxicity may be more prevalent. Caution in pts with inadequate bone marrow reserves. Age-related renal impairment may require dosage adjustment.

**Interactions**

**DRUG:** May decrease effects of antigout medications (e.g., allopurinol, probenecid). **Bone marrow depressants** (e.g., alemtuzumab, methotrexate) may increase myelosuppression. **Live virus vaccines** may potentiate virus replication, increase vaccine side effects, decrease pt’s antibody response to vaccine. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** May increase serum alkaline phosphatase, bilirubin, uric acid, ALT, AST. May cause EKG changes.

**Availability (Rx)**

**Injection Solution:** 1 mg/mL in 5-mL, 10-mL, 20-mL vials.

**Administration/handling**

<alert>Give by free-flowing IV infusion (never subcutaneous or IM). Gloves, gowns, eye goggles recommended during preparation/administration of medication. If powder/solution comes in contact with skin, wash thoroughly. Avoid small veins, swollen/edematous extremities, areas overlying joints/tendons.</alert>

**IV**

**Reconstitution**

• May give undiluted or dilute with 0.9% NaCl or D₅W.
Rate of Administration
• Administer IV push into tubing of freely running IV infusion of D\textsubscript{5}W or 0.9% NaCl, preferably via butterfly needle, slowly over 3–5 min.
• May give intermittent infusion over 10–15 min.
• Extravasation produces immediate pain, severe local tissue damage. Stop infusion immediately if extravasation occurs. Apply cold compresses for 30 min immediately, then q30min 4 times/day for 3 days. Keep extremity elevated.

Storage
• Refrigerate vials.
• Diluted solutions in 0.9% NaCl or D\textsubscript{5}W are stable for 72 hrs at room temperature or 7 days if refrigerated.

IV incompatibilities
Acyclovir (Zovirax), allopurinol (Aloprim), ampicillin and sulbactam (Unasyn), ceFAZolin (Ancef, Kefzol), cefepime (Maxipime), cefTAZidime (Fortaz), clindamycin (Cleocin), dexamethasone (Decadron), furosemide (Lasix), hydrocortisone (Solu-Cortef), LORazepam (Ativan), methotrexate, piperacillin and tazobactam (Zosyn), sodium bicarbonate, teniposide (Vumon), vancomycin (Vancocin), vinCRISTine (Oncovin).

IV Compatibilities
DiphenhydRAMINE (Benadryl), granisetron (Kytril), magnesium, potassium.

Indications/routes/dosage
Refer to individual protocols.

AML
IV:ADULTS, ELDERLY: (Induction): 12 mg/m\textsuperscript{2}/day for 3 days (in combination with cytarabine). A second induction cycle may be administered if necessary.

Dosage in Renal Impairment
ADULTS: CrCl 10–50 mL/min: Give 75% of dose. CrCl less than 10 mL/min: Give 50% of dose. CHILDREN: CrCl less than 50 mL/min: Give
75% of dose.

**Hemodialysis, Peritoneal Dialysis, Continuous Renal Replacement Therapy:**
Administer 75% of dose.

**Dosage in Hepatic Impairment**

**Bilirubin 2.6–5 mg/dL:** Give 50% of dose. **Bilirubin greater than 5 mg/dL:** Avoid use.

**Side effects**

**Frequent (82%–50%):** Nausea, vomiting, complete alopecia (scalp, axillary, pubic hair), abdominal cramping, diarrhea, mucositis. **Occasional (46%–20%):** Hyperpigmentation of nailbeds, phalangeal, dermal creases; fever, headache. **Rare:** Conjunctivitis, neuropathy.

**Adverse effects/toxic reactions**

Myelosuppression (principally leukopenia and, to lesser extent, anemia, thrombocytopenia) generally occurs within 10–15 days after starting therapy, returns to normal levels by third wk. Cardiotoxicity (either acute, manifested as transient EKG abnormalities, or chronic, manifested as HF) may occur.
Nursing considerations

Baseline assessment
Obtain CBC, BMP, LFT. Obtain EKG before therapy. Antiemetic medication before and during therapy may prevent or relieve nausea, vomiting. Inform pt of high potential for alopecia. Offer emotional support.

Intervention/evaluation
Monitor CBC, serum electrolytes, EKG, renal function, LFT. Monitor for hematologic toxicity (fever, sore throat, signs of local infection, unusual bruising/bleeding from any site), symptoms of anemia (excessive fatigue, weakness). Avoid IM injections, rectal temperatures, other trauma that may precipitate bleeding. Check infusion site frequently for extravasation (causes severe local necrosis). Assess for potentially fatal HF (dyspnea, rales, pulmonary edema), life-threatening arrhythmias.

Patient/family teaching
• Total body hair loss is frequent but reversible.
• New hair growth resumes 2–3 mos after last therapy dose and may have different color, texture.
• Maintain strict oral hygiene.
• Avoid crowds, those with infections.
• Report fever, sore throat, bruising/bleeding.
• Urine may turn pink or red.
• Frequent lab testing is a normal part of therapy.
• Use contraceptive measures.

<table>
<thead>
<tr>
<th>imipramine</th>

</tbody>
</table>
PHARMACOTHERAPEUTIC: Tricyclic antidepressant.

CLINICAL: Antidepressant, antineuritic, antipanic, antineuralgic, antin narcoleptic adjunct, anticataplectic, antibulimic.

■ BLACK BOX ALERT ■ Increased risk of suicidal ideation and behavior in children, adolescents, young adults 18–24 yrs with major depressive disorder, other psychiatric disorders.

Do not confuse imipramine with amitriptyline, desipramine, or Norpramin.

Uses

Precautions

Contraindications: Hypersensitivity to imipramine. Acute recovery period after MI, use within 14 days of MAOIs; initiation of imipramine in pts with concurrent use with linezolid or IV methylene blue. Cautions: Prostatic hypertrophy; history of urinary retention, history of bowel obstruction; glaucoma, diabetes, history of seizures, hyperthyroidism; cardiac, hepatic, renal disease; increased intraocular pressure, pts with high risk for suicide. Decreased GI motility, paralytic ileus, visual problems, respiratory disease, elderly.

Action

Blocks reuptake of neurotransmitters (norepinephrine, serotonin) at presynaptic membranes, increasing concentration at postsynaptic receptor sites. Therapeutic Effect: Relieves depression, controls nocturnal enuresis.

Interactions

DRUG: Alcohol, other CNS depressants (e.g., diphenhydramINE, LORazepam, morphine) may increase hypotensive effects, CNS, respiratory depression. Cimetidine, FLUoxetine may increase concentration, risk of
toxicity. **Phenytoin**, **barbiturates** may decrease concentration. **HERBAL:** **Kava kava**, **SAMe**, **St. John’s wort**, **valerian** may increase risk of serotonin syndrome, CNS depression. **St. John’s wort** may decrease concentration. **FOOD:** **Grapefruit products** may increase concentration/toxicity. **LAB VALUES:** May alter serum glucose, EKG readings. **Therapeutic serum level:** 225–300 ng/mL; **toxic serum level:** greater than 500 ng/mL.

**Availability (Rx)**

**Capsules (Tofranil-PM):** 75 mg, 100 mg, 125 mg, 150 mg. **Tablets (Tofranil):** 10 mg, 25 mg, 50 mg.

**Administration/handling**

**PO**

• Give with food, milk if GI distress occurs.

**Indications/routes/dosage**

**Depression**

**PO:ADULTS:(Outpatient):** Initially, 75 mg/day. May gradually increase to 150 mg/day as single dose at bedtime or in divided doses. **Maintenance:** 50–150 mg/day. **Maximum:** 200 mg/day. **(Inpatient):** Initially, 100–150 mg/day. May increase to 200 mg/day. May further increase to 250–300 mg/day after 2 wks. May give as single dose at bedtime or in divided doses. **Maximum:** 300 mg/day. Initially, 75–100 mg/day in 3–4 divided doses. May gradually increase to maximum of 200 mg/day (outpatient) or 300 mg/day (inpatient). **ELDERLY, ADOLESCENTS:** Initially, 25–50 mg/day at bedtime. May increase by 10–25 mg every 3–7 days. **Maximum:** 100 mg/day. **CHILDREN:** 1.5 mg/kg/day. May increase by 1 mg/kg every 3–4 days. **Maximum:** 5 mg/kg/day in 1–4 divided doses.

**Enuresis**

**PO:CHILDREN, 6 YRS AND OLDER:** Initially, 25 mg 1 hr before bedtime. May increase by 25 mg if inadequate response seen after 1 wk. **Maximum:** 2.5
mg/kg/day or 50 mg at bedtime for ages 6–12 yrs; 75 mg at bedtime for ages over 12 yrs.

**Dosage in Renal/Hepatic Impairment**
No dose adjustment.

**Side effects**

**Frequent:** Drowsiness, fatigue, dry mouth, blurred vision, constipation, delayed micturition, orthostatic hypotension, diaphoresis, impaired concentration, increased appetite, urinary retention, photosensitivity. **Occasional:** GI disturbances (nausea, metallic taste). **Rare:** Paradoxical reactions (agitation, restlessness, nightmares, insomnia), extrapyramidal symptoms (EPS) (particularly fine hand tremor).

**Adverse effects/toxic reactions**

Overdose may produce seizures, cardiovascular effects (severe orthostatic hypotension, dizziness, tachycardia, palpitations, arrhythmias). May result in altered temperature regulation (hyperpyrexia, hypothermia). Abrupt withdrawal from prolonged therapy may produce headache, malaise, nausea, vomiting, vivid dreams.

**Nursing considerations**

**Baseline assessment**
Assess appearance, behavior, speech pattern, level of interest, mood. Obtain renal function, LFT. Question medical history as listed in Precautions.

**Intervention/evaluation**
Supervise suicidal-risk pt closely during early therapy (as depression lessens, energy level improves, increasing suicide potential). Monitor appearance, behavior, speech pattern, level of interest, mood. For pts on long-term therapy, hepatic/renal function tests, blood counts should be performed periodically. Monitor daily pattern of bowel activity, stool consistency. Monitor B/P, pulse for hypotension, arrhythmias. Assess for urinary retention by bladder palpation.
**Therapeutic serum level:** 225–300 ng/mL; **toxic serum level:** greater than 500 ng/mL.

**Patient/family teaching**

- Report worsening depression, thoughts of suicide, agitation, irritability.
- Slowly go from lying to standing to avoid hypotensive effect.
- Tolerance to postural hypotension, sedative, anticholinergic effects usually develops during early therapy.
- Avoid tasks that require alertness, motor skills until response to drug is established.
- Therapeutic effect may be noted within 2–5 days, maximum effect within 2–3 wks.
- Sugarless gum, sips of water may relieve dry mouth.
- Do not abruptly discontinue medication.
- Limit caffeine; avoid alcohol.

<table>
<thead>
<tr>
<th>lorcaserin</th>
</tr>
</thead>
<tbody>
<tr>
<td>lor-kas-er-in</td>
</tr>
<tr>
<td>Belviq</td>
</tr>
<tr>
<td>Belviq XR</td>
</tr>
</tbody>
</table>

**CLASSIFICATION**

**PHARMACOTHERAPEUTIC:** Serotonin S2 receptor agonist.

**CLINICAL:** Weight loss agent.

**Uses**

Adjunct to reduced-calorie diet and increased physical activity for chronic weight management in adults with an initial body mass index (BMI) of 30 kg/m² or greater (obese), or 27 kg/m² or greater (overweight) with at least one weight-related comorbid condition (e.g., hypertension, dyslipidemia, type 2 diabetes).

**Precautions**

**Contraindications:** Hypersensitivity to lorcaserin, pregnancy. **Cautions:** Use in pts with severe renal impairment, end-stage renal disease is not recommended.
Concurrent use of serotonergic medications (particularly during initiation of therapy and dose increases). Moderate renal impairment, severe hepatic impairment, HF, pts predisposed to priapism (e.g., leukemia). Pts at high risk for suicidal thoughts, behavior. Bradycardia, heart block, diabetes.

**Action**

Activates $5\text{HT}_{20}$ receptors on anorexigenic neurons located in the hypothalamus.

**Therapeutic Effect:** Decreases food consumption, promotes satiety.

**Pharmacokinetics**

Rapidly absorbed from GI tract. Peak plasma concentration: 1.5–2 hrs. Distributed in cerebrospinal fluid and CNS. Protein binding: 70%. Metabolized in liver. Primarily excreted in urine.

**Lifespan considerations**

**Pregnancy/Lactation:** May cause fetal harm. Unknown if distributed in breast milk. **Children:** Not for use in this age group. **Elderly:** Age-related renal impairment may require dose adjustment.

**Interactions**

**DRUG:** May increase concentration/effects of CYP3D6 substrates (e.g., amitriptyline, metoprolol, venlafaxine). Triptans, MAOIs (e.g., phenelzine, selegiline), SNRIs (e.g., duloxetine, venlafaxine), SSRIs (e.g., escitalopram, paroxetine, sertraline), dextromethorphan, tricyclic antidepressants, buPROPion, lithium, traMADol, tryptophan may increase risk for serotonin syndrome. **HERBAL:** St. John’s wort increases potential for serotonin syndrome. **FOOD:** None known. **ALTERED LAB VALUES:** May lower Hgb, neutrophil count. May increase serum prolactin.

**Availability (Rx)**

**Capsules, Extended-Release:** (Belviq XR) 20 mg. **Tablets, Film-Coated:** (Belviq) 10 mg.
Administration/handling

• Do not break, crush, dissolve, or divide film-coated tablet. May give without regard to food.

Indications/routes/dosage

Weight Management

PO: ADULTS, ELDERLY: (Belviq) 10 mg twice daily. Do not exceed 10 mg twice daily. (Belviq XR) 20 mg once daily. Belviq should be discontinued if 5% weight loss is not achieved by week 12 of therapy.

Dosage in Renal Impairment

Mild impairment: No dose adjustment. Moderate: Use caution. Severe impairment, end-stage renal disease: Not recommended.

Dosage in Hepatic Impairment

Mild to moderate impairment: No dose adjustment. Severe impairment: Use caution.

Side effects

Note: Side effects tend to be mild and transient in nature, gradually diminishing during treatment. Frequent (16%–5%): Headache, dizziness, fatigue, diarrhea, nausea, dry mouth, constipation. Type 2 Diabetic Pts (29%–7%): Hypoglycemia, headache, back pain, nasopharyngitis, nausea, cough, fatigue, dizziness. Occasional (6%–2%): Cough, oropharyngeal pain, sinus congestion, musculoskeletal pain, rash. Rare (4%–2%): Type 2 Diabetic Pts: Muscle spasm, peripheral edema, anxiety, insomnia, seasonal allergy, gastroenteritis, toothache, decreased appetite, depression.

Adverse effects/toxic reactions

Potential for Serotonin Syndrome Serotonin syndrome symptoms including mental status changes (e.g., agitation, hallucinations, coma), autonomic instability (e.g., tachycardia, labile B/P, hyperthermia), neuromuscular changes
(e.g., hyperreflexia, incoordination), and/or GI symptoms (e.g., nausea, vomiting, diarrhea) have been observed. Serotonin syndrome, in its most severe form, can resemble neuroleptic malignant syndrome, which includes hyperthermia, muscle rigidity, autonomic instability with possible rapid fluctuation of vital signs, and mental status changes. Urinary tract infection occurs in 9% of type 2 diabetic pts.

Nursing considerations

Baseline assessment
Ensure negative pregnancy test prior to initiating treatment. Obtain baseline chemistries, particularly renal function, LFT. Obtain weight, BMI.

Intervention/evaluation
In trials, most patients lost at least 5% of their body weight over a year, and a further one-third lost at least 10%. Pts who develop signs or symptoms of valvular cardiac disease, including dyspnea, dependent edema, HF, or a new cardiac murmur while on medication should be consistently monitored; discontinuation of treatment may be necessary.

Patient/family teaching
• Discontinue therapy if 5% weight loss has not been achieved by 12 wks of treatment.
• High-fiber, low-fat diet decreases fat evacuation.
• Avoid tasks that require alertness, motor skills until response to drug is established.
• Do not break, chew, dissolve, or divide tablets; swallow whole.

lubiprostone
loo-bi-pros-tone
Amitiza
◆CLASSIFICATION
PHARMACOTHERAPEUTIC: Chloride channel activator.
CLINICAL: Laxative.
Uses
Treatment of chronic idiopathic constipation in adults. Treatment of opioid-induced constipation. Treatment of irritable bowel syndrome (IBS) with constipation in women 18 yrs and older.

Precautions

Action
Secretes fluid into abdominal lumen through activation of chloride channels in apical membranes of GI epithelium. Therapeutic Effect: Increases intestinal motility, thereby increasing passage of stool, alleviating symptoms associated with chronic idiopathic constipation.

Pharmacokinetics
Rapidly, extensively metabolized within stomach and jejunum. Minimal distribution beyond GI tissue. Protein binding: 94%. Excreted in urine (60%), feces (30%). Half-life: 0.9–1.4 hrs.

Lifespan considerations
May have potential for teratogenic effects. Unknown if distributed in breast milk. Children: Safety and efficacy not established. Elderly: No age-related precautions noted.

Interactions
DRUG: None significant. HERBAL: None significant. FOOD: None known. LAB VALUES: None significant.

Availability (Rx)
Capsules: 8 mcg, 24 mcg.
Administration/handling

PO
• Give with food and water.

Indications/routes/dosage

Chronic Idiopathic Constipation, Opioid-Induced Constipation
PO: ADULTS, ELDERLY: 24 mcg twice daily with food and water.

IBS
PO: ADULTS, ELDERLY (FEMALES): 8 mcg twice daily with food and water.

Dosage in Renal Impairment
No dose adjustment.

Dosage in Hepatic Impairment

Side effects
Frequent (31%): Nausea. Occasional (13%–4%): Headache, diarrhea, abdominal distention, abdominal pain, flatulence, vomiting, peripheral edema, dizziness. Rare (3%–2%): Dyspepsia, loose stools, fatigue, dry mouth, arthralgia, back pain, cough.

Adverse effects/toxic reactions
UTI, upper respiratory tract infection occurs in 4% of pts.
Nursing considerations

Baseline assessment
Confirm negative pregnancy test prior to beginning therapy, and comply with effective contraceptive measures during therapy. Assess for diarrhea (avoid use in these pts). Question characteristics of bowel movements.

Intervention/evaluation
Assess for improvement in symptoms (relief from bloating, cramping, urgency, abdominal discomfort). Monitor daily pattern of bowel activity, stool consistency.

Patient/family teaching
- Report new/worsening episodes of abdominal pain, severe diarrhea.
- Avoid tasks that require alertness, motor skills until response to drug is established.

meclizine
mek-li-zeen
Dramamine Less Drowsy
CLASSIFICATION
PHARMACOTHERAPEUTIC: Histamine H₁ antagonist, first generation.
CLINICAL: Antiemetic, antivertigo.
Do not confuse Antivert with Alavert or Axert.

Uses
Prevention/treatment of vertigo, nausea and vomiting due to motion sickness. Treatment of vertigo associated with diseases affecting vestibular system.

Precautions
Contraindications: Hypersensitivity to meclizine. Cautions: Narrow-angle glaucoma, asthma, CNS disorders where CNS depression is present; prostatic hyperplasia, pyloric/duodenal obstruction, bladder neck obstruction, elderly pts.
**Action**

Reduces labyrinthine excitability, diminishes vestibular stimulation of labyrinth, blocks anticholinergic action of chemoreceptor trigger zone. **Therapeutic Effect:** Reduces nausea, vomiting, vertigo.

**Pharmacokinetics**

</table>

Well absorbed from GI tract. Widely distributed. Metabolized in liver. Primarily excreted in urine. **Half-life:** 6 hrs.

**Lifespan considerations**

**Pregnancy/Lactation:** Unknown if drug crosses placenta or is distributed in breast milk (may produce irritability in nursing infants). **Children/Elderly:** May be more sensitive to anticholinergic effects (e.g., dry mouth).

**Interactions**

**DRUG:** Alcohol, CNS depressants (e.g., morphine, PHENobarbital, zolpidem) may increase CNS depressant effect. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** May produce false-negative results in antigen skin testing unless meclizine is discontinued 4 days before testing.

**Availability (Rx)**

**Tablets (Antivert):** 12.5 mg, 25 mg. **(Dramamine Less Drowsy):** 25 mg. **Tablets (Chewable):** 25 mg.

**Administration/handling**

**PO**

- Give without regard to meals.
- Scored tablets may be crushed.
Indications/routes/dosage

Motion Sickness
PO: ADULTS, ELDERLY, CHILDREN 12 YRS AND OLDER: 25–50 mg 1 hr before travel. May repeat q24h if needed.

Vertigo
PO: ADULTS, ELDERLY, CHILDREN 12 YRS AND OLDER: 25–100 mg/day in divided doses, as needed.

Dosage in Renal/Hepatic Impairment
No dose adjustment.

Side effects
Frequent: Drowsiness. Occasional: Blurred vision, dry mouth, nose, throat.

Adverse effects/toxic reactions
Hypersensitivity reaction (eczema, pruritus, rash, cardiac disturbances, photosensitivity) may occur. Overdose may vary from CNS depression (sedation, apnea, cardiovascular collapse, death) to severe paradoxical reaction (hallucinations, tremor, seizures). Children may experience paradoxical reaction (restlessness, insomnia, euphoria, anxiety, tremors). Overdose in children may result in hallucinations, seizures, death.

Nursing considerations

Baseline assessment
Assess degree of nausea/vomiting, degree of vertigo. Assess level of consciousness.

Intervention/evaluation
Monitor B/P, esp. in elderly (increased risk of hypotension). Monitor children closely for paradoxical reaction. Monitor serum electrolytes in pts with severe
vomiting. Assess skin turgor, mucous membranes to evaluate hydration status.

**Patient/family teaching**

- Avoid tasks that require alertness, motor skills until response to drug is established.
- Dry mouth, drowsiness, dizziness may be an expected response to drug.
- Tolerance to sedative effect may occur.
- Avoid alcohol.
- Sugarless gum, sips of water may relieve dry mouth.
- Coffee, tea may help reduce drowsiness.

---

**mepolizumab**

me-poe-liz-ue-mab

**Nucala**

**CLASSIFICATION**

PHARMACOTHERAPEUTIC: Interleukin-5 receptor antagonist. Monoclonal antibody.

**CLINICAL**: Antiasthmatic.

Do not confuse mepolizumab with atezolizumab, certolizumab, eculizumab, omalizumab, pembrolizumab, or Nucala with Calan or Nucynta.

---

**Uses**

Add-on maintenance treatment of pts 12 yrs of age and older with severe asthma and with an eosinophil phenotype.

**Precautions**

**Contraindications**: Hypersensitivity to mepolizumab. **Cautions**: History of herpes zoster infection, parasitic infection. Not indicated for treatment of other eosinophilic conditions; relief of acute bronchospasm, status asthmaticus, exercise-induced bronchospasm.

**Action**
Inhibits signaling of interleukin-5 cytokine, reducing production and survival of eosinophils responsible for asthmatic inflammation and pathogenesis. **Therapeutic Effect:** Prevents inflammatory process; relieves signs/symptoms of asthma.

**Pharmacokinetics**

Widely distributed. Degraded into small peptides and amino acids via proteolytic enzymes. Excretion not specified. **Half-life:** 16–22 days.

**Lifespan considerations**

**Pregnancy/Lactation:** Unknown if distributed in breast milk. However, human immunoglobulin G (IgG) is present in breast milk and is known to cross placenta. **Children:** Safety and efficacy not established in pts younger than 12 yrs. **Elderly:** Safety and efficacy not established.

**Interactions**

**DRUG:** None known. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** None known.

**Availability (Rx)**

**Injection Powder:** 100 mg.

**Administration/handling**

**Subcutaneous**

**Reconstitution**

- Using a 2- or 3-mL syringe and 21G needle, reconstitute vial with 1.2 mL Sterile Water for Injection to a final concentration of 100 mg/mL.
- Direct stream vertically onto center of the lyophilized cake.
- Gently swirl in a circular motion for 10 sec at 15-sec intervals until fully dissolved (approx. 5 min or more).
- Do not shake (may cause foaming/precipitate formation). If mechanical reconstitution device is used, swirl at 450 rpm for up to 10 min or at 1,000 rpm for up to 5 min.
• Visually inspect for particulate matter or discoloration. Solution should appear clear to opalescent, colorless to pale yellow or pale brown (essentially free of particles). Air bubbles are expected and allowed.
• Do not use if solution is cloudy or discolored or if visible particles are observed.

Administration
• Prior to administration, withdraw 1 mL of solution (100 mg) from vial.
• Do not shake or agitate.
• Using a polypropylene syringe fitted with a 21G–27G × 0.5 (13-mm) needle, subcutaneously insert needle into upper arms, outer thigh, or abdomen, and inject solution.
• Do not inject into areas of active skin disease or injury such as sunburns, skin rashes, inflammation, skin infections, or active psoriasis.
• Rotate injection sites.

Storage
• Store unused vials below 25°C (77°F).
• Do not freeze.
• Do not shake.
• Protect from light.
• May store reconstituted solution below 30°C (86°F) up to 8 hrs.

Indications/routes/dosage

Asthma (Severe)
SQ: ADULTS, ELDERLY, CHILDREN 12 YRS AND OLDER: 100 mg once q4wks.

Dosage in Renal/Hepatic Impairment
No dose adjustment.

Side effects
Frequent (19%): Headache. Occasional (8%–3%): Injection site reaction (pain, erythema, swelling, itching, burning sensation), back pain, fatigue, eczema, abdominal pain, pruritus, muscle spasms.
Adverse effects/toxic reactions

Hypersensitivity reactions including angioedema, bronchospasm, hypotension, urticaria, rash were reported. Hypersensitivity reactions typically occurred hrs to days after administration. Infections including herpes zoster, influenza, UTI may occur. Unknown if treatment will influence the immunological response to helminth (parasite) infection. Immunogenicity (auto-mepolizumab antibodies) reported in 6% of pts.

Nursing considerations

Baseline assessment
Obtain apical pulse, oxygen saturation. Auscultate lung fields. Question history of herpes zoster infection, parasitic infection, hypersensitivity reaction. Pts with preexisting helminth (parasite) infection should be treated prior to initiation. Consider varicella vaccination before starting therapy. Inhaled or systemic corticosteroids should not be suddenly discontinued upon initiation. Corticosteroids that are not gradually reduced may cause withdrawal symptoms or unmask conditions that were originally suppressed with corticosteroid therapy.

Intervention/evaluation
Monitor rate, depth, rhythm of respirations. Assess lungs for wheezing, rales. Monitor oxygen saturation. Interrupt or discontinue treatment if hypersensitivity reaction, opportunistic infection (esp. parasite infection, herpes zoster infection), worsening of asthma-related symptoms (esp. in pts tapering off corticosteroids) occurs. Obtain pulmonary function test to assess disease improvement. Monitor for increased use of rescue inhalers; may indicate deterioration of asthma.

Patient/family teaching
• Not indicated for relief of acute asthmatic episodes.
• Have a rescue inhaler readily available.
• Increased use of rescue inhaler may indicate worsening of asthma.
• Seek medical attention if asthma symptoms worsen or remain uncontrolled after starting treatment.
• Immediately report allergic reactions such as difficulty breathing, itching,
hives, rash, swelling of the face or tongue.
• Report infections of any kind, esp. shingles (herpes zoster).
• Do not stop corticosteroid therapy unless directed by prescriber.

mipomersen
mi-po-mer-sen
Kynamro

CLASSIFICATION
PHARMACOTHERAPEUTIC: Oligonucleotide inhibitor.
CLINICAL: Antihyperlipidemic.

BLACK BOX ALERT May cause hepatotoxicity. May cause hepatic steatosis (increase in hepatic fat) regardless of serum ALT, AST elevation; may be risk factor for progressive hepatic disease including steatohepatitis and cirrhosis. Monitor hepatic enzymes regularly.

Uses
Adjunct to lipid-lowering medications and diet to reduce low-density lipoprotein cholesterol (LDL-C), apolipoprotein B (apo-B), total cholesterol (TC), and non–high-density lipoprotein cholesterol (non-HDL-C) in pts with homozygous familial hypercholesterolemia (HoFH).

Precautions
Contraindications: Hypersensitivity to mipomersen. Moderate to severe hepatic impairment, active hepatic disease, hepatitis, unexplained persistent elevations of serum transaminases. Cautions: Alcohol dependency, other medications known to cause hepatotoxicity.

Action
Prevents assembly of apo-B–containing lipoproteins by inhibiting translation of apo-B 100 human messenger ribonucleic acid (mRNA), the principal precursor of LDL. Therapeutic Effect: Decreases plasma low-density lipoprotein
cholesterol (LDL-C) and total cholesterol.

Pharmacokinetics

Lifespan considerations
Pregnancy/Lactation: Unknown if distributed in breast milk. Must either discontinue drug or discontinue breastfeeding. Children: Safety and efficacy not established. Elderly: May have increased risk of adverse reactions including hypertension, peripheral edema.

Interactions
DRUG: Hepatotoxic medications (e.g., acetaminophen, isoniazid, ketoconazole, simvastatin) may increase risk of hepatotoxicity. HERBAL: Black cohosh, kava kava may increase risk of hepatotoxicity. FOOD: None known. LAB VALUES: May increase serum alkaline phosphatase, ALT, AST, bilirubin; urine protein.

Availability (Rx)
Single-Use Prefilled Syringe: 200 mg/mL (1 mL).

Administration/handling
Subcutaneous
Preparation
• Allow to warm to room temperature.
• Visually inspect for particulate matter or discoloration. Solution should appear clear and colorless. Do not use if solution is cloudy, discolored, or if particles are observed.
Administration
• Insert needle subcutaneously into upper arms, outer thigh, or abdomen, and
inject solution.
• Do not inject into areas of active skin disease or injury such as sunburns, skin rashes, inflammation, skin infections, or active psoriasis.
• Rotate injection sites.

Storage
• Refrigerate until time of use.
• Solution stored at room temperature expires after 14 days.
• Protect from light.

Indications/routes/dosage

Homozygous Familial Hypercholesterolemia
SQ: ADULTS/ELDERLY: 200 mg once wkly. (If dose is missed, the dose should be given at least 3 days from the next wkly dose.)

Dose Modification
If ALT, AST greater than 3 times upper limit of normal (ULN), withhold dose until resolution to below 3 times ULN and investigate for other causes. If treatment resumed, monitor LFT every 1–2 wks. Discontinue if symptomatic hepatotoxicity occurs or elevated serum ALT, AST does not resolve.

Dosage in Renal/Hepatic Impairment
No dose adjustment.

Side effects
Frequent (84%): Injection site reactions (pain, swelling, erythema, pruritus, rash, induration, urticaria). Occasional (14%–4%): Fatigue, nausea, body aches, chills, headache, pyrexia, extremity pain, hypertension, chills, peripheral edema, vomiting, musculoskeletal pain. Rare (3%): Palpitations, abdominal pain, insomnia.

Adverse effects/toxic reactions
Increased risk of progressive hepatic disease including steatohepatitis, cirrhosis due to increased hepatic fat. Elevated transaminases reported in 12% of pts.
Alcohol may exacerbate hepatotoxicity. Increased risk of myopathy including rhabdomyolysis (muscle pain/tenderness, weakness, dark or decreased urine output, elevated serum creatinine or CPK level) when used with other antihyperlipidemics (statins). Angina pectoris reported in 4% of pts. Immunogenicity (autoantibodies) reported in 38% of pts. Neoplasms (benign and malignant) reported in 4% of pts.

**Nursing considerations**

**Baseline assessment**
Obtain baseline lipid panel, LFT. Confirm positive history of HoFH. Receive full medication history, including herbal products. Screen for history of hepatic impairment, cardiovascular disease, alcohol dependency. Assess skin for appropriate injection sites.

**Intervention/evaluation**
Monitor lipid panel every 3 mos; LFT every mo for 12 mos, then every 3 mos. If serum ALT, AST elevations occur, obtain PT/INR and monitor for bruising, hematuria, jaundice, right upper abdominal pain, fever, lethargy, melena. Offer antiemetics for nausea/vomiting. Obtain EKG for chest pain, palpitations. Assess extremities for edema.

**Patient/family teaching**
- Diet and exercise are essential to treatment.
- Blood levels will be routinely monitored.
- Report signs of liver problems (yellowing of skin, bruising, black/tarry stool, right upper quadrant pain, fever, lethargy), chest pain, palpitations.
- Avoid alcohol.
- Most pts experience injection site reactions.
- Flu-like symptoms (chills, fatigue, nausea, muscle pain) most likely occur within 2 days.
- Inject medication into fatty tissue of upper arm, abdomen, thigh; do not inject into muscle.
na-ta-liz-yoo-mab

Tysabri

CLASSIFICATION
PHARMACOTHERAPEUTIC: Monoclonal antibody.
CLINICAL: Multiple sclerosis agent, immunologic agent.

BLACK BOX ALERT
Increased risk of leukoencephalopathy (progressive, often fatal viral brain infection).

Uses
Treatment of relapsing forms of multiple sclerosis to reduce frequency of clinical exacerbations. Treatment of moderate to severe Crohn’s disease in pts with inadequate response or unable to tolerate conventional Crohn’s disease therapies.

Precautions
Contraindications: Hypersensitivity to natalizumab. Pts who have or have had progressive multifocal leukoencephalopathy (PML). Cautions: Chronic progressive multiple sclerosis, children younger than 18 yrs. Concomitant immunosuppressants (may increase risk of infection).

Action
Binds to surface of leukocytes, inhibiting adhesion of leukocytes to vascular endothelial cells of GI tract, preventing migration of leukocytes across endothelium into inflamed parenchymal tissue. Therapeutic Effect: Inhibits inflammatory activity of activated immune cells, reduces clinical exacerbations of multiple sclerosis, Crohn’s disease.

Pharmacokinetics
Steady state reached in approximately 16–24 wks. Half-life: 11 days.

Lifespan considerations
Pregnancy/Lactation: Unknown if drug crosses placenta or is distributed in
breast milk. **Children:** Safety and efficacy not established in pts younger than 18 yrs. **Elderly:** No age-related precautions noted.

**Interactions**

**DRUG:** Antineoplastics, immunomodulating agents, immunosuppressants may increase risk of PML. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** May increase basophils, lymphocytes, monocytes, eosinophils, red blood cells (usually reversible within 16 wks after last dose).

**Availability (Rx)**

**Injection Solution:** 300 mg/15 mL concentrate.

**Administration/handling**

**IV**

**Reconstitution**
- Withdraw 15 mL natalizumab from vial; inject concentrate into 100 mL 0.9% NaCl.
- Invert solution to mix completely; do not shake.
- Discard if solution is discolored or particulate forms.

**Rate of Administration**
- Infuse over 1 hr.
- Following completion of infusion, flush with 0.9% NaCl.

**Storage**
- Refrigerate vials.
- Do not shake, freeze. Protect from light.
- After reconstitution, solution is stable for 8 hrs if refrigerated.

**IV incompatibilities**

Do not mix with any other medications or diluent other than 0.9% NaCl.

**Indications/routes/dosage**
Relapsed Multiple Sclerosis, Crohn’s Disease

IV Infusion: ADULTS 18 YRS AND OLDER, ELDERLY: 300 mg q4wks.

Dosage in Renal/Hepatic Impairment

No dose adjustment. Discontinue with jaundice or signs/symptoms of hepatic injury.

Side effects

Frequent (35%–15%): Headache, fatigue, depression, arthralgia. Occasional (10%–5%): Abdominal discomfort, rash, urinary urgency/frequency, irregular menstruation/dysmenorrhea, dermatitis. Rare (4%–2%): Pruritus, chest discomfort, local bleeding, rigors, tremor, syncope.

Adverse effects/toxic reactions

UTI, lower respiratory tract infection, gastroenteritis, vaginitis, allergic reaction, tonsillitis, PMI.

Nursing considerations

Baseline assessment

Obtain CBC, serum chemistries, LFT. Assess home situation for support of therapy.

Intervention/evaluation

Periodically monitor lab results. Assess for arthralgia, depression, urinary changes, menstrual irregularities. Assess skin for evidence of rash, pruritus, dermatitis. Monitor for signs/symptoms of UTI, respiratory infection, PML.

Patient/Family Teaching

• Treatment may depress your immune system and reduce your ability to fight infection. Report symptoms of infection such as body aches, burning with urination, chills, cough, fatigue, fever. Avoid those with active infection.
• PML, an opportunistic viral infection of the brain, may cause progressive,
permanent disabilities and death. Report symptoms of PML such as confusion, memory loss, paralysis, trouble speaking, vision loss, seizures, weakness.

**nebivolol**  
ne-biv-oh-lol

**Bystolic**

**Fixed-Combination(s)**

**Byvalson:** nebulol/valsartan (an ARB): 5 mg/80 mg.

**CLASSIFICATION**  
**PHARMACOTHERAPEUTIC:** Beta-adrenergic blocker.  
**CLINICAL:** Antihypertensive.

Do not confuse nebulol with nadolol or atenolol.

**Uses**

Management of hypertension. Used alone or in combination with other antihypertensives. **OFF-LABEL:** HF.

**Precautions**

**Contraindications:** Hypersensitivity to nebulol. Severe bradycardia, decompensated HF, cardiogenic shock, heart block greater than first degree, severe hepatic impairment, sick sinus rhythm (unless pt has pacemaker). **Cautions:** Diabetes, acute exacerbation of coronary artery disease, bronchospastic disease, peripheral vascular disease, Raynaud’s syndrome, thyrotoxicosis, renal impairment; concomitant use of verapamil, digoxin.

**Action**

Predominantly blocks beta$_1$-adrenergic receptors. Large doses block both beta$_1$ and beta$_2$ receptors. **Therapeutic Effect:** Lowers B/P.

**Pharmacokinetics**
<table>
<thead>
<tr>
<th>Onset</th>
<th>Peak</th>
<th>Duration</th>
</tr>
</thead>
<tbody>
<tr>
<td>PO 30 min</td>
<td>1.5–4 hrs</td>
<td>12 hrs</td>
</tr>
</tbody>
</table>

Completely absorbed from GI tract. Protein binding: 98%. Metabolized in liver. Excreted in feces (44%), urine (38%). **Half-life:** 12 hrs (increased in severe renal impairment).

**Lifespan considerations**

**Pregnancy/Lactation:** May cross placenta; appears to be distributed in breast milk. May produce low-birth-weight infants. **Children:** Safety and efficacy not established. **Elderly:** No age-related precautions noted.

**Interactions**

**DRUG:** Diuretics (e.g., furosemide, HCTZ), antihypertensives (e.g., amLODIPine, lisinopril, valsartan) may increase hypotensive effect. CYP2D6 inhibitors (e.g., FLUoxetine, PARoxetine) may increase concentration/effects. **HERBAL:** Ephedra, ginseng, yohimbe, ginger, licorice may worsen hypertension. **Black cohosh, periwinkle** may increase antihypertensive effect. **FOOD:** None known. **LAB VALUES:** May increase serum BUN, uric acid, ALT, AST, bilirubin, triglycerides. May decrease platelet count, serum HDL.

**Availability (Rx)**

**Tablets:** 2.5 mg, 5 mg, 10 mg, 20 mg.

**Administration/handling**

**PO**

- Give without regard to meals.
- Do not break, crush, dissolve, or divide tablets.

**Indications/routes/dosage**

**Hypertension**

**PO:** **ADULTS, ELDERLY:** Initially, 5 mg once daily. May increase at 2-wk intervals to maximum 40 mg once daily. Usual dose: 5–10 mg once daily.
Dosage in Renal Impairment

Mild to moderate impairment: No dose adjustment. Severe impairment (CrCl less than 30 mL/min): Initially, 2.5 mg once daily. Increase gradually.

Dosage in Hepatic Impairment

Mild impairment: No dose adjustment. Moderate impairment: Initially, 2.5 mg once daily. Increase cautiously. Contraindicated in severe impairment.

Side effects

Generally well tolerated, with mild and transient side effects. Occasional (9%): Headache. Rare (2%–1%): Fatigue, dizziness, diarrhea, nausea, insomnia, peripheral edema.

Adverse effects/toxic reactions

Large doses may produce bradycardia, dyspnea, rash. Acute pulmonary edema, renal failure, AV block reported. Antidote: Glucagon (see Appendix J for dosage).

Nursing considerations

Baseline assessment

Assess baseline renal function, LFT. Assess B/P, apical pulse immediately before drug administration (if pulse is 60/min or less, or systolic B/P is less than 90 mm Hg, withhold medication, contact physician). Question medical history as listed in Precautions.

Intervention/evaluation

Measure B/P near end of dosing interval (determines whether B/P is controlled throughout day). Monitor B/P for hypotension. Assess pulse for quality, regularity, bradycardia. Question for evidence of headache.

Patient/family teaching

• Compliance with therapy regimen is essential to control hypertension.
• Do not use nasal decongestants, OTC cold preparations (stimulants) without physician’s approval.
• Monitor B/P, pulse before taking medication.
• Restrict salt, alcohol intake.
• Do not chew, crush, dissolve, or divide tablets. Swallow whole.

**nilotinib**

nye-loe-ti-nib

Tasigna

CLASSIFICATION

PHARMACOTHERAPEUTIC: Protein-tyrosine kinase inhibitor.

CLINICAL: Antineoplastic.

■ BLACK BOX ALERT ■ Prolongs QT interval; sudden deaths reported.

Do not use in pts with hypokalemia, hypomagnesemia, prolonged QT syndrome.

Do not confuse nilotinib with dasatinib, erlotinib, imatinib, nilutamide, SORAfenib, SUNItinib.

**Uses**

Treatment of chronic phase and accelerated phase of chronic myelogenous leukemia (CML) in adult pts resistant or intolerant to prior therapy that included imatinib. Treatment of newly diagnosed Philadelphia chromosome positive chronic myeloid leukemia in chronic phase (Ph+ CML-CP). **OFF-LABEL:** Refractory gastrointestinal stromal tumor (GIST).

**Precautions**

**Contraindications:** Hypersensitivity to nilotinib. Hypokalemia, hypomagnesemia, long QT syndrome. **Cautions:** Myelosuppression, QT prolongation, history of pancreatitis, hepatic impairment, electrolyte abnormalities, pregnancy.

**Action**
Inhibits the Bcr-Abl tyrosine kinase, a translocation-created enzyme, created by the Philadelphia chromosome abnormality noted in chronic myelogenous leukemia (CML). **Therapeutic Effect:** Inhibits proliferation and tumor growth during two stages of CML: accelerated phase, chronic phase.

### Pharmacokinetics

Well absorbed following PO administration. Protein binding: 98%. Metabolized in liver. Excreted primarily in feces. Food increases concentration, and dose cannot be given less than 2 hrs before and less than 1 hr after food. **Half-life:** 17 hrs.

#### Lifespan considerations

**Pregnancy/Lactation:** May cause fetal harm. Breastfeeding not recommended.  
**Children:** Safety and efficacy not established in pts younger than 18 yrs.  
**Elderly:** No age-related precautions noted.

### Interactions

**DRUG:** CYP3A4 inhibitors (e.g., clarithromycin, ketoconazole) may increase concentration. CYP3A4 inducers (e.g., carBAMazepine, dexamethasone, phenytoin, rifampicin) may decrease concentration. QT-prolonging medications (e.g., amiodarone, ketoconazole, sotolol) may increase risk of prolonged QT interval. **HERBAL:** St. John’s wort may decrease concentration.  
**FOOD:** Grapefruit products may increase risk for torsades de pointes, myelotoxicity. **LAB VALUES:** May decrease WBCs, platelets, serum magnesium, phosphorus, albumin, sodium. May increase serum glucose, lipase, bilirubin, ALT, AST. May alter serum potassium, alkaline phosphatase, creatinine.

### Availability (Rx)

**Capsules:** 150 mg, 200 mg.

**Administration/handling**

PO
• Give at least 2 hrs before or 1 hr after ingestion of food.
• Contents may be opened, mixed with one teaspoonful of applesauce and taken within 15 min.
• Swallow capsules whole; do not break, crush, or open.
• Store at room temperature.

**Indications/routes/dosage**

**Note:** Dosage adjusted in hepatic impairment, hematologic toxicity, nonhematologic toxicity, QT prolongation (consult specific product labeling).

**Chronic Myelogenous Leukemia (CML)**

PO: **ADULTS, ELDERLY:** 400 mg twice daily q12hrs, without food.

Ph+**CML-CP**

PO: **ADULTS, ELDERLY:** 300 mg twice daily without food. **HEPATIC IMPAIRMENT:** 200 mg twice daily; may increase to 300 mg twice daily based on tolerability.

**Dosage in Renal Impairment**

No dose adjustment.

**Dosage in Hepatic Impairment**

300 mg twice daily; may increase to 400 mg twice daily based on tolerability.

**Side effects**

**Frequent (33%–21%):** Rash, nausea, headache, pruritus, fatigue, diarrhea, constipation, vomiting. **Occasional (18%–10%):** Arthralgia, cough, pharyngitis, asthenia, fever, myalgia, abdominal pain, peripheral edema, weight gain, bone pain, muscle spasm, back pain. **Rare (9%–1%):** Anorexia, insomnia, dizziness, paresthesia, vertigo, palpitations, flushing, hypertension, flatulence, alopecia, night sweats.

**Adverse effects/toxic reactions**
Prolongation of QT interval, producing ventricular tachycardia (torsades de pointes), may result in seizure, sudden death. Neutropenia, thrombocytopenia, anemia are expected response to drug. Respiratory toxicity manifested as dyspnea, pneumonia.

**Nursing considerations**

**Baseline assessment**
Obtain CBC q2wks for the first 2 mos and then monthly thereafter. Hypokalemia or hypomagnesemia must be corrected prior to initiating therapy. Monitor LFT before treatment begins and monthly thereafter. Obtain baseline weight, EKG.

**Intervention/evaluation**

**Patient/family teaching**
- Treatment may depress your immune system and reduce your ability to fight infection. Report symptoms of infection such as body aches, burning with urination, chills, cough, fatigue, fever. Avoid those with active infection.
- Avoid contact with anyone who recently received live virus vaccine; do not receive vaccinations.
- Do not ingest food less than 2 hours before and less than 1 hr after dose is taken.
- Avoid grapefruit products.

| nitroprusside | nye-troe-prus-ide |
| Nipride | Nitropress | CLASSIFICATION |
PHARMACOTHERAPEUTIC: Vasodilator.
CLINICAL: Antihypertensive, vasodilator, antidote.

- **BLACK BOX ALERT** - Must dilute with D$_5$W. Can cause sharp decrease in B/P; may lead to irreversible ischemia, death. Unless used briefly or at low infusion rate (less than 2 mcg/kg/min), potentially lethal levels of cyanide may result. Do not use maximum dose for longer than 10 min.

Do not confuse nitroprusside with nitroglycerin or Nitrostat.

**Uses**

Immediate reduction of B/P in hypertensive crisis. Produces controlled hypotension in surgical procedures to reduce bleeding. Treatment of acute HF. **OFF-LABEL:** Management of hypertension during acute ischemic stroke.

**Precautions**

**Contraindications:** Hypersensitivity to nitroprusside. Treatment of compensatory hypertension (AV shunt, coarctation of aorta), congenital (Leber’s) optic atrophy, to produce controlled hypotension during surgery in pts with inadequate cerebral circulation, moribund pts requiring emergency surgery, tobacco amblyopia (dim vision). High-output HF associated with reduced systemic vascular resistance. **Cautions:** Severe hepatic/renal impairment, hypothyroidism, hyponatremia, elderly, increased intracranial pressure.

**Action**

Direct vasodilating action on arterial, venous smooth muscle. Decreases peripheral vascular resistance, preload, afterload; improves cardiac output. **Therapeutic Effect:** Immediate decrease in BP.

**Pharmacokinetics**

<table>
<thead>
<tr>
<th>Route</th>
<th>Onset</th>
<th>Peak</th>
<th>Duration</th>
</tr>
</thead>
<tbody>
<tr>
<td>IV</td>
<td>Less than 2 min</td>
<td>Dependent on infusion rate</td>
<td>1–10 min</td>
</tr>
</tbody>
</table>
Reacts with Hgb in erythrocytes, producing cyanmethemoglobin, cyanide ions. Primarily excreted in urine. **Half-life:** Less than 10 min.

**Lifespan considerations**

**Pregnancy/Lactation:** Unknown if drug crosses placenta or is distributed in breast milk. **Children:** Safety and efficacy not established. **Elderly:** More sensitive to hypotensive effect. Age-related renal impairment may require dosage adjustment.

**Interactions**

**DRUG:** Antihypertensives (e.g., amLODIPine, lisinopril, valsartan) may increase hypotensive effect. **HERBAL:** Yohimbe may decrease effects. **FOOD:** None known. **LAB VALUES:** None significant.

**Availability (Rx)**

**Injection Solution:** 25 mg/mL (2-mL vial).

**Administration/handling**

**IV**

**Reconstitution**

- Dilute with 250–1,000 mL D_{5}W to provide concentration of 200 mcg, 50 mcg/mL, respectively. **Maximum concentration:** 200 mg/250 mL.
- Wrap infusion bottle in aluminum foil immediately after mixing.

**Rate of Administration**

- Give by IV infusion only, using infusion rate chart provided by manufacturer or protocol.
- Administer using IV infusion pump.
- Be alert for extravasation (produces severe pain, sloughing).

**Storage**

- Protect from light.
- Solution should appear very faint brown.
- Use only freshly prepared solution. Once prepared, do not keep or use longer than 24 hrs.
• Deterioration evidenced by color change from brown to blue, green, dark red.
• Discard unused portion.

IV incompatibility
Insulin (regular).

IV Compatibilities
Cisatracurium (Nimbex), dexmedetomidine (Precedex), diltiaZEM (Cardizem), DOBUTamine (Dobutrex), DOPamine (Intropin), enalapril (Vasotec), heparin, labetalol (Normodyne, Trandate), lidocaine, midazolam (Versed), milrinone (Primacor), nitroglycerin, propofol (Diprivan).

Indications/routes/dosage

Acute Hypertension
IV Infusion: ADULTS, ELDERLY, CHILDREN: Initially, 0.3–0.5 mcg/kg/min. May increase by 0.5 mcg/kg/min to desired hemodynamic effect or appearance of headache, nausea. Usual dose: 3 mcg/kg/min. Doses greater than 4 mcg/kg/min rarely needed. Maximum: 10 mcg/kg/min.

Acute HF
IV Infusion: ADULTS, ELDERLY: Initially, 5–10 mcg/min. Titrate rapidly to achieve desired hemodynamic effect. Range: 5–300 mcg/min.

Dosage in Renal/Hepatic Impairment
No dose adjustment. Limit use. Use caution.

Side effects
Occasional: Flushing of skin, pruritus, pain/redness at injection site.

Adverse effects/toxic reactions
Too-rapid IV infusion rate reduces B/P too quickly. Nausea, vomiting,
diaphoresis, apprehension, headache, restlessness, muscle twitching, dizziness, palpitations, retrosternal pain, abdominal pain may occur. Symptoms disappear rapidly if rate of administration is slowed or temporarily discontinued. Overdose produces metabolic acidosis, tolerance to therapeutic effect.

**Nursing considerations**

**Baseline assessment**

Check with physician for desired B/P parameters (B/P is normally maintained approximately 30%–40% below pretreatment levels). Medication should be discontinued if therapeutic response is not achieved within 10 min after IV infusion at 10 mcg/kg/min. Question medical history as listed in Precautions, and screen for interactions.

**Intervention/evaluation**

---

**nizatidine**
nye-za-ti-deen

Apo-Nizatidine

Axid

Axid AR Novo-Nizatidine

**CLASSIFICATION**

**PHARMACOTHERAPEUTIC**: H₂ receptor antagonist.

**CLINICAL**: Antiulcer, gastric acid secretion inhibitor.

**Do not confuse Axid with Ansaid.**

**Uses**

Short-term treatment of active duodenal ulcer, active benign gastric ulcer.
Prevention of duodenal ulcer recurrence. Treatment of gastroesophageal reflux disease (GERD), including erosive esophagitis. **OFF-LABEL:** Part of multidrug therapy for *H. pylori* eradication used to reduce risk of duodenal ulcer recurrence.

**Precautions**

**Contraindications:** Hypersensitivity to nizatidine, other H₂ antagonists. **Cautions:** Renal impairment.

**Action**

Inhibits histamine action at histamine-2 (H₂) receptors of gastric parietal cells. **Therapeutic Effect:** Inhibits basal/nocturnal gastric acid secretion.

**Pharmacokinetics**

Rapidly, well absorbed from GI tract. Protein binding: 35%. Metabolized in liver. Primarily excreted in urine. Not removed by hemodialysis. **Half-life:** 1–2 hrs (increased in renal impairment).

**Lifespan considerations**

**Pregnancy/Lactation:** Unknown if drug crosses placenta or is distributed in breast milk. **Children:** Safety and efficacy not established in pts younger than 12 yrs. **Elderly:** No age-related precautions noted.

**Interactions**

**DRUG:** None significant. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** Interferes with skin tests using allergen extracts. May increase serum alkaline phosphatase, ALT, AST.

**Availability (Rx)**

Capsules (Axid): 150 mg, 300 mg. **Oral Solution (Axid):** 15 mg/mL. **Tablet (Axid AR):** 75 mg.
Administration/handling

PO
• Give without regard to meals. Best given after meals or at bedtime.
• Do not administer within 1 hr of magnesium- or aluminum-containing antacids (decreases absorption).
• May give immediately before eating for heartburn prevention.

Indications/routes/dosage

Active Duodenal Ulcer
PO:  ADULTS, ELDERLY:  300 mg at bedtime or 150 mg twice daily.

Prevention of Duodenal Ulcer Recurrence
PO:  ADULTS, ELDERLY:  150 mg at bedtime.

Gastroesophageal Reflux Disease (GERD)
PO:  ADULTS, ELDERLY:  150 mg twice daily.

Active Benign Gastric Ulcer
PO:  ADULTS, ELDERLY:  150 mg twice daily or 300 mg at bedtime.

Dosage in Renal Impairment
Dosage adjustment is based on creatinine clearance.

<table>

</tbody>
</table>

Dosage in Hepatic Impairment
No dose adjustment.

Side effects
Occasional (2%):  Drowsiness, fatigue.  Rare (1%):  Hyperhidrosis, rash.
Adverse effects/toxic reactions

Asymptomatic ventricular tachycardia, hyperuricemia not associated with gout, nephrolithiasis occur rarely.

Nursing considerations

Baseline Assessment
Assess epigastric pain, heartburn, peptic ulcer disease, GERD.

Intervention/evaluation
Assess for abdominal pain, GI bleeding (overt blood in emesis/stool, tarry stools). Monitor LFT (hepatocellular injury).

Patient/family teaching
• Avoid tasks that require alertness, motor skills until response to drug is established.
• Avoid alcohol, aspirin, smoking, excessive amounts of caffeine.
• Report symptoms of heartburn, acid indigestion, sour stomach persisting after 2 wks of continuous use of nizatidine.

ombitasvir, paritaprevir, ritonavir
om-bit-as-vir/par-i-ta-pre-vir/ rit-oh-na-vir

Technivie

CLASSIFICATION
PHARMACOTHERAPEUTIC: NS5A inhibitor, protease inhibitor, CYP3A inhibitor.
CLINICAL: Antiviral.
Do not confuse ombitasvir with daclatasvir, or paritaprevir with boceprevir or simeprevir, or ritonavir with Retrovir, lopinavir, darunavir, or saquinavir.

Uses
Treatment of genotype 4 chronic hepatitis C virus (HCV) infection without
cirrhosis, in combination with ribavirin.

**Precautions**

**Contraindications:** Hypersensitivity to any component. Severe hepatic impairment; decompensated hepatic cirrhosis; contraindication or known hypersensitivity to ribavirin; concomitant use of strong or moderate CYP3A inducers; drugs highly dependent on CYP3A for clearance and for which elevated plasma concentrations are associated with serious and/or life-threatening events. Concurrent use of alfuzosin, carBAMazepine, efavirenz, ergotamine, dihydroergotamine, ethinyl estradiol–containing drugs including combined oral contraceptives, lovastatin, midazolam (oral), phenytoin, PHENobarbital, pimozide, rifAMPin, sildenafil (when used to treat pulmonary arterial hypertension), simvastatin, St. John’s wort, triazolam. **Cautions:** History of anemia, hepatitis B virus infection, HIV infection. Not recommended in pts with moderate hepatic impairment.

**Action**

Ombitasvir inhibits HCV NS5A needed for viral RNA replication and virion assembly. Paritaprevir inhibits HCV protease needed for cleavage of HCV-encoded polyproteins and viral replication. Ritonavir inhibits CYP3A clearance; increases plasma concentrations of paritaprevir. **Therapeutic Effect:** Inhibits viral replication of hepatitis C virus.

**Pharmacokinetics**

**Lifespan considerations**

**Pregnancy/Lactation:** Avoid pregnancy; may cause fetal harm. When administered with ribavirin, therapy is contraindicated in pregnant women and in
men whose female partners are pregnant. Unknown if distributed in breast milk. Concomitant use of ethinyl estradiol–containing drugs is contraindicated. Alternative contraception methods including progestin-only drugs, barrier methods, abstinence are recommended. **Children:** Safety and efficacy not established in pts younger than 18 yrs. **Elderly:** No age-related precautions noted.

**Interactions**

**DRUG:** May increase concentration/effects of antiarrhythmics (e.g., amiodarone, quiNIDine), antifungals (e.g., itraconazole), calcium channel blockers (e.g., amLODIPine, NIFEpidine), corticosteroids (e.g., fluticasone), immunosuppressants (e.g., cycloSPORINE), digoxin, HIV-antiretrovirals (e.g., paritaprevir, rilpivirine), phosphodiesterase-5 inhibitors (e.g., sildenafil), sedative/hypnotics (e.g., midazolam, triazolam), statins (e.g., atorvastatin, simvastatin), sirolimus, tacrolimus. Anticonvulsants (e.g., carBAMazepine, phenytoin), dexamethasone, efavirenz, omeprazole, rifAMPin may decrease concentration/effect. **HERBAL:** St. John’s wort, garlic may decrease concentration/effect. **Kava kava** may increase risk of hepatotoxicity. **Red yeast** may increase risk of myopathy, rhabdomyolysis. **FOOD:** Grapefruit products, Seville oranges may increase concentration/effect. **LAB VALUES:** May increase serum alkaline phosphatase, ALT, INR. May decrease Hct, Hgb.

**Availability (Rx)**

**Fixed-Dose Combination Tablets:** ombitasvir 12.5 mg/paritaprevir 75 mg/ritonavir 50 mg.

**Administration/handling**

**PO**

• Give with food.

**Indications/routes/dosage**
Hepatitis C Virus Infection (Genotype 4)

PO: ADULTS, ELDERLY: 2 tablets once daily in combination with ribavirin for 12 wks. Therapy without ribavirin may be considered if unable to tolerate ribavirin. **Recommended dose of ribavirin based on weight in kg:** Less than 75 kg: 1,000 mg/day in 2 divided doses. 75 kg or greater: 1,200 mg/day in 2 divided doses. For ribavirin dose modifications, refer to prescribing information.

**Dosage in Hepatic Impairment**

**Mild impairment:** No dose adjustment. **Moderate to severe impairment:** Contraindicated. Avoid use in cirrhosis.

**Dosage in Renal Impairment**

No dose adjustment.

**Side effects**

**Frequent (29%):** Asthenia. **Occasional (15%–7%):** Fatigue, nausea, insomnia, pruritus, rash, erythema, eczema, allergic dermatitis, photosensitivity reaction, urticaria, skin exfoliation, skin ulcer.

**Adverse effects/toxic reactions**

Serum ALT greater than 5 times upper limit of normal (ULN) reported in 1% of pts (usually occurred during the first 4 wks of treatment). Elevations of serum ALT were significantly higher in female pts using ethinyl estradiol–containing drugs such as contraceptive patches, combined oral contraceptives, vaginal rings. May increase risk of drug resistance in HCV/HIV-1 co-infected pts using HIV-1 protease inhibitors. Hypersensitivity reactions including angioedema may occur.

**Nursing considerations**

**Baseline assessment**

Obtain baseline CBC, LFT, HCV-RNA level, urine pregnancy. Confirm HCV genotype. Receive full medication history and screen for contraindications/interactions. Ethinyl estradiol–containing contraceptive drugs
should be discontinued prior to initiation. Question history as listed in Precautions. To reduce risk of HIV-1 protease inhibitor drug resistance, consider suppressive antiretroviral drug therapy upon initiation.

**Intervention/evaluation**

Monitor LFT periodically during the first 4 wks of treatment, then as clinically indicated thereafter. Discontinue treatment for serum ALT persistently greater than 10 times ULN; serum ALT elevation associated with increase in serum alkaline phosphatase, bilirubin, INR; hepatic injury. Periodically monitor CBC for anemia, HCV-RNA level for treatment effectiveness. Reinforce birth control compliance. Monitor for abdominal pain, bruising, jaundice, nausea, vomiting; may indicate hepatic injury. Ethinyl estradiol–containing contraceptives may be restarted approx. 2 wks after discontinuation.

**Patient/family teaching**

- Treatment must be used in combination with ribavirin.
- Take with meals.
- Inform pt of contraindications/adverse effects of therapy.
- Do not take newly prescribed medication unless approved by prescriber who originally started treatment. Do not take herbal products.
- Pregnancy should be avoided when combination regimen is given with ribavirin. Females pts of childbearing potential must use reliable forms of birth control such as progestin-containing contraception, barrier methods, abstinence. Immediately report suspected pregnancy. Do not breastfeed.
- Report abdominal pain, bruising easily, dark-colored urine, fatigue, yellowing of the skin or eyes.
- Avoid alcohol.
- Report skin changes such as rash, peeling, ulcers; allergic reactions such as difficulty breathing, itching, hives, tongue swelling.

<tr>
<td>Creon</td>
</tr>
<tr>
<td>Pancreaze</td>
</tr>
<tr>
<td>Zenpep</td>
</tr>
</tbody>
</table>
**CLASSIFICATION**

**PHARMACOTHERAPEUTIC**: Digestive enzyme.

**CLINICAL**: Pancreatic enzyme replacement.

**Uses**

**Creon, Pancreaze, Pertyze, Ultresa, Zenpep**: Treatment of exocrine pancreatic insufficiency (EPI) due to cystic fibrosis or other conditions. **Creon**: Chronic pancreatitis, pancreatectomy. **Viokace**: (with a proton pump inhibitor): Chronic pancreatitis, pancreatectomy.

**Precautions**

**Contraindications**: Hypersensitivity to pancrelipase. **Cautions**: Gout, hyperuricemia, renal impairment, hypersensitivity to pork proteins.

**Action**

Replaces endogenous pancreatic enzymes. **Therapeutic Effect**: Assists in digestion of protein, starch, fats.

**Pharmacokinetics**

Not absorbed systemically. Confined mainly within GI tract.

**Interactions**

**DRUG**: May decrease absorption of iron supplements. **HERBAL**: None significant. **FOOD**: None known. **LAB VALUES**: May increase serum uric acid.

**Availability (Rx)**

**Capsules, Delayed-Release**: **(Creon)**: 3,000 units lipase; 9,500 units protease;
15,000 units amylase. 6,000 units lipase; 19,000 units protease; 30,000 units amylase. 12,000 units lipase; 38,000 units protease; 60,000 units amylase. 24,000 units lipase; 76,000 units protease; 120,000 units amylase. (Pancreaze): 4,200 units lipase; 10,000 units protease; 17,500 units amylase. 10,500 units lipase; 25,000 units protease; 43,750 units amylase. 16,800 units lipase; 40,000 units protease; 70,000 units amylase. 21,000 units lipase; 37,000 units protease; 61,000 units amylase. (Zenpep): 3,000 units lipase; 10,000 units protease; 16,000 units amylase. 5,000 units lipase; 17,000 units protease; 27,000 units amylase. 10,000 units lipase; 34,000 units protease; 55,000 units amylase. 15,000 units lipase; 51,000 units protease; 82,000 units amylase. 20,000 units lipase; 68,000 units protease; 109,000 units amylase. 25,000 units lipase; 85,000 units protease; 136,000 units amylase. Pertyze: 8,000 units lipase; 28,750 units protease; 30,250 units amylase. 16,000 units lipase; 57,500 units protease; 60,500 units amylase. Ultresa: 13,800 units lipase; 27,600 units protease; 27,600 units amylase. 20,700 units lipase; 41,400 units protease; 41,400 units amylase. 23,000 units lipase; 46,000 units protease; 46,000 units amylase. Tablets, Viokace: 10,440 units lipase; 39,150 units protease; 39,150 units amylase. 20,880 units lipase; 78,300 units protease; 78,300 units amylase.

Administration/handling

PO

• Give capsules whole with generous amount of liquid.
• If pt unable to swallow intact capsule, contents may be given without crushing/chewing, followed by fluid. Contents may be sprinkled on soft acidic food such as applesauce.
• Swallow immediately after mixing. Give tablets whole; do not break, crush, dissolve, or divide.
• Viokace: must be given with a proton pump inhibitor.

Indications/routes/dosage

Dosage expressed as lipase units/kg. Individualize dose based on clinical symptoms, degree of steatorrhea, fat content in diet.
Pancreatic Insufficiency (Due to Conditions Such as Cystic Fibrosis)

**PO:** ADULTS, ELDERLY, CHILDREN 4 YRS AND OLDER: Initially, 500 units/kg lipase/kg/meal up to 2,500 units lipase/kg/meal (or less than or equal to 10,000 lipase units/kg/day) or less than 4,000 lipase units/g of fat ingested/day. **CHILDREN OLDER THAN 12 MOS AND YOUNGER THAN 4 YRS:** Initially, 1,000 units lipase/kg/meal up to 2,500 units lipase/kg/meal (or less than or equal to 10,000 lipase units/kg/day) or less than 4,000 lipase units/g of fat ingested/day. **INFANTS UP TO 12 MOS:** 2,000–4,000 units lipase per 120 mL of formula or per breastfeeding. Do not mix Creon or Zenpep capsule contents directly into formula or breast milk prior to administration.

Pancreatic Insufficiency (Due to Chronic Pancreatitis or Pancreatectomy)

**PO:** ADULTS, ELDERLY: (Cream): 72,000 units/meal, while consuming 100 g or more of fat daily. (Viokace): 500 units/kg/meal. Range: 500–2,500 units/kg/meal.

**Dosage in Renal/Hepatic Impairment**
No dose adjustment.

**Side effects**
**Rare:** Allergic reaction, mouth irritation, shortness of breath, wheezing.

**Adverse effects/toxic reactions**
Excessive dosage may produce nausea, cramping, diarrhea. Hyperuricosuria, hyperuricemia reported with extremely high dosages.

**Nursing considerations**

**Intervention/evaluation**
Question for therapeutic relief from GI symptoms. Do not change brands without consulting physician.
**Patient/family teaching**

- Do not chew capsules.
- Instruct pts with trouble swallowing to open capsules, spread contents over applesauce, mashed fruit, rice cereal, or follow with glass of water or juice to ensure swallowing.
- Do not break, crush, dissolve, or divide tablets. Swallow whole.

---

**Patiromer**

pa-tir-oh-mer

**Veltassa**

**CLASSIFICATION**

**PHARMACOTHERAPEUTIC:** Cation exchange polymer.

**CLINICAL:** Antihyperkalemic, potassium binder.

Do not confuse patiromer with glatiramer, Levemir, or Veltassa with Pentasa, Valturna, or Voltaren.

---

**Uses**

Treatment of hyperkalemia.

---

**Precautions**

**Contraindications:** Hypersensitivity to patiromer. **Cautions:** Baseline hypomagnesemia, conditions predisposing to hypomagnesemia (alcohol abuse, chronic diarrhea, hypercalcemia, hyperaldosteronism, malnutrition). Avoid use in pts with acute bowel obstruction, bowel impaction; postoperative GI motility disorders, severe constipation. Not indicated for emergent or life-threatening hyperkalemia due to delayed onset of action.

---

**Action**

Increases fecal excretion of potassium by binding to free potassium in GI tract. **Therapeutic Effect:** Decreases serum potassium levels.

---

**Pharmacokinetics**

**Lifespan considerations**

*Pregnancy/Lactation:* Not absorbed systemically. Not expected to result in exposure during pregnancy or breastfeeding. *Children:* Safety and efficacy not established. *Elderly:* May have higher incidence of GI side effects.

**Interactions**

**DRUG:** Decreases effectiveness of other oral medications. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** Expected to decrease serum potassium. May decrease serum magnesium.

**Availability (Rx)**

*Packets, Oral:* 8.4 g, 16.8 g, 25.2 g.

**Administration/handling**

**PO**

**Preparation**

- Measure 1/3 cup (~80 mL) of water and pour half into empty container.
- Add packet contents and stir.
- Add remaining water to mixture and stir.
- Powder will not dissolve (mixture will look cloudy).
- Additional water may be added for desired consistency.

**Administration**

- Give with food.
- Do not administer in dry powder form.
- Do not heat (e.g., microwave) or add heated liquids or foods.
- If powder remains in container after initial administration, add more water, stir, and give immediately (repeat until full dose is ingested).
- Give oral medications at least 6 hrs before or 6 hrs after dose.
**Hyperkalemia**

**PO: ADULTS, ELDERLY:** 8.4 g once daily. Adjust dose in increments of 8.4 g at 1-wk intervals (or longer) based on desired target range of serum potassium level. **Maximum:** 25.2 g/day.

**Dosage in Renal Impairment**

No dose adjustment.

**Dosage in Hepatic Impairment**

Use caution (not studied).

**Side effects**

Occasional (7%–4%): Constipation, diarrhea. **Rare (2%):** Nausea, flatulence.

**Adverse effects/toxic reactions**

Hypomagnesemia, hypokalemia reported in 5% of pts. Hypomagnesemia, hypokalemia may result in cardiac arrhythmias. Hypersensitivity reaction, including lip edema, occurs rarely.

**Nursing considerations**

**Baseline assessment**

Obtain serum potassium, magnesium; EKG. Obtain full medication history and decide whether to give patiromer or other oral medications. Question history of GI motility disorders, chronic constipation, bowel obstruction. Therapy does not rapidly correct severe hyperkalemia. If medical emergency occurs, consider other measures to treat severe hyperkalemia (IV calcium, IV sodium bicarbonate, IV glucose, IV insulin; nebulized albuterol treatment; dialysis).

**Intervention/evaluation**

Monitor serum potassium, magnesium; EKG. Monitor for symptoms of hypokalemia including confusion, delayed thought process, fatigue, irritability, weakness; EKG changes (prolonged QT interval; widening, flattening, or
inversion of T wave; biphasic T wave, prominent U wave). Monitor for symptoms of hypomagnesemia including coma, numbness, nystagmus, seizures, tremors, weakness; EKG changes (prolonged PR interval, widened QRS complex, prolonged QT interval, depressed T wave, premature ventricular contractions, torsades de pointes). If hypomagnesemia occurs, consider magnesium supplementation. Monitor daily pattern of bowel activity, stool consistency. Monitor I&O.

**Patient/family teaching**

- Patiromer binds to some oral medications and can reduce their effectiveness. Oral medications must be taken at least 6 hrs before or at least 6 hrs after dose.
- Take with food.
- Do not heat in microwave or add heated liquids or foods.
- Report symptoms of low potassium such as confusion, fatigue, muscle cramps/twitching, palpitations, weakness; or symptoms of low magnesium such as coma, fatigue, muscle twitching, palpitations, seizures, tremors, weakness.
- Therapy relies on fecal excretion; report severe constipation or severe diarrhea.
- Drink plenty of fluids.

---

**pegaspargase**

**Oncaspar**

**CLASSIFICATION**

PHARMACOTHERAPEUTIC: Enzyme, immunomodulator.

CLINICAL: Antineoplastic.

Do not confuse pegasparagase with asparaginase.

**Uses**

Treatment of acute lymphoblastic leukemia (ALL).

**Precautions**

**Contraindications:** Hypersensitivity reaction to pegasparagase, history of hemorrhage, pancreatitis, or thrombosis with l-asparaginase therapy. **Cautions:** Diabetes, underlying coagulopathy, hepatic impairment,
concurrent hepatotoxic medications, previous hematologic complications with asparaginase. Concomitant use of aspirin, NSAIDs, anticoagulation therapy.

**Action**

Inhibits protein synthesis by deaminating asparagine in plasma and extracellular fluid. **Therapeutic Effect:** Deprives tumor cells of amino acids necessary for protein synthesis, thereby inhibiting tumor cell growth.

**Pharmacokinetics**

Slowly absorbed following IM administration. Primarily excreted in urine elimination. **Half-life:** 6 days.

**Lifespan considerations**

- **Pregnancy/Lactation:** Unknown if distributed in breast milk. Must either discontinue drug or discontinue breastfeeding. **Children:** Safety and efficacy not established in children younger than 1 yr of age. **Elderly:** No age-related precautions noted.

**Interactions**

- **DRUG:** Anticoagulants (e.g., heparin, warfarin), antiplatelets (e.g., clopidogrel), NSAIDs (e.g., ibuprofen, ketorolac, naproxen) may increase risk of coagulopathy, bleeding.  
  **HERBAL:** Echinacea may decrease concentration/effects.  
  **FOOD:** None known.  
  **LAB VALUES:** May increase serum ALT, AST, bilirubin, glucose.

**Availability (Rx)**

- **Injection Solution:** 3,750 international units/5 mL (750 international unit/mL).

**Administration/handling**

- **Note:** Refrigerate unused vial.

- **IM**
  - Visually inspect for particulate matter.
• Do not inject volume greater than 2 mL for single injection site.
• Use multiple sites if injecting more than 2 mL of volume.

 четырехугольник IV

Reconstitution
• Withdraw appropriate volume and dilute in 100 mL bag of NaCl or D₂W.
• Gently mix bag by inversion.
• Do not shake or agitate.

Rate of Administration
• Infuse over 1–2 hrs.

Storage
• Solution should appear clear, colorless.
• May refrigerate diluted solution up to 48 hrs.
• Protect infusion bag from direct sunlight.

четырехугольник IV incompatibilities

Do not mix with other intravenous medications.

Indications/routes/dosage

Acute Lymphoblastic Leukemia (ALL)

IM/IV: ADULTS/ELDERLY/CHILDREN: 2,500 international units/m² every 14 days (of 28-day cycle) (in combination with other chemotherapeutic agents).

Dosage in Renal/Hepatic Impairment

No dose adjustment.

Side effects

Occasional: Nausea, headache.

Adverse effects/toxic reactions

Hypersensitivity reactions including anaphylactic reaction may include angioedema, dyspnea, flushing, hypotension, laryngeal edema, urticaria,
wheezing. Central nervous system thrombosis including acute CVA occurred in 3% of pts. Pancreatitis may result in septic shock, acute respiratory distress syndrome (ARDS), hypotension, or death. Coagulopathy may increase risk of fatal bleeding. Immunogenicity (autoantibody formation) reported in 2%–10% of pts.

**Nursing considerations**

**Baseline assessment**

Obtain baseline serum chemistries, PT/INR, capillary blood glucose. Question history of hepatic impairment, pancreatitis, prior hypersensitivity, DVT, MI, CVA. Receive full medication history.

**Intervention/evaluation**

Monitor serum LFT, capillary blood glucose, PT/INR regularly. Monitor pt for hypersensitivity reaction for at least 1 hr after administration. If anaphylactic reaction occurs, consider treatment with antihistamine, intravenous steroids, racemic EPINEPHrine; locate rapid sequence intubation kit. If pancreatitis suspected (abdominal pain, Grey Turner’s sign, intractable vomiting), contact physician to obtain serum chemistries, amylase and lipase levels, possible radiologic testing. Immediately report dyspnea, chest pain, hypoxia, unilateral peripheral edema/pain (may indicate thromboembolic event).

**Patient/family teaching**

- Treatment may induce allergic reaction (difficulty breathing, itching, wheezing, rash, dizziness).
- Increased urination, thirst, confusion, dehydration, fruity breath may indicate elevated blood sugar levels.
- Immediately report flank bruising, vomiting, abdominal pain (may indicate pancreatitis).
- Report difficulty breathing, chest pain, extremity pain swelling.
- Report abdominal pain, yellowing of skin or eyes, dark-amber urine, clay-colored stools, fatigue, loss of appetite; may indicate liver problems.

**peginterferon alfa-2a**
**Pegasys**

**CLASSIFICATION**
- **PHARMACOTHERAPEUTIC**: Immunomodulator.
- **CLINICAL**: Immunologic agent.

- **BLACK BOX ALERT**
  - Peginterferon alfa-2a can cause or aggravate fatal or life-threatening autoimmune disorders, neuropsychiatric disorders (depression, suicidal ideation/behaviors), and infectious disorders. Combination with ribavirin can cause fetal mortality, birth defects, hemolytic anemia. May be carcinogenic. Avoid pregnancy in female pts and female partners of male pts.

**Do not confuse peginterferon alfa-2a with interferon alfa-2b, interferon alfa-n3, or peginterferon alfa-2b.**

**Uses**

Treatment of chronic hepatitis C virus (HCV) infection alone or in combination with ribavirin (unless contraindicated or significant intolerance to ribavirin) in pts 5 yrs or older who have compensated hepatic disease. Treatment of adults co-infected with HCV and clinically stable HIV disease. Treatment of chronic hepatitis B virus infection with compensated hepatic disease and evidence of viral replication and hepatic inflammation.

**Precautions**

**Contraindications**: Hypersensitivity to peginterferon alfa-2a. Autoimmune hepatitis, decompensated hepatic disease with cirrhosis, or pts with chronic HCV and co-infected with HIV; infants, neonates. **Extreme Caution**: History of neuropsychiatric disorders, depression. **Cautions**: Renal impairment (CrCl less than 30 mL/min), elderly, pulmonary disorders, compromised CNS function, cardiac diseases, autoimmune disorders, endocrine abnormalities (e.g., diabetes, thyroid disorders), colitis, ophthalmologic disorders, myelosuppression.

**Action**
Binds to specific membrane receptors on virus-infected cell surface, inhibiting viral replication. Suppresses cell proliferation, producing reversible decreases in leukocyte, platelet counts. **Therapeutic Effect:** Inhibits viral hepatitis.

**Pharmacokinetics**
Readily absorbed after SQ administration. Excreted by kidneys. **Half-life:** 50–140 hrs.

**Lifespan considerations**

**Pregnancy/Lactation:** May have abortifacient potential. Unknown if distributed in breast milk. **Children:** Safety and efficacy not established in pts younger than 5 yrs. **Elderly:** CNS, cardiac, systemic effects may be more severe in the elderly, particularly in pts with renal impairment.

**Interactions**

**DRUG:** Didanosine may cause hepatic failure, peripheral neuropathy, pancreatitis, lactic acidosis. May increase concentration, risk of toxicity of methadone, theophylline. Concurrent use of ribavirin may increase risk of hemolytic anemia. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** May increase serum ALT. May decrease absolute neutrophil count, platelets.

**Availability (Rx)**

**Injection, Prefilled Syringe:** 135 mcg/0.5 mL, 180 mcg/0.5 mL. **Injection Solution:** 180 mcg/mL.

**Administration/handling**

**SQ**
- Refrigerate.
- Vials are for single use only; discard unused portion.
- Give subcutaneously in abdomen, thigh.
**Indications/routes/dosage**

**Note:** Duration of therapy based on genotype.

**Hepatitis C**

**SQ:** **ADULTS 18 YRS AND OLDER, ELDERLY:** 180 mcg injected in abdomen or thigh once wkly as monotherapy or in combination with ribavirin. **CHILDREN 5 YRS AND OLDER:** 180 mcg/m² × body surface area once wkly. **Maximum:** 180 mcg (with ribavirin).

**Chronic Hepatitis B**

**SQ:** **ADULTS, ELDERLY:** 180 mcg once wkly for 48 wks.

**Dosage in Renal Impairment**

CrCl less than 30 mL/min or pt who requires hemodialysis: 135 mg injected in abdomen or thigh once wkly.

**Dosage in Hepatic Impairment**

Progressive serum ALT elevation above baseline: 135 mcg injected in abdomen or thigh once wkly.

**Side effects**

**Frequent** (54%): Headache. **Occasional** (23%–13%): Alopecia, nausea, insomnia, anorexia, dizziness, diarrhea, abdominal pain, flu-like symptoms, psychiatric reactions (depression, irritability, anxiety), injection site reaction. **Rare** (8%–5%): Impaired concentration, diaphoresis, dry mouth, nausea, vomiting.

**Adverse effects/toxic reactions**

Serious acute hypersensitivity reactions (urticaria, angioedema, bronchoconstriction, anaphylaxis), pancreatitis, colitis, endocrine disorders (diabetes mellitus, hyperthyroidism, hypothyroidism), ophthalmologic disorders, pulmonary abnormalities occur rarely.
Nursing considerations

Baseline assessment
CBC, urinalysis, renal function, LFT, EKG should be performed before initial therapy and routinely thereafter. Pts with diabetes, hypertension should have ophthalmologic exam before treatment begins.

Intervention/evaluation

Patient/family teaching
• Clinical response occurs in 1–3 mos.
• Flu-like symptoms tend to diminish with continued therapy.
• Immediately report symptoms of depression, suicidal ideation.
• Avoid tasks requiring alertness, motor skills until response to drug is established.
• Avoid alcohol.

peginterferon alfa-2b
peg-in-ter-feer-on
PEG-Intron
PEG-Intron RediPen
Sylatron

CLASSIFICATION
PHARMACOTHERAPEUTIC: Immunomodulator.
CLINICAL: Immunologic agent.

BLACK BOX ALERT■ Peginterferon alfa-2b can cause or aggravate fatal or life-threatening autoimmune disorder, neuropsychiatric disorder (depression, suicidal ideation/behaviors), and infectious disorders.
Combination with ribavirin can cause fetal mortality, birth defects, hemolytic anemia. May be carcinogenic. Avoid pregnancy in female pts and female partners of male pts.

Do not confuse peginterferon alfa-2b with interferon alfa-2b, interferon alfa-n3, or peginterferon alfa-2a.

**Uses**

**PEG-Intron**: As monotherapy or in combination with ribavirin for treatment of chronic hepatitis C virus infection in pts not previously treated with interferon alfa who have compensated hepatic disease and are older than 18 yrs. **Sylatron**: Treatment of melanoma or gross nodal involvement within 84 days of definitive surgical resection including complete lymphadenectomy.

**Precautions**

**Contraindications**: Hypersensitivity to peginterferon alfa-2b. Autoimmune hepatitis, decompensated hepatic disease with cirrhosis. Hypersensitivity to interferon alfa-2b, other alfa interferons. **Cautions**: Renal impairment (CrCl less than 50 mL/min), elderly, pulmonary disorders, history of psychiatric disorders, compromised CNS function, cardiac diseases, autoimmune disorders, endocrine disorders (diabetes, hyperthyroidism, hypothyroidism), ophthalmologic disorders, myelosuppression.

**Action**

Inhibits viral replication in virus-infected cells, suppresses cell proliferation, increases phagocytic action of macrophages, augments specific cytotoxicity of lymphocytes for target cells. **Therapeutic Effect**: Inhibits viral hepatitis.

**Pharmacokinetics**

Bioavailability is increased after multiple wkly doses. Excreted in urine. **Half-life**: 22–60 hrs.

🩸 **Lifespan considerations**
**Pregnancy/Lactation:** May have abortifacient potential. Unknown if distributed in breast milk. **Children:** Safety and efficacy not established in pts younger than 3 yrs. **Elderly:** CNS, cardiac, systemic effects may be more severe in the elderly, particularly in pts with renal impairment.

**Interactions**

**DRUG:** None significant. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** May increase serum ALT. May decrease neutrophil, platelets.

**Availability (Rx)**

**Prefilled Syringe (RediPen):** 50 mcg, 80 mcg, 120 mcg, 150 mcg. **Sylatron:** 200 mcg, 400 mcg, 600 mcg.

**Administration/handling**

**SQ**

**Reconstitution**

- To reconstitute, add 0.7 mL Sterile Water for Injection (supplied) to vial.
- Gently swirl. Use immediately. Reconstituted solution may be refrigerated for up to 24 hrs before use.
- Prefilled Syringe (RediPen): Hold cartridge upright, press two halves together until “click” is heard.
- Gently invert to mix.

**Storage**

- Store at room temperature.
- Refrigerate RediPen. Once reconstituted, both products stable for 24 hrs if refrigerated.

**Indications/routes/dosage**

**Melanoma**

**SQ:ADULTS, ELDERLY:** *(Sylatron)*: 6 mcg/kg/wk for 8 doses, then 3 mcg/kg/wk for up to 5 yrs.
Chronic Hepatitis C, Monotherapy
SQ: ADULTS 18 YRS AND OLDER, ELDERLY: (PEG-Intron): Initially, 1 mcg/kg/wk. Administer appropriate dosage (see chart below) once wkly for 1 yr on same day each wk.

</tbody>
</table>
Combination: ADULTS: CrCl less than 50 mL/min: Not recommended. CHILDREN: Serum creatinine more than 2 mg/dL: Discontinue.

Dosage in Hepatic Impairment
Use is contraindicated.

Side effects
Frequent (50%–47%): Flu-like symptoms; inflammation, bruising, pruritus, irritation at injection site. Occasional (29%–18%): Psychiatric reactions (depression, anxiety, emotional lability, irritability), insomnia, alopecia, diarrhea. Rare: Rash, diaphoresis, dry skin, dizziness, flushing, vomiting, dyspepsia.

Adverse effects/toxic reactions
Serious, acute hypersensitivity reactions (urticaria, angioedema, bronchoconstriction, anaphylaxis), pulmonary disorders, endocrine disorders (diabetes mellitus, hypothyroidism, hyperthyroidism), pancreatitis occur rarely. Ulcerative colitis may occur within 12 wks of starting treatment.

Nursing considerations

Baseline assessment
CBC, urinalysis, renal function, LFT, EKG should be performed before initial therapy and routinely thereafter. Pts with diabetes, hypertension should have ophthalmologic exam before treatment begins.

Intervention/evaluation
**Patient/family teaching**

- Maintain adequate hydration.
- Avoid alcohol.
- May experience flu-like symptoms.
- Report persistent abdominal pain, bloody diarrhea, fever, signs of depression, suicidal ideation, or infection, unusual bruising/bleeding.
- Use 2 forms of contraception during combination therapy with ribavirin and for 6 months after taking last dose of the combination.

---

**peginterferon beta-1a**

*peg-in-ter-feer-on*

**Plegridy**

**CLASSIFICATION**

**PHARMACOTHERAPEUTIC**: Biologic response modifier.

**CLINICAL**: Multiple sclerosis agent.

*Do not confuse peginterferon beta with peginterferon alfa or interferon beta.*

---

**Uses**

Treatment of relapsing forms of multiple sclerosis.

---

**Precautions**

**Contraindications**: History of hypersensitivity reaction to natural or recombinant interferon beta or peginterferon. **Cautions**: Pts with severe psychiatric disorders, history of depression, high risk for suicide. Pts with active/history of hepatic disease, alcohol consumption, or increased ALT at baseline; bone marrow suppression; preexisting cardiac disease (e.g., angina, arrhythmias, HF); seizure disorder.

---

**Action**

Exact mechanism of action unknown. May alter expression/response to surface antigens and enhance immune cell activity. **Therapeutic Effect**: Decreases progression of multiple sclerosis.
Pharmacokinetics

*Lifespan considerations*
**Pregnancy/Lactation:** Unknown if distributed in breast milk. **Children:** Safety and efficacy not established. **Elderly:** Safety and efficacy not established.

**Interactions**
**DRUG:** None known. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** May increase serum ALT, AST, GGT. May decrease neutrophils, platelets, WBC.

**Availability (Rx)**
**Prefilled Injector Pens, Prefilled Syringes:** 63 mcg/0.5 mL, 95 mcg/0.5 mL, 125 mcg/0.5 mL.

**Administration/handling**

**SQ**
**Premedication**
• Prophylactic and concurrent use of analgesics and/or antipyretics may prevent or lessen flu-like symptoms.

**Administration**
• If refrigerated, allow pen/syringe to warm to room temperature for 30 min before using.
• Administer any time of day, without regard to meals, at same time each administration day.
• Subcutaneously insert needle into abdomen, thigh, or back of upper arm.
• Do not inject where skin is bruised, infected, reddened, or scarred.
• Do not reuse pens/syringes.
• Rotate injection sites.

**Storage**
• Refrigerate in original carton.
• Do not freeze.
• May store at room temperature for up to 30 days (if cooling unavailable).
• If carton returned to refrigerator, total combined time out of refrigeration may not exceed 30 days.
• Protect from light.

**Indications/routes/dosage**

**Note:** Analgesics and/or antipyretics may decrease flu-like symptoms on treatment days.

**Multiple Sclerosis**

**SQ: ADULTS, ELDERLY:**

**Treatment initiation:** Dose 1: 63 mcg on day 1.  
Dose 2: 94 mcg on day 15 (14 days later).  
Dose 3: 125 mcg on day 29.  
**Maintenance:** 125 mcg every 14 days thereafter.

**Dosage in Renal/Hepatic Impairment**

No dose adjustment.

**Side effects**

**Frequent (47%–44%):** Flu-like symptoms, pyrexia, headache.  
**Occasional (19%–4%):** Myalgia, chills, asthenia, arthralgia, nausea, vomiting, hyperthermia, pruritus.  
**Injection Site Reactions: Frequent (62%):** Erythema.  
**Occasional (15%–2%):** Pain, pruritus, edema, warmth, hematoma, rash.

**Adverse effects/toxic reactions**

Hepatic injury including autoimmune hepatitis, hepatitis, hepatic failure, or elevation of LFT greater than 5 times upper limit of normal (ULN) occurred in 2% of pts. Depression and/or suicidal ideation reported in 8% of pts. Serious hypersensitivity reactions including anaphylaxis, angioedema, urticaria have been reported. Cardiomyopathy, HF occurred in 7% of pts. Treatment may decrease blood counts across all cell lines; may cause anemia, lymphopenia, neutropenia, pancytopenia, thrombocytopenia. Approximately 7% of pts developed neutralizing antibodies to peginterferon. Injection site reactions occurred in 66% of pts and may rarely include necrosis of injection site. Seizures
occurred in less than 1% of pts.

**Nursing considerations**

**Baseline assessment**

Obtain CBC, LFT, urine or serum pregnancy test. Assess pt’s understanding of proper self-injection techniques. Question history of depression or suicidal ideation, heart disease, hematologic abnormalities, hypersensitivity reactions, renal impairment. Question plans for breastfeeding.

**Intervention/evaluation**

Monitor CBC for hematologic abnormalities. Be alert for worsening depression, suicidal ideation. If pt develops loss of treatment effectiveness, consider testing for anti-peginterferon antibodies. Check injection site after 2 hrs for redness, swelling, or tenderness. Due to increased drug exposure, monitor pts with renal impairment for adverse reactions.

**Patient/family teaching**

- Report changes in mood or behavior, thoughts of suicide, self-destructive behavior.
- A health care provider will show you how to properly inject your medication. You must demonstrate correct injection technique before using at home.
- Inject under skin (subcutaneously); do not inject into muscle or vein.
- Rotate injection sites.
- Injection site reactions such as itching, swelling, redness are common.
- Report generalized rash, itching, hives; may indicate allergic reaction.
- Discard used needles using regulated sharps container.
- Treatment may cause worsening of autoimmune or liver disease.
- Report any upper abdominal pain, body aches, bruising, dark-colored urine, fever, yellowing of skin or eyes.
- Protect drug from light.
- Do not freeze medication.
- Do not breastfeed.

**pentamidine**
Uses

**IM/IV:** Treatment of pneumonia caused by *Pneumocystis jiroveci* (PCP). **Inhalation:** Prevention of PCP in high-risk HIV-infected pts either with history of PCP or with a CD4+ count 200/mm³ or less. **OFF-LABEL:** Treatment of African trypanosomiasis, cutaneous/visceral leishmaniasis. Prevention of PCP in non–HIV-infected pts.

Precautions

**Contraindications:** Hypersensitivity to pentamidine. **Cautions:** Diabetes, hepatic impairment, hypertension/hypotension, anemia, thrombocytopenia, preexisting cardiac disease, hypocalcemia, prolonged QT interval, congenital long QT syndrome, medications that prolong QT interval, ventricular tachycardia, severe renal impairment, concurrent use of other nephrotoxic drugs, history of seizures or pancreatic disease, or elevated amylase/lipase levels, hematologic disorders. Pts with Stevens-Johnson syndrome.

Action

Interferes with nuclear metabolism, incorporation of nucleotides, inhibiting DNA, RNA, phospholipid, protein synthesis. **Therapeutic Effect:** Produces antifungal, antipROTOzoal effects.

Pharmacokinetics

Well absorbed after IM administration; minimally absorbed after inhalation. Widely distributed. Primarily excreted in urine. Minimally removed by hemodialysis. **Half-life:** 6.4–9.4 hrs (increased in renal impairment).
Lifespan considerations

Pregnancy/Lactation: Unknown if drug crosses placenta or is distributed in breast milk. Children: No age-related precautions noted. Elderly: No age-related information available.

Interactions

DRUG: Nephrotoxic medications (e.g., acyclovir, amphotericin B, diclofenac, furosemide, gentamicin, IV contrast dye, NSAIDs) may increase risk of nephrotoxicity. HERBAL: None significant. FOOD: None known. LAB VALUES: May increase serum alkaline phosphatase, bilirubin, BUN, creatinine, ALT, AST. May decrease serum calcium, magnesium. May alter serum glucose.

Availability (Rx)

Administration/handling

Pt must be in supine position during IM, IV administration, with frequent B/P checks until stable (potential for life-threatening hypotensive reaction). Have resuscitative equipment immediately available.

IV

Reconstitution

• For intermittent IV infusion (piggyback), reconstitute each vial with 3–5 mL D5W or Sterile Water for Injection.
• Withdraw desired dose; further dilute with 50–250 mL D5W to concentration not to exceed 6 mg/mL.

Rate of Administration

• Infuse over 60–120 min.
• Do not give by IV injection or rapid IV infusion (increases potential for severe hypotension).

Storage

• Store vials at room temperature.
• After reconstitution, IV solution is stable for 48 hrs at room temperature (24
hrs if reconstituted with D₅W).
  • Discard unused portion.

**IM**
  • Reconstitute 300-mg vial with 3 mL Sterile Water for Injection to provide concentration of 100 mg/mL.
  • Administer deep IM.

**Aerosol (Nebulizer)**
  • Aerosol stable for 48 hrs at room temperature.
  • Reconstitute 300-mg vial with 6 mL Sterile Water for Injection. Avoid NaCl (may cause precipitate).
  • Do not mix with other medication in nebulizer reservoir.

**IV incompatibilities**
CeFAZolin (Ancef), cefotaxime (Claforan), cefTAZidime (Fortaz), cefTRIAXone (Rocephin), fluconazole (Diflucan), foscarnet (Foscarin), interleukin (Proleukin).

**IV Compatibilities**
DiltiaZEM (Cardizem), total parenteral nutrition (TPN), zidovudine (Retrovir).

**Indications/routes/dosage**

**Treatment of Pneumocystis jiroveci Pneumonia (PCP)**
**IV, IM:** ADULTS, ELDERLY, CHILDREN OLDER THAN 4 MOS: 4 mg/kg/day once daily for 14–21 days.

**Prevention of PCP**
**Inhalation:** ADULTS, ELDERLY, CHILDREN 5 YRS AND OLDER: 300 mg once q4wks.

**Dosage in Renal/Hepatic Impairment**
Use caution.

**Side effects**

**Frequent: Injection (Greater Than 10%)**: Abscess, pain at injection site.  
**Inhalation (Greater Than 5%)**: Fatigue, metallic taste, shortness of breath, decreased appetite, dizziness, rash, cough, nausea, vomiting, chills.  
**Occasional: Injection (10%–1%)**: Nausea, decreased appetite, hypotension, fever, rash, altered taste, confusion.  
**Inhalation (5%–1%)**: Diarrhea, headache, anemia, muscle pain.  
**Rare: Injection (less than 1%)**: Neuralgia, thrombocytopenia, phlebitis, dizziness.

**Adverse effects/toxic reactions**

Life-threatening/fatal hypotension, arrhythmias, hypoglycemia, leukopenia, nephrotoxicity, renal failure, anaphylactic shock, Stevens-Johnson syndrome, toxic epidural necrolysis occur rarely. Hyperglycemia, insulin-dependent diabetes mellitus (often permanent) may occur even mos after therapy has stopped.

**Nursing considerations**

**Baseline assessment**

Avoid concurrent use of nephrotoxic drugs. Establish baseline for B/P, serum glucose, EKG. Obtain specimens for diagnostic tests before giving first dose. Screen for concomitant medications that increase risk of QT interval prolongation or nephrotoxicity.

**Intervention/evaluation**

Monitor B/P during administration until stable for both IM and IV administration (pt should remain supine). Check serum glucose levels; observe for clinical signs of hypoglycemia (diaphoresis, anxiety, tremor, tachycardia, palpitations, dizziness, headache, numbness of lips, double vision, incoordination), hyperglycemia (polyuria, polyphagia, polydipsia, malaise, visual changes, abdominal pain, headache, nausea/vomiting). Evaluate IM sites for pain, redness, induration; IV sites for phlebitis (heat, pain, red streaking over vein). Monitor
renal, hepatic, hematology test results. Assess skin for rash. Evaluate equilibrium during ambulation. Be alert for respiratory difficulty when administering by inhalation route.

**Patient/family teaching**

- Remain flat in bed during administration of medication; get up slowly with assistance only when B/P stable.
- Immediately report profuse sweating, shakiness, dizziness, palpitations.
- Drowsiness, increased urination, thirst, anorexia may develop in mos following therapy.
- Maintain adequate fluid intake.
- Report fever, cough, shortness of breath.
- Avoid alcohol.

---

**phenazopyridine**

fen-ay-zoe-pir-i-deen

Azo-Gesic

**Pyridium**

**CLASSIFICATION**

PHARMACOTHERAPEUTIC: Interstitial cystitis agent.

CLINICAL: Urinary tract analgesic.

Do not confuse phenazopyridine with pyridoxine, or Pyridium with Dyrenium or Perdiem.

---

**Uses**

Symptomatic relief of pain, burning, urgency, frequency resulting from lower urinary tract mucosa irritation (may be caused by infection, trauma, surgery).

**Precautions**

**Contraindications:** Hypersensitivity to phenazopyridine. Renal impairment (CrCl less than 50 mL/min). **Cautions:** Renal impairment (CrCl 50–80 mL/min).
**Action**

Exerts topical analgesic effect on urinary tract mucosa. **Therapeutic Effect:** Relieves urinary pain, burning, urgency, frequency.

**Pharmacokinetics**

Well absorbed from GI tract. Partially metabolized in liver. Primarily excreted in urine. **Half-life:** Unknown.

**Lifespan considerations**

**Pregnancy/Lactation:** Unknown if drug crosses placenta or is distributed in breast milk. **Children:** No age-related precautions noted in pts older than 6 yrs. **Elderly:** Age-related renal impairment may increase toxicity.

**Interactions**

**DRUG:** None significant. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** May interfere with urinalysis tests based on color reactions (e.g., urinary glucose, ketones, protein, 17-ketosteroids).

**Availability (Rx)**

**Tablets:** *(Azo-Gesic, Azo-Standard, Uristat):* 95 mg. *(Pyridium):* 100 mg, 200 mg.

**Administration/handling**

**PO**

- Give with meals.

**Indications/routes/dosage**

**Urinary Analgesic**

**PO:** **ADULTS, ELDERLY, CHILDREN 12 YRS AND OLDER:** *(Rx):* 200 mg 3 times/day for 2 days. *(OTC):* 190 mg 3 times/day for 2 days.
Dosage in Renal Impairment
Use contraindicated in pts with CrCl less than 50 mL/min.

Dosage in Hepatic Impairment
No dose adjustment.

Side effects
Occasional: Headache, GI disturbance, rash, pruritus.

Adverse effects/toxic reactions
Overdose in pts with renal impairment, severe hypersensitivity may lead to hemolytic anemia, nephrotoxicity, hepatotoxicity. Methemoglobinemia generally occurs as result of massive, acute overdose.

Nursing considerations

Baseline assessment
Assess pt for dysuria, urinary urgency or frequency.

Intervention/evaluation
Monitor for therapeutic response: relief of dysuria (pain, burning), urgency, frequency of urination.

Patient/family teaching
• Reddish orange discoloration of urine should be expected.
• May stain fabric.
• Take with meals (reduces possibility of GI upset).

piroxicam
peer-ox-i-kam
Apo-Piroxicam
Feldene
Uses
Management of acute or chronic rheumatoid arthritis (RA), osteoarthritis. **OFF-LABEL:** Treatment of juvenile idiopathic arthritis.

Precautions
**Contraindications:** Hypersensitivity to piroxicam. Perioperative pain in setting of CABG surgery, history of hypersensitivity to aspirin/NSAIDs, active GI bleeding. Pts with aspirin triad (asthma, rhinitis, and aspirin intolerance). **Cautions:** Advanced renal disease, hepatic impairment, asthma, coagulation disorders, concomitant use of anticoagulants, poor CYP2C9 metabolizers. History of GI bleeding or ulcers, alcohol abuse. Avoid use in late pregnancy.

Action
Produces analgesic, anti-inflammatory effects by inhibiting prostaglandin synthesis. **Therapeutic Effect:** Reduces inflammatory response, intensity of pain.

Pharmacokinetics

<table>
<thead>
<tr>
<th>Route</th>
<th>Onset</th>
<th>Peak</th>
<th>Duration</th>
</tr>
</thead>
<tbody>
<tr>
<td>PO</td>
<td>1 hr</td>
<td>3–5 hrs</td>
<td>—</td>
</tr>
</tbody>
</table>

Well absorbed following PO administration. Protein binding: 99%. Metabolized in liver. Primarily excreted in urine; small amount eliminated in feces. **Half-life:**
50 hrs.

Lifespan considerations

**Pregnancy/Lactation:** Crosses placenta; distributed in breast milk. Avoid use during third trimester (may adversely affect fetal cardiovascular system: premature closing of ductus arteriosus). **Children:** Safety and efficacy not established. **Elderly:** Age-related renal impairment may increase risk of hepatotoxicity, renal toxicity; reduced dosage recommended. More likely to have serious adverse effects with GI bleeding/ulceration.

**Interactions**

**DRUG:** May decrease effects of **antihypertensives** (e.g., amLODIPine, lisinopril, valsartan), **diuretics** (e.g., furosemide, HCTZ). **Aspirin,** other **salicylates** may increase risk of GI side effects, bleeding. **May increase effects of heparin,** oral **anticoagulants** (e.g., rivaroxaban, warfarin), **thrombolytics** (e.g., alteplase). May increase concentration, risk of toxicity of **lithium,** methotrexate. **HERBAL:** Cat’s claw, dong quai, evening primrose, feverfew, garlic, ginger, ginkgo, ginseng, horse chestnut, red clover possess antiplatelet activity, may increase risk of bleeding. **St. John’s wort** may increase risk of phototoxicity. **FOOD:** None known. **LAB VALUES:** May increase serum BUN, creatinine, LDH, alkaline phosphatase, ALT, AST. May decrease serum uric acid, Hgb, Hct, platelets, leukocytes.

**Availability (Rx)**

**Capsules:** 10 mg, 20 mg.

**Administration/handling**

**PO**

- Do not break, crush, or open capsules.
- May give with food, milk, antacids if GI distress occurs.

**Indications/routes/dosage**
**Rheumatoid Arthritis (RA), Osteoarthritis**

**PO: ADULTS, ELDERLY:** Initially, 10–20 mg/day as a single dose or in divided doses. **Maximum:** 20 mg/day. **CHILDREN:** *(Juvenile Idiopathic Arthritis)* 0.2–0.4 mg/kg/day. **Maximum:** 15 mg/day.

**Dosage in Renal Impairment**

**Mild to moderate impairment:** No dose adjustment. **Severe impairment:** Not recommended.

**Dosage in Hepatic Impairment**

No dose adjustment.

**Side effects**

**Frequent (9%–4%):** Dyspepsia, nausea, dizziness. **Occasional (3%–1%):** Diarrhea, constipation, abdominal cramps/pain, flatulence, stomatitis. **Rare (less than 1%):** Hypertension, urticaria, dysuria, ecchymosis, blurred vision, insomnia, phototoxicity.

**Adverse effects/toxic reactions**

Peptic ulcer, GI bleeding, gastritis, severe hepatic reaction (cholestasis, jaundice) occur rarely. Nephrotoxicity (dysuria, hematuria, proteinuria, nephrotic syndrome), hematologic toxicity (anemia, leukopenia, eosinophilia, thrombocytopenia), severe hypersensitivity reaction (fever, chills, bronchospasm) occur rarely with long-term treatment.

**Nursing considerations**

**Baseline assessment**

Assess onset, type, location, duration of pain/inflammation. Inspect appearance of affected joints for immobility, deformities, skin condition.

**Intervention/evaluation**

Monitor daily pattern of bowel activity, stool consistency. Monitor for evidence
of nausea, GI distress. Assess for therapeutic response: relief of pain, stiffness, swelling; increased joint mobility; reduced joint tenderness; improved grip strength. Monitor CBC, renal/hepatic function tests.

**Patient/family teaching**

- Avoid aspirin, alcohol during therapy (increases risk of GI bleeding).
- If GI upset occurs, take with food, milk, antacids.
- Avoid tasks that require alertness until response to drug is established.

<table>
<thead>
<tr>
<th>plerixafor</th>
</tr>
</thead>
<tbody>
<tr>
<td>pler-ix-a-for</td>
</tr>
</tbody>
</table>

**CLASSIFICATION**

**PHARMACOTHERAPEUTIC**: Chemokine receptor inhibitor.  
**CLINICAL**: Hematopoietic stem cell mobilizer.

**Uses**

Indicated in combination with granulocyte colony-stimulating factor (G-CSF) to mobilize stem cells to peripheral blood for collection and transplantation in pts with non-Hodgkin’s lymphoma and multiple myeloma.

**Precautions**

**Contraindications**: Hypersensitivity to plerixafor. **Cautions**: Avoid use in leukemic pts, in pts with neutrophil count greater than 50,000 cells/mm³, those with moderate to severe renal impairment.

**Action**

Immobilizes hematopoietic stem cells in bone marrow. Once in the marrow, acts to help anchor these cells to marrow matrix through induction of adhesion molecules. **Therapeutic Effect**: Results in leukocytosis, elevation in circulating hematopoietic progenitor cells in peripheral blood system.
Pharmacokinetics

Lifespan considerations

**Pregnancy/Lactation:** Potential for teratogenic effects. May cause fetal harm.
**Children:** Safety and efficacy not established. **Elderly:** Age-related renal impairment may require dosage adjustment.

Interactions

**DRUG:** None significant. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** May increase WBC count. May decrease platelet count.

Availability (Rx)

**Injection Solution:** 24 mg/1.2 mL vial.

Administration/handling

**SQ**

- Aspirate syringe before injection (avoid intra-arterial administration).

Storage

- Store at room temperature.
- Discard if particulate matter is present or if solution is discolored.
- Use single-dose vial; discard unused drug.

Indications/routes/dosage

**Alert** Begin therapy after pt has received daily morning doses of G-CSF, 10 mcg/kg once daily for 4 days prior to the first evening dose of plerixafor and approximately 11 hrs prior to initiation of apheresis for up to 4 consecutive days.

**Daily Dosage**

**SQ:** **ADULTS, ELDERLY (WEIGHING MORE THAN 83 KG):** 0.24 mg/kg
once daily (about 11 hrs prior to apheresis) for up to 4 consecutive days. **Maximum:** 40 mg/day. **(83 KG or LESS):** 20 mg fixed dose or 0.24 mg/kg once daily for up to 4 consecutive days.

**Dosage in Moderate to Severe Renal Impairment (CrCl Equal to or Less Than 50 mL/min):**

**SQ:ADULTS, ELDERLY(WEIGHING MORE THAN 83 KG):** Decrease dose to 0.16 mg/kg, not to exceed 27 mg/day. **(83 KG OR LESS):** 13 mg fixed dose or 0.16 mg/kg once daily.

**Dosage in Hepatic Impairment**

No dose adjustment.

**Side effects**

**Frequent (37%–22%):** Diarrhea, nausea, injection site irritation, fatigue, headache. **Occasional (13%–7%):** Arthralgia, dizziness, vomiting, insomnia, flatulence.

**Adverse effects/toxic reactions**

Thrombocytopenia may occur. Dyspnea, hypoxia, vasovagal reaction, periorbital edema, urticaria have been noted; may resolve spontaneously, generally responds to antihistamines, corticosteroids.

**Nursing considerations**

**Baseline assessment**

Obtain CBC, renal function test in pts with renal impairment.

**Intervention/evaluation**

Monitor WBC, platelet count. Assess for potential systemic reaction (periorbital edema, dyspnea, urticaria), orthostatic hypotension during or shortly after injection. Advise female pt with reproductive potential to use effective contraceptive method.
Patient/family teaching

- Manage gastrointestinal disorders; report severe diarrhea, nausea, vomiting.
- Report upper quadrant pain or scapular/shoulder pain.

**progesterone**

pro-jes-te-rone

Crinone

Endometrin Vaginal Insert

Prochieve

Prometrium

CLASSIFICATION

PHARMACOTHERAPEUTIC: Progestin.

CLINICAL: Hormone.

■ BLACK BOX ALERT ■ Not indicated to prevent coronary heart disease. Risk of dementia may be increased in postmenopausal women.

Uses

**PO:** Prevent endometrial hyperplasia in nonhysterectomized, postmenopausal women receiving conjugated estrogens, secondary amenorrhea. **IM:** Amenorrhea, abnormal uterine bleeding due to hormonal imbalance. **Vaginal gel:** Treatment of infertility, secondary amenorrhea. **Vaginal insert:** Treatment of infertility. **OFF-LABEL:** Reduce risk of recurrent spontaneous preterm birth.

Precautions

**Contraindications:** Hypersensitivity to progesterone. History of or suspected carcinoma of breast, active breast cancer; thromboembolic disorders, thrombophlebitis, missed abortion or ectopic pregnancy, severe hepatic dysfunction, undiagnosed abnormal vaginal bleeding, use as a pregnancy test. **Cautions:** Diabetes, conditions aggravated by fluid retention (e.g., asthma, epilepsy, migraine, cardiac/renal dysfunction), history of mental depression.
**Action**
Promotes mammary gland development, relaxes uterine smooth muscle, induces secretory changes in the endometrium, blocks follicular maturation and ovulation, maintains pregnancy. **Therapeutic Effect:** Decreases abnormal uterine bleeding; transforms endometrium from proliferative to secretory in estrogen-primed endometrium.

**Pharmacokinetics**
Protein binding: 96%–99%. Metabolized in liver. Excreted in bile, urine. **Half-life (vaginal gel):** 5–20 min.

**Lifespan considerations**
**Pregnancy/Lactation:** Distributed in breast milk. Avoid use during pregnancy. None established for vaginal gel, vaginal insert, or injection. **Children:** Safety and efficacy not established. **Elderly:** No age-related precautions noted.

**Interactions**
**DRUG:** CYP3A4 inducers (e.g., carBAMazepine, phenytoin, rifAMPin) may decrease effects. **HERBAL:** St. John’s wort may decrease effect. **FOOD:** None known. **LAB VALUES:** May alter HDL, cholesterol, triglycerides, LDL. May increase serum ALT, AST.

**Availability (Rx)**
**Capsules (Prometrium):** 100 mg, 200 mg. **Injection Oil:** 50 mg/mL. **Vaginal Gel (Crinone, Prochieve):** 4% (45 mg/dose), 8% (90 mg/dose). **Vaginal Insert (Endometrin Vaginal Insert):** 100 mg. **Vaginal suppository:** 25 mg, 50 mg, 100 mg, 200 mg, 400 mg.

**Administration/handling**
**IM**
- Store at room temperature.
- Administer only deep IM in large muscle mass.
PO
• If given in morning, administer 2 hrs after breakfast with full glass of water.

Vaginal Gel
• Remove applicator from sealed wrapper. Do not remove twist-off tab at this time.
• Hold applicator by thick end. Shake down several times (like a thermometer) to ensure that contents are at thin end.
• Hold applicator by flat section of thick end and twist off tab at other end. Do not squeeze thick end while twisting tab (could force some gel to be released before insertion).
• Insert applicator into vagina either in sitting position or lying on back with knees bent.
• Insert thin end well into vagina.
• Squeeze thick end of applicator to deposit gel.
• Remove applicator, discard.

Indications/routes/dosage

Amenorrhea
PO:ADULTS: 400 mg daily in evening for 10 days.
Vaginal:ADULTS: Apply 45 mg (4% gel) every other day for 6 or fewer doses. If response inadequate, may increase to 8% gel at same schedule.

Abnormal Uterine Bleeding
IM:ADULTS: 5–10 mg/day for 6 days. When estrogen given concomitantly, begin progesterone after 2 wks of estrogen therapy; discontinue when menstruation begins.

Prevention of Endometrial Hyperplasia
PO:ADULTS: 200 mg in evening for 12 days per 28-day cycle, in combination with daily conjugated estrogen.
**Infertility**

**Vaginal Gel: ADULTS:** 90 mg (8% gel) once daily (twice daily in women with partial or complete ovarian failure). If pregnancy occurs, may continue up to 10–12 wks. **Vaginal Insert:** 100 mg 2–3 times/day starting at oocyte retrieval and continuing for up to 10 wks.

**Dosage in Renal Impairment**

No dose adjustment.

**Dosage in Hepatic Impairment**

Contraindicated.

**Side effects**

**Frequent:** Breakthrough bleeding/spotting at beginning of therapy, amenorrhea, change in menstrual flow, breast tenderness. **Gel:** Drowsiness. **Occasional:** Edema, weight gain/loss, rash, pruritus, photosensitivity, skin pigmentation. **Rare:** Pain/swelling at injection site, acne, depression, alopecia, hirsutism.

**Adverse effects/toxic reactions**

Thrombophlebitis, cerebrovascular disorders, retinal thrombosis, pulmonary embolism occur rarely.

**Nursing considerations**

**Baseline assessment**

Question for possibility of pregnancy, hypersensitivity to progestins before initiating therapy. Obtain baseline weight, serum glucose level, B/P. Question history of thromboembolism.

**Intervention/evaluation**

Check weight daily; report wkly gain over 5 lbs. Assess skin for rash, urticaria. Immediately report development of chest pain, sudden shortness of breath,
sudden decrease in vision, migraine headache, pain (esp. with swelling, warmth, redness) in calves, numbness of arm/leg (thrombotic disorders). Check B/P periodically. Note progesterone therapy on pathology specimens.

**Patient/family teaching**

- Use sunscreen, protective clothing to protect from sunlight, ultraviolet light until tolerance determined.
- Report abnormal vaginal bleeding, other related symptoms.
- Stop taking medication, contact physician at once if pregnancy suspected.
- If using vaginal gel, avoid tasks that require alertness, motor skills until response to drug is established.

### Fixed-Combination(s)

**Advil Cold, Motrin Cold:** pseudoephedrine/ibuprofen (an NSAID): 30 mg/200 mg, 15 mg/100 mg per 5 mL. **Allegra-D:** pseudoephedrine/fexofenadine (an antihistamine): 120 mg/60 mg. **Allegra-D 24 Hour:** pseudoephedrine/fexofenadine: 240 mg/180 mg. **Claritin-D:** pseudoephedrine/loratadine (an antihistamine): 120 mg/5 mg, 240 mg/10 mg. **Clarinex-D 24-Hour:** pseudoephedrine/desloratadine (an antihistamine): 240 mg/5 mg. **Clarinex-D 12-Hour:** pseudoephedrine/desloratadine: 120 mg/2.5 mg. **Rezira:** pseudoephedrine/HYDROcodone (an opioid analgesic): 60 mg/5
mg per 5 mL. **ZyrTEC-D:** pseudoephedrine/cetirizine (an antihistamine): 120 mg/5 mg.

**CLASSIFICATION**

**PHARMACOTHERAPEUTIC:** Sympathomimetic.

**CLINICAL:** Nasal decongestant.

**Uses**

Temporary relief of nasal congestion due to common cold, upper respiratory allergies, sinusitis. Enhances nasal, sinus drainage.

**Precautions**

**Contraindications:** Hypersensitivity to pseudoephedrine. Use of MAOIs within 14 days. Severe hypertension, coronary artery disease. **Cautions:** Elderly, hyperthyroidism, diabetes, ischemic heart disease, prostatic hypertrophy, mild to moderate hypertension, arrhythmias, renal impairment, seizure disorder, increased intraocular pressure.

**Action**

Directly stimulates alpha₁-adrenergic, beta₂-adrenergic receptors. **Therapeutic Effect:** Produces vasoconstriction; causes bronchial relaxation, increased heart rate/contractility.

**Pharmacokinetics**

**Lifespan considerations**

**Pregnancy/Lactation:** Crosses placenta. Distributed in breast milk. **Children:** Safety and efficacy not established in pts younger than 2 yrs. **Elderly:** Age-
related prostatic hypertrophy may require dosage adjustment.

**Interactions**

**DRUG:** May decrease effects of antihypertensives (e.g., amLODIPine, lisinopril, valsartan), beta blockers (e.g., carvedilol, metoprolol), diuretics (e.g., furosemide, HCTZ). **HERBAL:** Ephedra, yohimbe may cause hypertension. **FOOD:** None known. **LAB VALUES:** None significant.

**Availability (OTC)**

**Liquid:** 15 mg/5 mL, 30 mg/5 mL. **Syrup:** 30 mg/5 mL. **Tablets:** 30 mg.

**Tablets, Extended-Release:** (12 Hour): 120 mg. **Tablets, Extended-Release:** (12 Hour): 120 mg. **Tablets, Extended-Release:** (24 Hour): 240 mg.

**Alert** Pseudoephedrine is a key ingredient in synthesizing methamphetamine. Many pharmacies have moved pseudoephedrine behind the counter due to concerns about its purchase or theft for purposes of methamphetamine manufacture.

**Administration/handling**

**PO**

- Administer with water or milk to decrease GI upset.
- Do not break, crush, dissolve, or divide extended-release forms; give whole.

**Indications/routes/dosage**

**Decongestant**

**PO:** ADULTS, ELDERLY, CHILDREN 12 YRS AND OLDER: 30–60 mg q4–6h. **Maximum:** 240 mg/day. **CHILDREN 6–11 YRS:** 30 mg q4–6h. **Maximum:** 120 mg/day. **CHILDREN 4–5 YRS:** 15 mg q4–6h. **Maximum:** 60 mg/day.

**PO (Extended-Release):** ADULTS, CHILDREN 12 YRS AND OLDER: 120 mg q12h or 240 mg once daily.
Dosage in Renal/Hepatic Impairment
No dose adjustment.

Side effects
Occasional (10%–5%): Nervousness, restlessness, insomnia, tremor, headache. Rare (4%–1%): Diaphoresis, weakness.

Adverse effects/toxic reactions
Large doses may produce tachycardia, palpitations (particularly in pts with cardiac disease), light-headedness, nausea, vomiting. Overdose in those older than 60 yrs may result in hallucinations, CNS depression, seizures.

Nursing considerations

Patient/family teaching
• Discontinue drug if adverse reactions occur.
• Report insomnia, dizziness, tremors, tachycardia, palpitations.

</tbody>
</table>

CLASSIFICATION
PHARMACOTHERAPEUTIC: Bulk-forming agent.
CLINICAL: Laxative.
Do not confuse Fiberall with Feverall.

Uses
Treatment of occasional constipation. Dietary fiber supplement. Reduce risk of coronary heart disease (CHD).
Precautions

Contraindications: Hypersensitivity to psyllium, difficulty swallowing. **Cautions:** Esophageal strictures, ulcers, stenosis, intestinal adhesions, difficulty swallowing, management of irritable bowel syndrome (IBS), elderly. Pts with or prone to fecal impaction or GI obstruction. Avoid use in pts with nausea, vomiting, or abdominal pain.

Action

Dissolves and swells in water providing increased bulk, moisture content in stool. **Therapeutic Effect:** Promotes peristalsis, bowel motility.

Pharmacokinetics

</tbody>
</table>

Acts in small, large intestines.

Lifespan considerations

**Pregnancy/Lactation:** Safe for use in pregnancy. **Children:** Safety and efficacy not established in pts younger than 6 yrs. **Elderly:** No age-related precautions noted.

Interactions

**DRUG:** None significant. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** May increase serum glucose. May decrease serum potassium.

Availability (OTC)

**Capsules:** 500 mg.  **Powder:** 300 g, 450 g bulk powder.

Administration/handling

**PO**

• Administer at least 2 hrs before or after other medication.
• All doses should be followed with 8 oz liquid.
• Drink 6–8 glasses of water/day (aids stool softening).
• Do not swallow in dry form; mix with at least 1 full glass (8 oz) of liquid.

**Indications/routes/dosage**

**Constipation**
Refer to specific dosing guidelines on product labeling.
 **PO:** **ADULTS, ELDERLY:** (2.5–30 g/day in divided doses) 2–5 capsules/dose up to 3 times/day. 1 rounded tsp or 1 tbsp of powder up to 3 times/day. **CHILDREN 6–11 YRS:** (1.25–15 g/day in divided doses). Approximately ½ adult dose up to 3 times/day.

**Reduce Risk of CHD**
PO: **ADULTS, ELDERLY:** 7 g or more daily.

**Side effects**
**Rare:** Some degree of abdominal discomfort, nausea, mild abdominal cramps, griping, faintness.

**Adverse effects/toxic reactions**
Esophageal/bowel obstruction may occur if administered with insufficient liquid (less than 250 mL).

**Nursing considerations**

**Intervention/evaluation**

**Patient/family teaching**
• Take each dose with full glass (250 mL) of water.
Inadequate fluid intake may cause GI obstruction.
Institute measures to promote defecation (increase fluid intake, exercise, high-fiber diet).

**Fixed-Combination(s)**

**Avandamet:** rosiglitazone/metFORMIN: 1 mg/500 mg, 2 mg/500 mg, 4 mg/500 mg, 2 mg/1 g, 4 mg/1 g. **Avandaryl:** rosiglitazone/glimepiride (an antidiabetic): 4 mg/1 mg, 4 mg/2 mg, 4 mg/4 mg.

**CLASSIFICATION**

**PHARMACOTHERAPEUTIC:** Thiazolidinedione.
**CLINICAL:** Antidiabetic agent.

■ **BLACK BOX ALERT** ■ May cause or exacerbate heart failure.

Do not confuse Avandia with Avalide or AVINza, or Avandaryl with Benadryl.

**Uses**

Adjunct to diet/exercise to lower serum glucose in pts with type 2 diabetes. Used as monotherapy or in combination with metFORMIN, sulfonylurea to improve glycemic control. Use with insulin not recommended.

**Precautions**

**Contraindications:** Hypersensitivity to rosiglitazone. Type 1 diabetes, ketoacidosis. NYHA class III or IV HF. **Cautions:** Hepatic impairment, preexisting macular edema or diabetic retinopathy, pts at risk for cardiovascular events, edema, anemia, premenopausal or anovulatory women.

**Action**

Improves target-cell response to insulin without increasing pancreatic insulin
secretion. Decreases hepatic glucose output, increases insulin-dependent glucose utilization in skeletal muscle. **Therapeutic Effect:** Lowers serum glucose, Hgb A1C levels.

**Pharmacokinetics**

Rapidly absorbed. Protein binding: 99%. Metabolized in liver. Excreted in urine (64%), feces (23%). Not removed by hemodialysis. **Half-life:** 3–4 hrs.

**Lifespan considerations**

**Pregnancy/Lactation:** Unknown if drug crosses placenta or is distributed in breast milk. Not recommended in pregnant or breastfeeding women. **Children:** Safety and efficacy not established. **Elderly:** No age-related precautions noted.

**Interactions**

**DRUG:** RifAMPin may decrease concentration/effects. **Gemfibrozil** may increase concentration, toxicity. **HERBAL:** Garlic, ginger, ginseng may cause hypoglycemia. **FOOD:** None known. **LAB VALUES:** May increase serum ALT, AST, cholesterol, HDL, LDL. May decrease Hgb, Hct.

**Availability (Rx)**

**Tablets:** 2 mg, 4 mg, 8 mg.

**Administration/handling**

**PO**

- Give without regard to meals.

**Indications/routes/dosage**

**Note:** Do not initiate with active hepatic disease or ALT greater than 2.5 times upper limit of normal (ULN).

**Diabetes Mellitus**
PO: ADULTS, ELDERLY: Initially, 4 mg as single daily dose or in divided doses twice daily. May increase to 8 mg/day after 12 wks of therapy if fasting glucose level is not adequately controlled.

**Dosage in Renal/Hepatic Impairment**
No dose adjustment. Do not initiate with active hepatic disease or elevated transaminases at baseline.

**Side effects**

**Frequent (9%):** Upper respiratory tract infection. **Occasional (4%–2%):** Headache, edema, back pain, fatigue, sinusitis, diarrhea.

**Adverse effects/toxic reactions**
Hepatotoxicity occurs rarely. Increased risk of HF. May cause or worsen macular edema. May increase risk of fractures. Pts with ischemic heart disease are at high risk of MI.

**Nursing considerations**

**Baseline assessment**
Obtain LFT before initiation of therapy and periodically thereafter. Ensure follow-up instruction if pt, family do not thoroughly understand diabetes management, glucose-testing technique.

**Intervention/evaluation**
Monitor Hgb, serum glucose, LFT. Assess for hypoglycemia (cool/wet skin, tremors, dizziness, anxiety, headache, tachycardia, numbness in mouth, hunger, diplopia), hyperglycemia (polyuria, polyphagia, polydipsia, nausea, vomiting, dim vision, fatigue, deep/rapid breathing). Be alert to conditions that alter glucose requirements (fever, increased activity/stress, trauma, surgical procedures).

**Patient/ family teaching**
• Diabetes requires lifelong control.
• Prescribed diet, exercise are principal parts of treatment; do not skip/delay meals.
• Wear medical alert identification.
• Continue to adhere to dietary instructions, regular exercise program, regular testing of urine or blood glucose.
• When taking combination drug therapy with a sulfonylurea or insulin, have source of glucose available to treat symptoms of low blood sugar.
• Report rapid increase in weight, edema, shortness of breath, chest pain, abdominal pain, yellowing of skin/eyes.

sofosbuvir
soe-fos-bue-veer
Sovaldi

**Fixed-Combination(s)**

**Harvoni**: Sofosbuvir/ledipasvir (a hepatitis C virus NSSA inhibitor): 400 mg/90 mg.

- **CLASSIFICATION**
  - **PHARMACOTHERAPEUTIC**: Nucleotide polymerase inhibitor.
  - **CLINICAL**: Antiviral.
- **Do not confuse sofosbuvir with fosamprenavir or simeprevir.**

**Uses**

Treatment of chronic hepatitis C virus (HCV) infection, in combination with peginterferon alfa and/or ribavirin or simeprevir. Indicated for HCV genotype 1, 2, 3, or 4 infection, including pts with hepatocellular carcinoma that meet Milan criteria (awaiting liver transplantation), and pts with HCV/HIV-1 co-infection.

**Precautions**

- **Contraindications**: Hypersensitivity to sofosbuvir. All contraindications to peginterferon alfa or ribavirin including pregnancy, male partners of pregnant women. **Cautions**: Concurrent use of potent P-glycoprotein inducers (e.g., rifAMPin, St. John’s wort) may decrease concentration/effects. Do not use as
monotherapy.

**Action**

Inhibits viral replication of viral-infected cells. Suppresses cell proliferation by interrupting polymerase activity, resulting in chain termination. **Therapeutic Effect:** Decrease in detectable HCV RNA.

**Pharmacokinetics**

Well absorbed after PO administration. Metabolized in liver. Protein binding: 61%–65%. Peak plasma concentration: 2–4 hrs. Excreted in urine (80%), feces (14%), expired air (2.5%). Approximately 18% of dose removed by dialysis. **Half-life:** 27 hrs.

**Lifespan considerations**

**Pregnancy/Lactation:** Strictly avoid pregnancy when used with ribavirin. May cause birth defects or fetal demise. Women of childbearing age must use two different forms of reliable birth control during treatment and for at least 6 mos after discontinuation. Do not initiate therapy until negative pregnancy test confirmed. Unknown if distributed in breast milk. Breastfeeding contraindicated. **Children:** Safety and efficacy not established in pts younger than 18 yrs. **Elderly:** No age-related precautions noted.

**Interactions**

**DRUG:** P-glycoprotein inducers (e.g., amiodarone, azithromycin, captopril, carvedilol, cyclosporine, felodipine, ticagrelor) may decrease concentration/effects. **HERBAL:** St. John’s wort may decrease concentration/effects. **FOOD:** None known. **LAB VALUES:** May decrease Hgb, Hct, platelets, neutrophils, leukocytes. May increase serum ALT, AST, bilirubin, creatine kinase, lipase.

**Availability (Rx)**

Tablets (Film-Coated): 400 mg.
Administration/handling

PO
• Give without regard to meals.

Indications/routes/dosage

Must use in combination with peginterferon alfa and/or ribavirin or simeprevir. Not recommended as monotherapy. Dose reduction of sofosbuvir not recommended.

Chronic Hepatitis C Infection

PO: ADULTS/ELDERLY: (Genotype 1): (with simeprevir) 400 mg daily with food for 12 wks (without cirrhosis), for 24 wks (with cirrhosis). (Genotype 1 or 4): (with peginterferon alfa and ribavirin) 400 mg daily with food for 12 wks. If pt ineligible to receive peginterferon alfa, may consider extending ribavirin regimen to 24 wks. If serious adverse reactions occur, consider dose reduction of peginterferon alfa and/or ribavirin. (Genotype 2): (with ribavirin only) 400 mg daily with food for 12 wks. If serious adverse reactions occur, consider dose reduction of ribavirin. (Genotype 3): (with ribavirin only) 400 mg daily with food for 24 wks. If serious adverse reaction occurs, consider dose reduction of ribavirin.

Ribavirin Dose Modification for Adverse Effects

History of Noncardiac Disease: Reduce ribavirin dose to 600 mg/day if Hgb less than 10 g/dL. Discontinue ribavirin if Hgb less than 8.5 g/dL. History of Stable Cardiac Disease: Reduce ribavirin dose to 600 mg/day if Hgb decreases greater than or equal to 2 g/dL during any 4-wk treatment period. Discontinue ribavirin if Hgb less than 12 g/dL despite 4 wks at reduced dose.

Chronic Hepatitis C with Hepatocellular Carcinoma (Awaiting Liver Transplantation)

PO:ADULTS/ELDERLY: 400 mg daily with food for 48 wks (with peginterferon alfa and ribavirin) or until liver transplantation occurs.

Dosage in Renal/Hepatic Impairment
No dose adjustment.

**Side effects**

*(With ribavirin): Frequent (38%–22%):* Fatigue, headache, nausea.  
*Occasional (15%–6%):* Insomnia, pruritus, irritability, diarrhea, rash, asthenia, anorexia, myalgia.  
*Rare (4%–2%):* Pyrexia, body aches, chills. *(With peginterferon alfa and ribavirin): Frequent (55%–29%):* Fatigue, headache, nausea, insomnia, pruritus.  
*Occasional (18%–14%):* Rash, anorexia, chills, body aches, diarrhea, myalgia, irritability, pyrexia.  
*Rare (3%):* Asthenia.

**Adverse effects/toxic reactions**

Increased risk of thromboembolic events associated with peginterferon alfa. Anemia may cause discontinuation of therapy. Severe depression, suicidal ideation occurs rarely.

**Nursing considerations**

**Baseline assessment**

Obtain baseline vital signs, CBC, serum CPK, complete metabolic panel, LFT, lipase level. Confirm hepatitis C virus genotype. Receive full history of home medications including herbal products. Screen for contraindications to peginterferon alfa/ribavirin. Confirm negative pregnancy test before initiating treatment for female pts of childbearing potential or female partners of male pts. Question history of anemia, pancytopenia, dialysis, hepatitis B infection, HIV infection, liver transplantation, renal impairment, pancreatitis.

**Intervention/evaluation**

Assess vital signs, O$_2$ saturation routinely. Monitor CBC routinely or with any dosage change. Obtain monthly pregnancy tests; monitor for intrauterine device failures if applicable. Reinforce birth control compliance. Assess for anemia-related dizziness, exertional dyspnea, fatigue, weakness, syncope. Report decreases in Hgb, Hct, platelets, neutrophils. Monitor for acute infection (fever, diaphoresis, lethargy, oral mucosal changes, productive cough), bloody stools, bruising, DVT, hematuria, pulmonary embolism. Encourage nutritional intake;
assess for anorexia, weight loss. Observe for signs of dyspnea or depression, suicidal ideation.

**Patient/family teaching**

- Periodic lab testing is an essential part of therapy.
- Treatment must be used in combination with peginterferon, ribavirin. Inform pt of side effects/contraindications of multi-medication regimen.
- Report any newly prescribed medications.
- Do not take herbal products.
- Women of childbearing age must use two different forms of reliable birth control during treatment and for at least 6 mos after treatment. Do not breastfeed. Notify physician if female partner becomes pregnant.
- May alter taste of food or decrease appetite.
- Report bloody stool/urine, increased bruising, difficulty breathing, weakness, dizziness, palpitations, weight loss.
- Avoid alcohol.
- Report signs of depression or suicidal ideation.

### sucralfate

soo-kral-fate

Apo-Sucralfate

Carafate

Novo-Sucralate

**CLASSIFICATION**

PHARMACOTHERAPEUTIC: Gastrointestinal agent.

CLINICAL: Antiulcer.

Do not confuse Carafate with Cafergot, or sucralfate with salsalate.

### Uses

Short-term treatment (up to 8 wks) of duodenal ulcer. Maintenance therapy of duodenal ulcer after healing of acute ulcers.

### Precautions

Action
Forms ulcer-adherent complex with proteinaceous exudate (e.g., albumin) at ulcer site. Forms viscous, adhesive barrier on surface of intact mucosa of stomach, duodenum. Therapeutic Effect: Protects damaged mucosa from further destruction by absorbing gastric acid, pepsin, bile salts.

Pharmacokinetics
Minimally absorbed from GI tract. Eliminated in feces, with small amount excreted in urine. Not removed by hemodialysis.

Lifespan considerations
Pregnancy/Lactation: Unknown if drug crosses placenta or is distributed in breast milk. Children: Safety and efficacy not established. Elderly: No age-related precautions noted.

Interactions
DRUG: May decrease absorption of digoxin, ketoconazole, levothyroxine, phenytoin, quinIDine, quinolones (e.g., ciprofloxacin), ranITIdine, tetracycline, theophylline. HERBAL: None significant. FOOD: None known. LAB VALUES: None known.

Availability (Rx)
Oral Suspension: 1 g/10 mL. Tablets: 1 g.

Administration/handling
PO
• Administer 1 hr before meals and at bedtime.
• Tablets may be crushed and dissolved in water.
Avoid antacids for 30 min before or after giving sucralfate.
• Shake suspension well before using.

Indications/routes/dosage

Active Duodenal Ulcers
PO: ADULTS, ELDERLY: 1 g 4 times/day (before meals and at bedtime) for up to 8 wks.

Maintenance Therapy of Duodenal Ulcers
PO: ADULTS, ELDERLY: 1 g twice daily.

Dosage in Renal/Hepatic Impairment
No dose adjustment. Use caution in chronic renal failure.

Side effects
Frequent (2%): Constipation. Occasional (less than 2%): Dry mouth, backache, diarrhea, dizziness, drowsiness, nausea, indigestion, rash, urticaria, pruritus, abdominal discomfort.

Adverse effects/toxic reactions
Bezoars (compacted, undigestible material that does not pass into intestine) have been reported.

Nursing considerations

Intervention/evaluation
Monitor daily pattern of bowel activity, stool consistency.

Patient/family teaching
• Take medication on an empty stomach.
• Antacids may be given as an adjunct but should not be taken for 30 min before or after sucralfate (formation of sucralfate gel is activated by stomach acid).
Dry mouth may be relieved by sour hard candy, sips of tepid water.

**temazepam**

*te-maz-e-pam*

Apo-Temazepam

Restoril

◆ **CLASSIFICATION**

PHARMACOTHERAPEUTIC: Benzodiazepine (Schedule IV).

CLINICAL: Sedative-hypnotic.

Do not confuse Restoril with RisperDAL, Vistaril, or Zestril, or temazepam with flurazepam, LORazepam, or clonazePAM.

**Uses**

Short-term treatment of insomnia.

**Precautions**

**Contraindications:** Hypersensitivity to temazepam. Narrow-angle glaucoma, CNS depression, pregnancy, breastfeeding, severe, uncontrolled pain, sleep apnea. **Cautions:** Mental impairment, elderly, pts with drug dependence potential.

**Action**

Enhances action of inhibitory neurotransmitter gamma-aminobutyric acid (GABA), resulting in CNS depression. **Therapeutic Effect:** Induces sleep.

**Pharmacokinetics**

◆ **Lifespan considerations**
Pregnancy/Lactation: Crosses placenta. May be distributed in breast milk. Chronic ingestion during pregnancy may produce withdrawal symptoms, CNS depression in neonates. **Children:** Not recommended in pts younger than 18 yrs. **Elderly:** Use small initial doses with gradual dosage increases to avoid ataxia, excessive sedation, falls, fractures.

**Interactions**

**DRUG:** Alcohol, other CNS depressants (e.g., LORazepam, morphine, zolpidem) may increase CNS depression. **HERBAL:** St. John’s wort may decrease concentration. **Gotu kola, kava kava, St. John’s wort, valerian** may increase CNS depression. **FOOD:** None known. **LAB VALUES:** None significant.

**Availability (Rx)**

**Capsules:** 7.5 mg, 15 mg, 22.5 mg, 30 mg.

**Administration/handling**

**PO**

- Give without regard to meals.
- Capsules may be emptied and mixed with food.

**Indications/routes/dosage**

**Insomnia**

**PO:ADULTS:** 15–30 mg at bedtime. **ELDERLY, DEBILITATED:** 7.5–15 mg at bedtime.

**Dosage in Renal/Hepatic Impairment**

No dose adjustment.

**Side effects**

**Frequent:** Drowsiness, sedation, rebound insomnia (may occur for 1–2 nights
after drug is discontinued), dizziness, confusion, euphoria. **Occasional:** Asthenia, anorexia, diarrhea. **Rare:** Paradoxical CNS excitement, restlessness (particularly in elderly, debilitated pts).

**Adverse effects/toxic reactions**

Abrupt or too-rapid withdrawal may result in pronounced restlessness, irritability, insomnia, hand tremor, abdominal/muscle cramps, vomiting, diaphoresis, seizures. Overdose results in drowsiness, confusion, diminished reflexes, respiratory depression, coma. **Antidote:** Flumazenil (see Appendix J for dosage).

**Nursing considerations**

**Baseline assessment**

**Intervention/evaluation**

Assess elderly or debilitated pts for paradoxical reaction, particularly during early therapy. Monitor respiratory, cardiovascular, mental status. Evaluate for therapeutic response: decrease in number of nocturnal awakenings, increase in length of sleep.

**Patient/family teaching**

• Avoid alcohol, other CNS depressants.
• Avoid tasks that require alertness, motor skills until response to drug is established.
• May cause daytime drowsiness.
• Take approximately 30 min before bedtime.
• Inform physician if pregnant or planning to become pregnant.

**terbinafine**
ter-bin-a-feen
Apo-Terbinafine
LamISIL
LamISIL AT
Terbinex

CLASSIFICATION
PHARMACOTHERAPEUTIC: Synthetic allylamine derivative.
CLINICAL: Antifungal.
Do not confuse LamISIL with LaMICtal, or terbinafine with terbutaline.

Uses

Precautions

Contraindications: Hypersensitivity to terbinafine. Chronic or active hepatic disease. Cautions: Preexisting hepatic or renal impairment (CrCl 50 mL/min or less), sensitivity to allylamine antifungals (e.g., butenafine). Not recommended in pts with active or chronic hepatic disease.

Action

Inhibits the enzyme squalene epoxidase, thereby interfering with fungal biosynthesis. Therapeutic Effect: Results in death of fungal cells.

Pharmacokinetics

Well absorbed following PO administration. Protein binding: 99%. Metabolized in liver. Primarily excreted in urine; minimal excretion in feces. Half-life: PO, 36 hrs; topical, 22–26 hrs.
Lifespan considerations

Interactions

DRUG: Alcohol, other hepatotoxic medications (e.g., acetaminophen, amiodarone, ketoconazole, isoniazid) may increase risk of hepatotoxicity. CYP3A inducers (e.g., carbAMazepine, phenytoin, rifAMPin) may increase clearance. CYP3A inhibitors (e.g., clarithromycin, ketoconazole, ritonavir) may decrease clearance. HERBAL: None significant. FOOD: None known. LAB VALUES: May increase serum ALT, AST.

Availability (Rx)

Cream (LamISIL AT): 1%. Gel (LamISIL Advanced): 1%. Oral Granules (LamISIL): 125 mg/packet. Tablets (LamISIL, Terbinex): 250 mg. Topical Solution (LamISIL, LamISIL AT): 1%.

Administration/handling

• Tablets may be given without regard to food.
• Granules should be sprinkled on a spoonful of nonacidic food (e.g., mashed potatoes). Instruct pt to swallow without chewing.

Indications/routes/dosage

Tinea Pedis

Topical: ADULTS, ELDERLY, CHILDREN 12 YRS AND OLDER: (Cream): Apply once or twice daily for at least 1 wk. (Gel/Solution): Apply once daily for at least 1 wk.

Tinea Cruris, Tinea Corporis

Topical: ADULTS, ELDERLY, CHILDREN 12 YRS AND OLDER: Apply once daily for at least 1 wk until signs/symptoms significantly improve; not to
exceed 4 wks.

**Onychomycosis**

*Note:* Continue for 6 wks. **PO:** ADULTS, ELDERLY, CHILDREN 12 YRS AND OLDER: 250 mg/day for 6 wks (fingernails) or 12 wks (toenails).

**Tinea Versicolor**

*Topical Solution:* ADULTS, ELDERLY: Apply to the affected area once or twice daily for 7 days.

**Tinea Capitis**

*Note:* Continue for 6 wks.

**PO:** ADULTS, ELDERLY: 250 mg once daily. CHILDREN 4 YRS AND OLDER: (Use granules). WEIGHING GREATER THAN 35 KG: 250 mg once daily. WEIGHING 25–35 KG: 187.5 mg once daily. WEIGHING LESS THAN 25 KG: 125 mg once daily.

**Dosage in Renal Impairment**

No dose adjustment.

**Dosage in Hepatic Impairment**

Not recommended in pts with active or chronic hepatic disease.

**Side effects**

**Adverse effects/toxic reactions**

Hepatobiliary dysfunction (including cholestatic hepatitis), serious skin reactions, severe neutropenia occur rarely. Ocular lens, retinal changes have been noted.
Nursing considerations

Baseline assessment
Serum LFT should be obtained in pts receiving treatment for longer than 6 wks.

Intervention/evaluation
Check for therapeutic response. Discontinue medication, notify physician if local reaction occurs (irritation, redness, swelling, pruritus, oozing, blistering, burning). Monitor LFT in pts receiving treatment for longer than 6 wks.

Patient/family teaching
• Keep areas clean, dry; wear light clothing to promote ventilation.
• Avoid topical cream contact with eyes, nose, mouth, other mucous membranes.
• Rub well into affected, surrounding area.
• Do not cover with occlusive dressing.
• Report rash, dark urine, abdominal pain, anorexia, yellowing of skin.

Fixed-Combination(s)
Pylera: tetracycline/bismuth/metroNIDAZOLE (an anti-infective): 125 mg/140 mg/125 mg.
CLASSIFICATION
PHARMACOTHERAPEUTIC: Tetracycline.
CLINICAL: Antibiotic.

Uses
Treatment of susceptible infections due to Rickettsiae, M. pneumoniae, C. trachomatis, C. psittaci, H. ducreyi, Yersinia pestis, Francisella tularensis,
**Vibrio cholerae, Brucella spp.**; treatment of susceptible infections due to gram-negative organisms including inflammatory acne vulgaris, Lyme disease, mycoplasma disease, *Legionella*, Rocky Mountain spotted fever, chlamydial infection in pts with gonorrhea. Part of multidrug regimen of *H. pylori* eradication to reduce risk of duodenal ulcer recurrence.

### Precautions

**Contraindications:** Hypersensitivity to tetracycline. **Cautions:** Sun, ultraviolet light exposure (severe photosensitivity reaction). Renal, hepatic impairment. Avoid use during tooth development (children 8 yrs or younger). Do not use during pregnancy.

### Action

Inhibits bacterial protein synthesis by binding to ribosomes. **Therapeutic Effect:** Bacteriostatic.

### Pharmacokinetics

Readily absorbed from GI tract. Protein binding: 30%–60%. Widely distributed. Excreted in urine; eliminated in feces through biliary system. Not removed by hemodialysis. **Half-life:** 6–11 hrs (increased in renal impairment).

### Lifespan considerations

**Pregnancy/Lactation:** Readily crosses placenta. Distributed in breast milk. Avoid use in women during last half of pregnancy. **Children:** Not recommended in pts 8 yrs or younger; may cause permanent staining of teeth, enamel hypoplasia, decreased linear skeletal growth rate. **Elderly:** No age-related precautions noted.

### Interactions

**DRUG:** May decrease effects of oral contraceptives. Antacids, calcium or iron supplements, laxatives containing magnesium may form nonabsorbable, undigestible complexes. **HERBAL:** Dong quai, St. John’s wort may increase risk of photosensitivity. **FOOD:** Dairy products inhibit absorption. **LAB**
VALUES: May increase serum BUN, alkaline phosphatase, amylase, bilirubin, ALT, AST.

Availability (Rx)
Capsules: 250 mg, 500 mg.

Administration/handling

PO
• Give with full glass of water 1 hr before or 2 hrs after meals.
• Avoid antacids, dairy products within 3 hrs of tetracycline.

Indications/routes/dosage
Space doses evenly around the clock.

Usual Dosage
PO: ADULTS, ELDERLY: 250–500 mg q6–12h. CHILDREN OLDER THAN 8 YRS: 25–50 mg/kg/day in 4 divided doses.

Dosage in Renal Impairment
Dosage interval is modified based on creatinine clearance.

<table>
<thead>
<tr>
<th>Creatinine Clearance</th>
<th>Dosage</th>
</tr>
</thead>
<tbody>
<tr>
<td>50–80 mL/min</td>

<td>Usual dose q12–24h</td>
</tr>
<tr>
<td>Less than 10 mL/min</td>
<td>Usual dose q24h</td>
</tr>
</tbody>
</table>

Dosage in Hepatic Impairment
No dose adjustment.

Side effects
Frequent: Dizziness, light-headedness, diarrhea, nausea, vomiting, abdominal cramps, photosensitivity (may be severe). Occasional: Pigmentation of skin or
mucous membranes, anal/genital pruritus, stomatitis, discoloration of teeth.

**Adverse effects/toxic reactions**
Superinfection (esp. fungal), anaphylaxis, elevated intracranial pressure (ICP) may occur. Bulging fontanelles occur rarely in infants.

**Nursing considerations**

**Baseline assessment**
Question for history of allergies, esp. tetracyclines, sulfite.

**Intervention/evaluation**

**Patient/family teaching**
- Continue antibiotic for full length of treatment.
- Space doses evenly.
- Take oral doses on empty stomach (1 hr before or 2 hrs after food, beverages).
- Avoid antacids, dairy products within 3 hrs of tetracycline.
- Drink full glass of water with capsules; avoid bedtime doses.
- Report diarrhea, rash, other new symptoms.
- Protect skin from sun, ultraviolet light exposure.
- Consult physician before taking any other medication.
- Avoid tasks that require alertness, motor skills until response to drug is established (may cause dizziness, light-headedness).

<table>
<thead>
<tr>
<th>thiamine (vitamin B₁)</th>
</tr>
</thead>
<tbody>
<tr>
<td>thy-a-min</td>
</tr>
<tr>
<td>Betaxin</td>
</tr>
</tbody>
</table>

**CLASSIFICATION**
PHARMACOTHERAPEUTIC: Water-soluble vitamin.
Uses
Prevention/treatment of thiamine deficiency (e.g., beriberi, Wernicke’s encephalopathy syndrome, peripheral neuritis associated with pellagra, alcoholic pts with altered sensorium), metabolic disorders.

Precautions
Contraindications: Hypersensitivity to thiamine. Cautions: Wernicke’s encephalopathy.

Action
Combines with adenosine triphosphate in liver, kidneys, leukocytes to form thiamine diphosphate, a coenzyme necessary for carbohydrate metabolism. Therapeutic Effect: Prevents, reverses thiamine deficiency.

Pharmacokinetics
Rapidly and completely absorbed from GI tract, primarily in duodenum, after IM administration. Widely distributed. Primarily excreted in urine.

Lifespan considerations
Pregnancy/Lactation: Crosses placenta. Unknown if drug is distributed in breast milk. Children/Elderly: No age-related precautions noted.

Interactions
DRUG: None significant. HERBAL: None significant. FOOD: None known. LAB VALUES: None significant.

Availability (Rx)
Injection Solution (Vitamin B₁): 100 mg/mL. Tablets (OTC): 50 mg, 100
mg, 250 mg, 500 mg.

**Administration/handling**

- **IV, IM administration** used only in acutely ill or those unresponsive to PO route (GI malabsorption syndrome). IM route preferred to IV use. Give by IV push, or add to most IV solutions and give as infusion.

**PO**

- May take without regard to food.

**IV incompatibilities**

None known.

**IV Compatibilities**

Famotidine (Pepcid), multivitamins, folic acid, magnesium.

**Indications/routes/dosage**

**Dietary Supplement**

**PO:** ADULTS, ELDERLY: 1–2 mg/day. CHILDREN: 0.5–1 mg/day. INFANTS: 0.3–0.5 mg/day.

**Thiamine Deficiency (Beriberi)**

**PO:** ADULTS, ELDERLY: 5–30 mg/dose IM or IV 3 times/day (if critically ill), then 5–30 mg/day orally, as a single dose or in 3 divided doses, for 1 mo. CHILDREN: 10–25 mg IM or IV (if critically ill) or 10–50 mg/dose orally every day for 2 wks, then 5–10 mg/day for 1 mo.

**Alcohol Withdrawal Syndrome**

**IV, IM:** ADULTS, ELDERLY: 100 mg/day for several days, then **PO:** 50–100 mg/day.

**Metabolic Disorders**
PO: ADULTS: 10–20 mg/day.

Wernicke’s Encephalopathy

IV: ADULTS, ELDERLY: Initially, 100 mg then IV/IM: 50–100 mg/day until consuming a regular, balanced diet.

Dosage in Renal/Hepatic Impairment
No dose adjustment.

Side effects

Frequent: Pain, induration, tenderness at IM injection site.

Adverse effects/toxic reactions

IV administration may result in rare, severe hypersensitivity reaction marked by feeling of warmth, pruritus, urticaaria, weakness, diaphoresis, nausea, restlessness, tightness in throat, angioedema, cyanosis, pulmonary edema, GI tract bleeding, cardiovascular collapse.

Nursing considerations

Intervention/evaluation
Assess for clinical improvement (improved sense of well-being, weight gain). Observe for reversal of deficiency symptoms (neurologic: altered mental status, peripheral neuropathy, hyporeflexia, nystagmus, ophthalmoplegia, ataxia, muscle weakness; cardiac: venous hypertension, bounding arterial pulse, tachycardia, edema).

Patient/family teaching
• Discomfort may occur with IM injection.
• Foods rich in thiamine include pork, organ meats, whole grain and enriched cereals, legumes, nuts, seeds, yeast, wheat germ, rice bran.
• Urine may appear bright yellow.
Uses

Treatment of symptomatic hypervolemic or euvoletic hyponatremia resistant to correction with fluid restriction, including pts with HF, cirrhosis, and syndrome of inappropriate antidiuretic hormone (SIADH).

Precautions

**Contraindications:** Hypersensitivity to tolvaptan. Hypovolemic hyponatremia, concurrent use with strong CYP3A4 inhibitors (clarithromycin, indinavir, itraconazole, ketoconazole, nefazodone, nelfinavir, ritonavir, saquinavir), pts with urgent need to raise sodium level, inability to sense or respond to thirst, pts who are anuric. **Cautions:** Hyperkalemia, concurrent use of medications that increase serum potassium, GI bleeding in pts with cirrhosis, dehydration, hypovolemia, concurrent use with hypertonic saline.

Action

Inhibits action of antidiuretic hormone to promote excretion of free water (without loss of serum electrolytes), resulting in net fluid loss, increased urine output, decreased urine osmolarity and increase in serum sodium concentration. **Therapeutic Effect:** Restores normal serum sodium levels.
Pharmacokinetics
Readily absorbed following oral administration. Metabolized in liver. Protein binding: 99%. Excreted in feces. **Half-life:** 5 hrs.

Lifespan considerations
**Pregnancy/Lactation:** Systemic exposure to fetus likely. Potential for decreased neonatal viability, delayed growth/development. Unknown if distributed in breast milk. **Children:** Safety and efficacy not established. **Elderly:** No age-related precautions noted.

Interactions
**DRUG:** CYP3A4 inhibitors (e.g., clarithromycin, ketoconazole, saquinavir, verapamil) may increase concentration, effects. **CYP3A4 inducers** (e.g., carbamazepine, phenytoin, rifAMPin) may decrease concentration. **CycloSPORINE** may increase concentration. **HERBAL:** St. John’s wort may decrease concentration. **FOOD:** Grapefruit products may increase absorption, concentration. **LAB VALUES:** May increase serum potassium, magnesium. May alter serum glucose.

Availability (Rx)
**Tablets:** 15 mg, 30 mg, 60 mg.

Administration/handling
• Give without regard to meals.

Indications/routes/dosage

Usual Dosage
**PO:** **ADULTS, ELDERLY:** 15 mg once daily. Increase dose to 30 mg once daily, after at least 24 hrs (maximum: 60 mg once daily), to achieve desired level of serum sodium.

Dosage in Renal Impairment
Not recommended with CrCl less than 10 mL/min.

**Dosage in Hepatic Impairment**
Avoid use.

**Side effects**

**Frequent (16%–13%):** Thirst, dry mouth. **Occasional (11%–4%):** Increase in urine output/urgency, asthenia, nausea, constipation, hyperglycemia, anorexia.

**Adverse effects/toxic reactions**
Dysphagia, lethargy, slurred speech or inability to speak, affective changes, spastic quadriparesis, seizures, coma, death may occur with too-rapid correction of hyponatremia.

**Nursing considerations**

**Baseline assessment**
Initiate only in hospital setting with serum sodium monitoring. Obtain baseline CBC, BMP, LFT, renal function test. Assess for increased pulse rate, poor skin turgor, nausea, diarrhea (signs of hyponatremia).

**Intervention/evaluation**
During initiation and titration, frequently monitor for changes in serum electrolytes and volume. Avoid fluid restriction during first 24 hrs of therapy. Monitor for improvement in signs/symptoms of hyponatremia, hypernatremia (flushing, edema, restlessness, dry mucous membranes, fever).

**Patient/family teaching**
- Continue ingesting fluids in response to thirst.
- Report urinary changes, loss of strength, unusual fatigue.
- Report immediately symptoms of osmotic demyelination (e.g., trouble speaking/swallowing, confusion, mood changes, trouble controlling body movements, seizures).
triamcinolone
trye-am-sin-oh-lone

trimethoprim
trye-meth-oh-prim
Apo-Trimethoprim
Primsol

Fixed-Combination(s)
Bactrim, Septra: trimethoprim/sulfamethoxazole (a sulfonamide): 16 mg/80 mg/mL (injection), 40 mg/200 mg/5 mL (suspension), 80 mg/400 mg, 160 mg/800 mg (tablets).

CLASSIFICATION
PHARMACOTHERAPEUTIC: Folate antagonist.
CLINICAL: Antibacterial.

Uses

Precautions
Contraindications: Hypersensitivity to trimethoprim. Megaloblastic anemia due to folic acid deficiency. Cautions: Renal/hepatic impairment, pts with folic acid deficiency, elderly.

Action
Inhibits folic acid reduction to tetrahydrofolate, inhibiting microbial growth. Therapeutic Effect: Bacteriostatic.
Pharmacokinetics

Rapidly, completely absorbed from GI tract. Protein binding: 42%–46%. Widely distributed, including to CSF. Metabolized in liver. Primarily excreted in urine. Moderately removed by hemodialysis. **Half-life:** 8–10 hrs (increased in renal impairment, newborns; decreased in children).

 здоровья

**Pregnancy/Lactation:** Drug readily crosses placenta; is distributed in breast milk. **Children:** Safety and efficacy not established. **Elderly:** No age-related precautions noted. May increase incidence of thrombocytopenia.

Interactions

**DRUG:** Folate antagonists (e.g., methotrexate) may increase risk of megaloblastic anemia. May increase concentration, side effects of phenytoin. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** May increase serum BUN, bilirubin, creatinine, ALT, AST.

Availability (Rx)

**Oral Solution (Primsol):** 50 mg/5 mL. **Tablets:** 100 mg.

Administration/handling

**PO**

• Space doses evenly to maintain constant therapeutic level.
• Give with milk or food.

Indications/routes/dosage

**UTI**

**PO:ADULTS, ELDERLY, CHILDREN 12 YRS AND OLDER:** 100 mg q12h or 200 mg once daily for 10–14 days. **CHILDREN YOUNGER THAN 12 YRS:** 4–6 mg/kg/day in 2 divided doses for 10 days.
**Otitis Media**

**PO: CHILDREN, 6 MOS AND OLDER:** 10 mg/kg/day in divided doses q12h for 10 days. **Maximum:** 400 mg/day.

**Pneumocystis jiroveci Pneumonia (PCP)**

**ADULTS, ELDERLY, CHILDREN 12 YRS AND OLDER:** 15–20 mg/kg/day in 3 divided doses for 21 days in combination with dapsone.

**Dosage in Renal Impairment**

Dosage and frequency are modified based on creatinine clearance.

<table>
<thead>
<tr>
<th>Creatinine Clearance</th>
<th>Dosage</th>
</tr>
</thead>
<tbody>
<tr>

<td>50 mg q12h or 100 mg once daily</td>
</tr>
<tr>
<td>Less than 15 mL/min</td>
<td>Avoid use</td>
</tr>
</tbody>
</table>

**Dosage in Hepatic Impairment**

No dose adjustment.

**Side effects**

**Occasional:** Nausea, vomiting, diarrhea, decreased appetite, abdominal cramps, headache. **Rare:** Hypersensitivity reaction (pruritus, rash), methemoglobinemia (bluish fingernails, lips, skin; fever; pale skin; sore throat; asthenia, photosensitivity.

**Adverse effects/toxic reactions**

Stevens-Johnson syndrome, erythema multiforme, exfoliative dermatitis, anaphylaxis occur rarely. Hematologic toxicity (thrombocytopenia, neutropenia, leukopenia, megaloblastic anemia) more likely to occur in elderly pts, debilitated pts, alcoholics, those with renal impairment or receiving prolonged high dosage.

**Nursing considerations**

**Baseline assessment**
Assess hematology baseline reports, serum renal function tests.

**Intervention/evaluation**
Assess skin for rash. Evaluate food tolerance. Monitor serum hematology reports, renal function, LFT. Check for developing signs of hematologic toxicity (pallor, fever, sore throat, malaise, bleeding/bruising).

**Patient/family teaching**
- Space doses evenly.
- Complete full length of therapy (10–14 days).
- May take on empty stomach or with food if stomach upset occurs.
- Avoid sun, ultraviolet light; use sunscreen, wear protective clothing.
- Immediately report pallor, fatigue, sore throat, bruising/bleeding, discoloration of skin, fever, rash.

<tbody>
<tr>
<td>trip-toe-rel-in</td>
</tr>
<tr>
<td>Trelstar</td>
</tr>
<tr>
<td>Trelstar Depot</td>
</tr>
<tr>
<td>Trelstar LA</td>
</tr>
</tbody>
</table>

**CLASSIFICATION**
PHARMACOTHERAPEUTIC: Gonadotropin-releasing hormone analogue.
CLINICAL: Antineoplastic.

**Uses**
Palliative treatment of advanced prostate cancer.

**Precautions**
**Contraindications:** Hypersensitivity to triptorelin, luteinizing hormone-releasing hormone (LHRH), LHRH agonists, pregnancy. **Cautions:** None known.
Action
Through a negative feedback mechanism, inhibits gonadotropin hormone secretion. Circulating levels of luteinizing hormone (LH), follicle-stimulating hormone (FSH), testosterone, estradiol rise initially, then subside with continued therapy. **Therapeutic Effect:** Suppresses growth of abnormal prostate tissue.

LifeSpan considerations

Pregnancy/Lactation: May cause fetal harm if given to pregnant women. Unknown if distributed in breast milk. **Children:** Safety and efficacy not established. **Elderly:** No age-related precautions noted.

Interactions

**DRUG:** None significant. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** May alter serum pituitary-gonadal function test results. May cause transient increase in serum testosterone, usually during first wk of treatment.

Availability (Rx)

**Injection, Powder for Reconstitution (Trelstar Depot):** 3.75 mg. **Injection, Powder for Reconstitution (Trelstar LA):** 11.25 mg, 22.5 mg.

Administration/handling

**IM**

- Reconstitute with 2 mL Sterile Water for Injection.
- Administer into large muscle mass, esp. gluteus muscle, alternating injection sites.

Indications/routes/dosage

**Prostate Cancer**

**IM:** **ADULTS, ELDERLY:** 3.75 mg once q4wks, 11.25 mg q12 wks, or 22.5 mg q24 wks.
**IM (Trelstar LA): ADULTS, ELDERLY:** 11.25 mg q12wks, 22.5 mg q24wks.

**Dosage in Renal/Hepatic Impairment**
No dose adjustment.

**Side effects**
**Frequent (Greater Than 5%):** Hot flashes, skeletal pain, headache, impotence. **Occasional (5%–2%):** Insomnia, vomiting, leg pain, fatigue. **Rare (Less Than 2%):** Dizziness, emotional lability, diarrhea, urinary retention, UTI, anemia, pruritus.

**Adverse effects/toxic reactions**
Bladder outlet obstruction, skeletal pain, hematuria, spinal cord compression with weakness, paralysis of lower extremities may occur.

**Nursing considerations**

**Intervention/evaluation**
Obtain serum testosterone, prostate-specific antigen (PSA), prostatic acid phosphatase (PAP) levels periodically during therapy. Serum testosterone, PAP levels should increase during first wk of therapy. Testosterone level then should decrease to baseline level or less within 2 wks, PAP level within 4 wks. Monitor pt closely for worsening signs and symptoms of prostatic cancer, esp. during first wk of therapy (due to transient increase in testosterone).

**Patient/family teaching**
- Do not miss monthly injections.
- May experience increased skeletal pain, blood in urine, urinary retention initially (subsides within 1 wk).
- Hot flashes may occur.
- Report tachycardia, persistent nausea or vomiting, numbness of arms/legs, pain/swelling of breasts, difficulty breathing, infection at injection site.
